WHO has admitted H1N1 is not deadly. But in Greece, France.... 'mandatory' is rolling. Greek health minister declared all 12 million citizens will get shots "without exception"! And there is something sinister about the vaccines, and it is more than money.

Baxter, mentioned above, is also a bio-warfare company. Hard to believe? Google it.

Biggest vaccine misconception

Vaccines don't stop an outbreak. The biggest lie being touted everywhere is that vaccines can slow an epidemic. Vaccines can only mitigate symptoms.

After vaccination, you can still catch flu and you will still go through a contagious period and miss work.

So why should anyone be forced to be vaccinated if they will still be contagious? Those with shots would still need mask anyway.

Forced masks make sense; forced untested vaccines do not. There is no excuse for forced vaccinations, unless there is ulterior motive and considering all the secrecy. We can assume there is.

We have to **ask, "Why?"**

"Why did WHO change definition of pandemic?"

"Why did Bush sign away our rights without telling us?"

"Why does CDC want everyone to take UNTESTED shots and constantly lies about them being adequately tested?"

"Why is Hawaii DOH ignorant of international Level 6 protocols and dumbing us down with naive statements?"

Between secret manipulation and naivety, who can we trust?

On Friday Oct 9, 2009, the writer briefed the Director, the spokesperson, and much of the staff at Hawaii Dept of Health, as well as hundreds of the faculty and thousands of students at University of Hawaii Manoa, about the charges filed with the FBI naming WHO, UN, CDC, and drug companies as a syndicate with criminal intent. (See Jane Burgermeister, theflucase.com)

Injunctions against these unwarranted, untested, H1N1 vaccines are also being put in place in several states now by investigative citizens. Hawaii should do the same. (Attorneys reading this might check the bottom lower links.)

One last big question... How can there be USA patents for H1N1 virus from 2008, obtained before the 'swine flu' even existed?

Swine flu was never novel nor from a Mexican pig farm.
H1N1 was already created in a lab years before. The public was lied to. Again, it is Baxter trusted to produce and test its own vaccines that has the patent.

The nasal spray is the most dangerous because it contains live virus that could be manipulated to create an intensified surge of infection and panic.
This will be needed to carry out the mandatory agenda.

But remember, every year 36,000 Americans die of flu complicated deaths. We can bet every single death this year will be used by media to push H1N1 vaccines.

Criminal intent?
When adding the legal manipulations, the secrecy, the drug company presence at WHO , the initial lies that swine flu H1N1 was a new virus, no independent testing, that laws have been passed so no drug maker can be sued for damages from their 'safe' products, the advanced established protocol to use military for a mild influenza,...it becomes difficult to breath without noticing a foul smell of criminal intent.

And what would motive be for such a global plot?
One theory is that a global elite cannot survive a random collapse that must come due to eventual resource depletion and too many people, so they have come up with a solution that preserves their total control. There are bio weapons that can be triggered by a third shot that could be used to selectively take down populations. They are now rushing to get the first two shots into us.

Depopulation with the bonus of being in control during crisis is this author's conclusion about motive, however the reader may deduce a different motive. Regardless, it is difficult to see anything benign in all the fraud and manipulation, so perhaps, without fully understanding their plan, we can see there is a criminal leadership on the level of the UN, WHO, CDC, certain presidents, drug companies, and corporate media, that has organized this debacle.

Missing in the criminals' entire equation is the good will within human beings to solve problems. Missing is cooperation and inclusiveness and compassion. Missing is true education and a truly informed and powerful citizenry.
The idea that the masses can be lifted to create a higher civilization never ever crosses their minds because they are gangsters and have been for centuries. The top dog can only bite and tear.
Vaccines cannot slow the spread of an epidemic... they can only somewhat reduce symptoms in the individual. There is no sound rationale for mandatory vaccinations. The widespread erroneous assumption that shots will slow infection rate is being marketed to a naive public via our schools and airports.

Do not let anyone you care about take untested vaccines without first showing them the research. Protest a mandatory agenda in your neighborhood and municipality as if your life depends on it, for it probably will.

We are all Jews in Hitler Germany now. Never again!
Have compassion for the police as individuals who in their hearts, also want a civilization based on good will.
Expect intensified media panic. Expect protest news to be censored. And expect the monsters behind this plot to fail, and people power to prevail.
The more concentrated 'their' power becomes, the closer they will come to their own end. Things will get worse before better, but the good will within you can never be taken away.

Be strong! Think!

THE FLU CASE

French scientist calculates people 50 times more likely to die from "swine flu" jab than from flu

The Flu Case, 14 October 2009 11:19
https://web.archive.org/web/20100816013724/http://www.theflucase.com/index.php?option=com_content&view=article&id=1027:french-scientist-calculates-people-50-times-more-likely-to-die-from-qswine-fluq-jab-than-from-flu&catid=1:latest-news&Itemid=64&lang=en

French scientist Jean-Jacques Crevecouer has calculated that people are 50 times more likely to die from the "swine flu" vaccination than from the actual flu.

While there is a one in 520,000 chance of dying from the "swine flu", according to his calculations, there is a one in 10,000 chance of dying from the "swine flu" jab on the basis of the moderate fatalities estimated by French doctor Marc Girard alone.

Jean-Jacques Crevecour has listed his reasons for refusing the jab in his latest post:

Pourquoi je refuse catégoriquement le vaccin contre la grippe H1N1?

Cette énumération de raisons n'engage que moi. Ce sont les conclusions auxquelles je suis arrivé, après plusieurs mois d'études approfondies des documents scientifiques, des publications officielles et des déclarations des instances sanitaires. Je vous ai placé quelques liens de sites Internet pour que vous puissiez vérifier par vous-même l'information, et pour que vous puissiez approfondir votre propre réflexion. Comme vous le verrez, les raisons de mon refus sont nombreuses. Je ne vous demande pas d'adhérer Ã l'ensemble de mes arguments, car chacun a une sensibilité différente. Ce que je vous invite Ã faire, c'est de ressentir quelles sont les phrases qui entrent en résonance avec votre propre réalité. Et de suivre simplement la voix de votre conscience. De toute manière, une seule raison devrait suffire pour vous pousser Ã refuser ce vaccin. Si tel est votre choix, pour vous et pour vos proches.

je refuse ce vaccin parce qu'il n'existe, Ã ce jour, aucune pandémie de grippe en 2009 (Je rappelle que c'est l'OMS qui, le 27 avril 2009, a manipulé la définition d'un niveau de pandémie et a abaissé fortement le seuil d'atteinte d'une pandémie - Voir:
http://www.who.int/csr/disease/influenza/pipguidance09FR.pdf.

Avant cette date, les chiffres actuels n'auraient même pas fait l'objet de la moindre communication médiatique. En effet, cette grippette n'a fait que 4.525 morts (chiffres de l'OMS au 4 octobre 2009 – voir: http://www.who.int/csr/don/2009_10_09/en/index.html), soit cinquante fois moins que la grippe saisonnière habituelle, qui tue entre 250.000 et 500.000 personnes par an! - voir: http://www.who.int/mediacentre/factsheets/fs211/fr/);

je refuse ce vaccin parce que quarante années de vaccination antigrippale n'ont apporté aucune preuve convaincante de son efficacité (En d'autres termes, depuis quarante ans, les gens vaccinés contre la grippe sont aussi malades de la grippe que les non-vaccinés – voir : http://www.rolandsimion.org/IMG/pdf/Vacciner_ou_pas.pdf , mais dépensent davantage en soins de santé dans l'année qui suit la vaccination) ;

je refuse ce vaccin parce que j'ai 50 fois plus de chances de mourir des conséquences de la vaccination que de mourir de cette grippe (en effet, si dans les six prochains mois, on double le

nombre de morts provoqués par la grippe H1N1, cela fera 13.000 morts en un an pour l'ensemble de la planète (6,8 milliards d'habitants). J'ai donc une chance sur 520.000 de mourir de la grippe. Par contre, d'après le pharmacoépidémiologue Marc Girard, nous avons une chance sur 10.000 de mourir des suites de ce vaccin H1N1 – voir:http://www.youtube.com/watch?v=dXAK_6iZbH0&feature=player_embedded#. Faites le calcul: j'ai donc, en cas de vaccination forcée, cinquante fois plus de chances de mourir de la vaccination que de la grippe);

je refuse ce vaccin parce que l'histoire récente a montré que le dernier vaccin préparé dans la précipitation contre une pandémie de grippe porcine (qui n'a jamais eu lieu) en 1976 a fait bien plus de morts que la pandémie elle-même et a causé des milliers d'effets secondaires (dont plus de 530 cas de Guillain Barré) voir : http://pharmacritique.20minutes-blogs.fr/archive/2009/08/26/la-grippe-a-ou-grippe-porcine-de-1976-epidemie-d-effets-seco.html ;

je refuse de servir de cobaye pour tester un nouveau type de vaccin que je n'ai pas demandé et qui n'a jamais été testé en aucune circonstance (voir, Ã ce propos, l'excellent argumentaire du syndicat national des professionnels infirmiers, en France:
http://www.syndicat-infirmier.com/Vaccination-H1N1-mefiance-des.html);

je refuse ce vaccin parce qu'aucun test sérieux n'a été effectué pour mesurer l'effet Ã long terme (quelques mois Ã quelques années) des adjuvants (dont le squalène) contenus dans ce nouveau type de vaccin (voir aussi le même argumentaire du Syndicat des infirmiers. C'est la première fois que ce type de vaccin sera mis sur le marché, avec des doses d'antigène dix fois moins élevées. Ce qui oblige les fabricants Ã augmenter la quantité d'adjuvants et d'additifs, sans disposer d'aucun recul sur les conséquences de ce changement en termes de santé publique et en termes de sécurité);

je refuse ce vaccin parce qu'il contient plus de mercure (sous forme de Thimérosal) que tous les vaccins jamais fabriqués ;

je refuse ce vaccin parce qu'aucun échantillon suffisamment large de population ne sera utilisé pour détecter les effets secondaires sévères et rares de ce vaccin (par exemple, pour vérifier si le vaccin pourrait augmenter les cas de syndromes de Guillain Barré – voir:
http://www.dailymail.co.uk/news/article-1206807/Swine-flu-jab-link-killer-nerve-disease-Leaked-letter-reveals-concern-neurologists-25-deaths-America.html, il faudrait tester le vaccin pendant plusieurs semaines sur un échantillon d'un million de personnes avant sa mise en marché – voir: http://www.journals.uchicago.edu/doi/abs/10.1086/603560. Or, habituellement, les nouveaux vaccins sont testés sur quelques dizaines ou quelques centaines de personnes, pendant quelques jours);

je refuse de recevoir dans mon corps, par l'entremise de ce vaccin, l'information génétique contenue dans le virus A H1N1, tant que toute la lumière n'aura pas été faite sur son origine mystérieuse (en effet, je rappelle que l'équipe du laboratoire de Pathologie Moléculaire des Forces Armées Américaines, sous la direction du docteur J.K. Taubenberger, a déterré, en 2004, le cadavre d'une victime de la grippe espagnole de 1918 pour prélever des tissus pulmonaires – voir:
http://www.sciencemag.org/cgi/content/abstract/310/5745/77 ou
http://www.nature.com/nature/journal/v437/n7060/abs/nature04230.html. Grâce Ã cela, ils ont ressuscité le virus pandémique de 1918, ce qui a inquiété plusieurs scientifiques Ã propos des possibilités d'utilisation de ce virus comme arme bio-terroriste – voir:
http://www.thelancet.com/journals/laninf/article/PIIS1473-3099(06)70442-X/fulltext.
Le fait que ces manipulations aient été faites dans un laboratoire des Forces Armées Américaines n'a rien pour me rassurer. Voir aussi les déclarations de l'expert russe Leonid Ivachov:
http://etat-exception.blogspot.com/2009/05/leonid-ivachov-les-medecins-militaires.html);

je refuse ce vaccin qui m'est imposé Ã coups de propagande par les médias, Ã coups de mensonges et de manipulation de la part des autorités sanitaires et Ã coups de lois liberticides qui feraient de moi un criminel passible d'emprisonnement si je refuse de m'y soumettre;

je refuse ce vaccin parce que depuis des années, je prends soin de mon équilibre physiologique, émotionnel et intérieur de manière autonome et responsable, sans recourir Ã des médicaments et des vaccins susceptibles d'engendrer bien plus d'effets secondaires indésirables que les bénéfices qu'ils procurent (surtout que dans le cas spécifique des vaccins antigrippaux, aucun bénéfice n'est Ã mettre Ã l'actif de ceux-ci) ;

je refuse ce vaccin parce que je revendique le droit inconditionnel et inaliénable d'être malade, car j'ai compris depuis des années que - comme le disait Carl Gustav Jung - *« la maladie est l'effort que fait la nature pour retrouver son équilibre. »* Et je préfère être malade de la grippe pendant quatre jours, que paralysé pendant mes quarante prochaines années de vie;

je refuse ce vaccin parce que je n'ai aucune garantie qu'on ne m'injectera pas, par la même occasion, une micro-puce fabriquée par Hitachi ou Verichip, sous prétexte de pouvoir détecter en temps réel la présence du virus H1N1 dans mon corps (voir:
http://www.verichipcorp.com/092109.html), me réduisant par le fait-même Ã une proie qu'on peut suivre Ã la trace, Ã du bétail qu'on peut manipuler Ã distance par ondes radio-fréquence et Ã un citoyen dont on peut, Ã tout moment, contrôler les dossiers médical, juridique, judiciaire, administratif, bancaire et personnel (voir aussi ce reportage de LCI:
http://www.dailymotion.com/video/x5fyck_puce-sous-cutanee-rfid-verichip-mic_news);

je refuse ce vaccin parce que je n'ai plus aucune confiance dans l'intégrité des scientifiques et des responsables politiques en conflit d'intérêt permanent avec les compagnies pharmaceutiques ;

je refuse ce vaccin parce que je n'ai plus aucune confiance dans l'indépendance et la neutralité de l'Organisation Mondiale de la Santé, financée par des banques privées (Rockefeller, Rothschild et Morgan) qui détiennent des parts majoritaires dans les plus grosses compagnies fabriquant les vaccins;

je refuse ce vaccin parce que je ne veux pas être complice de l'enrichissement des sociétés pharmaceutiques sous prétexte de m'offrir une protection factice et illusoire ;

je refuse ce vaccin, tout simplement, parce que nul ne peut m'obliger Ã accepter un remède ou un traitement médical sans mon consentement libre et éclairé ;

je refuse ce vaccin qui ferait de moi l'esclave soumis de l'élite du monde. Et je suis conscient que mon refus m'élève au-dessus de la logique maître - esclave et me transforme en individu debout, libre et souverain.

Pour certains d'entre vous, il ne reste que quelques jours pour choisir l'attitude que vous adopterez. Continuerez-vous Ã vivre dans la peur et dans la soumission ? Ou allez-vous enfin vous mettre debout et reprendre votre vie et votre santé en mains, de façon autonome et responsable?

Quelque soit votre choix, faites-le en conscience. Que votre OUI soit un OUI, et que votre NON soit un NON! Souvenez-vous que l'Ombre travaille, sans le savoir et sans le vouloir, au service de la Lumière. À vous, Ã présent, de choisir votre camp !

Restons debout et vigilants.
Cordiales salutations.

TIEDOTTEET

Poll: 75% Of Finns Don't Want The Swine Flu Vaccine

Tiedotteet, 15 October 2009, 10:39
https://web.archive.org/web/20091022100151/http://sikainfluenssa.biz/628/poll-75-of-finns-dont-want-the-swine-flu-vaccine

In Finland at least three somewhat big media outlets, Ilta-Sanomat, MTV3 and Helsingin Sanomat, have held polls asking the Finnish people if they are going to take the swine flu vaccine. The results are as follows.

The first online poll was held by MTV3. It's unclear how many people took part in it, but 61% said they do not want the swine flu vaccine.

Nearly 12,000 people answered the Helsingin Sanomat gallup, and the overwhelming majority, 75%, answered "No".

Then a third poll at the end of September held by Ilta-Sanomat rendered the exact same percentage as the Helsingin Sanomat gallup, 75% will not be taking the vaccine. Over 16,000 people took part in the Ilta-Sanomat poll.

So it seems that inspite of intense government and mainstream media propaganda and fear mongering on the swine flu, the Finnish people have not bought the hype. Better luck next time.

Grippe A: l'Etat assigné en justice

Le Soir, 15 Octobre 2009, 10:07
https://web.archive.org/web/20091018041159/http://www.lesoir.be/actualite/belgique/2009-10-15/grippe-etat-belge-assigne-732585.shtml

Des adversaires du vaccin contre la grippe A/H1N1 assignent l'Etat belge en justice. Ils demandent la suspension de la campagne de vaccination. D'autres actions judiciaires sont annoncées, alors que les députés sont appelés à voter, ce jeudi, la loi de pouvoirs spéciaux sur la grippe.

EPA

Cinq membres du collectif Initiative citoyenne, qui contestent la campagne de vaccination volontaire et gratuite contre le virus de la grippe A/H1N1, ont assigné l'État belge en justice. Leurs avocats, Georges-Henri Beauthier, Philippe Vanlangendonck et Inès Wouters, ont déposé, mercredi soir, une citation, en référés, au tribunal civil de Bruxelles. D'autres actions judiciaires sont annoncées, alors que les députés sont appelés à voter, ce jeudi, la loi de pouvoirs spéciaux qui régularisera les procédures engagées par le ministère de la Santé pour lutter contre l'épidémie… La présidente de la Commission santé de la Chambre, Muriel Gerkens (Ecolo) annonce des amendements afin d'éviter le risque de voir les autorités sanitaires imposer une campagne de vaccination obligatoire (ce qui reste possible, dans l'état actuel du projet de loi déposé par le gouvernement).

Plaidant le caractère expérimental du vaccin contre la grippe «pandémique» et le manque d'informations de la part des autorités sanitaires face aux risques encourus par les candidats à la vaccination, les plaignants estiment que l'Etat belge porte atteinte à leur « droit fondamental et absolu à l'intégrité physique ».

«Des cobayes»

«Les citoyens qui se verront administrer le vaccin sont en fait des cobayes, commente Me Wouters, *faute d'un consentement éclairé de leur part». «Il est strictement interdit de faire des essais cliniques de vaccins sur des femmes enceintes, pour des raisons éthiques évidentes, ajoute Me Vanlangendonck, mais nos autorités s'apprêtent, la semaine prochaine, à administrer gratuitement le vaccin contre la grippe A/H1N1 aux femmes enceintes, en tant que groupe à risque à protéger! Qu'on nous explique?»*.

Les plaignants contestent aussi la procédure d'enregistrement centralisé des patients vaccinés, via la plateforme électronique e-health. Cette formalité, qui est également contestée par les syndicats médicaux (tant l'Absym que le GBO), violerait leur droit à la vie privée. La citation introduite en référés demande la suspension de la campagne de vaccination.

Belgian lawyers take legal action against mass "swine flu" vaccinations

The Flu Case, 16 October 2009

https://web.archive.org/web/20100817032235/http://www.theflucase.com/index.php?option=com_content&view=article&id=1086:belgian-lawyers-take-legal-action-to-stop-mass-qswine-fluq-vaccinations&catid=41:highlighted-news&Itemid=105&lang=en

Five Belgian citizens went to court on Wednesday evening to stop the mass "swine flu“ vaccinations.

Three lawyers representing the citizen’s group deposited court filings in Brussels to stop the government from implementing a mass vacccination campaign, arguing that the "swine flu“ jabs are untested, pose risks, and that the government, by mandating them without giving adequate information, is in breach of its duty to protect the fundamental right of its citizens to health and life.

The legal steps are being taken as the Belgium parliament meets today, Thursday, to decide whether to give the government sweeping "emergency“ powers to fight the „swine flu“ pandemic.

Belgian MPs are under increasing pressure to drop a provision that would allow forced vaccinations, and the President of the Chamber of Health Muriel Gerkens has said that this clause will be omitted in new draft legislation.

Lawyers Georges-Henri Beauthier, Philippe Vanlangendonck and Inès Wouters have said additional legal action is envisaged as the protests over the mass "swine flu“ vaccination campaign grows.

"Citizens who are going to be given this vaccine are being turned into guinea pigs,“ said Ines Wouters.
"It is strictly forbidden to undertake clinical vaccine trials on pregnant women, for ethical reasons that are evident, but authorities are planning to administer from next week onwards the H1N1 vaccines to pregnant womenâ€¦.How can that be explained?“ said Philippe Vanlangendonck.

PRESSEPORTAL

Deutschland-Trend im ARD-Morgenmagazin Mehrheit der Deutschen geht nicht zur Schweinegrippeimpfung

Presse Portal, 16 Oktobre 2009, 00:00
https://www.presseportal.de/pm/6694/1494240

Köln (ots).
Über die Hälfte der Deutschen sieht derzeit keine Notwendigkeit sich gegen die Schweinegrippe durch eine Impfung zu schützen. 39% der Deutschen würden sich auf keinen Fall gegen die Schweinegrippe impfen lassen, jeder Vierte (27%) würde wahrscheinlich nicht zur Impfung gehen. Nur 19% der Befragten würden sich wahrscheinlich den Impfschutz abholen. Und 12% der Deutschen sind sich ganz sicher: Sie wollen, wenn möglich, eine Impfung. Dies ergab eine Umfrage von Infratest dimap im Auftrag des ARD-Morgenmagazins.

Kaum Angst: Nur 18% der Deutschen lassen sich durch die Schweinegrippe verunsichern Nur 4% der Bundesbürger sind wegen der Schweinegrippe und den Nebenwirkungen einer Schutzimpfung stark verunsichert. 14% fühlen sich verunsichert. Rund jeder Dritte (32%) ist wenig beunruhigt, und jeder Zweite (50%) ist es gar nicht.

Deutschland-Trend: Kurz nach der Wahl gibt es nichts Neues Auf die Frage, wem die Bürgerinnen und Bürger ihre Stimme geben würden, wenn am kommenden Sonntag Bundestagswahl wäre, antworten 34% der Befragten, sie würden die CDU/CSU wählen. 22% würden sich für die SPD entscheiden, 14% für die FDP, 12% für die Grünen, 13% für die Linke und 5% für die sonstigen Parteien.

Im Vergleich zur Deutschlandtrend-Umfrage der Vorwoche gewinnen die Grünen einen Prozentpunkt, die SPD verliert einen Prozentpunkt. Die Stimmen für die Union, FDP, die Linken und die sonstigen Parteien bleiben unverändert.

Befragt wurden am 13. und 14. Oktober 1000 Bundesbürger. Die Fehlertoleranz liegt bei 1,4 (bei einem Anteilswert von 5%) bis 3,1 (bei einem Anteilswert von 50%) Prozentpunkten. Die vollständige Untersuchung kann unter Tel. 02150 - 20 65 62 oder 0172- 24 39 200 (Agentur Ulrike Boldt) angefordert werden. Die Ergebnisse werden im ARD-Morgenmagazin am Freitag, 16. Oktober 2009, veröffentlicht.

Schweinegrippe: Mehrheit lehnt Impfung ab

Apotheke Adhoc, 16 Oktobre 2009, 06:40 Uhr
https://www.apotheke-adhoc.de/nachrichten/detail/panorama/mehrheit-lehnt-impfung-ab/

Mehr als die Hälfte der Deutschen sieht laut einer Umfrage keine Notwendigkeit, sich gegen die Schweinegrippe impfen zu lassen. Wie die Untersuchung von Infratest dimap im Auftrag des ARD-Morgenmagazins ergab, würden sich 39 Prozent der Deutschen "auf keinen Fall" gegen die Schweinegrippe impfen lassen, 27 Prozent "wahrscheinlich nicht". Nur 19 Prozent der Befragten wollen sich "wahrscheinlich" impfen lassen, 12 sind sich "ganz sicher", dass sie eine Impfung wollen. Der Start der massenhaften Impfung ist in Deutschland für den 26. Oktober geplant.

Die Umfrage ergab auch: Nur 14 Prozent der Deutschen fühlen sich von der Schweinegrippe "verunsichert". 4 Prozent der Bundesbürger sind wegen der Schweinegrippe und den Nebenwirkungen einer Schutzimpfung sogar "stark verunsichert". Die meisten sind dagegen in Sachen Schweinegrippe entspannt. Fast jeder Dritte (32 Prozent) ist "wenig beunruhigt" und jeder Zweite (50 Prozent) ist "gar nicht beunruhigt". Befragt wurden am 13. und 14. Oktober 1000 Bundesbürger.

Aachener Zeitung

Patienten unterschätzen Risiken von Nasensprays

Aachener Zeitung, 16 Oktobre 2009, um 12:48 Uhr
https://web.archive.org/web/20210623053250/https://www.aachener-zeitung.de/ratgeber/gesundheit/patienten-unterschaetzen-risiken-von-nasensprays_aid-27482729

Hamburg: Viele Menschen unterschätzen nach einer Umfrage das Risiko von Nasensprays. Insgesamt 40 Prozent der Befragten gingen davon aus, abschwellende Sprays bis zu zwei Wochen oder länger ohne gesundheitliche Gefährdung benutzen zu können.

Von dpa
Das teilte die Techniker Krankenkasse (TK) am Freitag in Hamburg mit.
Vier Prozent hielten sogar die unbegrenzte Verwendung für unbedenklich. "Dabei führen abschwellende Nasensprays schon nach nur ein bis zwei Wochen zu einer Gewöhnung. Die Sprays können zu einer Nasenspray-Abhängigkeit führen", sagte TK-Apothekerin Ursula Battmer. Nach Schätzungen der Deutschen Hauptstelle für Suchtfragen gibt es 100.000 Nasenspray- Süchtige in Deutschland.
Für die repräsentative Umfrage hatte Forsa 1000 Menschen befragt. Jeder Achte sagte, er habe Nasenspray schon einmal länger als empfohlen eingesetzt. Bei den 18 bis 25 Jahre alten Befragten setzte sogar jeder Fünfte die Mittel übermäßig lange ein.
Die Sprays führen im Normalfall dazu, dass sich die Blutgefäße in der Nasenschleimhaut zusammenziehen und der Kranke wieder besser durch die Nase atmen kann, erklärte Battmer. "Das ist bei akuten Erkältungen gewünscht, damit die Nasennebenhöhlen besser belüftet werden und sich nicht entzünden." Eine längere Anwendung aber sei gefährlich. "Beim Einsatz von Nasenspray über einen langen Zeitraum kann es auch zu schweren Schäden in der Nase kommen, die von einem Arzt behandelt werden müssen."

THE FLU CASE

81% of Germans say they are not likely to take the "swine flu" jab

The Flu Case, 16 October 2009 10:12
https://web.archive.org/web/20100816013809/http://www.theflucase.com/index.php?option=com_content&view=article&id=1101:81-of-germans-say-not-likely-to-take-the-qswine-fluq-jab-&catid=41:highlighted-news&Itemid=105&lang=en

A new poll shows that the majority of Germans at 81 per cent are not likely to get the "swine flu jab." A total of 39 per cent said they will definitely not get the jab. 27 per cent said that they are not likely to get the jab compared to only 19 per cent, who said that they are likely to get the jab.
Only 12 per cent of Germans will definitely get the "swine flu" jab, according to the ARD poll of 1000 people conducted on October 13th and 14th.
The new poll comes amid growing concerns over the safety of the jab, fuelled by the decision of the German army to order a completely different vaccine without mercury and adjuvants that has been mandated by WHO and the German government.

stralingsarm-nederland.org

Nederlandse stichting eist informatie over de griepvaccins bij de rechter

Stralingsarm-Nederland, The Flu Case, 17 October 2009
https://web.archive.org/web/20091022105239/http://www.theflucase.com/index.php?option=com_content&view=article&id=1126%3Adutch-foundation-goes-to-court-to-find-out-what-is-in-the-shot&catid=1%3Alatest-news&Itemid=64&lang=en

De stichting 'StralingsArm Nederland' is naar de rechter gestapt omdat het exact wil weten wat er in de vaccins tegen de Mexicaanse griep zit. 'Dit is informatie die van cruciaal belang is voor iedere burger die zich een oordeel wil vormen over het al dan niet toestemmen in de vaccinatie.'

'Het Nederlandse ministerie van Volksgezondheid en het College ter Beoordeling van Geneesmiddelen weigeren categorisch om documenten vrij te geven, die wij op 23 juli via de Wet Openbaarheid Bestuur opgevraagd hebben en die onontbeerlijk zijn om het vaccinatiebeleid te kunnen toetsen', zegt één van de initiatiefnemers van de stichting, de freelance-arts Jannes Koetsier.

'Wij willen kunnen beschikken over alle documenten die inzicht kunnen geven over de ingrediënten die in de griepvaccins zitten en over de producenten ervan. Ook moet er duidelijkheid komen wat voor afspraken er bestaan omtrent de juridische aansprakelijkheid, wanneer burgers gezondheidsschade oplopen door vrijwillige, verplichte of gedwongen vaccinatie.'

'Bepaalde ingrediënten in de vaccins, zoals kwik en aluminiumverbindingen, worden immers onder invloed van elektromagnetische straling 'elektro-aktief' en zouden daardoor, vooral in zenuwweefsel, onvoorspelbaar onheil kunnen aanrichten.'

Verder wil de stichting uitsluiten dat tegelijk met de vaccinatie een nano RFID-chip ingebracht zal worden.'

Het kort geding is aangespannen tegen de Nederlandse minister van Volksgezondheid, Ab Klink en het College ter Beoordeling van geneesmiddelen (CBG) zal volgende week donderdag worden behandeld bij de rechtbank in Zwolle.

Minister Klink van Volksgezondheid kondigde vandaag aan dat de vaccinaties tegen de Mexicaanse griep in Nederland rond half november zullen beginnen. Tot het eind van het jaar worden zo'n 10 miljoen vaccins toegediend.

Dutch foundation goes to court to find out what is in the shot
– The Flu Case, 17 October 2009

The Dutch foundation 'StralingsArm Netherlands' goes to the court because it wants to know exactly what the vaccines against the swineflu are containing. 'This information is critical for every citizen who wants to form an opinion on whether or not consent to the vaccination.'

The Dutch Ministry of Health and the Medicines Evaluation Board categorically refuse to release documents, which we have requested at July 23 through the Public Law Board.

It should also become clear what agreements exist about the legal liability when public health is damaged through voluntary, mandatory or compulsory vaccination.

Furthermore the foundation wants exclude that at the same time with vaccination nano RFID-chip will be inserted.

The case is brought against the Dutch health minister, Ab Klink and Evaluation Board medicines (CBG) and will be discussed next week at the court in Zwolle.

Minister Klink of Public Health announced today that the vaccination against the swineflu in the Netherlands will start around mid November. Until the end of the year he wants about 10 million vaccines administered.

Ten questions about flu vaccines that doctors and health authorities refuse to answer

Infowars, 17 October 2009
https://web.archive.org/web/20091125045135/http://www.infowars.com/ten-questions-about-flu-vaccines-that-doctors-and-health-authorities-refuse-to-answer/

Vaccine mythology remains rampant in both western medicine and the mainstream media. To hear the vaccination zealots say it, vaccines are backed by "good science," they've been "proven effective" and they're "perfectly safe."

Oh really? Where's all that good science? As it turns out, there's isn't any. Flu vaccines (including swine flu vaccines) are based entirely on a *vaccine mythology* that assumes all vaccines work and no vaccines can be scientifically questioned. Anyone who dares question the safety or effectiveness of vaccines is immediately branded a danger to public health and marginalized in the scientific community.

Here are ten questions vaccine-pushing doctors and health authorities absolutely refuse to answer:

#1) Where are the randomized, double-blind, placebo-controlled studies proving flu vaccines are both safe and effective?

Answer: There aren't any. (Flu vaccines revealed as the greatest quackery ever pushed in the history of medicine. – Natural News, 14 October 2009)
https://web.archive.org/web/20100105014224/http://www.naturalnews.com/027239_vaccines_flu_vaccine_.html

#2) Where, then, is the so-called "science" backing the idea that flu vaccines work at all?

Answer: Other than "cohort studies," there isn't any. And the cohort studies have been thoroughly debunked. Scientifically speaking, there isn't a scrap of honest evidence showing flu vaccines work at all.

#3) How can methyl mercury (Thimerosal, a preservative used in flu vaccines) be safe for injecting into the human body when mercury is an extremely toxic heavy metal?

Answer: It isn't safe at all. Methyl mercury is a poison. Along with vaccine adjuvants, it explains why so many people suffer autism or other debilitating neurological side effects after being vaccinated.

#4) Why do reports keep surfacing of children and teens suffering debilitating neurological disorders, brain swelling, seizures and even death following flu vaccines or HPV vaccines?

Answer: Because vaccines are dangerous. The vaccine industry routinely dismisses all such accounts – no matter how many are reported – as "coincidence."

#5) Why don't doctors recommend vitamin D for flu protection, especially when vitamin D activates the immune response far better than a vaccine? => (Sixty million years of evolution says vitamin D may save your life from swine flu. – Natural News, 13 October 2009)
https://web.archive.org/web/20100104214539/http://www.naturalnews.com/027231_Vitamin_D_immune_system_vaccines.html

Answer: Because vitamin D can’t be patented and sold as "medicine.” You can make it yourself. If you want more vitamin D, you don’t even need a doctor, and doctors tend not to recommend things that put them out of business.

#6) If human beings need flu vaccines to survive, then how did humans survive through all of Earth’s history?

Answer: Human genetic code is already wired to automatically defend you against invading microorganisms (as long as you have vitamin D). (Sixty million years of evolution says vitamin D may save your life from swine flu. – Natural News, 13 October 2009)
https://web.archive.org/web/20100104214539/http://www.naturalnews.com/027231_Vitamin_D_immune_system_vaccines.html

#7) If the flu vaccine offers protection against the flu, then why are the people who often catch the flu the very same people who were vaccinated against it?

Answer: Because those most vulnerable to influenza infections are the very same people who have a poor adaptive response to the vaccines and don’t build antibodies. In other words flu vaccines only "work” on people who don’t need them. (And even building antibodies doesn’t equate to real-world protection from the flu, by the way.)

#8) If the flu vaccine really works, then why was there no huge increase in flu death rates in 2004, the year when flu vaccines were in short supply and vaccination rates dropped by 40%?
(Flu vaccines revealed as the greatest quackery ever pushed in the history of medicine. – Natural News, 14 October 2009)
https://web.archive.org/web/20100105014224/http://www.naturalnews.com/027239_vaccines_flu_vaccine_.html

Answer: There was no change in the death rate. You could drop vaccination rates to zero percent and you’d still see no change in the number of people dying from the flu. That’s because flu vaccines simply don’t work.

#9) How can flu vaccines reduce mortality by 50% (as is claimed) when only about 10% of winter deaths are related to the flu in the first place?

They can’t. The 50% statistic is an example of quack medical marketing. If I have a room full of 100 people, then I take the 50 healthiest people and hand them a candy bar, I can’t then scientifically claim that "candy bars make people healthy.” That’s essentially the same logic behind the "50% reduction in mortality” claim of flu vaccines. (Flu vaccines revealed as the greatest quackery ever pushed in the history of medicine. – Natural News, 14 October 2009)

#10) If flu vaccines work so well, then why are drug makers and health authorities so reluctant to subject them to scientific scrutiny with randomized, placebo-controlled studies?

Answer: Although they claim such studies would be "unethical,” what’s far more unethical is to keep injecting hundreds of millions of people every year with useless, harmful vaccines that aren’t backed by a shred of honest evidence.

Vaccine voodoo?

The vaccine industry is about making money, not actually offering immune protection against the flu. Whether people get the flu or not is irrelevant to the bottom-line profits of the drug companies. What matters most is that people continue to take the flu shots, and making that happen depends entirely on pushing the vaccine mythology that infects the minds of doctors and health authorities today.

There was a time when all "good” doctors believed in bloodletting. Sickness was caused by evil spirits, they thought, and releasing pints of blood from the patient would clear the evil spirits and accelerate healing. Any doctor who questioned the science behind bloodletting was called a "denier.” All the "good” doctors said, "We know bloodletting works, so we don’t need science to back it up.”

Today, you hear the exact same thing about vaccines. "We know they work," doctors claim, "so we don't need any real science to back it up." Anyone who questions the safety of flu vaccines (or H1N1 vaccines) is branded a "denier." Anyone who asks for solid scientific evidence supporting the efficacy of vaccines is called a troublemaker. They don't need any evidence. They already know vaccines work.

With that being the case, why bother calling it medicine at all? Why not just call it VOODOO? Why not accompany vaccines with the wave of a magic wand and some shamanic chanting? Maybe doctors should tell their patients to cross their fingers before being injected with a vaccine because "that makes it work better."

Seriously. Everything that doctors accuse "quacks" of doing with homeopathy, or herbs, or energy medicine is now being done by the doctors themselves when it comes to vaccines. They are following the exact same "quackery" they accuse other of pursuing.

This brings me to an important observation about modern medicine: MY quackery is okay, but YOUR quackery isn't!

That's the attitude of vaccine-pushing doctors and health authorities. As long as the quackery is widely agreed upon by the medical masses, then to heck with actual scientific evidence.

Quackery only needs good company, not good science, to be accepted as true.

Why natural medicine is inherently safer

Of course, these vaccine devotees might say, well, you don't have any good evidence to support your anti-viral herbs, or your medicinal teas, or your vitamin D nutrition either. But in saying that, they miss the whole point: Foods, herbs and nutrition are all natural, biocompatible healing elements that have been part of the human experience for as long as humans have roamed this planet. A chemical injection with a sharp needle that pierces the skin, on the other hand, is extremely interventionist. It's unnatural and in many ways quite radical. As such, it demands *a higher burden of scientific proof* than something that human beings have evolved with over time.

Foods, herbs and natural medicines have been around for millions of years. Vaccines have existed for less than a hundred years, and routine season flu vaccinations have really only been pushed hard for less than twenty years. *They have no track record of success.* They aren't natural, they aren't compatible with human biology, and they contain extremely toxic substances that clearly do not belong in the human body.

Given such extremes, the burden of proof for both safety and efficacy of vaccines falls onto those who would advocate them. And yet, to this day, no such proof has been offered… or is even pursued. There isn't even a plan in place to someday find out if flu vaccines really work. The whole plan is to just pursue "business as usual" and keep injecting people whether it really works or not.

Vaccine needles would be far more honest if they were shaped like question marks.

Flu vaccines are the voodoo of modern medicine.

Seriously. You would have the same level of protection from the flu if you brought your own personal voodoo doll to the clinic and had them inject that with the vaccine instead of you!

That's an interesting idea, actually. We could really reduce national health care costs if we just administered western medicines to our voodoo dolls instead of our actual bodies. Got cancer? Just poison your voodoo doll with chemotherapy. Side effects are almost non-existent. Need heart bypass surgery? Just have them operate on the doll (it's far less complicated). Want some protection from the winter flu? Just vaccinate the doll. It's quick and painless.

The results would be no worse than what people are experiencing right now. In fact, in most cases they might actually be better.

ALEX JONES' PRISONPLANET.COM

Kurt Nimmo

German Chancellor, Ministers get Special Vaccine without Soft Kill Ingredients

Prison Planet, 18 October 2009.

https://web.archive.org/web/20091020001641/http://www.prisonplanet.com/german-chancellor-ministers-get-special-vaccine-without-soft-kill-ingredients.html

Spiegel Online is reporting that German Chancellor Angela Merkel and government ministers will receive a special, additive-free H1N1 vaccine. "The Vakzin [vaccine] does not contain disputed additives – contrary to the vaccine for the remainder of the population," reports the newspaper.

Angela Merkel, the German Chancellor, is shown here hobnobbing with fellow minions of the elite, Gordon Brown and Nicolas Sarkozy

Here is an English translation of the article.

"Critics argue that Adjuvantien [adjuvants in the vaccine] could lead to increased inoculation reactions such as headache or fever." The German government elite and the armed forces will receive Celvapan, an adjuvant-free vaccine manufactured by Baxter. The German public will receive a vaccine produced by GlaxoSmithKline with adjuvants.

Employees of the Paul Ehrlich Institute will also get the adjuvant-free vaccine. Johannes Löwer, president of the institute, said in August that the vaccine causes worse side effects than the virus. Löwer's comment came after German lung specialist Wolfgang Wodarg said the vaccine increases the risk of cancer. The nutrient solution for the vaccine consists of cancerous cells from animals.

Spiegel reports that there is an "open rebellion" by general medical professionals and child physicians in Germany over use of the toxic vaccine. Dieter Ludwig, chairman of the drug

commission of the German medical profession, told Spiegel that health authorities have colluded with pharmaceutical companies.

On July 13, the World Health Organization ordered the inclusion of the deadly adjuvants in the H1N1 vaccine. WHO's vaccine advisory panel is stacked executives from Baxter, Novartis, GSK and Sanofi. Baxter's own scientists have stated in the New England Journal of Medicine that adjuvants do not improve antibody response.

As Dr. Russell Baylock has warned, the adjuvant squalene is linked to the Gulf War Syndrome. Soldiers who took the anthrax vaccine from 1990 to 1991 had an increased risk of 200 percent in developing the deadly disease amyotrophic lateral sclerosis (ALS), also called Lou Gehrig's disease. The soldiers also suffered from a number of debilitating and life-shortening diseases, such as polyarteritis nodosa, multiple sclerosis (MS), lupus, transverse myelitis (a neurological disorder caused by inflammation of the spinal cord), endocarditis (inflammation of the heart's inner lining), optic neuritis with blindness and glomerulonephritis (a type of kidney disease), according to Baylock.

"Because squalene, the main ingredient in MF-59, can induce hyperimmune responses and induce autoimmunity, a real danger exists for prolonged activation of the brain's immune cells, the microglia. This type of prolonged activation has been strongly associated with such diseases as multiple sclerosis, Alzheimer's disease, Parkinson's disease, ALS and possibly vaccine-related encephalitis. It has been shown that activation of the systemic immune system, as occurs with vaccination, rapidly activates the brain's microglia at the same time, and this brain inflammation can persist for long periods," notes Baylock.

The fact minions of the ruling elite in Germany will get a special vaccine without adjuvants is simply more evidence that squalene is a soft kill weapon designed to injure and slow kill the general population, considered by our eugenicist rulers as little more than useless eaters.

In the United States, a large number of people are refusing to take the deadly vaccine. In response, the government has launched a massive propaganda campaign.

If this propaganda effort fails, the government may eventually impose mandatory vaccinations on the public under the ruse of a public emergency.

Addendum

The CDC says H1N1 vaccine in the U.S. will not contain squalene, however some doses of the H1N1 vaccine *will* contain thimerosal, a known culprit in causing autism and neurological deficits.

On September 15, Physorg reported that the H1N1 vaccine will contain thimerosal. The mercury-based preservative "will be found in most vials of the H1N1 vaccine."

4,500 families are suing the government because they believe vaccines caused their child's autism.

"Studies indicate that mercury tends to accumulate in the brains of primates and other animals after they are injected with vaccines. Mercury poisoning has been linked to cardiovascular disease, autism, seizures, mental retardation, hyperactivity, dyslexia and many other nervous system conditions," writes Dawn Prate for Natural News. Since the 1990s, there has been a tenfold or 1000-percent increase in autism, according to research cited by Prate.

1976 All Over?
Makers of Vaccination Refuse to take H1N1

Wolfgang W. Merkel

Zwei-Klassen-Impfung ist ein verheerendes Signal
[Two-class vaccination is a devastating signal]

Welt, 18 Oktober 2009, 17:44 Uhr
https://web.archive.org/web/20091020232925/http://www.welt.de/wissenschaft/article4887314/Zwei-Klassen-Impfung-ist-ein-verheerendes-Signal.html

Die Bundesregierung, Ministerialbeamte und Mitarbeiter von oberen Bundesbehörden bekommen für den Schutz vor der Schweinegrippe einen verträglicheren und unbedenklicheren Impfstoff als der normale Deutsche. Kein ermutigendes Signal für den in seiner Impfentscheidung schwankenden Bürger.

Es ist ein verheerendes Signal – und ein entlarvendes: Die Bundesregierung, Ministerialbeamte und Mitarbeiter von oberen Bundesbehörden bekommen eine "Extrawurst". Nicht jener Impfstoff wird ihnen injiziert, mit dem sich der normale Bürger vor der Schweinegrippe schützen soll. Sie bekommen stattdessen, wie das Nachrichtenmagazin "Spiegel" vom Innenministerium erfuhr, eine später zugelassene Vakzine, die keinen Wirkverstärker ("Booster") enthält. Die Booster-freie Variante stufen viele Experten als verträglicher ein.

Das wirft zum einen ein verräterisches Licht auf die Bekundungen des Bundesgesundheitsministeriums und des für Impfstoffe zuständigen Paul-Ehrlich-Instituts (PEI). Warum eine Sonderbehandlung für Regierende und hohe Beamte, fragt sich der der Regierte. Das böse Wort von der Zwei-Klassen-Medizin drängt sich ihm auf. Und dann fällt ihm noch George Orwells Roman "Farm der Tiere" ein, in dem alle gleich sind, "aber manche sind gleicher".

Verheerend ist die Bestellung dieser 200.000 Impfstoffdosen für die Bemühung der Behörden, möglichst viele Deutsche von der Unbedenklichkeit des ihnen zugedachten Impfstoffs zu überzeugen. Schon zuvor hatte, so heißt es von Seiten der Ländergesundheitsministerkonferenz, nur etwa ein Viertel der Bevölkerung vor, sich impfen zu lassen. Jetzt lautet die Botschaft: So unbedenklich ist der Impfstoff nicht, deshalb sollen wichtige Entscheidungsträger einen harmloseren, besseren bekommen. Kein ermutigendes Signal für den in seiner Impfentscheidung schwankenden Bürger.

Es ist richtig: Nebenwirkungen dürften in den meisten Fällen über lokale Schmerzen oder Schwellungen an der Injektionsstelle, Kopfschmerzen oder Müdigkeit nicht hinausgehen. Das ist bei 90 Prozent aller Geimpften zu erwarten, wie eine Untersuchung schon 2007 ergab; die Studienergebnisse waren im renommierten Magazin "The Lancet" nachzulesen. Doch der Booster wurde nie an einer großen Zahl von Patienten angewandt oder getestet. Deshalb sind auch einzelne schwere Komplikationen nicht auszuschließen oder gar wahrscheinlich.

Keine Wirkung ohne Nebenwirkung, wussten Pharmakologen schon immer. Doch beides muss in einem vernünftigen Verhältnis zueinander stehen. Bei bedrohlichen Krankheiten sind Mediziner und ihre Patienten geneigt, ein größeres Komplikationsrisiko einzugehen, um einen schweren Gesundheitsschaden abzuwenden. Doch die Schweinegrippe ist unter dem Strich weit harmloser als

etwa die saisonale Grippe. An der Ersten starben weltweit bislang rund 3000 Menschen; sehr viele von ihnen in Ländern mit weit schlechterer Gesundheitsversorgung als Deutschland. Der saisonalen Grippe erliegen jedoch jedes Jahr allein in Deutschland 5000 bis 20.000 Menschen. Die Schweinegrippe verläuft hierzulande fast immer mild, da muss der Einzelne eigentlich gar nicht groß darüber nachdenken, ob er das Risiko einer Impfnebenwirkung eingehen will.

Dass sich die Bedrohlichkeit der Schweinegrippe in den kommenden Monaten ändert, ist wenig wahrscheinlich. Das zeigt die Erfahrung in Australien, wo es während des jetzt zu Ende gehenden Südwinters zu keiner gefährlichen wechselseitigen Vermischung von saisonaler und Schweinegrippe kam. Aber zugegeben: Es besteht ein Restrisiko. Dann würde auch eine Impfung mit Nebenwirkungen in einem anderen Licht erscheinen.

Vielleicht hatten Regierung und Gesundheitsbehörden keine andere Wahl als die Impfstoffentwicklung so schnell wie möglich zu forcieren. Würde das Restrisiko tragische Realität und kein Impfstoff wäre da – man würde die Verantwortlichen selbstverständlich der Verantwortungslosigkeit zeihen.

Aber fragen muss man doch, ob angesichts des in Europa fast immer milden Krankheitsverlaufs es nicht sinnvoll und notwendig gewesen wäre, nicht den ersten lieferbaren, sondern später den besseren Impfstoff zu bestellen. Die Verträge über 50 Millionen Dosen des Booster-Impfstoffs wurden übereilt geschlossen, jetzt muss die Bundesregierung diese auch abnehmen. Neben den 200.000 Dosen der verträglicheren Variante für Beamte nun noch weitere 50 Millionen für jedermann nachzubestellen, ist illusorisch – logistisch wie finanziell. Dass sie sich bei den Exklusivverträgen mit zwei Herstellern hat über den Tisch ziehen lassen, das bestätigt die Bundesregierung jetzt indirekt mit ihrer Extrawurst.

THE FLU CASE

Germans become aware of genocidal intention of their government

The Flu Case, 19 October 2009
https://web.archive.org/web/20091023032857/http://www.theflucase.com/index.php?option=com_content&view=article&id=1158:germans-become-aware-of-genocidal-intention-of-their-government-&catid=41:highlighted-news&Itemid=105&lang=en

The German Chancellor Angela Merkel, the Interior Minister Wolfgang Schüble and Health Minister Ulla Schmidt announced today that they are all going to get the same "swine flu" jab with mercury and adjuvants as the rest of the population as the uproar over the revelation that they had ordered special vaccines without the lethal preservatives and adjuvants continues.

A commentary in the mainstream "Die Welt" on October 18th gives a flavour of the reaction among the Germans to the news that their government has ordered poison for the population -- a poison doctors and nurses are refusing to take -- while ensuring a stockpile of harmless vaccines for themselves.

Two tier vaccination is a horrendous signal

It's a horrendous signal – and one that reveals a great deal: the (German) federal government, officials in ministries and staff working for in upper government offices are to get a "special deal." Not the same vaccine is going to be injected into them as into the ordinary citizen to protect them against the "swine flu." Instead, they are getting, as the news magazine "Spiegel" found out from the Interior Ministry, a vaccine that received market approval later on, which does not have any adjuvant (booster). The booster-free variation is considered by many experts to be less risky.

That throws a threacherous light on the announcments of the German health ministry and the Paul Ehrlich Institute (PEI) responsible for vaccines. Why should the government and high-ranking officials get special treatment, the people who they rule over are asking. The dirty word of a "two-tier medicine" comes to mind. And then thoughts turn to Orwell's novel "Animal Farm" where all are equal but "some are more equal."

Horrendous is the order of 200,000 doses of vaccine and the attempt by the officials to persuade as many Germans as possible that the vaccine meant for them is without risks. Before this, according to the state health ministry conference, only a quarter of the population planned to get vaccinated. Now the message is: the vaccine is not all that straightforward and that is why important decision-makers should need to get a version that is more harmless, and better. Not a very encouraging signal for a citizen unsure about whether to get the vaccination or not.

RADIO NETHERLANDS WORLDWIDE

Willemien Groot

Reluctance to have flu vaccine increases

Radio Netherlands Worldwide. 18 October 2009, 10:26 am
https://web.archive.org/web/20091021171154/http://www.rnw.nl/english/article/reluctance-have-flu-vaccine-increases

Just weeks before the Dutch vaccination campaign against influenza A(H1N1) is due to begin, the reluctance to have the vaccine is increasing. In the Netherlands, two thirds of nursing staff say they do not want to be vaccinated against the A(H1N1) virus. There is little enthusiasm for the flu jab in other European countries such as France, Belgium and Spain.

In a small pub often visited by nursing staff near Amsterdam's university hospital, the AMC, the question "Who wants to have the vaccination?" immediately sparks a lively debate. People have their doubts.

"*For me it's not really clear whether there is a reduced risk in vaccination or not, if there is a reduced risk for the patient. And it's not very clear so far. There are discussions on television and in the papers, but so far it's not very clear*."

Ute, who works in a home for people with disabilities, says she would not even consider having the vaccine:

"*No, I certainly wouldn't. For a start it is very difficult to really protect yourself against flu. Every flu jab targets a certain virus. And there are hundreds going around, so you are not protected at all. The side effects can be really serious. And it seems like there is a lot of panic-spreading going on. It is only the pharmaceutical industry that stands to benefit from it."*

Anti-vaccination groups

The reluctance to the H1N1 vaccine is not just limited to the Netherlands. The same debate is taking place in Spain, France and Belgium. Organisations which actively oppose the vaccination campaign are gaining momentum, says virologist and influenza advisor for the Belgian government, Marc van Ranst. They are spreading fears about side effects, the pharmaceutical industry and the government. It is high time we heard a well-informed counter-argument. The usual strategy of ignoring the problem is no longer working, says Mr Van Ranst.

"*And in any case the worst thing you can do is to allow even a glimmer of a rumour that vaccination might become obligatory. Let's be quite clear: obligatory vaccination is out of the question in any European country. This is a vaccine taken on a voluntary basis, when someone is convinced that this is good for his or her health. It is fine to get vaccinated, but it is also fine if you don't.*"

Caution appears to be the magic word. In the University Medical Centre St. Radboud in Nijmegen, the sixth information campaign in as many years which draws the attention of the medical staff to the importance of getting vaccinated is due to begin.

Successful campaigns

Here the response is 51 percent, compared to a national average of around 25 percent. In previous years, vaccination campaigns were just for seasonal flu. Now attention is focused on the A(H1N1) virus. Nannet van der Geest, company doctor at the hospital and closely involved in the campaign, is not keen on compulsory vaccination campaigns like the one in the United States.

"*I think it's important to give the right information and to motivate the healthcare workers. Have a little patience because when I look back, in the last few years you can see the percentage is increasing. So give it a try. I don't like to force those things*."

Ignorance

Virologist Marc van Ranst concedes that it is impossible to persuade the real die-hards, but some people can be convinced with solid arguments. That is because the reluctance of the nursing staff is mainly based on ignorance, thinks independent nurse Tineke van der Kruk.

"*I think they do not know enough about the background of the vaccination. They think it's in the interest of their institutions that they won't have too many sick employees to pay for. And I think they underestimate the disease itself and all the consequences it has*."

At the end of October, the leaders of a number of medical organisations will be vaccinated during a meeting open to the public. In November, it is the turn of the hospital staff.

Chandler firefighters refuse H1N1 vaccine

Tribune, 18 October 2009, 12:19 PM
https://web.archive.org/web/20091021002055/http://www.eastvalleytribune.com/story/145952

About three-quarters of Chandler firefighters eligible to receive doses from an early batch of the H1N1 flu vaccine have refused it, according to fire department officials.

Most of the 200 doses allocated to the department's roughly equal number of emergency responders likely will be returned to Maricopa County health officials for redistribution to medical professionals likely to encounter cases of the virus, said Marc Walker, a fire department spokesman.

Only about 50 Chandler firefighters volunteered Wednesday and Thursday to receive a nasal mist containing a weakened form of the virus, said Donna Pierce, a Chandler Fire Department captain who traveled around to several city fire stations to administer the vaccine.

Many of those who volunteered for the vaccine said it was because they have young children to whom they didn't want to spread a possible infection. "The other two-thirds are like, 'Nope, we don't want it,'" Pierce said. Those who declined the vaccination generally said it was because the vaccine was new and untested, she said.

Three volunteers at a fire station just southwest of Warner and Alma School roads opted to take the vaccine Thursday afternoon. Among them was firefighter Mike Cravener, who has a baby at home and whose wife is pregnant. Cravener said if he is exposed, he doesn't want to pass on the illness to his family. "I feel like I should probably do it," he said.

Suzy Vargo, a fire department engineer, took the vaccine, as well. Vargo said it's because she has a 21-month-old at home. She said firefighters already are responding to calls from patients with flulike symptoms in Chandler.

Chandler firefighters were the city's first employees to have been offered the H1N1 flu vaccine.

County health officials have said doses for the public are still three to four weeks away, but area hospital workers began receiving the vaccine last week, and another 100 to 200 doses are slated to go out soon to paramedics, pediatricians and obstetrical-gynecological doctors.

Queen Creek fire Chief Van Summers said nearly all of the town's 28 firefighters have been vaccinated with the nasal spray vaccine, delivered by the Maricopa County Department of Public Health last week. The main exceptions, including him, have been those people over age 49, who are not advised to take this form of the vaccine, and two firefighters who were on vacation.Summers said the department's emergency responders have been receptive to the voluntary program.
"We're out seeing patients in emergencies and we don't want our people to expose the patients to the flu," Summers said.

He added that he wouldn't agree with mandating the vaccine. "Everyone has their own medical history, so health care should be a personal decision," Summers said.

The Gilbert Fire Department has received 100 doses of the nasal spray, according to emergency management coordinator Sherri Gibbons. As of Friday afternoon, 52 firefighters had taken the vaccine; the department has 153 firefighters. Gibbons said the vaccines will continue to be administered.

Mesa's vaccination schedule for its nearly 450 emergency responders begins this week. Keith Pyers, division chief at the city's Emergency Medical Services Division, said the department received multiple queries about the vaccine's safety, since being told three weeks ago that the vaccine would be made available.

Pyers said all vaccines tend to be controversial, so the concerns were not a surprise."The question we've received most has to do with the mercury-based preservative, thimerosal – if the nasal mist contains it," Pyers said.

Pyers was uncertain how many Mesa emergency responders will go ahead and get vaccinated. The response rate to the regular flu shot typically has been between 60 and 70 percent, he said.

SPIEGEL International

Germans unhappy with alternative swine flu vaccine for politicians

Spiegel, 19 October 2009, 17.45 Uhr
https://www.spiegel.de/international/germany/second-class-medicine-germans-unhappy-with-alternative-swine-flu-vaccine-for-politicians-a-656028.html

Damage control is the name of the game in Berlin on Monday as politicians rush to deny that they are receiving a better, safer swine flu vaccine than ordinary Germans. The first of 50 million doses arrived in Germany on Monday.

One might think that the arrival in Germany of the first of 50 million doses of swine flu vaccine on Monday might be cause for celebration. But with news breaking over the weekend that top government officials in Berlin will be injected with an alternative vaccine – one widely seen as safer – a debate about an alleged two-class medical system has erupted.

SPIEGEL over the weekend reported that Chancellor Angela Merkel, a number of her ministers and other government officials would receive a vaccine manufactured by the pharmaceutical company Baxter – the same vaccine that the German military opted for, as was reported last week.

The mass-circulation tabloid *Bild* on Monday plastered the story on its front page on Monday, assuring its readers that "experts are accusing the government" of serving up "second class medicine" to ordinary Germans.

Fevers and Headaches

The controversy centers on an additive included in the vaccine manufactured by pharmaceutical giant GlaxoSmithKline. The additive includes an inactive strain of the entire flu virus as opposed to virus fragments. Critics say the additive can increase the risk of side effects from the flu vaccine such as fevers and headaches.

Supporters counter that the additive is safe, and its use allows the drug manufacturer to quickly produce more doses of the vaccine. The SPIEGEL story mentioned that the GlaxoSmithKline vaccine, with the additive, has undergone more testing than the Baxter version.

An Interior Ministry spokesman told SPIEGEL that the Baxter vaccine had been ordered for all ministries and other agencies as well as for the employees of the Paul Ehrlich Institute, the authority responsible for approving vaccines.

Merkel's spokesman Ulrich Wilhelm on Monday denied that Merkel was taking a different vaccine than the one available to ordinary Germans. He said that the Baxter vaccine had been ordered four months ago as part of a deal hammered out one year ago and has nothing to do with recent concerns surrounding the GlaxoSmithKline vaccine.

'Second-Class Medicine'

Still, voices have become raised. The Green Party's health expert Biggi Bender said that the separate vaccines amount to "big risk for the people, little risk for the government. This type of second-class medicine cannot be allowed to exist in a democracy."

Leading physicians also complained about the planned vaccination. The head of the Institute for Hygiene and Public Health at the University of Bonn, Martin Exner, said: "The fact that politicians

and top civil servants in ministries will be vaccinated with a vaccine other than the people is a terrible sign. Today politicians must take what they recommend."

Virologist Alexander Kekulé Hall of the University Hospital said the fact "that the members of the Federal Government and the authorities have any other vaccine is a scandal."

The Interior Ministry has also rejected the sharp criticism. A spokeswoman for Interior Minister Wolfgang Schäuble pointed out that at that time the Baxter vaccine was ordered the differences between the two vaccines was not yet an issue. The Paul Ehrlich Institute has repeatedly defended its decision to provide the population with the GlaxoSmithKline version, known as Pandemrix.

'Alleged Threat'

Germany is not the only government working to contain a potential outbreak of swine flu, the popular though inaccurate name given to the H1N1 flu virus. The UK has seen an increase in cases in recent weeks. As a result, the country has purchased 60 million doses of Pandemrix. Since swine flu emerged, a number of people in the US showing symptoms have died, leading the government to purchase 251 million doses of the swine flu vaccine from various manufacturers. The European Medicines Agency approved Pandemrix for use recently, amid concern for the upcoming winter flu season and the expected uptick in swine flu cases.

Some German politicians have joined Merkel in opting out of the alternative vaccine. Health Minister Ulla Schmidt said in Bild, "I will allow myself to be vaccinated with the same vaccine as the people. It is exactly like the other approved vaccine, safe and effective."

The weekend scandal has drowned out a second debate which has been raging in recent weeks in the US and which has also found resonance here in Germany: whether such a massive vaccination program is necessary in the first place.

Wolf-Dieter Ludwig, chairman of the Drug Commission of the German Medical Association, has called the planned vaccination campaign a "scandal." "The health authorities have fallen for a campaign from the pharmaceutical companies, who simply want to earn money with an alleged threat," he told SPIEGEL.

Two-class vaccines?

Deutsche Welle, 19 October 2009
https://www.dw.com/en/german-officials-reject-charges-of-two-classes-of-swine-flu-vaccines/a-4803801

As Germany prepares for a mass-immunization against the swine flu, there are growing concerns about the existence of two different shots - one for a selected few and one for the rest of the population.

In one week's time, Germany is scheduled to begin a mass immunization against the swine flu. But the type of shot a person gets is to depend on their position in society, leading to complaints about a 'second class' swine-flu vaccine.

Politicians, certain government employees and members of the German military are scheduled to receive one type of the swine flu vaccine, while average citizens in Germany are to receive a different one.

The difference between the two vaccines is that the one meant for members of the government is said to have fewer side-effects. It also lacks certain additives which are said to be present in the version for the general population.

A spokesperson for the German interior minister, quoted by the Berliner Zeitung newspaper, said that the vaccines marked for the government were ordered months ago, when there were no clear differences between the two vaccines. She added that the other version was not a second-class vaccine.

According to a separate report in the mass-circulation Bild newspaper, Chancellor Angela Merkel and Health Minister Ulla Schmidt are planning on getting vaccinated with the shot provided to the general population.

"It's the same as the rest," said Schmidt, "safe and effective."

Власти Германии закупили вип-вакцину от "свиного гриппа"

РБК, 19 октября 2009
https://www.rbc.ru/society/19/10/2009/5703d6f69a7947733180bd1f

В Германии назревает скандал по поводу предстоящей вакцинации против гриппа А (H1N1). Как сообщило немецкое издание Spiegel, правительство Германии будет привито более щадящим видом вакцины, нежели остальная часть населения страны.

Как сообщил изданию источник в Министерстве внутренних дел ФРГ, для членов правительства и солдат бундесвера были закуплены 200 тыс. доз вакцины Celvapan производства американской фармацевтической компании Baxter. Эта вакцина отличается тем, что не содержит адъювантов (веществ, повышающих иммунитет) и является более щадящей для организма.

В то же время для противогриппозной вакцинации остального населения Германии было приобретено другое средство - препарат производства британской фармацевтической компании GlaxoSmithKline (GSK).

Прививки с "привилегированной" вакциной будут сделаны и сотрудникам Института имени Пауля Эрлиха. Именно эта организация высказалась в пользу препарата GSK для массовой вакцинации, несмотря на ряд явных недостатков этого средства. В частности, из-за отсутствия клинических исследований на беременных женщинах оно не может быть использовано для их вакцинации, передает Deutsche Welle.

SPIEGEL Wissenschaft

Sozialverbände und Mediziner rügen Zweiklassen-Impfung

Spiegel, 19 Oktober 2009.
http://www.spiegel.de/wissenschaft/medizin/0%2C1518%2C655860%2C00.html

Die Rede ist von einem "Skandal", von einem "verheerenden Zeichen". Weil die Bundesregierung Spitzenbeamte und Politiker mit einem alternativen Schweinegrippe-Impfstoff versorgen will, gehen Ärzte und der Sozialverband VdK auf die Barrikaden. Das Innenministerium weist die harsche Kritik zurück.

Berlin - Die Empörung über die geplanten Impfungen von Politikern und Beamten gegen die Schweinegrippe mit einem besonderen Wirkstoff reißt nicht ab. Die Präsidentin des Sozialverbandes VdK, Ulrike Mascher, sagte der "Bild"-Zeitung: "Zweierlei Impfstoffe für Regierung und Bevölkerung ist das falsche Signal. Da verstärkt sich bei vielen Menschen der Eindruck, sie seien Patienten zweiter Klasse. Das zeugt von wenig Fingerspitzengefühl."

Ähnlich äußerte sich die Grünen-Gesundheitsexpertin Biggi Bender: "Großes Risiko fürs Volk, kleines Risiko für die Regierung. Diese Art von Zweiklassenmedizin darf es in einer Demokratie nicht geben."

Auch führende Mediziner rügten die geplante Impfpraxis. Der Chef des Instituts für Hygiene und Öffentliche Gesundheit an der Universität Bonn, Martin Exner, sagte: "Dass Politiker und Spitzenbeamte in Ministerien mit einem anderen Impfstoff geimpft werden als die Bevölkerung, ist ein verheerendes Zeichen. Gerade Politiker müssen diejenigen sein, die das, was sie empfehlen, auch für sich selbst in Anspruch nehmen." Der Virologe Alexander Kekulé von der Uniklinik Halle sagte: "Dass die Mitglieder der Bundesregierung und der Behörden offenbar einen anderen Impfstoff bekommen sollen, ist ein Skandal."

Innenministerium weist Kritik zurück

Hintergrund der Debatte: Kanzlerin und Minister sollen nach SPIEGEL-Informationen mit speziellem Impfstoff vor der Schweinegrippe geschützt werden. Beamte von Ministerien und nachgeordneten Behörden ebenso. Das Vakzin enthält keine umstrittenen Zusatzstoffe - im Gegensatz zum Impfstoff für den Rest der Bevölkerung.

Das Bundesinnenministerium hat die scharfe Kritik zurückgewiesen. Sie weise den Vorwurf der Zweiklassen-Impfung zurück, sagte eine Sprecherin von Bundesinnenminister Wolfgang Schäuble (CDU) der "Berliner Zeitung". Das Schäuble unterstellte Beschaffungsamt habe mit dem Hersteller Baxter schon vor vielen Monaten einen Vertrag abgeschlossen, der eingehalten werden müsse. Zum damaligen Zeitpunkt sei von möglichen Unterschieden der Impfstoffe noch keine Rede gewesen.

Laut einem Bericht der "Bild" setzt Bundeskanzlerin Angela Merkel (CDU) trotz des für die Bundesregierung bestellten Impfstoffes auf ihren Hausarzt, von dem sie - wie jeder Bürger - den Massen-Impfstoff Pandemrix bekommen soll. Genauso hält es laut "Bild" Gesundheitsministerin Ulla Schmidt (SPD): "Ich lasse mich mit dem Impfstoff impfen, mit dem auch die Bevölkerung geimpft wird. Der ist genauso wie die anderen zugelassen, sicher und wirksam."

Süddeutsche Zeitung

Aufregung um "Zwei-Klassen-Impfung"

Süddeutsche Zeitung, 19 Oktobre 2009, 12:26
https://web.archive.org/web/20091022130331/http://www.sueddeutsche.de/wissen/158/491523/text/

Eine Woche vor dem Start der Massenimpfungen gegen die Schweinegrippe ist ein Streit um die Impfstoffe entbrannt. Bekommen Politiker den besseren?

Große Aufregung um unterschiedliche Schweinegrippe-Impfstoffe: Während die Bundesländer am Montag auf die ersten Lieferungen des Massen-Impfstoffes Pandemrix warten, sieht sich die Bundesregierung dem Vorwurf einer "Zwei-Klassen-Impfung" ausgesetzt.

Am Wochenende war bekannt geworden, dass die Bundesregierung, Bundesbeamte und Soldaten der Bundeswehr einen anderen Impfstoff bekommen sollen als Otto Normalverbraucher. Sie erhalten einen Schweinegrippeimpfstoff vom US-Pharmakonzern Baxter, der keinen umstrittenen Wirkstoff-verstärker enthält. Der Vorsitzenden der Arzneimittelkommission der deutschen Ärzteschaft, Wolf-Dieter Ludwig, sprach im Spiegel von einem Skandal, der den Menschen kaum zu vermitteln sei.

Die Diskussion verunsichere die Bevölkerung und schüre Angst vor der Impfung, sagt der Göttinger Angstforscher Borwin Bandelow. Die Angst vor einer Impfung gegen die Schweinegrippe ist nicht unbegründet und wird durch diese Diskussion sicher nicht geringer." Seiner Einschätzung nach könnte ein Großteil der bestellten Impfdosen deshalb ungenutzt bleiben. "Wer dann richtig Angst haben muss, ist der Steuerzahler, mit dessen Geld das Ganze bezahlt wird", sagt er.

Auch das Thüringer Gesundheitsministerium befürchtete, die Debatte könne die Impfbereitschaft der Menschen dämpfen. "Die Diskussion um einen vermeintlich besseren Impfstoff für Bundeswehr und Bundesregierung wirkt demotivierend", sagte Ministeriumssprecher Thomas Schulz.

Gesundheitsexperten und Politiker von Grünen und SPD hatten die unterschiedliche Impfpolitik am Wochenende stark kritisiert. Die Bundesregierung wies die Vorwürfe am Montag zurück.

Aus welchen Gründen der eine Impfstoff so und der andere so bestellt worden sei, entziehe sich seiner Kenntnis, sagte Innenminister Wolfgang Schäuble (CDU) im Bayerischen Rundfunk (BR). "Aber die Darstellung, dass hier eine Privilegierung von politischen Verantwortungsträgern vorgesehen sei, das ist nun wirklich jenseits jeder Realität."

Regierungssprecher Ulrich Wilhelm sagte, die Vorwürfe entbehrten jeglicher Grundlage. "Richtig ist, es gibt keinen besseren oder schlechteren Impfstoff." Der Sprecher des Gesundheitsministeriums, Klaus Vater, sagte, der Impfstoff für die Mehrheit habe entscheidende Vorteile.

Das Innenministerium hat 200.000 Dosen des Baxter-Impfstoffes bestellt. Der Rest der Bevölkerung bekommt dagegen einen Impfstoff von der britischen Firma GlaxoSmithKline, dessen Wirkstoff-verstärker (Adjuvans) von einigen Ärzten kritisch gesehen werden. Mögliche Nebenwirkungen einer Grippeimpfung sind Hautrötungen oder Gliederschmerzen. Die verstärkenden Wirkstoffe könnten auch die Nebenwirkungen verstärken und zu Kopfschmerzen oder Fieber führen, befürchten Mediziner. Für Schwangere und Kinder könnte Pandemrix darum wenig geeignet sein.

THE FLU CASE

German government "spin" claims safe jab for them is "cheaper"

The Flu Case, 19 October 2009
https://web.archive.org/web/20091030000731/http://www.theflucase.com/index.php?option=com_content&view=article&id=1159%3Agerman-government-qspinq-claims-safe-jab-for-them-is-qcheaperq&catid=1%3Alatest-news&Itemid=64&lang=en

The German government is trying to put its "spin" on its decision to order the Baxter "swine flu" jab without toxic ingredients for itself, leaking the version that the Baxter jab was less expensive, according to the Sueddeutsche Zeitung.

However, no details of the contract that the German govenrment sealed with Baxter have been made public that substantiate this claim.

Also, a spokesperson from the German Interior Ministry has admitted that Baxter only changed the composition of its Celvapan jab and removed the lethal mercury and squalene at the last moment just before submitting Celvapan for approval to the EMEA.

Baxter appears to have been forced to remove the lethal ingredients after the German army and states refused the toxic and untested "jab."

Baxter was caught contamininating and distributing 72 kilos of vaccine material with the live bird flu virus supplied by WHO this February, so nearly triggering a pandemic.

Baxter executives sat as observers on a special June meeting of the WHO vaccine advisory board, SAGE, that recommended "swine flu" jabs with mercury and adjuvants, also for pregnant women and children, even though these jabs have not been tested on this group, so assuring the pharma company bumper profits from a pandemic level 6 declaration and mandatory vaccinations.

The German news magazine "Spiegel" reports the Green Party health expert Biggi Bender as saying the different types of "swine flu" jabs spell a "big risk for the people, a small risk for the government. This type of two-tier medicine should not be allowed in a democracy."

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

Steve Watson

Europeans Reject Swine Flu Vaccine
Danes, Finns, Germans, French, Spanish, Belgians, Dutch
all refusing to roll sleeves up despite government, media pressure

Infowars, 19 October 2009
https://web.archive.org/web/20091022073136/http://www.infowars.net/articles/October2009/191009Europeans.htm

People throughout Europe **are rejecting the H1N1 vaccine** en mass, despite huge campaigns by their governments to get them to take the shot when it becomes available within the next week.

In Germany uproar continues to grow concerning the fact that German Chancellor Angela Merkel and government ministers, as well as the armed forces there, will receive a special, additive-free H1N1 vaccine. The soldiers and the German government elites will receive Celvapan, an adjuvant-free vaccine manufactured by Baxter. The German public, however, will receive a vaccine produced by GlaxoSmithKline which contains squalene and the mercury based preservative thimerosal.

A report yesterday in the leading German newspaper Die Welt describes the public sentiment towards the news:

That throws a treacherous light on the announcements of the German health ministry and the Paul Ehrlich Institute (PEI) responsible for vaccines. Why should the government and high-ranking officials get special treatment, the people who they rule over are asking. The dirty word of a "two-tier medicine" comes to mind. And then thoughts turn to Orwell's novel "Animal Farm" where all are equal but "some are more equal."

Polls in Germany, even before this news, have indicated that only one third of the population are interested in receiving the H1N1 vaccination.

Last week Spiegel reported that there has been an "open rebellion" by general medical professionals and child physicians in Germany over use of the toxic vaccine. Dieter Ludwig, chairman of the drug commission of the German medical profession, told Spiegel that health authorities have colluded with pharmaceutical companies.

GlaxoSmithKline itself has issued a press statement in which the company defends the decision by the German government.

Across the border in **Denmark**, public officials and health care workers chosen as primary recipients of the vaccine are declining it, saying that the virus is too mild to warrant taking the shot.

Of 360,000 police officers, nurses, doctors and others identified as holding key positions, only around 30% have applied for vaccination appointments, according to Denmark's largest vaccination agency.

Danske Lægers Vaccinations Service (DLVS, Danish Doctors Vaccination Service) Chairman Karsten Østergaard revealed that under a third of those chosen will take the vaccine.

The news comes despite extensive planning for a massive swine flu immunization campaign on behalf of the Danish Government this Fall to inoculate one fifth of the total population.

Meanwhile, the vast majority of Scandinavian neighbours in **Finland** have indicated that they have no interest in taking the vaccine.

Results of three major nationwide polls held by Finnish media outlets Ilta-Sanomat, MTV3 and Helsingin Sanomat reveal that up to 75% of people there will refuse to take the H1N1 shot when it becomes available in the next few days.

The Finnish government has also launched a mass campaign to vaccinate the public there. Healthcare workers in Finland are due to receive the first inoculations next week.

Rejection of the vaccine is also prevalent In the Netherlands, with two thirds of nursing staff saying they do not want to be inoculated against the H1N1 virus. Large portions of the populations of France, Belgium and Spain have also indicated they want no part of the jab.

The feeling of the people in Europe reflect those of the populations of the UK, the US and Canada, large portions of which have indicted great reservations over the safety of the vaccine.

Regierung bekommt Extra-Impfstoff gegen Schweinegrippe

WELT, 19 Oktober 2009
https://www.welt.de/welt_print/politik/article4892505/Regierung-bekommt-Extra-Impfstoff-gegen-Schweinegrippe.html

Chef der Arzneimittelkommission: "Behörden sind auf Kampagne reingefallen" – SPD kritisiert Innenminister Schäuble scharf

Berlin – Gut eine Woche vor dem Beginn der bundesweiten Impfaktion gegen die Schweinegrippe hat die Beschaffung unterschiedlicher Präparate für Politiker und die Bevölkerung einen heftigen Streit ausgelöst. Der SPD-Gesundheitsexperte Karl Lauterbach sagte der "Bild am Sonntag": "Dieser Vorgang ist äußerst unglücklich. So entsteht der Eindruck einer Zweiklassenmedizin bei der Impfung. Innenminister Wolfgang Schäuble hatte hier nicht das notwendige Gespür."

Die Kanzlerin, die Mitglieder ihres Kabinetts und Beamte der Ministerien sowie nachgeordneter Behörden sollen mit einem Impfstoff ohne Verstärker vor der Schweinegrippe geschützt werden. "Wir haben 200 000 Dosen des nicht adjuvantierten Impfstoffes Celvapan der Firma Baxter gekauft", sagte ein Sprecher des Bundesinnenministeriums dem "Spiegel" zufolge. Auch die Bundeswehr soll einen Impfstoff ohne Zusatz- und Konservierungsstoffe bekommen.

Anders als das Präparat von GlaxoSmithKline (GSK), das ab dieser Woche in 50 Millionen Dosen für die Bevölkerung ausgegeben wird, enthält der Baxter-Impfstoff keinen Wirkverstärker ("Adjuvans") und wird den für die Aufrechterhaltung der öffentlichen Ordnung zuständigen Staatsdienern gespritzt. Dazu zählen Mitarbeiter des für die Impfstoffzulassung zuständigen Paul-Ehrlich-Instituts, das wiederholt seine Entscheidung verteidigt hat, der Bevölkerung die GSK-Vakzine zu beschaffen.

Für den Vorsitzenden der Arzneimittelkommission der deutschen Ärzteschaft, Wolf-Dieter Ludwig, ist das "ein Skandal", der den Menschen kaum zu vermitteln sei. "Wir sind unglücklich über diese Impfkampagne", sagte Ludwig. Sie werfe zahlreiche Probleme auf, ihr Nutzen sei ungewiss: "Die Gesundheitsbehörden sind auf eine Kampagne der Pharmakonzerne hereingefallen, die mit einer vermeintlichen Bedrohung schlichtweg Geld verdienen wollten."

Weil der GSK-Impfstoff nicht an Schwangeren getestet wurde, muss auch für sie kurzfristig nicht adjuvantierter Impfstoff besorgt werden. Der Staatssekretär im Bun-desgesundheitsministerium, Klaus Theo Schröder, sagte dem Magazin: "Es laufen Gespräche mit Herstellern sowie den Gesundheitsministerien in Frankreich und den USA, mit dem Ziel, für Schwangere auch nicht adjuvantierten Impfstoff zu beschaffen."

Offene Rebellion herrscht laut "Spiegel" unter Allgemeinmedizinern und Kinderärzten. Der Präsident der Deutschen Gesellschaft für Allgemeinmedizin und Familienmedizin, Michael Kochen, rät den deutschen Hausärzten von der Impfung ab. "Das Schadensrisiko überwiegt den Nutzen", sagte der Göttinger Professor.

Wolfram Hartmann, Präsident des Berufsverbands der Kinder- und Jugendärzte, wirft der Bundesregierung "wissenschaftliche Falschaussagen" vor. Wie bei Schwangeren so gelte auch für Kinder unter drei Jahren: "Der Impfstoff ist an ihnen noch überhaupt nicht getestet, deshalb ist das Risiko einfach zu groß, ihn jetzt bedenkenlos einzusetzen."

In der EU sind bislang drei Impfstoffe gegen die Schweinegrippe (H1N1) zugelassen: Focetria, Pandemrix und Celvapan. Focetria und Pandemrix enthalten verstärkende Zusatzstoffe, sogenannte Adjuvanzien. Allerdings kommt Celvapan nur deshalb ohne die umstrittenen Verstärker aus, weil es eine größere Konzentration an inaktivierten Schweinegrippe-Viren enthält.

Only 13% of Germans say they will get a "swine flu" jab: dramatic drop to new low

https://web.archive.org/web/20091028004412/http://www.theflucase.com/index.php?option=com_content&view=article&id=1344%3Aonly-13-of-germans-say-they-will-get-a-qswine-fluq-jab-dramatic-drop-to-new-low&catid=1%3Alatest-news&Itemid=64&lang=en

There has been a dramatic drop in the willingness of people in Germany to take the "swine flu" jab, with only 13 % now saying they are willing to have the shot compared to 51% in July.

According to a poll of 1000 people published today, Friday, 66 % of Germans say they will categorically refuse the jab, about twice as many as in previous polls. 20 % of the respondents said they were not sure if they would take the jab or not. 85 % said they though the threat of the "swine flu" was being exaggerated.

Austrian Ministers try to hide their actions as genocidal plan unravels

The Flu Case, 20 October 2009

https://web.archive.org/web/20091024040051/http://www.theflucase.com/index.php?option=com_content&view=article&id=1247:austrian-ministers-run-for-safety-as-genocidal-plan-unravels&catid=41:highlighted-news&Itemid=105&lang=en

The Austrian government is putting a positive "spin" on the fact that Baxter was forced to drop mercury and squalene from its "swine flu" vaccine at the last moment by the German army and the German states - and claiming it had ordered the safer vaccine for Austrians all along.

The controlled media in Austria is happily going along with this misrepresentation of the facts.

The Austrian government failed to launch an investigation into Baxter's contamination of 72 kilos of vaccine material with the live bird flu virus, an act which endangered the lives of millions, if not billions of people, inside Austria and outside Austria.

Far from investigating, the Austrian government appears to have actually actively helped cover up the crime by Baxter.

All the political parties in Austria, including the Green Party, had knowledge of Baxter's illegal and dangerous activities and none of them shared this knowledge with the general public.

The Austrian government appears to have put pressure on those sections of the police force that investigated Baxter to resign.

The various members of the Austrian government, specifically the Chancellor, Health Minister, Justice Minister and Interior Minister have implicated themselves in a crime on an international scale.

THE IRISH TIMES

Derek Scally

Concern in Germany as safety of swine flu vaccines questioned

The Irish Times, 20 October 2009, 01:00
https://www.irishtimes.com/news/concern-in-germany-as-safety-of-swine-flu-vaccines-questioned-1.759250

Germany’s swine flu vaccination programme has been hit by public health concerns over the vaccines being used – one of which has been ordered by the Irish Government.

Germany’s 16 federal states have spent a reported €600 million buying 50 million doses of the Pandemrix vaccine, produced by GlaxoSmithKline (GSK).

This new vaccine, one of two to be offered by Irish doctors, is the subject of controversy in Germany because it contains a "booster” substance known as an "adjuvant”. This allows less virus material to be used per dose and, according to GSK, boosts the immune system’s response to the jab.

Pandemrix was approved for use by the European Medicines Agency last month and has the approval of Germany’s Paul Ehrlich Institute, which advises the government on vaccination matters. However, another government body, the Federal Vaccination Agency, has contradicted the institute and has advised against the use of vaccines containing adjuvants.

Concerns about Pandemrix’s safety and efficacy have been raised by several German medical organisations, with warnings against using it to vaccinate high-risk groups such as pregnant women and children.

Dr Wolfram Hartmann, president of the German association of paediatricians, accused the federal government of "false testimony” for recommending Pandemrix for use on young children – six weeks after it issued advice to the contrary. – "The vaccine has not yet been tested on children under three, so the risk is simply too big to use on them without misgivings,” he said.

The vaccine confusion grew over the weekend when it emerged that the German government and armed forces are to receive a different jab to the public. Celvapan, produced by drug company Baxter, is a traditional vaccine containing no booster substances.

The interior ministry in Berlin denied yesterday it was a case of two-tier medical care. A spokes-person said the federal government had a contract to buy Baxter flu vaccination products for state employees.

The Health Service Executive (HSE), now delivering the GSK vaccine to GPs and awaiting supplies of the Baxter one, said the safety data base for the GSK adjuvant includes more than 10,000 individuals.

"As with any vaccines, risks have to be balanced with the benefits and the authorities in Ireland are satisfied that the benefits from both vaccines outweigh any possible risks of side effects.” The HSE said Ireland continues to see an increase in swine flu cases every week as well as fatalities associated with this virus. The fifth fatality was confirmed last night. The deceased, an adult male in the east, had an underlying medical condition. – "Vaccination is the most important tool we have to protect the Irish population,” the HSE said.

Stirring things up even further in Germany yesterday, outgoing interior minister Wolfgang Schäuble said: "I’m not even sure if I will be getting vaccinated at all.”

In an attempt to calm the situation, Chancellor Angela Merkel’s spokesman said the German leader, if so advised by her doctor, would be vaccinated with Pandemrix.

New Poll Indicates Mass Rejection of Swine Flu Vaccine.
62% of Americans will refuse jab to due to safety concerns

Infowars, 22 October 2009
https://web.archive.org/web/20100110081835/http://www.infowars.net/articles/october2009/221009Vaccinations.htm

A new scientific poll has found that the *vast majority of Americans have no intention* of rolling up their sleeves for the H1N1 vaccine because they do not trust government assurances that the shot is safe.

In the week that the first H1N1 vaccines have become available, 62% of respondents to ABC News/Washington Post survey said they will probably not get vaccinated, while 30% said they are not confident in the shot's safety.

The poll shows that the vast majority of Americans would rather risk sickness than trust their government's advice of necessity, indicating that the $16 million federal propaganda effort is failing.

In addition, the survey reveals that around four parents out of ten say they have no intention of allowing their children to receive the vaccine.

Over half of respondents in that group said that the primary reason they would not allow their kids to be vaccinated was because of the possibility of side effects and suspicions that the shot has not been adequately tested.

The rest cited the belief that H1N1 was not serious enough to warrant vaccination or that getting the shot was not "worth the trouble".

The results come despite the fact that concerns over getting the flu have also increased significantly from 39% to 52%. More people are worried over H1N1 than they were over bird flu and SARS in 2006 and 2003 respectively, according to the poll.

"These results suggest that encouraging vaccinations depends not merely on warning people about getting the flu but as much on persuading doubters that the vaccine is safe." The ABC report states.

The numbers in the ABC/Washington Post poll dovetail almost exactly with those in recent AP, Consumer Reports and Harvard University surveys.

Elsewhere there have been mixed reports on the uptake of the vaccine. Some clinics have reported thousands lining up on the streets to get the vaccine, while others have reported very low turnouts.

Chicago has taken the step of making the vaccine free for pregnant women; health-care workers; caregivers of children younger than 6 months; children and adults under 24, and adults who have underlying medical conditions.

abc NEWS

POLL: Swine Flu Vaccine, Parents Doubt Safety
Citing safety, nearly 4 in 10 parents won't have their children vaccinated

ABC News, 22 October 2009
https://abcnews.go.com/PollingUnit/SwineFlu/swine-flu-abc-news-washington-post-poll/story?id=8879819

October 22, 2009. – Nearly four in 10 parents do not plan to have their children get the swine flu vaccine this year, with doubts about its safety overwhelmingly cited as the chief reason, underscoring safety concerns as potentially a major impediment to vaccination efforts.

Other results in the latest ABC News/Washington Post poll buttress the point: Three in 10 adults are not confident the vaccine is safe (including one in three parents), and 22 percent believe it's "very" safe. These attitudes heavily influence intentions to get vaccinated, with views of the vaccine's safety a stronger factor than the perceived risk of getting the flu itself.

Even though concern about catching the flu has risen sharply since August, only 35 percent of adults plan to get vaccinated (including 2 percent who say they've already done so); 62 percent say they probably will not get vaccinated. More parents, 56 percent, intend to have their children vaccinated (including 4 percent who say they've done so), but even among parents, 39 percent say they probably won't.

Why Not? – This poll asked those parents, open-endedly, why they don't plan to have their children vaccinated, a robust approach because it doesn't prompt for predetermined answers. Far surpassing other mentions, 53 percent in this group raised safety concerns, citing worry about side effects or doubts whether the vaccine's been sufficiently tested.

Far behind that reason, 18 percent of parents who intend not to have their children vaccinated said they're not worried about the flu or don't believe getting the vaccine is worth the trouble; 15 percent said they don't believe the illness is serious enough; 3 percent were unsure about the vaccine's availability; and 1 percent were unsure about its cost. The rest gave scattered other answers.

Los Angeles Times

Andrew Malcolm

Opinion: **Forget the rush on that H1N1 swine flu vaccine; 62% of Americans have no intention of getting it anyway**

Los Angeles Times, 22 October 2009, 2:06 AM PT
https://www.latimes.com/archives/blogs/top-of-the-ticket/story/2009-10-22/opinion-forget-the-rush-on-that-h1n1-swine-flu-vaccine-62-of-americans-have-no-intention-of-getting-it-anyway

Kathleen Sebelius, the secretary of Health and Human Services, who recently taught Americans the federally-approved way to sneeze this season, was on Capitol Hill on Wednesday. She was trying to explain widespread delays in the delivery of the H1N1 vaccine across the country.
=> https://www.latimes.com/archives/la-xpm-2009-oct-22-na-swine-flu-health22-story.html

Basically, of course, she said it wasn't the Obama administration's fault, that as soon as the vaccines come in, they're being shipped out immediately by the many thousands of doses.

You know how everyone talks about Americans not making things anymore, that so many manufacturing jobs, for instance, have been shipped overseas?

Well, Sebelius was essentially saying the same goes for flu-vaccine-making.

Four of the world's five makers are foreign. And we all think we know what that means.

Members of Congress could have been exploring this subject last winter when their latest automatic pay raises took effect.

Instead, Wednesday they expressed shock and dismay at the situation now that it's October and thousands are already falling ill with the H1N1 virus (see photo above, shown somewhat larger than life).

Also, Purdue University researchers reported the late deliveries may not matter because by the end of this year 63% of Americans will be infected anyway. So, too many doses, too late.
=> https://www.latimes.com/archives/la-xpm-2009-oct-22-na-swine-flu-health22-story.html

But *wait*! There's more.

This morning comes word from a new ABC News/Washington Post poll that almost four parents out of 10 do not believe the vaccine is safe and have no intention of allowing their children to receive it.

More than 60% of adults say they have no intention of getting the vaccine either.

Using an open-ended question, the poll also found the overwhelming reason for rejecting the vaccine this year despite federal warnings and mounting concern about the illness' seriousness was concern about side effects and disbelief in its safety, especially suspicions that it has been inadequately tested.
=> https://abcnews.go.com/PollingUnit/SwineFlu/swine-flu-abc-news-washington-post-poll/story?id=8879819

Other reasons included general ignorance and a belief the illness was probably less serious than the danger of the vaccine.

So much for the persuasive powers of the U.S. federal government. Think about that for a minute: A whopping majority of Americans (62%) would rather risk illness than believe in their government's urgings of necessity and safety.

Radio-Canada

Climat de méfiance dans plusieurs pays

Radio-Canada, 22 octobre 2009 à 4 h 37 UTC+8
https://ici.radio-canada.ca/nouvelle/450991/vaccination-monde-mefiance

La campagne de vaccination contre le virus H1N1 qui débute un peu partout sur la planète est accueillie avec réticence en Grande-Bretagne, comme dans plusieurs pays européens et aux États-Unis.

La Grande-Bretagne met en branle sa campagne de vaccination contre la grippe A (H1N1) mercredi. Comme dans plusieurs pays, tels la France, la Belgique, l'Allemagne et les États-Unis, la méfiance est omniprésente en sol britannique.

D'ailleurs, le gouvernement de Gordon Brown hésite encore à faire vacciner toute sa population, même s'il a commandé assez de doses pour tout le monde. Pour le moment, l'inoculation est limitée au personnel de la santé, aux femmes enceintes et autres personnes à risque.

Selon un sondage réalisé auprès de 17 000 infirmières britanniques, près de la moitié disent ne pas avoir l'intention de se faire vacciner, la plupart invoquant des doutes sur la sécurité du vaccin. Une infirmière citée par le site web nursingtimes.net, qui a réalisé le sondage, estime que le vaccin «n'a pas été testé correctement».

La Chine au garde-à-vous

La campagne de vaccination a aussi commencé mercredi dans les écoles de Pékin et elle se poursuivra jusqu'à la fin décembre dans tout le pays. La priorité sera donnée aux groupes considérés à risque: les étudiants, les personnes âgées et les travailleurs de la santé.

La Chine a déjà recensé plus de 26 000 cas de H1N1 depuis le printemps. Avec l'arrivée prochaine de la saison froide, les autorités s'attendent à une flambée de nouveaux cas. « Nous avons appris beaucoup d'autres situations semblables, dit la directrice du Centre de prévention des maladies de Pékin, Pang Xinghuo. La population étudiante est un groupe critique qu'il faut suivre de près. »

La Chine a encore en mémoire l'épisode du SRAS, alors qu'elle avait été critiquée pour avoir tardé à rapporter l'épidémie. Avec la grippe A (H1N1), c'est tout le contraire. Le gouvernement prend des mesures draconiennes qui vont jusqu'à la quarantaine préventive pour limiter la propagation de la grippe.

Polémiques autour du monde

En France, où la campagne a débuté mardi, les craintes par rapport au vaccin sont aussi bien présentes.

Près de deux infirmières sur trois refusent de se faire vacciner, selon une consultation du Syndicat national du personnel infirmier. La moitié des médecins rejettent aussi la vaccination, d'après un sondage Ipsos. Et plus de 60 % de la population n'a pas l'intention de se prémunir contre le virus, selon des enquêtes compilées par l'AFP.

Ces statiques se rapprochent de celles du Québec. Selon un sondage du *Journal de Montréal*, publié mardi, seulement 33 % des Québécois comptent se faire immuniser; 25 % sont toujours indécis.

En Allemagne, la vaccination a dégénéré en controverse politique avant même le début de la vaccination. La presse a révélé que les hauts fonctionnaires, les militaires et les responsables de la santé notamment bénéficieront d'un vaccin sans adjuvant, aux effets secondaires moindres que celui réservé au reste de la population.

Ces révélations ont scandalisé l'opinion allemande. Redoutant les maux de tête et les poussées de fièvre associées au vaccin avec adjuvant, seulement 12 % des Allemands ont l'intention de se faire vacciner contre la grippe H1N1, rapporte *Le Figaro*.

Pour calmer la tempête médiatique, la chancelière Angela Merkel a annoncé mardi qu'elle se fera administrer le vaccin avec adjuvant, comme le commun des mortels.

En Belgique, la campagne entamée lundi a entraîné le dépôt d'une plainte devant les tribunaux. Une centaine de citoyens se sont regroupés pour poursuivre le ministère de la Santé. Ils soutiennent que le vaccin n'a pas été suffisamment testé et que l'ajout d'un adjuvant peut être dangereux.

La suspicion sévit aussi aux États-Unis, où certains soignants ont intenté une action en justice contre la vaccination « forcée » du personnel de la santé. Par ailleurs, seulement 40 % des adultes se disent prêts à se faire vacciner, selon une étude de la Harvard School of Public Health. Un parent sur deux prévoit faire vacciner son enfant.

Dans d'autres pays, la vaccination n'a pas créé de remous. En Suède, par exemple, où la campagne a débuté le 12 octobre, de 50 % à 70 % de la population projette de se faire vacciner.

Radio Canada reports on growing worldwide resistance to swine flu jab

The Flu Case, 22 October 2009

https://web.archive.org/web/20091028004326/http://theflucase.com/index.php?option=com_content&view=article&id=1278%3Aradio-canada-reports-on-growing-worldwide-resistance-to-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Radio Canada reports on the growing unease about the "swine flu" jab around the world, especially among health care workers as the Canadian government gives approval to GlaxoSmithKline's Pandemrix vaccine and moves ahead with an unprecedented mass vaccination campaign.

N24-Emnid-Umfrage:
Diskussion um Impfstoff führt zu Vertrauensverlust
Dramatischer Einbruch bei Impfbereitschaft

Bankkaufmann, 23 Octobre 2009
https://www.bankkaufmann.com/a-232483-N24-EMNID-UMFRAGE-Diskussion-um-Impfstoff-f%C3%BChrt-zu-Vertrauensverlust---Dramatischer-Einbruch-bei-Impfbereitschaft.html

Berlin (ots) - Kurz vor Beginn der bundesweiten Impfaktion gegen die Schweinegrippe schwindet das Vertrauen der Bürger, auch wirklich den richtigen Impfwirkstoff zu bekommen: 55 Prozent der Deutschen sind nach der Diskussion um eine "Zwei-Klassen-Impfung" tief verunsichert.

"Die öffentliche Diskussion um die Verabreichung verschiedener Impfstoffe für Politiker und Volk führt dazu, dass viele glauben, sie bekämen ein minderwertiges Mittel", sagt Klaus-Peter Schöppner, Geschäftsführer von Emnid.

Die Meinungsforscher haben zudem in der aktuellen Umfrage für den Nachrichtensender N24 nach der Bereitschaft gefragt, sich impfen zu lassen.

Diese sank in den letzten Monaten dramatisch: waren im Juli noch 51 Prozent zur Impfung entschlossen, sind es jetzt nur noch 13 Prozent.

Eine weitere Gruppe von 20 Prozent der Bürger ist noch unentschlossen. 66 Prozent schließen eine Impfung kategorisch aus.

"Es ist bemerkenswert: Gerade jetzt, wo die Zahl der Schweinegrippefälle zunimmt, nimmt die Impfbereitschaft ab", analysiert Schöppner. "Viele ziehen ihre Schlüsse aus der früheren Diskussion um die Vogelgrippe.

Auch damals wurde die Gefahr beschworen, ohne dass etwas passierte.

Viele glauben, dies könne auch jetzt so sein."

Wie die Umfrage zeigt, halten 85 Prozent der Bundesbürger mittlerweile die Gefahr der Schweinegrippe für übertrieben.

Only 13% of Germans say they will get a "swine flu" jab: dramatic drop to new low

The Flu Case, 23 October 2009
https://web.archive.org/web/20100106084912/http://www.theflucase.com/index.php?option=com_content&view=article&id=1344%3Aonly-13-of-germans-say-they-will-get-a-qswine-fluq-jab-dramatic-drop-to-new-low&catid=1%3Alatest-news&Itemid=64&lang=en

There has been a dramatic drop in the willingness of people in Germany to take the "swine flu" jab, with only 13 % now saying they are willing to have the shot compared to 51% in July.

According to a poll of 1000 people published today, Friday, 66 % of Germans say they will categorically refuse the jab, about twice as many as in previous polls.

20 % of the respondents said they were not sure if they would take the jab or not.

85 % said they though the threat of the "swine flu" was being exaggerated.

Jean-Jacques Crevecoeur

Les Gouverne-Menteurs Nous Déclarent La Guerre

Jean-Jacques Crevecoeur, 23 Octobre 2009
https://web.archive.org/web/20091029222158/http://www.jean-jacques-crevecoeur.com/index.php?option=com_content&view=article&id=111:courriel-7&catid=65:grippe-a-h1n1&Itemid=98

Madame, Monsieur,
Chers amis,

J'ai très peu de temps pour vous écrire.
C'est important que vous receviez cette information le plus rapidement possible. Et que vous la répandiez (car, il ne faudra pas compter sur les journalistes prostitués et muselés pour informer les populations de ce qui suit).

Les Etats-Unis viennent de décréter l'état d'urgence sanitaire, ce samedi midi (heure de Montréal). Pour beaucoup, ça semblera très banal comme information.
Mais pour ceux capables de lire entre les lignes, cette déclaration d'Obama est une déclaration de guerre contre l'humanité. Dans quelques jours, je ne serais pas étonné que d'autres pays suivent l'exemple des USA, ou que, tout simplement, l'Organisation du Mensonge Systématique (OMS) donne le coup d'envoi d'un état d'urgence sanitaire mondial.

Le 10 septembre 2009, j'avais envoyé un courriel à tous mes contacts. Ce courriel contenait deux parties. Dans la première partie, je posais 26 questions troublantes à propos de cette soi-disant pandémie de grippe porcine. Cette partie a été publiée sur des dizaines de blogs et de sites Internet, envoyée à des centaines de milliers de personnes et traduite dans près de dix langues. Dans la deuxième partie, je proposais un scénario possible de ce qui allait se dérouler. Peu de gens l'ont transmis et beaucoup m'ont critiqué (j'ai même perdu beaucoup d'amis et de connaissances à cause de ce passage). On me reprochait d'être un prophète d'une prétendue apocalypse annoncée, de bonimenteur de rue prêchant la fin du monde. C'est même la raison pour laquelle, dans un premier temps, je n'ai pas reproduit ce passage sur mon site Internet.
À cette époque, je vous expliquais comment créer une pandémie de toutes pièces.
Pourtant, je ne suis pas voyant. Je n'ai pas de boule de cristal. Et je ne suis pas complice des crapules qui siègent à l'OMS, à la tête des compagnies pharmaceutiques, à la tête des ministères de la Maladie et à la tête des médias. J'ai simplement essayé de me mettre à leur place, et je me suis demandé comment je ferais pour exterminer une bonne partie de la population des pays dits développés.
Petit retour en arrière: voici mon texte écrit la nuit du 9 au 10 septembre dernier (dont on pouvait dire, à l'époque que c'était un délire paranoïaque):
Il y a, par contre, une question que je vais poser ici et à laquelle je vais répondre, car beaucoup de mes interlocuteurs ne comprennent pas cela. La question est: comment un virus aussi bénin va-t-il s'y prendre pour tuer des millions de personnes ? Ça, c'est la question à un million de dollars !!!
Eh bien c'est l'histoire des pandémies du passé qui nous apporte la réponse. La recette est simple (en douze étapes, déjà expérimentées pendant le XXe siècle, avec des succès divers):
1. **On annonce qu'un foyer d'une nouvelle grippe vient d'apparaître au Mexique** et que c'est très grave, car c'est un virus animal qui s'est transmis à l'homme!
2. **On annonce ensuite 250 morts** en une semaine, pour rectifier ensuite le décompte **à 8 morts**. Mais tout le monde a retenu qu'il y avait eu beaucoup de morts dès le début (ça ne vous rappelle rien,

ça: le 11 septembre, on nous a annoncé à la télévision 40 à 50.000 morts dans les Twin Towers – ce qui a justifié la croisade contre l'axe du Mal – puis, on a révisé le nombre de morts à 2.974); etc ...

=> see a link presented below the title .

https://web.archive.org/web/20091029222158/http://www.jean-jacques-crevecoeur.com/index.php?option=com_content&view=article&id=111:courriel-7&catid=65:grippe-a-h1n1&Itemid=98

Ça, c'est ce que j'avais écrit le 10 septembre 2009. À cette époque, nous en étions à l'étape n° 5.

Ceux qui ont gardé un peu de lucidité auront compris pourquoi les médias se sont déchaînés depuis le 15 octobre, en nous annonçant que la deuxième vague de grippe A (H1N1) (étape n° 6) allait se déchaîner. Juste au moment où les vaccins sont enfin prêts! Quelle coïncidence, quand même. Quand on pense que le virus aurait pu muter dans l'hémisphère sud pendant tout l'hiver, il ne s'est rien passé!!! C'est quand même extraordinaire, non. ... etc ... => ...

Aux Etats-Unis, par contre, ils ont déjà commencé à vacciner les gens, depuis le 6 octobre (étape n° 8).

Mais les gens n'ont pas été vaccinés avec les vaccins injectables préparés contre le H1N1 (ils n'étaient pas prêts), mais ils ont été vaccinés avec un vaccin dont ***personne, je dis bien personne***, n'a parlé pendant les cinq mois et demi de propagande de peur. Ce vaccin, j'ai découvert son existence le mardi 6 octobre 2009, après ma conférence donnée à Québec. Il s'agit d'un vaccin intranasal, appelé FluMist (littéralement brouillard de grippe). Lorsque j'ai entendu l'interview du docteur Rima Laibow (http://www.youtube.com/watch?v=Rqe40-REclU), lorsque j'ai lu plusieurs de ses articles relatifs au FluMist (http://www.healthfreedomusa.org/docs/TamiFlu.pdf), mon sang s'est glacé d'effroi. Pourquoi ? Pour quatre raisons:

Premièrement, le FluMist contient deux séquences d'ADN génétiquement modifiées du virus de la grippe H5N1 (le virus de la grippe aviaire). Ce sont les deux séquences qui manquent actuellement pour transformer le virus naturel H5N1 en un virus pandémique extrêmement mortel;

Deuxièmement, le FluMist contient le virus vivant, et non atténué, contrairement aux autres vaccins, ce qui le rend évidemment beaucoup plus dangereux. Je rappelle que le vaccin oral Sabin contre la polio contenait, à l'époque, un virus vivant. Lors de campagnes massives de vaccination faites par l'OMS partout dans le monde, ce vaccin a été reconnu responsable de la recrudescence spectaculaire des cas de polio, ce qui a obligé l'OMS de stopper ses campagnes;

Troisièmement, les fabricants du FluMist (MedImmune) avertissent dans la notice du vaccin (http://www.medimmune.com/pdf/products/flumist_pi.pdf) que la personne qui vient de recevoir ce vaccin est potentiellement contagieuse pendant 21 jours. Car les virus vivants vaporisés dans les muqueuses nasales peuvent être réexpulsés pendant trois semaines. MedImmune recommande donc aux personnes vaccinées de se tenir à l'écart de toutes les personnes immunodéprimées. Ils ajoutent d'ailleurs dans la même notice que ce virus peut être très dangereux pour les personnes immuno-déprimées recevant le vaccin. Quand on sait qu'aux Etats-Unis, on compte 65 millions de personnes immunodéprimées, quand on sait que les vaccinations de masse ne prévoient plus les procédures de diagnostic médical avant la vaccination, on imagine le carnage que ça peut faire chez les vaccinés immunodéprimés et dans l'entourage des vaccinés au FluMIst;

Quatrièmement, je me suis souvenu d'un article que j'avais lu en mai 2009, écrit par un des grands opposants français à cette campagne de vaccination de masse, le Docteur Marc Vercoutere (http://www.lepost.fr/article/2009/09/04/1681457_dossier-grippe-a-les-3-documents-emis-par-le-docteur-marc-vercoutere.html). Ce qu'il disait avait retenu toute mon attention: Le virus H1N1 (humain-porcin) est très contagieux, mais très peu virulent (ça, on l'a constaté). Le virus H5N1 (aviaire) est très peu contagieux, mais très virulent (ça aussi, on l'a constaté, puisque seulement 248 personnes sont mortes entre 1998 et 2008 de la soi-disant pandémie de grippe aviaire). Par contre, si le virus H1N1 entrait en contact avec le virus H5N1, il pourrait se produire une commutation qui créerait un virus résultant de la combinaison H1N1 + H5N1 qui serait à la fois très contagieux et très virulent.

Ce dernier point, la combinaison des différentes souches, je l'avais mentionné à l'étape n° 9. Sauf que je m'étais trompé sur la méthode. Je pensais que ce mélange serait fait au sein des vaccins officiellement préparés. En fait, le FluMist était un moyen bien plus pratique pour contaminer non

seulement les vaccinés, mais aussi l'entourage des vaccinés. Pas étonnant que les Etats-Unis n'ont commandé que 40 millions de doses. Amplement suffisant pour contaminer également l'entourage porteur du virus H1N1.

Aux Etats-Unis, on observe depuis quelques jours, une augmentation du nombre de morts de la grippe, que les autorités attribuent, évidemment, à la mutation du virus H1N1 sous une forme beaucoup plus dangereuse et mortelle que la souche qui a circulé jusqu'à présent (étape n° 10). Évidemment, personne ne pensera à attribuer la cause de la mortalité à la vaccination. Bien sûr que non. De toute façon, le peuple hypnotisé par six mois de propagande médiatique ne réfléchit plus. Pour eux, c'est trop tard, et personne ne pourra rien faire.

C'est là que la logique voudrait qu'on arrête de vacciner, même quand on croit à l'efficacité du vaccin. Car si le virus mute, le vaccin préparé depuis fin mai 2009, ne sera plus d'aucune utilité. Mais ça, c'est un détail qui ne dérangera même pas les experts prostitués du Monde entier à la solde des consortiums pharmaceutiques.

C'est la raison pour laquelle il a été très facile pour le très méritant prix Nobel de la Paix, Barak Hussein Obama (c'est son vrai nom), de décréter l'état d'urgence sanitaire (étape n° 11), qui est l'étape préalable à l'instauration d'un état totalitaire et dictatorial. Je rappelle quand même que la FEMA (Federal Emergency Management Agency) aura la gestion de toute cette campagne de vaccination massive que j'annonce comme obligatoire depuis fin août. Quand on sait, par ailleurs, que c'est à la FEMA qu'on a confié la gestion des 800 camps de concentration vides disséminés sur tout le territoire des Etats-Unis, ça donne des frissons. Mais on n'en est pas encore là, mes amis. Ça, c'est l'étape n° 12 que je vous prédisais le 10 septembre dernier.

Dans les autres pays:

À noter que la France sera, d'après moi, le premier pays européen à déclarer l'état d'urgence sanitaire. En effet, son Führer Nicola SS arkozy ne voudrait quand même pas être à la traîne de son modèle américain, le dictateur Obama. Comme le FluMist n'est pas autorisé en Europe, la stratégie est différente, mais le principe est le même. Il faut savoir qu'un premier lot de vaccins a été livré à la France le 27 août dernier, en provenance de l'entreprise pharmaceutique la plus criminelle du monde: Baxter (je vous rappelle que c'est Baxter qui avait contaminé 72 kg de matériel vaccinal en février 2009, en mélangeant «par accident» le virus de la grippe H3N2 à celui de la grippe H5N1 – je ne recommence pas mon explication sur les commutations. C'est la même chose que ci-dessus).

Ces vaccins livrés fin août à la France sont très certainement des vaccins contenant le virus de la grippe aviaire H5N1, issus de ce qui avait été produit antérieurement par Baxter en préparation de la pandémie de grippe aviaire (il faut bien recycler les invendus, non ?). D'ailleurs, il est impossible que ce soit des vaccins contenant le H1N1 – les délais de fabrication étant trop courts, par rapport à la date de livraison de la souche Californienne qui a servi à la production des vaccins. Ces vaccins ont été gardés sous haute surveillance militaire à Miramas, en Provence (Sud de la France). Et ce sont eux qui sortent les premiers...

Mon hypothèse intuitive (jusqu'à présent, toutes les intuitions que j'ai depuis mai 2009 se sont avérées exactes, mais je peux me tromper): les premières personnes vaccinées en France le seront avec le vaccin contre le H5N1 (mais, on ne leur dira pas). Les vaccinés qui seront déjà porteurs du H1N1 risquent de vivre une commutation entre le H5N1 vaccinal et le H1N1 présent dans le corps et faire des complications, et en mourir probablement. ... etc. see the link

Donc, attendez-vous, chers amis Français, que la France décrète, elle aussi l'état d'urgence sanitaire dans quelques jours, car c'est dans ce pays que la deuxième vague va frapper dur! Entraînant, à sa suite, la déclaration de l'état d'urgence sanitaire dans tous les pays européens. Et que mes amis belges ne se croient pas protégés par l'amendement obtenu il y a quinze jours, garantissant la liberté de vaccination! Si l'OMS déclare l'obligation, pour tous les pays signataires de sa charte, de procéder à des vaccinations de masse, le gouvernement belge et Madame Onkelinx auront beau jeu de déclarer que ce n'est plus sous leur contrôle... etc. see the link

Concrètement, que faire ?

Tout d'abord, ne pas paniquer. Quand vous entendrez que le nombre de morts augmente, vérifiez (une fois de plus) si c'est parmi les vaccinés. Si c'est le cas, vous saurez la position à prendre par rapport à ce vaccin.

Rappelez-vous aussi qu'en aucun cas, un vaccin ne renforce le système immunitaire. Au contraire, chaque vaccination est une agression qui affaiblit un peu plus le système immunitaire (je n'ai pas le temps de développer cela, mais ce que je vous dis est basé sur 25 ans de lectures relatives à la vaccination). Donc, quand on conseille aux personnes à risque de se faire vacciner en premier (les jeunes enfants, les femmes enceintes, les personnes immunodéprimées, les personnes atteintes de maladie chronique, etc.), je crains qu'il ne s'agisse d'un remake du massacre des innocents relaté dans la Bible!

Protégez vos enfants. Je vous avertis que, dans quelques jours, des unités mobiles débarqueront dans les écoles pour vacciner tous vos enfants. Rien ne garantit que le consentement des parents sera demandé (étant donné la soi-disant urgence). Certaines sources avancent la date du 5 novembre pour la France. À votre place, je donnerais, dès à présent, un congé à durée illimitée à mes enfants. Rater une année scolaire n'est rien face au danger mortel de cette campagne de vaccination.

Continuez à diffuser de manière large ces informations. Plus il y aura de gens au courant, moins les gouvernements auront de marge de manoeuvre dans leurs mensonges. Nous sommes en train de gagner la bataille de l'information, ne l'oubliez pas ! En France, il n'y a plus que 17 % des Français qui acceptent la vaccination. En Allemagne, il n'y en a pas beaucoup plus !

Enfin, n'oubliez pas que tout cela est une merveilleuse opportunité pour nous de grandir en conscience et en Puissance, dans notre souveraineté individuelle ! L'ombre a toujours travaillé au service de la lumière. Ne l'oubliez pas.

THE FLU CASE

Three schools closed in south of France because of pandemic: are Baxter vaccines the cause?

The Flu Case, 16 November 2009, 11:04

https://web.archive.org/web/20100102010044/http://theflucase.com/index.php?option=com_content&view=article&id=1821%3Athree-schools-closed-in-south-of-france-because-of-pandemic-are-baxter-vaccines-the-cause&catid=1%3Alatest-news&Itemid=64&lang=en

Three schools have been closed in the south of France, in the Pyrenees-Atlantic region following an outbreak of swine flu.

The college Henri IV and a grammar school in Nay as well as the Sainte Marie school in Biarritz have been closed from today, Monday, for a week because so many pupils are sick, according to Le Figaro.
http://www.lefigaro.fr/flash-actu/2009/11/15/01011-20091115FILWWW00059-grippe-3-ecoles-fermees-en-pyrenees.php

Jean-Jacques Crèvecoeur predicted in a report dated October 23rd that any pandemic in France would start in the south, noting that stocks of Baxter vaccine material were delivered at the end of August to a facility at Miramas, Provence, where they are kept under military guard.
http://www.jean-jacques-crevecoeur.com/index.php?option=com_content&view=article&id=111:courriel-7&catid=65:grippe-a-h1n1&Itemid=98

Crevecoeur argues that the Baxter vaccine material must almost certainly contain the bird flu virus, the H5N1 virus, because of the impossibility given the short time of producing large quantities of swine flu flu virus vaccines by the end of August.

He maintains that the vaccine material must have been produced by Baxter in advance and for the bird flu pandemic.

«My intutitive hypothesis (...): the first people to be vaccinated in France will get the vaccine against the H5N1 (but they won't be told). The vaccinated who are already carriers of the H1N1 risk experiencing a co-mutation between the injected H5N1 and the H1N1 present in their body in such a way as to create complications and possible death."

Juan Gérvas et Jim Wright

Grippe A, une immunité naturelle plutôt qu'artificielle

ASANAT, 23 Octobre 2009
https://web.archive.org/web/20091111134440/http://www.asanat.org/immunite_naturelle.htm

Les vaccins approuvés par le FDA [NdT. et l'EMEA] contre la grippe A (H1N1) [1] permettent au gouvernement d'envisager des programmes de vaccination de masse pour la grippe H1N1 à la fin de cette année. De tels plans sont irrationnels et basés sur la peur et non sur une politique «de bon sens et de sang-froid» (comme proposé par les médecins espagnols et d'autres professionnels de la santé) [2].

Nous désapprouvons vivement la vaccination de masse qui est fondée sur plusieurs hypothèses erronées.

La première hypothèse est que la pandémie H1N1 sera analogue à celle de la grippe espagnole de 1919. C'est fort improbable étant donné que la grippe espagnole était une grippe mondiale dans un contexte de grande pauvreté, sans systèmes de santé publique, sans eau courante et sans antibiotiques pour traiter les complications. À l'appui de ceci, la grippe espagnole a tué principalement des gens pauvres; en Inde par exemple, elle a tué des soldats (dans des casernes, avec de la nourriture de mauvaise qualité, de mauvaises conditions d'hygiène) mais non des officiers (bonne nourriture, maisons de style britannique, etc.).

La deuxième hypothèse est que la grippe H1N1 est grave et mortelle. Il y a des évidences substantielles que ce n'est pas le cas et qu'en réalité le taux de mortalité de la grippe H1N1 est bien moindre que celui la grippe saisonnière [3, 4].

La troisième hypothèse est que le vaccin fonctionnera. La réponse immunologique ne constitue pas une garantie que le vaccin peut réduire les infections graves et la mortalité. La démonstration de cet avantage exige de grands essais cliniques RCT (Essais Contrôlés Randomisés), qui manquent singulièrement aussi bien pour les vaccins H1N1 bien que pour les vaccins de la grippe saisonnière.

La quatrième hypothèse est que le vaccin H1N1 fournira une immunité analogue à celle d'une infection naturelle. L'immunité contre la grippe virale a cette particularité très intéressante, connue comme le "pêché antigénique originel" [5]. Ce concept signifie que le premier virus de grippe auquel nous sommes exposés produit la réponse immunitaire la plus forte et que cette immunité dure plus de 50 ans. Cela explique le fait que les gens de plus de 50 ans semblent avoir une certaine immunité face au virus H1N1 parce qu'un virus semblable de la grippe A a circulé à l'échelle mondiale de 1918 à 1957. Il s'avère ainsi que l'infection naturelle crée une immunité pendant 50 ans pour un coût nul alors que les vaccins de la grippe exigent une (ou deux) injection(s) annuelle(s) pour arriver à un degré d'immunité moindre.

Nous recommandons donc que la plupart sinon tous les vaccins H1N1 soient utilisés dans le cadre d'une étude en double aveugle randomisée avec contrôle placebo pour établir si les avantages

sont supérieurs aux nuisances. Sans une telle approche, en septembre 2010 nous serons de nouveau en position de ne pas savoir qui vacciner. Des études en double aveugle randomisées semblables sont également nécessaires pour le vaccin de la grippe saisonnière étant donné que les effets à long terme de la vaccination annuelle contre la grippe sont inconnus, et il y a de fortes chances que les nuisances d'une vaccination annuelle contre la grippe soient supérieures aux avantages d'une non-vaccination.

Le vaccin inquiète partout dans le monde

France Info, 23 octobre 2009
https://web.archive.org/web/20091025092035/http://www.france-info.com/sciences-sante-2009-10-23-le-vaccin-contre-le-h1n1-pris-en-grippe-359973-29-30.html

En France, 60 à 65% des Français n'ont pas l'intention de se faire vacciner contre la grippe A (H1N1).

Ce vaccin a été fabriqué trop rapidement estiment beaucoup de professionnels de santé. " *injecter 94 millions de doses d'un produit sur lequel nous n'avons aucun recul peut poser un problème de santé publique* " estime Thierry Amouroux, le Secrétaire Général du Syndicat National des Professionnels Infirmiers SNPI CFE-CGC.

En Allemagne, des sondages montrent que 19 % des Allemands hésitent à se faire vacciner contre la grippe A(H1N1). Inquiétudes aussi au Canada, en Israël, au Royaume Uni. Aux Etats-Unis, certains soignants ont intenté une action en justice contre la vaccination "forcée".

Le ministre de la santé, Roselyne Bachelot, a fait à nouveau appel cette semaine au sens des responsabilités des soignants afin qu'ils se vaccinent contre le nouveau virus H1N1. Elle s'insurge aussi contre ceux qui parlent de vaccins développés dans la "*précipitation*".

Le Monde

**Le vaccin H1N1 entraîne une plainte contre X...
pour tentative d'empoisonnement**

Le Monde, 23 octobre 2009 à 13h49
https://www.lemonde.fr/societe/article/2009/10/23/le-vaccin-h1n1-entraine-une-plainte-contre-x-pour-tentative-d-empoisonnement_1257803_3224.html

Neuf Isérois ont déposé plainte contre X..., vendredi 23 octobre à Grenoble, dénonçant la campagne de vaccination contre la grippe H1N1 comme *"une véritable tentative d'empoisonnement"* de la population, une première en France qui sera suivie d'autres plaintes, a annoncé leur avocat.

Cette plainte avec constitution de partie civile, également déposée pour *"tentative d'administration de substances* (...) *de nature à entraîner la mort"*, a été remise au doyen des juges d'instruction du tribunal de grande instance de Grenoble, a précisé M[e] Jean-Pierre Joseph. Ces plaignants sont neuf habitants de la vallée du Grésivaudan, dont une professionnelle de santé, une animatrice de radio et une enseignante, qui se sont rencontrés dans des réunions publiques consacrées notamment aux risques supposés du vaccin contre la grippe H1N1.

"Le but est d'arrêter ce que nous considérons comme un empoisonnement", a souligné M[e] Joseph. *"L'intérêt de cette action est que des gens en France aient une attitude citoyenne et disent publiquement: nous avons compris que la campagne de vaccination est une arnaque"*, a ajouté l'avocat.

Pour les autorités de santé, les vaccins H1N1 arrivant sur le marché sont des produits nouveaux pouvant provoquer des effets secondaires inattendus, qui devront faire l'objet d'une surveillance, mais elles estiment que les avantages d'une vaccination l'emportent sur les risques éventuels.

Subject: Campbell vs. the US: Comprehensive Federal Lawsuit Against Forced Vaccinations Filed 10/23/09-3:30 PM PDT

Although this federal case was ostensibly filed by one person against one government, that one person has filed it on behalf of all of the peoples of the world so that they might hold their own governments accountable for the crimes that these governments have perpetrated in their names against other peoples, as well as against themselves.

Although it could have been filed on a narrower legal premise that might have made it easier to win in court, it was filed so that the larger context of the secret and sinister forces that have long controlled the governments of this world being finally exposed and thereby extirpated from this planet. It was filed in such a way so as not only to be heard in a court of law, but also to be heard in the court of public opinion, to help to win the hearts and minds of the people to a greater truth; to help win on earth the cosmic war now being waged for truth, rather than in this war to win but one more isolated battle.

To those who shall say that this one person acted without good faith, due diligence or sufficient discernment, let the judgement of eternity be the final arbiter.

Complaint for Declaratory and Injunctive Relief

Plaintiff alleges the following in support of her claim for declaratory and injunctive relief and damages:

Jurisdiction and Venue

1. This is a claim for declaratory and injunctive relief and damages with jurisdiction in this court based upon 28 U.S.C. § 1331 with issues arising under the Constitution and laws of the United States.

2. Venue is proper in this district pursuant to 28 U.S.C. § 1391(e) because this is a civil action in which the defendants are officers or employees of the United States acting in their official capacity or under color of legal authority, plaintiff resides in this district and no real property is involved in the action.

Parties

3. Plaintiff Rebecca Em Campbell is a universal sovereign being, a citizen of the United States and a resident of Seattle, King County, Washington.

4. Defendant Kathleen Sebelius (hereafter "defendant Sebelius") is an adult resident of the state of Kansas with a professional address of 200 Independence Avenue, S.W. , Washington, D.C. 20201. Defendant Sebelius is the secretary of the United States Department of Health and Human Services.

5. Defendant Thomas R. Frieden, M.D., M.P.H. (hereafter "defendant Frieden") is an adult resident of the state of New York with a professional address of 1600 Clifton Road, Atlanta, GA 30333. Defendant Frieden is the director of the United States Centers for Disease Control and Prevention.

6. Defendant Francis S. Collins, M.D., Ph.D. (hereafter "defendant Collins") is an adult resident of the state of Virginia with a professional address of 9000 Rockville Pike, Bethesda, MD 20892. Defendant Collins is the director of the United States National Institutes of Health.

7. Defendant Margaret Ann Hamburg, M.D. (hereafter "defendant Hamburg") is an adult resident of the state of New York with a professional address of 10903 New Hampshire Avenue, Silver Spring, MD 20903. Defendant Hamburg is the commissioner of the United States Food and Drug Administration.

…

Factual Allegations

8. There presently exists a bank-based transnational corporate criminal conspiracy to violate the fundamental constitutional rights and wellbeing of the American people, including those of the plaintiff, through fraudulent political, legal and financial contracts in the form of surreptitiously signed/enacted international treaties and federal laws/executive orders enabling the mandated imposition of bioweaponized H1N1 influenza vaccinations and quarantines/detentions through martial law. The aforementioned measures, being fraudulent, are therefore null and void, with no legitimate power to be enforced by any government, national or international, upon the American people.

9. Controlled by the same bank-based transnational corporate crime syndicate that now controls the United States government and virtually all of the national governments of the world, the United Nations World Health Organization (UN/WHO) has fraudulently declared, without any scientific justification, the highest possible Level 6 Pandemic for an indefinite period of time, which is akin to a medical "war on terror".

10. Level 6 Pandemic status gives the UN/WHO, by various international agreements signed by the US government and by various federal executive orders, as well by various laws surreptitiously approved by the US Congress and supported by the US Supreme Court, indefinite control over this nation and its people that subsumes the US Constitution, the US Bill of Rights, the American Declaration of Independence and all federal, state and local laws.

11. Level 6 Pandemic status may generate, via the aforementioned planned mandated martial law, quarantines/ detentions and enforced bioweaponized H1N1 influenza vaccinations, massive profits for this bank-based transnational corporate crime syndicate through the hugely profitable sale of said vaccinations to the US and other national governments, as well as through massive confiscation of private property through coordinated medical genocide and disablement of the American people.

12. There is an urgent need to return to, reconsider and reapply those fundamental declarations of universal and national law that have so eloquently set forth the basis of our freedom and wellbeing, both as singular sovereign beings, and as a people, which this federal legal action seeks to remedy. ...

21. Public health agencies of the US government, including the Centers for Disease Control (CDC), the Food and Drug Administration (FDA), the National Institutes of Health (NIH), the National Institute of Allergic and Infectious Diseases (NIAID), and the Institute of Medicine (IOM), as well as the United Nations World Health Organization (UN-WHO) and major transnational pharmaceutical corporations met at the Simpsonwood Retreat Center in Norcross, Georgia in June 2000 to listen to the research findings of a CDC epidemiologist as to his findings, derived from the CDC's own comprehensive national database, that vaccines are not only ineffective in protecting the public against the diseases they are supposedly designed to curtail, but that they are actively harmful, causing other serious chronic disease conditions and death long-term, and sometimes soon after their administration.

22. The rest of that weekend was spent by officials of these government public health agencies conspiring with those representatives of transnational pharmaceutical corporations present to actively suppress in the future all scientific research disproving the safety and efficacy of vaccinations as a public health measure.

23. On June 11, 2009, the World Health Organization (WHO) of the United Nations (UN) declared – without any scientific justification whatsoever – attracting much criticism from medical experts – a worldwide highest possible "Level 6 Pandemic," thereby triggering deliberately unpublicized US presidential executive orders and UN treaties that place all US military, law enforcement and health services under the control of WHO and UN.

24. According to the International Health Regulations of 2005 (IHR 2005), which have been incorporated into legislation also in the International Partnership on Avian Influenza of 2005 (IPAI 2005), as well as numerous US presidential directives, the WHO and the UN become the controlling agencies of the US in the event of a declared Level 6 Pandemic, and are entitled to control of this country under martial law, with obvious implications for all of the above, under the pretext of dealing with a pandemic emergency.

25. Since refusing a WHO-mandated vaccination has been criminalized by these, and various other state laws derived from the Model State Emergency Health Powers Act, (MEHPA) members of law enforcement/ the military can use bodily/deadly force against "criminal suspects" refusing these mandated vaccinations or resulting order of quarantine.

26. Immediately following the abovementioned announcement by the WHO in June 2009, all signatory nations of the International Health Regulations of 2005, including the US, are obliged to give mass mandatory vaccinations and prepare for other measures such as quarantines, as/when mandated by the WHO.

27. The United States may then be controlled via various international agreements and executive orders by the United Nations (UN)/World Health Organization (WHO), now in turn controlled by the abovementioned bank-based transnational corporate crime syndicate through national governments and major nonprofit funding foundations that it presently controls.

28. There exists evidence from a WHO Memo dated from 1972, in which the WHO describes a method for using injections/vaccines to kill those injected in three steps: first, by weakening the immune system; second, by injecting a huge dose of virus into the body, which the weakened immune system cannot fight; and third, by injecting an adjuvant that triggers a massive an inflammatory reaction with an ensuing cytokine storm. There is evidence that the H1N1 influenza vaccinations recently mandated by the WHO follow that same three-step process outlined in the aforementioned WHO memos, and so intentionally cause damage and death.

29. There is evidence that the WHO is systematically concealing evidence of the lethality/morbidity of these vaccines, classified as bioweapons by US and EU regulators, in an act of fraudulent misrepresentation, to induce the populations of these countries to take said vaccines of their own free will, even while putting in place measures to make these vaccinations mandatory.

30. Now-FDA Director Margaret Hamburg publicly conferred with David Nabarro, key official with the UN/WHO and others as to how exactly such a pandemic would occur at a conference at Colorado's Aspen Institute on October 13, 2007, discussing with suspiciously precise prescience a future WHO-declared pandemic emergency eerily resembling the one it has declared at present.

31. The United States government has begun actively planning for mass forced vaccinations, detainment and quarantine of American citizens, including surreptitiously excavating mass gravesites in diverse locations.

32. There is evidence that in February 2009, the WHO was involved in nearly triggering a pandemic in Austria , by supplying Baxter's Austrian subsidiary with a H1N1 virus that Baxter then used to contaminate 72 kilos of vaccine material.

33. The Baxter laboratory in Orth von der Donau manufactured and distributed 72 kilos of vaccine material contaminated with a H1N1 virus, to sixteen laboratories in four countries, including Austria, thereby nearly triggering a pandemic.

34. The contaminated vaccine material consisted of a mixture of a seasonal H3N2 human influenza virus and the deadly H5N1 virus. By adding a virus of the type H5N1 to an ordinary flu virus of the type H3N2, Baxter produced a highly dangerous bioweapon.

35. A staff member of a subcontracted laboratory in the Czech Republic discovered this lethal contamination, when all animals they tested died from this vaccine, and the contamination was reported to health authorities.

36. In Poland during this same period, twenty-one out of thirty homeless research subjects – on whom these vaccines were tested without full disclosure of what was being administered to them – died, manifestly violating basic medical ethics and international law.

37. Since Baxter is obliged to use BSL 3 (Biosafety Level 3) precautions in its laboratories when handling the H1N1 virus (classified as a biological agent, BSL3 or 4 under EU regulations), such safeguards are in place as would make accidental contamination of ordinary influenza material with the dangerous H1N1 virus impossible. In other words, this deadly contamination and distribution was almost certainly due to criminal intent.

38. Thirty-six people had to be preventatively hospitalized in Austria and the Czech Republic because of their exposure to this vaccine-based contamination, underlining the danger of a pandemic.

39. This incident, that very nearly killed millions, was investigated by WHO, EU and Austrian health authorities only perfunctorily. This incident was neither investigated nor reported upon by any of the mainstream media corporations controlled by the transnational bank-based corporate crime syndicate, which, via institutional investment firms such as Goldman Sachs and State Street Global Advisors, also owns Baxter International.

40. It was later revealed in Austrian parliamentary questioning of Baxter executives that this incident had been handled, not as a serious violation of biosecurity regulations as mandated by law, but as a minor offense against the Austrian veterinary code: a veterinarian was sent to the Austrian Baxter laboratory for a brief inspection together, with a representative from the department for human medicine. No action appears to have been taken, other than recommendations to tighten Austrian veterinary laws.

41. On April 28, 2009, a shipment of said deadly virus from a WHO/Baxter-affiliated laboratory in Mexico was released from a suspiciously atypical hazardous biomaterials container, allegedly by accident, on an intercity train bound for Geneva, Switzerland , exposing sixty-one passengers to infection. To date, there has been no credible forensic investigation of this incident by the UN/WHO or Swiss/EU officials, and none of those exposed in this alleged bioaccident were ever properly treated for their exposure to this virus.

42. There is further indication of Baxter's criminal intent: in 2006, Baxter distributed hemophiliac blood components that were contaminated with HIV virus and administered to tens of thousands of people, including thousands of children in Europe . Baxter continued to release this HIV-contaminated vaccine, even after its contamination was known, yet Baxter International is still eligible to be one of the medical contractors being used by the United States government in their current purchase of vaccines that it by executive order could mandate for the American people.

43. Baxter International patented a vaccine for the allegedly new "H1N1" virus in 2008, indicating, with its aforementioned actions that it might potentially be involved in initiating such a pandemic.

44. It would therefore appear that officials of the Swiss health ministry and other officials of the UN, WHO, EU, US, Austria, Switzerland and/or Baxter International should also be interrogated concerning this matter by a grand jury; this has thus far not occurred.

45. In spite of the scientific evidence that mercury preservatives and assorted adjuvants are dangerous, the WHO is specifically recommending the production and use of vaccines containing highly toxic mercury preservative and oil-in-water adjuvants in its planned mass vaccination campaign starting in October 2009.

46. In a briefing note of July 13, 2009, the WHO stated: "In view of the anticipated limited vaccine availability at global level and the potential need to protect against "drifted" strains of virus, (it was) recommended that promoting production and use of vaccines such as those that are formulated with oil-in-water adjuvants and live attenuated influenza vaccines, was important."

47. Adjuvants are added to vaccines supposedly to make them more "effective" and to reduce the amount of vaccine required per dose. This is induced by causing the immune system to react in a powerful, unnatural and potentially dangerous way to the presence of the virus being vaccinated against. As previously mentioned, an adjuvant added to a high dose of virus can cause a massive inflammatory reaction with a cytokine storm, followed by death.) ...

53. These H1N1 influenza vaccines will be developed, "tested," and shipped for mass distribution in a matter of weeks without adequate trials for long-term safety.

54. Transnational vaccine manufacturers are present as observers on key WHO vaccine advisory boards of the WHO that can formally recommend vaccinations, indicating substantial conflict of interest.

55. The WHO refused to release minutes of a key meeting on July 7, 2009, when its "vaccine advisory board" -- packed with transnational pharmaceutical corporation executives as observers -- recommended to the WHO that it order enforced vaccinations around the world using their vaccines, ensuring them vast profits.

56. The institutional investors and banks behind the WHO and these vaccine manufacturers are set to reap huge profits from the mass murder of Americans in terms of property and financial assets acquired, as well as profits from massive US government vaccine purchases.

57. The WHO has made a unilateral declaration of highest Pandemic Level 6 on the basis of a relatively harmless H1N1 influenza, manipulating data, and so misusing a provision designed for a deadly plague unjustified by any scientific evidence, in order to declare an international public health emergency for an indefinite period of time to acquire new emergency powers throughout the globe.

58. Cases of H1N1 influenza have been relatively mild, requiring little or no medical intervention, and deaths from the H1N1 virus remain extremely low, at less than one half of one percent of reported cases as of July 6, 2009, with no sign of the virus mutating to become more deadly, according to leading medical experts in France and Switzerland, Sweden and other countries, as well as according to Dr. Margaret Chan, head of the WHO.

59. Rapid tests have been shown to diagnose the H1N1 virus has been inaccurate nine times out of ten, casting doubt on the purportedly swift spread of this disease, and H1N1 has symptoms virtually indistinguishable from normal flu, and has never so far been isolated in the laboratory, further casting doubt on the legitimacy of the WHO's declaration of highest level pandemic emergency.

60. The WHO altered its official definition of pandemic in 2003, being guilty thereby of manipulating data. According to WHO’s present definition, a declaration of pandemic can be constantly maintained. In fact, every year since 1918 would have been Pandemic Level 6 under the WHO's latest definition.

61. The WHO has also changed this definition again this past spring of 2009, so as to be able to declare a pandemic based on the alleged spread of a disease, rather than based on its lethality as had been the case before, while discontinuing the use of accurate reporting standards for its incidence.

62. There is scientific evidence the Spanish Flu Pandemic was started by mass vaccinations of soldiers in 1918-1919.

63. A 1976 mass "swine flu" vaccination campaign in the USA had to be abandoned because more people died from the vaccines than the "swine flu" itself.

64. A recent WHO polio vaccination campaign in Nigeria has resulted in infection and a mutated polio virus crippling hundreds of Nigerians.

65. Criminal charges have been filed against Baxter International over the 72 kilos of contaminated biomaterial with the city state prosecutor in Vienna, Austria, resulting in a police investigation, and criminal charges filed with the FBI in the US concerning the role of Baxter International, the WHO and others in these spuriously declared pandemics and measures toward mass vaccinations.

66. On July 17, 2009, US Department of Health and Human Services Secretary Kathleen Sebelius signed an emergency use order, giving to Baxter International and all other potential US government influenza vaccine contractors legal immunity from prosecution or lawsuit for any possible injury done by their vaccines to the American people during this spuriously declared public health emergency.

67. On September 15, 2009, the FDA approved H1N1 influenza vaccines, despite the massive evidence presented to it concerning their lack of safety/efficacy.

68. The American people, including the plaintiff as a class of one, will suffer substantial and irreparable harm and injury if they are forced to take this unproven vaccine without their consent, in accordance with the federal Model State Emergency Health Powers Act, National Emergency Act, National Security Presidential Directive/NSPD 51, Homeland Security Presidential Directive/HSPD-20, and the International Partnership on Avian and Pandemic Influenza.

Therefore, given that --

69. A bank-based transnational bank-based corporate crime syndicate controls the pharmaceutical cartel, the UN/WHO, as well as the US government;

70. Public health-related agencies of the US government, the UN/WHO and the pharmaceutical cartels have together conspired to promulgate injurious, ineffective vaccinations, despite massive evidence from their own databases that they also have together conspired to conceal from the general public;

71. There were two recent narrowly averted international medical catastrophes -- which facts and evidence point to being intentionally engineered by Baxter International and the WHO -- that almost triggered a pandemic, and these H1N1 vaccines – classified as bioweapons by regulators -- are being fraudulently misrepresented as prophylactic measures for a mild flu;

72. Baxter International and other potential/actual US government vaccine contractors have been given immunity from legal recourse by the American people for any substantial injury or death caused by federally mandated enforced vaccinations;

73. NIAID/CDC-sponsored trials of the H1N1 influenza vaccine scheduled to begin on pregnant women and small children in August/September 2009 do not include toxic adjuvants, and will give a misleading impression of the impact of the planned, possibly imminent federally mandated enforced vaccination on the health of those receiving them. They therefore do not fulfill the criteria laid down for adequate clinical trials, any more than levels of toxic mercury preservative in vaccines being increased in those given to pregnant women and young children and the addition of dangerous adjuvants such as squalene represent ethical or effective public healthcare procedures;

74. The UN/WHO has declared, without adequate scientific evidence, a highest possible Level 6 Pandemic giving them, by various fraudulent international agreements surreptitiously signed by the US government and various federal executive orders, indefinite control over the US and its populace that subsumes the US Constitution, the Bill of Rights, the Declaration of Independence and all federal, state and local laws – it is therefore these very oracles of human freedom that must now be invoked to protect the American people.

Constitutional Basis of This Case

75. Amendment 1 to the United States Constitution declares:

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

76. The First Amendment forbids Congress to enact any laws abridging freedom of speech or of the press; of the right of the people peaceably to assemble or to petition the government for a redress of grievances. Yet the corrupt US Congress has for the past hundred years enabled and/or engaged in all of the aforementioned violations of our constitutional rights by passing laws and allowing to stand without investigation or legislative action executive orders and judicial decisions depriving the American people of these constitutional rights through corporate consolidation of the communications media denying Americans free expression and timely, accurate information essential for authentic democracy to exist; corporate control of our federal government through money-based elections, lobbying, extortion and bribery; its letting stand executive orders allowing detentions and quarantines during martial law, denying the people their right peaceably to assemble; and, most recently, emergency use orders issued by the federal executive branch on behalf of pharmaceutical corporations giving them immunity from administrative redress through federal disciplinary action on behalf of the American people who may have injured or killed by their untested vaccines.

77. Amendment 4 to the United States Constitution provides:

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issued but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

78. The Fourth Amendment forbids home invasions by public health officials for citizens refusing enforced vaccinations, and the right of the people to be secure in their persons expressly forbids enforced vaccinations without due process as well.

79. Amendment 5 to the United States Constitution provides:

Trial and Punishment, Compensation for Takings. No person shall be...deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

80. The Fifth Amendment forbids public health quarantines or detentions with confiscation of property without due process of law, which measures mandating martial law, enforced vaccinations and quarantines/ detentions without due process of law manifestly violate.

81. Amendment 7 to the United States Constitution provides: Right to Trial by Jury. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury, shall be otherwise reexamined in any court of the United States, than according to the rules of the common law.

82. The Seventh Amendment forbids the federal government granting legal immunity to corporations for any death or injury caused by their products, such as has just been granted to pharmaceutical corporations for their vaccines, precluding any lawsuits or prosecution by the American people.

83. Amendment 8 to the United States Constitution provides: Cruel and Unusual Punishment. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

84. The Eighth Amendment forbids cruel and unusual punishments, such as would be inflicted by spuriously mandated, inadequately tested, toxically composed H1N1 influenza vaccinations, and mandated quarantine/ detention and/or deprivation of property for those who refuse them.

85. Amendment 9 to the United States Constitution provides: Construction of Constitution. The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

86. Amendment 10 to the United States Constitution provides: Powers of the States and People. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

87. The Ninth and Tenth Amendments, respectively, forbid the use of federal power to deny the sovereign rights of the people, and affirm that ultimate power resides with state governments and with the American people.

88. Amendment 14, Section 1 to the United States Constitution provides: All persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

89. Amendment 14, Section 3 to the United States Constitution provides: No person shall be a Senator or Representative in Congress, or elector of President and Vice President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof...

90. Article 14, Section 1 of the United States Constitution generally reinforces and affirms all of the rights of US citizens enumerated in the previously cited constitutional amendments, including the right to privacy, being violated by all of the aforementioned WHO/US healthcare mandates. Section 3 forbids anyone who commits treason against the United States

-- as many present federal officials of the executive, legislative and judicial branches are manifestly doing -- from holding any further public office, much less continuing to act with apparent immunity from any investigation and prosecution.

91. The American Declaration of Independence states:

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable right; that among these are life, liberty and the pursuit of happiness.

That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute new government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness.

Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security.

92. The last paragraph of the American Declaration of Independence very precisely describes the continuous tyranny that we as a people have long been experiencing from our corrupt, corporate-controlled federal government, along with its precisely prescribing its just and effectual remedy. It also declares the right of the people to abolish any existing political contract with their government when the basis of that political contract has become fraudulent in nature, and therefore null and void

Causes of Action

COUNT NO. 1: Violation of the First Amendment: abridgement by the federal government of freedom of speech and of the press, of the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

COUNT NO. 2: Violation of the Fourth Amendment: abridgement by the federal government of the right of the people to be secure in their homes and in their persons.

COUNT NO. 3: Violation of the Fifth Amendment: abridgement by the federal government of the right of the people to enjoy their life, liberty and property without interference, unless otherwise abridged by due process of law.

COUNT NO. 4: Violation of the Seventh Amendment: abridgement by the federal government of the right of the people to trial by jury and legal redress of grievances.

COUNT NO. 5: Violation of the Eighth Amendment: abridgement by the federal government of protection of the people from cruel and unusual punishment.

COUNT NO. 6: Violation of the Ninth and Tenth Amendments: abandonment by the federal government of the fundamental constitutional principle that all unspecified sovereign power resides with the people and with the various states.

COUNT NO. 7: Violation of the Fourteenth Amendment: abridgement by the federal government of untrammeled access by the American people to all aforementioned constitutional rights of citizenship, including that of privacy, and the right of the people to remove from office all public officials who have committed treason against the United States .

COUNT NO. 8: Violation of the American Declaration of Independence: abridgement by the federal government of the right of the people to maintain their sovereignty and freedom from any foreign power; their right to expect good faith on the part of their government in the political contract that it has with the people, and their right to remove from power any government that violates their sovereign human rights through fraudulent political contract.

Demand for Relief

WHEREFORE, plaintiff prays for relief as follows:

1. That the Court immediately grant an Injunction for relief in these matters, thereby revoking, by authority of the 1st, 4th, 5th, 7th, 8th, 9th, 10th, and 14th Amendments of the US Constitution, as well as by the authority of the American Declaration of Independence from the royally chartered corporations of the British Empire any powers spuriously presumed by the federal government, now or in the future, through executive orders or international agreements issued/signed by any officials, past or present, of the federal government; that any officials of the federal government be thereby forbidden, now or in the future, to commit perjury concerning the alleged benefits or efficacy of any suspiciously derived/designed mandatory or voluntary vaccination, thus engaging in fraudulent financial contracts with their makers, to declare unilaterally any corporate legal immunity to the purveyors of vaccines for said vaccinations, or to unilaterally impose any federally mandated vaccinations/quarantines/detentions/international governments upon the American people, thus making their political contract with the people fraudulent, and therefore null and void.

2. That the Court order the United States Attorney to convene a grand jury investigation based upon the abovementioned allegations by the authority vested in this Court and the US Attorney to prevent any possible injury to the American people by means of any aforementioned possible federally mandated martial law, with enforced vaccinations/quarantines/ detentions.

3. That the Court order an investigation of this matter by the US Attorney under the Racketeering Influenced Corrupt Organizations Section (RICO-USC 18) of the Organized Crime Control Act (OCCA) of 1970, particularly its Sections 175-Prohibition with Respect to Biological Weapons; 241-Conspiracy Against Rights; 1031-Fraud Against the United States; 1091-Genocide; 2384-Seditious Conspiracy; 2382-Misprision of Treason and 2384-Seditious Conspiracy, as well as the Sherman Antitrust Act of 1890, whose farsighted provisions have been largely ignored by the US government since the latter half of the twentieth century.

4. That the Court order an investigation by the US Attorney of persons who may be responsible in an effort to prevent any planned enforced bioweaponized vaccinations, which persons to be investigated should include:

Baxter USA Executives:

- Joseph Martin 221 N Walnut St , Bensenville , IL 60106 .
- Bruce McGillivray 151 Ridge Lane , Lake Forest , IL 60045 .
- Norbert Riedel 1520 N Sheridan Rd , Lake Forest , IL 60045 .

Other Government/Corporate Officials:

● Jeffery K. Taubenberger, M.D., Ph.D., presently employed as a vaccine development expert at the NIH, who exhumed frozen bodies with the admitted purpose of reconstructing the deadly 1918 flu, caused by tainted vaccines injected into US military servicemen that killed 50-100 million people.

● US Health and Human Services Secretary Katherine Sebelius, who in July 2009, signed an order indemnifying Baxter International and other purveyors of the H1N1 vaccines from compensatory lawsuits or prosecution by US citizens, and who is implementing a mass vaccination campaign in spite of the evidence other measures such as surgical masks and natural preventive remedies would be more effective and less expensive if a pandemic actually did break out.

● Drs. Margaret Hamburg, Margaret Chan and David Nabarro, presiding officers of, respectively, the US Food and Drug Administration (FDA) and the UN World Health Organization (UN-WHO) who, immediately following Dr. Jeffery K. Taubenberger's six-year program of reconstructing the deadly 1918 virus, announced to the world via the UN that a new pandemic is about to occur that would kill "...5 to 150 million". Hamburg and Nabarro, as previously mentioned, also discussed exactly how such a deadly pandemic would occur at a videotaped conference at the Aspen Institute-US on October 13, 2007.

● Goldman Sachs, State Street Global Advisors, the Bank of Austria, the Rothschild family-owned, Bernard Madoff-tainted Banco de Medici, the Rockefeller family interests, and all other financial or funding institutions which have institutional ownership or regular financial dealings with Baxter International and other transnational vaccine manufacturers, as well as all major private foundations funding the WHO and vaccine research, including the Rockefeller and Bill & Melinda Gates Foundations.

● Past and present officials of the US Department of Health and Human Services, the US Food and Drug Administration and the National Institutes of Health/US Centers for Disease Control and US Departments of Defense enabling the above-cited possible criminal/treasonous activities violating the US Bill of Rights, US Constitution, Declaration of Independence from the British Empire and its royally chartered corporations and other aforementioned US laws.

● Those presidents of the United States past and present signing executive orders giving over control of the United States to the United Nations and its associated agencies in the case of a WHO-declared Level 6 pandemic;

● As well as those members of Congress past and present who failed to investigate and halt these probable criminal and treasonous activities.

5. I do also hereby affirm the right of the American people inhabiting each and every state of the present federal union to engage in legal nonviolent official and unofficial secession from any government that has denied them their sovereign human rights, based on the 9th and 10th Amendments of the US Bill of Rights, as well as on the American Declaration of Independence from the royally chartered corporations of the British Empire and other aforementioned US laws; that they have the right to secede from a federal government, which, presently controlled by a bank-based transnational corporate crime syndicate, has in fact seceded from the American people, and has conspired to commit acts of treason and crimes against humanity, not only against the people of the United States but against all of the peoples of the world.

I do hereby affix my signature and the date to the above pleading to this

honorable court.

DATED this 23rd day of October, 2009.

'Poisoning attempt' charges filed against French H1N1 campaign

Flesh & Stone, 24 October 2009, 05:17:00
https://web.archive.org/web/20091203031309/http://www.fleshandstone.net/healthandsciencenews/1662.html

In what is being seen as the first of many such actions to come, nine individuals have filed formal charges claiming that the H1N1 campaign is a deliberate attempt to poison the French population.

These charges, which were filed yesterday, could not come at a more inopportune moment for the government and health specialists. The vaccination campaign got underway last Tuesday in a climate of national skepticism as to the vaccine's safety and efficiency, and this news will surely boost the morale of the increasing number of anti-vaccine lobbyists who are beginning to organize their resistance to any attempt to vaccinate the population against H1N1.

Nine inhabitants of the Isére region of France are cited as joint plaintiffs in the case, including a health sector worker, a teacher and a radio talk show host. They met each other at various public meetings held to denounce the vaccine's alleged health risks.

The charges take the form of a 'plainte contre X' which means that the perpetrator of an alleged crime or felony is not known, or is not named, in the charge sheet. This is a commonly used manner of filing complaints in France, particularly where the charges relate to supposed government implication in alleged breaches of the law. In cases where those trials proceed after prior examination of the facts, the specific persons or organizations concerned are designated and charged as the trial proceeds.

Jean-Pierre Joseph, the plaintiffs' lawyer, describes the vaccination campaign as "A veritable attempt to poison." He confirmed that the charges were filed at the High Court in Grenoble before the court's senior examining magistrate. He said other court cases involving other plaintiffs would begin soon

The various charges filed included one of "Attempting to administer substances…of a nature which could result in death."

"The aim is to put a stop to what we consider to be an act of poisoning," according to Joseph. "The interest of this action is that people in France now have a means by which to express their concern as citizens by saying publicly "We are aware that the vaccination campaign is a swindle."

Similar court actions are planned in other areas of the Isére, as well as in Paris, Pau and Nantes, and several hundred vaccine opponents are beginning to organize themselves on the internet with a view to filing class action charges.

The government and health authorities are currently battling to persuade people to get vaccinated against increasingly difficult odds. Opposition to the campaign has been increasing steadily, and various polls taken over the last few days put the figure for those who do not intend to get vaccinated as high as 70 percent.

Their task is being made even more arduous by the fact that while authorities believe on the one hand that vaccination is essential despite negative public reaction, the French have traditionally proved to be very quick to condemn and file charges in cases where not enough was said to be done to prevent other medical mishaps such as the Mad Cow outbreak and an AIDS contamination case, in which several people died and many more became HIV positive after receiving AIDS-contaminated blood transfusions in hospitals.

That signifies that the authorities have very little room to maneuver and are more or less obliged to continue the campaign in order to avoid similar charges should they decide or be forced to abandon the campaign and high numbers of people die as a result of not being vaccinated.

Grippe A. Seuls 17% des Français prêts à se faire vacciner

Quest France, 25 Octobre 2009
https://web.archive.org/web/20091027034704/http://www.ouest-france.fr/actu/actuDetFdj_-Grippe-A.-Seuls-17-des-Francais-prets-a-se-faire-vacciner_39382-1127162_actu.Htm

Seuls 17% des Français envisagent de se faire vacciner contre la grippe A (H1N1), selon un sondage Ifop pour le journal dimanche Ouest France.

Retournement radical

Cette étude traduit un retournement radical de l'opinion des personnes interrogées: à la mi-septembre, 55% des personnes interrogées par l'Ifop pour Sud-Ouest Dimanche se disaient prêtes à se faire vacciner.

Près d'un sondé sur deux (49%) explique qu'il ne se fera "certainement pas vacciner" contre le virus qui a fait 36 morts en France, selon le dernier bilan de l'Institut national de veille sanitaire publié mardi.

Faible inquiétude

Parallèlement, le niveau d'inquiétude des Français face à la grippe A chute très nettement: 16% des sondés se disent inquiets contre 32% il y a un mois.

Le sondage a été réalisé les 22 et 23 octobre par téléphone ou à domicile auprès d'un échantillon de 965 personnes représentatif de la population française âgée de 18 ans et plus.

Le Monde PLANÈTE

Seuls 17 % des Français envisageraient le vaccin contre la grippe H1N1

Le Monde, 25 October 2009, 08h 23
https://web.archive.org/web/20091029044725/http://www.lemonde.fr/planete/article/2009/10/25/seuls-17-des-francais-envisageraient-le-vaccin-contre-la-grippe-h1n1_1258524_3244.html

D'après un sondage paru dans Dimanche Ouest-France, seuls 17 % des Français envisageraient de se faire vacciner contre la grippe H1N1. Mi-septembre, 55 % des sondés pensaient se faire vacciner. Près d'un sondé sur deux est nettement opposé au vaccin.

L'évolution de ces chiffres s'explique notamment par la diminution de l'inquiétude ressentie face au virus. Alors qu'il y a un mois, 32 % des sondés se disaient "inquiets", le chiffre est tombé à 16 %.

Le sondage a été réalisé auprès d'un échantillon dit représentatif de 965 personnes.

THE FLU CASE

Only 17% in France now wants the "swine flu" vaccine - down from 55%

The Flu Case, 27 October 2009.
https://web.archive.org/web/20091029223221/http://www.theflucase.com/index.php?option=com_content&view=article&id=1420:only-17-in-france-now-wants-the-qswine-fluq-vaccine-down-from-55&catid=41:highlighted-news&Itemid=105&lang=en

According to the French mainstream newspaper Le Monde, the number of people in France who are planning to take the swine flu jab has dropped dramatically in the last month, falling from 55% in the middle of September to just 17 % today.

The latest poll also showed that the number of people who were worried about the "swine flu" pandemic had fallen from 32 % to just 16 % in the same period. As many as one person in two is opposed to the "swine flu" jab.

The poll of 965 people was first printed in Dimanche Ouest-France.

Les footballeurs allemands rechignent à se faire vacciner contre la grippe A

Lemonde // AFP, 25 Octobre 2009, 21h12
https://web.archive.org/web/20091027165359/http://www.lemonde.fr/sport/article/2009/10/25/les-footballeurs-allemands-rechignent-a-se-faire-vacciner-contre-la-grippe-a_1258629_3242.html#ens_id=1227013

Les clubs de football allemands rechignent à faire vacciner leurs joueurs contre la grippe H1N1 alors qu'une campagne massive de vaccination doit débuter lundi dans le pays.

"D'un côté la grippe porcine est une maladie contagieuse qui, lorsqu'elle frappe un joueur, peut mettre toute l'équipe à plat. D'un autre côté, il y a toutes sortes de questions sur les effets secondaires" du vaccin, a affirmé dimanche le porte-parole du Bayern Munich Markus Hijrwick. "On discute en interne pour le moment quant à savoir s'il faut se faire vacciner. Mais aucune décision n'a encore été prise", a-t-il ajouté.

Au FC Cologne, on se montre également sceptique. "Nous n'allons pas accepter le vaccin parce qu'on ne sait pas s'il y a des effets secondaires pour les sportifs de haut niveau", a affirmé le manageur Michael Meier. "Nous allons laisser nos médecins décider. Je trouve qu'en ce moment on laisse un peu trop jouer l'hystérie", a affirmé pour sa part le président du Werder Brême Klaus Allofs. Schalke 04 et le Hambourg HV ont également décidé d'attendre avant de prendre une décision.

Trois personnes sont mortes des suites de la grippe H1N1 qui a frappé quelque 25.000 personnes en Allemagne. Le ministère de la Santé a appelé la population à se faire vacciner, à partir de lundi.

Adam Murdock

Stop the Swine Whine!

FreeManInstitute, 25 October 2009
https://web.archive.org/web/20091104182138/http://www.freemeninstitute.com/adam-murdock-stop-the-swine-whine.html

" ... The H1N1 "swine" flu is an extraordinarily deadly virus.
" ... You need to get the vaccine or you could suffer the consequences.
" ... So-and-so has died in your neighborhood. Do you want to be next?

The above statements are typical of the lines that have been fed to the people of the world from the controlled media. In fact, the drum beat has been so deafening that you *would think that people were dropping like flies*. Sure there have been some deaths related to the flu but most have affected individuals with risk factors such as pre-existing lung conditions or people who are immunocompromised. Most healthy individuals that I have personally seen and in general have experienced nothing more than run of the mill flu symptoms.

Unfortunately, a lot of the hysteria has arisen out of disinformation or lack of information. I am going to address some of the disinformation by posing a few questions. First, do people die from the virus itself? And, if so, why do some individuals succumb to the virus and not others? The answers to the above questions are not commonly known but are pretty well established in the medical community. The facts are that the flu virus is seldom the sole cause of death, even among compromised individuals. In fact, many of the fatal cases arise from individuals that acquire bacterial superinfections. These bacterial infections arise after the lining of the lung is damaged by the virus which leaves the lung susceptible. The reason for this is that the lining of the lungs are critical for the removal of infectious elements and debris acquired during inhalation or from the upper respiratory tract. When these normal mechanisms breakdown or are already impaired, as is the case in pre-existing lung conditions, fatal bacterial infections can arise. It is these infections that are frequently the culprits in the flu. A result of this knowledge is that, I, as a physician am particularly cognizant of examining patients with presumed flu for signs and symptoms of pneumonia and in particular bacterial pneumonia.

What facts about the 1918 flu made some infectious disease experts worried about the swine flu this time around? The timeline of the 1918 flu was really composed of two flu seasons. The particularly virulent form of the flu was preceded by a mild flu much earlier in the season. It is believed that the milder form of the flu was able to acquire virulence factors by "mutating" into a more virulent form that affected younger, healthier patients. It was the second more virulent form that was the cause of the millions of deaths. Or was it? The media and public health officials like to blame all the deaths on the flu. As usual, there are some "confounding" variables, which in the case of the flu are other variables that may have affected the outcomes of flu victims. The first variable was sanitation. The cities of the early twentieth century were not known for their high sanitation standards. Nor was the importance of methods for preventing transmission of the virus such as hand washing and limited close contact understood. The second variable was an understanding about the virus itself and how it spreads, which as you might expect was rather limited at that time. Finally, treatment for flu patients at the time consisted entirely of supportive care. The advent of antivirals

and antibiotics for the treatment of bacterial complications of the flu had yet to be invented. These factors greatly contributed to the mortality of the disease.

What about this year's swine flu? This year's flu also started earlier in the year, somewhat like the 1918 virus and has been relatively mild. The fear was that this virus would also acquire the factors that would make it more virulent. It is this question that has generated all the hysteria and government intervention.

This leads me to the next question: Did we really need all the hysteria over a highly speculative event with little probability of happening?

The answer might have been "maybe," if we really were experiencing an exact copy of the 1918 flu. Yet, I am unaware that the current mild swine flu has undergone any type of comparable virulent transformation as many were predicting. In addition, a couple of the original vaccine trials published in the prestigious New England Journal of Medicine examining the efficacy of the H1N1 vaccine demonstrated that up to 40 % of people already had antibodies to the flu and therefore were possibly already immune. (1) (2) As this data is now several months old, the percentage is likely much higher now. It may be that the majority of people already have antibodies to the swine flu. Another study recently published in Euroscience by Purdue scientists predicts that the peak number of cases of swine flu will happen this week through Oct. 24. They also predict that the vaccine is not likely to have much effect on the total number of people that will acquire the swine flu because it has arrived too late. (3)

So with this information in hand what has been the response of government health officials? Have they halted a massive multi-billion dollar vaccination campaign that would vaccinate a group of people that may be already immune to a mild swine flu? Quite the contrary; they have intensified their efforts. They are calling medical professionals unethical if they don't get vaccines and even in some cases forcing vaccinations upon nurses and doctors as in New York. In addition, there has much talk about suspending constitutional freedoms and forcing vaccinations upon the general population.

What is scariest about the whole situation is that governments are seizing this opportunity to create emergency power bills that include pandemics such as with flu, thus mimicking the unconstitutional powers that have already been usurped by our Presidents. Recently, Pennsylvania has proposed such legislation. (4)

House bill 492 proposes emergency powers to "compel a person to submit to a physical examination or testing, or both, as necessary to diagnose or treat the person." This is to be done "without resort to judicial or quasi-judicial authority." This legislation will also require that "any physician or other health care provider to perform the medical examination or testing, or both" under penalty of law. In addition, "the public health authority may, for such period as the state of public health emergency exists, compel a person to be vaccinated or treated, or both, for an infectious disease." In other words, the rights of the patient and physician can be removed solely because a government public health authority believes a health emergency is imminent. This dictatorial power is to be accomplished without any judicial review.

What about the big pharmaceutical companies? I was recently reading about the pharmaceutical company, Baxter, who is projecting earnings of $30 - 40 million this quarter alone from swine flu vaccinations. Indeed, "Baxter International Inc., best known for its drug pumps and products for blood disorders and kidney disease, said it sees a lucrative new revenue source in vaccines and a multiyear opportunity in H1N1 swine flu vaccines." (5) It appears that big pharma is seizing upon the hysteria around this flu to potentially establish a new flu vaccine for years to come. This is despite the fact that a majority of the people may be already immune to the current H1N1 virus and the potential for pandemic swine flu in the years to come is likely minimal.

What about harm from the vaccine? Public health officials and the media like to portray the vaccine as virtually harmless. Nothing could be further from the truth. Although most immediate side-effects are minimal, it is well established that people can experience severe allergic reactions and Guillain-Barre syndrome, a severe neurological condition characterized by ascending paralysis. These conditions can lead to death and frequently do if unrecognized. In addition, there may be long-term side-effects related to adjuvants and mercury in vaccines that yet to have been fully characterized due to a lack of randomized studies for vaccinations. To add insult to injury, this vaccination has been rushed through the usual safety evaluation for vaccines in order that the government might "save" us from the deadly swine flu. So why take the risk if the benefits at this point are ill-defined. Indeed, physicians are mandated by law to tell their patients about all risks, benefits, and alternatives to any proposed treatment. Surely, any self-respecting physician should uphold his/her Hippocratic Oath by sharing the information with their patients.

Finally, it is not my right to tell you whether or not you should get flu vaccines, much less force you. Under the constitution, nobody else should have that right either. Unfortunately, it may be soon that our constitutional rights are only as good as the next flu season.

INDEPENDENT

More than half of Chinese 'don't want swine flu shot'

Independent, 25 October 2009
https://www.independent.co.uk/life-style/health-and-families/health-news/more-than-half-of-chinese-don-t-want-swine-flu-shot-poll-5503315.html

Beijing – More than half of all Chinese do not plan to be vaccinated against swine flu because they are unsure about the safety of the shot, according to a survey by state media published Monday.

The poll by the China Daily and popular web portal sohu.com said more than 54 percent of the 2,000 respondents said they did not want the A(H1N1) vaccine – a huge turnaround from two months ago, when 76 percent said they did.

"The vaccine has been developed and administered so quickly that I couldn't help questioning its quality and reliability," the paper quoted 36-year-old Zhang Lin, who refused the shot for her eight-year-old son, as saying.

China, which has the world's largest population at 1.3 billion people, has launched a mass swine flu vaccination campaign in a bid to stave off large outbreaks, especially as winter – and the regular flu season – sets in here.

But only 30 percent of those polled by the China Daily said they definitely would like to receive the shot. About 15 percent said they would make a decision based on what other people did.

The government has said it plans to inoculate five percent of the population, or 65 million people, against swine flu by year's end. So far, 300,000 people have received the vaccination.

More than 33,000 cases of A(H1N1) influenza had been reported as of Friday, according to health ministry figures, with the number of infections accelerating in recent weeks. Two deaths have so far been confirmed.

Health authorities have repeatedly warned they are facing a "grim" task of preventing outbreaks and keeping the death toll low.

"Tens of millions could be infected," the China Daily quoted Zeng Guang, chief epidemiologist at the Chinese Centre for Disease Control and Prevention (CDC), as saying.

The World Health Organization said nearly 5,000 swine flu deaths had been recorded as of October 18.

Alert Canadians:
Toxic ingredients in the Arepanrix H1N1 vaccine harm your health

Prevent Disease, 26 October 2009.
https://web.archive.org/web/20091029101856/http://preventdisease.com/news/09/102609_Alert_Canadians_Arepanrix_vaccine_analysis.shtml

Health Canada has authorized the sale of Arepanrix™ H1N1 vaccine based on no conclusive clinical testing. The authorization is based on the Health Canada review of available data on the quality, safety and immunogenicity of similar vaccines, which established the benefit/risk profile in favour of inoculating the Canadian population.

Read the Notice of Decision issued by Health Canada. The decision by the Health Minister was based on a belief (not qualified or informed) that immediate action is required to deal with the H1N1 risk. The assertion that the decision is based on limited clinical testing is being misapplied. There has been NO conclusive results from any clinical trials on the Arepanrix H1N1 vaccine.

This report is designed to inform you how the risks outweigh the benefits of the vaccine. It will demonstrate how the Health Canada assessment is flawed and contradictory to established research on the detrimental health effects of the vaccine ingredients contained in Arepanrix.

All Vaccine Ingredients Cause Immunotoxicity,
Neurotoxicity, Sterility and Carcinogenicity

Description and Composition

Arepanrix™ H1N1 (AS03-adjuvanted H1N1 pandemic influenza vaccine) is a two-component vaccine consisting of an H1N1 antigen (as a suspension), and an AS03 adjuvant (as an oil-in-water emulsion).

The virus is inactivated followed by formaldehyde treatment and disrupted with sodium deoxycholate.

Preservative content: 5µg (micrograms) Thimerosal USP per 0.5mL dose or 2.5 micrograms organic mercury (Hg) per 0.5mL dose

Adjuvant: The AS03 adjuvant system is composed of DL-α-tocopherol, squalene and polysorbate 80 in a 3mL vial:
DL-α-tocopherol: 11.86 milligrams/0.5mL dose
Squalene: 10.69 milligrams/0.5mL dose,
Polysorbate 80: 4.86 milligrams/0.5mL dose

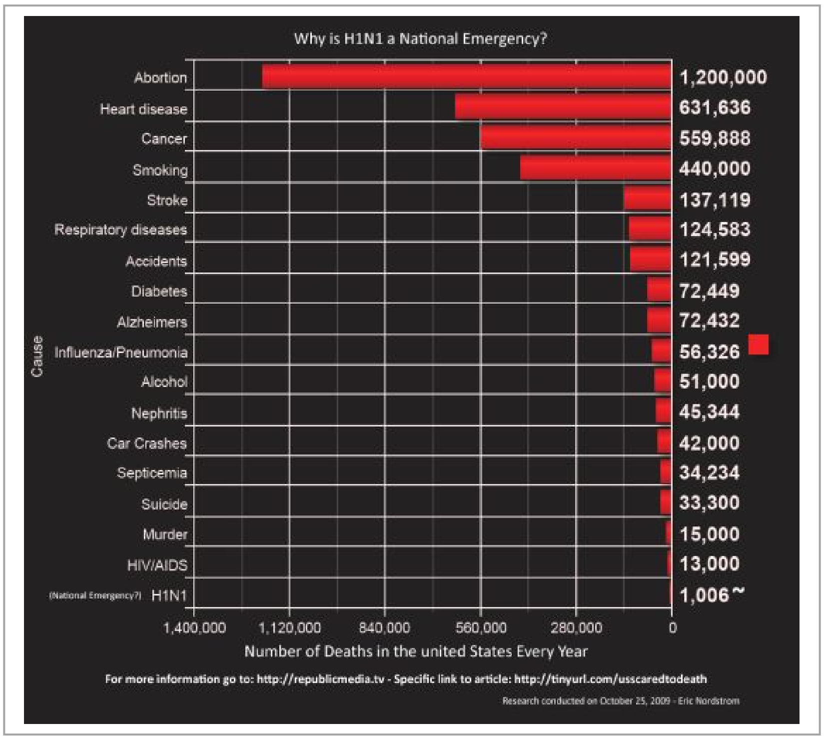
Chinese Join Worldwide Rejection of Swine Flu Vaccine
Less than one third say they will definitely get H1N1 shot

Infowars, 26 October 2009
https://web.archive.org/web/20091205164446/http://infowars.net/articles/october2009/261009Vaccinations.htm

The people of China are the latest to reject the H1N1 vaccine, according to results of national poll there indicating that concern over the vaccine's safety outweighs concern over the virus itself.

The poll, conducted by China Daily and news website sohu.com found that only 30% of 2,000 respondents said they would definitely get the shot.



Over 54% of the respondents rejected the vaccine outright, meaning that 702 000 000 people will refuse to roll up their sleeves and take the shot.

The survey indicates a seismic shift in popular opinion from just two months ago, when 76% of people in China indicated that they would opt for inoculation.

The primary reason for the turnaround, according to the survey results, is a general worry over the quality and reliability of the vaccine, given that it has been fastracked and is based on "mock up vaccines" that are up to two years old.

Just two deaths resulting from H1N1 flu have been confirmed in China, according to the health ministry.

Why N1H1 is National Emergenmcy?

The views of the Chinese people also reflect those of populations within the United States, Canada, the UK and in the rest of Europe.

Last week, when the first H1N1 vaccines became available, 62% of American respondents to an ABC News/Washington Post survey said they will probably not get vaccinated, while 30% said they are not confident in the shot's safety.

Despite a relatively low number of deaths in the U.S. (see table below), coupled with the fact that the H1N1 virus remains mild, President Obama declared a national state of emergency over the weekend, prompting fears of mandatory vaccinations and martial law.

Meanwhile, in Europe, similar levels of rejection of the vaccine have been reported, with large portions of Danes, Finns, Germans, French, Spanish, Belgians and Dutch people all saying they do not intend to take the shot.

The number of refusniks is set to increase following reports late last week of severe side effects and even deaths in Sweden and Bulgaria that may have been linked with the vaccine.

In France, nine individuals have filed formal charges claiming that the H1N1 mass vaccination campaign is a deliberate attempt to poison the French population.

In Germany, where the mass vaccination campaign begins today, just 13% now say they are willing to take the shot, down from 51% in July.

The dramatic fall off in willing recipients follows revelations that government officials, the German military, police and members of pandemic crisis committees will receive a non adjuvanted H1N1 vaccine, while the general public will only be offered the GlaxoSmithKline Pandemrix shot, which contains squalene and thimerosal.

Parintele Justin Parvu

Sa nu confundam strategia cu depunerea armelor
Inter-viu real-izat de mon-ahia Fotini, 7 octombrie, 2009, extras din nr. 8 al revis-tei

Atitudini, 26 October 2009, N 8
https://www.atitudini.com/2009/10/parintele-justin-parvu-s-a-ajuns-la-apogeul-nihilismului/

– *Parinte, cum sfatuiti poporul sa procedeze cu privire la aceste vaccinuri criminale* care se vor impune cu forta, asupra copi-ilor nostri si asupra mamelor insarcinate, si poate pe viitor asupra tuturor?

Dragii mei, e greu sa dai un raspuns unui popor intreg, pentru ca nu avem decat solutii dureroase, pentru ca aceasta este realitatea in care traim, foarte, foarte dureroasa. Am spus de la inceputul anului ca trebuie sa ne pregatim pentru martiraj si mai mult de atat nici nu as mai fi avut de grait, dar oamenii sunt neputinciosi cu duhul si cu mintea ca sa inteleaga. Nu e usor sa traiesti in ziua de azi. Dar daca Domnul asa a binevoit ca noi sa suferim aceste vremuri, apoi trebuie sa ne supunem si sa primim cu bucurie toate cele ce vin asupra noastra, ca din mana lui Dumnezeu, si nu a vrajmasului. E mai greu acum, pentru ca neam invatat cu comoditatea, cu televizorul si cu toate mofturile si libertatile; ei bine, dragii mei, abia acum se vede efectul daunator al acestor libertati – neau slabit puterile sufletului. Mintea este ingreuiata, trupul slabit si datorita alimentatiei otravite cu care ne hranesc mai marii nostri, si nu suntem obisnuiti sa purtam niciun fel de razboi, nici duhovnicesc, nici trupesc.

De aceea, va rog sa nu mai cautati solutii. Solutii omenesti nu sunt, dragii mei! Solutia este moartea pentru Hristos. Tata pe fiu si mama pe fiica va da la moarte. Iata ca asistam la implinirea acestei proorocii. Daca mama va lasa copilul sa fie vaccinat, este ca si cum lar da la moarte. Am spus de mai multe ori sa luam modelul lui Brancoveanu, care cu marime de suflet privea mucenicia fiului sau cel mic, Matei. Invatati copiii sa traiasca in legea crestineasca, aceste obiceiuri sa le deprinda mai cu seama; nu mai e nevoie de nicio alta stiinta, de nicio scoala; prin orice mijloace copiii nostri sunt otraviti nu numai cu aceste vaccinuri, ci cu atatea informatii mincinoase la adresa creatiei lui Dumnezeu, cu calculatorul si cu tot soiul de filme, care ofera copilului o educatie antihristica. Daca nu aveti unde sa va retrageti din societatea aceasta potrivnica lui Dumnezeu, stati fiecare la locurile dumneavoastra si marturisiti pe Hristos, opunanduva tuturor masurilor viclene de exterminare a omului. Pentru ca asta tanjeste vrajmasul sa faca, sa distruga faptura lui Dumnezeu. Invidia lui cea mai mare, aceasta este – crearea OMULUI: De ce il iubeste Dumnezeu atat de mult pe om? Tocmai de aceea ar trebui sa prindem putere si curaj, pentru ca daca suntem asa de tare luptati si impresurati din toate partile de atatea primejdii si nevoi, inseamna ca si invidia vrajmasului se mareste datorita dragostei lui Dumnezeu sporite fata de noi, chipul si asemanarea Sa. Dar iata cat de mult ne iubeste Dumnezeu ca inca mai rabda toate pacatele si faradelegile noastre. Numai dracul nu intelege mila si iertarea lui Dumnezeu, ca daca ar fi inteleso, cred ca sar fi pocait si el.

De aceea va zic – aveti incredere ca Domnul va va da putere sa marturisiti pentru El. Traim intro lume anarhica, intreaga clasa politica este vrajmasa a lui Hristos si slujitoare raului, de aceea numai simpla noastra vietuire, fara sa abdicam de la principiile noastre crestine, este o marturisire si o mucenicie de zi cu zi.

Asadar: Nu primiti acest vaccin si nimic ce aduc nou puterile politice de azi. Evreii conduc lumea si americanii lucreaza pentru ei si cred ca au ajuns sa o stapaneasca deoarece nu mai au nicio sfiala; totul este la vedere si sunt constienti ca nu mai au niciun adversar de temut si lupta pentru exterminarea populatiei, ca cei putini care vor ramane sa se inchine lor. Acum ei studiaza si fac trierea iar modul prin care vor distinge oamenii intre ei sunt cipurile. Ai sau nu ai cip? Caci in fond cipul ce este? O arma impotriva omului. Iar noi nu mai avem arme; tineretul nostru este obosit, incat chiar sa vrea sa se ridice din vraja in care traieste, nu mai are putere. Singurele noastre arme sunt numai cele duhovnicesti: rugaciunea, smerenia, dragostea, dar si marturisirea. Nu se poate dragoste fara marturisire. Dragostea este jertfitoare, iar noi daca ne temem sa marturisim adevarul, ce jertfa mai avem? Sau daca nu ne pasa de aproapele nostru care este in nestiinta si noi nu il informam si il lasam sa cada prada acestui sistem, ce dragoste mai avem? Cei care se mai lupta astazi sa trezeasca pe fratele lor, care nu au ramas nepasatori fata de viitorul unei natii si al unei Biserici, aceia sunt fii ai dragostei lui Dumnezeu, care isi pun viata pentru fratii lor.

De aceea, mamelor, educativa crestineste copiii si nu ii lasati necontrolati! Nu ii lasati sa isi faca mendrele lor, nu ii lasati prada educatiei acestei societati, pentru ca leati asigurat si moartea sufleteasca, dar iata ca si pe cea trupeasca! Mai degraba iesiti din mijlocul acestei societati si va cresteti copiii in dragoste si simplitate. Saracia si greutatile va vor intari mai mult si mintea, si sufletul, si trupul. Nu vedeti ca prin atatea libertati si drepturi ale copilului, ei ajung sa aiba dreptul de a til ucide, dreptul de a distruge o natie?

– *Sf. Apostol Pavel spune sa ne supunem stapanirilor si mai marilor nostri*? In ce masura ne mai putem supune in astfel de conditii?

– Tot Sfantul Pavel spune sa ascultam de Dumnezeu mai mult decat de oameni. Nu mai avem de cine asculta, dragii mei, decat numai de Dumnezeu. Diavolul sa intrupat in acest sistem politic si se lupta cu noi prin ei, mai aprig ca niciodata. Iti ofera mai intai toate pricinile pacatuirii: carciumi si alcool, dezmat si imagini cat mai desfranate, amuzament si libertati de tot soiul. Asa se alege un conducator: prin harul lui Dumnezeu si vointa natiunii, nu? Dar acestia ce har de la Dumnezeu sa aiba? Acestia sunt lupi rapitori, nu mai este o stapanire aleasa, este o stapanire antihristica, potrivnica lui Hristos. Daca se impotriveste lui Hristos, glasul acelei stapaniri nu va mai fi unul de ascultat.

Ce stapanire este aceasta care ne da paine otravita sa mancam? Care ne ucid copiii? Nu vedeti ca au inceput cu copiii, cu sufletele acestea nevinovate? De ce? Pentru ca ii ucide nevinovatia copiilor. Cu martirajul copiilor a inceput Biserica lui Hristos, cu martirajul pruncilor, iata ca incepe si prigoana acestui veac de pe urma. Dar socotesc ca jertfa nevinovata a acestor copii nu va fi nelucratoare, ci ea va da putere alesilor Bisericii lui Hristos. Si cred ca va fi o incununare a crestinismului prin jertfa copiilor nevinovati. Este foarte periculos acum pacatul nestiintei; toti vedem pericolul in care ne gasim si suntem obligati sa ne informam si avem datoria de a informa si pe ceilalti frati ai nostri mai simpli si neajutorati. Nimeni nu va putea spune ca nu a stiut ca vaccinul acesta este ucigas… iar pentru cei care nu au stiut cu adevarat, pentru acestia Biserica, prin preotii si slujitorii ei, este responsabila si va raspunde pentru sufletele lor.

Omul vine sa se formeze in Biserica si ce formare ii dam noi, daca propovaduim aceeasi invatatura cu a statului antihristic? Biserica nu ramane straina fata de toata conjunctura aceasta politica si sociala si este datoare sa se implice atat in societate cat si in politica, atata timp cat legile politice impiedica porunca lui Dumnezeu. Preotul, la hirotonie, jura ca se va supune lui Dumnezeu si poruncilor Lui, dar si stapanirii statale. Pai cui juram noi? Presedintilor si parlamentarilor care legalizeaza prostitutia si actele cu cip? Pai rolul preotului este numai sa cunune si sa inmormanteze? Nu. El este sarea pamantului si lumina oamenilor. Ce lumina mai aduce, daca el se supune legilor intunecate ale acestui veac? Iar daca tace, inseamna ca refuza sa aduca lumina oamenilor. Nu ei sunt urmasii apostolilor,

carora Mantuitorul lea poruncit: Mergeti in toata lumea si propovaduiti Evanghelia la toata faptura (Mc. 16:15)? Nu lea poruncit sa taca. Daca sar ridica o elita de preoti si de calugari, care intradevar sa se angajeze in slujba Adevarului, atunci sar mai schimba situatia. Iar prin aceasta schimbare eu nu inteleg imbunatatirea conditiilor de viata si nici macar a caracterului celor ce ne conduc, ci inteleg o schimbare in sufletele credinciosilor, o intarire a credintei care ne va da forta sa marturisim impreuna, ne va da unitatea si dragostea jertfirii. Important este sa ne opunem tuturor antihristilor si sa murim demn; sa nu avem o pozitie de lasitate. Iar poporul cum sa se mobilizeze, cum sa aiba tarie duhovniceasca, daca nu are lideri?

– *Poate ca preotii acestia se tem* sa nu fie inlaturati din posturile lor si astfel sa nu mai poata catehiza credinciosii pe care ii mai avea.

– Represalii au fost dintotdeauna si vor fi. Noi nu trebuie sa calculam cat timp de cateheza avem la dispozitie. Poate sa fie si o saptamana, dar sa imi fac datoria cu toata jertfelnicia fata de Evanghelia lui Hristos si neamul meu. Au fost 12 Apostoli si pana si acolo a intrat diviziunea, tradarea. Si ce catehizare este aceea daca taci? Pe mine nu trebuie sa ma ingrijoreze faptul ca ma va schimba si va trimite alt preot in locul meu, cu mult mai slab si care sa corespunda baremului. Daca patimim ceva pentru Hristos, mai mult folos vom aduce natiei. Jertfa naste viata. Nu este suficient sa marturisesti un adevar numai celui de sub epitrahilul tau, ci trebuie sa il propovaduiesti in auzul tuturor, avem datoria sa scoatem adevarul la lumina. Te mai poti retrage din strategie, dar cat dureaza aceasta strategie, mai? Sufera poporul asta de atata strategie si nu mai facem nimic. Sa nu confundam strategia cu depunerea armelor. Doar nu suntem facuti numai pentru zile bune; un razboi cine il mai sustine? Si cine sunt luptatorii? Nu noi cei din lumea aceasta de aici? De ce i se zice Biserica luptatoare? Luptatoare inseamna zi de zi sa sustii un atac impotriva puterilor intunericului. O asceza retrasa in individualitatea ei nu mai este un adevar marturisit in plenitudinea lui.

Foarte frumos citeam la Evdokimov mai devreme: Biserica nu trebuie sa isi asume treburile concrete ale cetatii, dar constiinta crestina este chemata sa actioneze din plin pana si in chestiunile cele mai tehnice. Politica, economia, dezvoltarea sunt sferele comune in care credinciosii si necredinciosii se intalnesc. Si ce imensa sarcina aceea de a desavarsi lumea prin sobornicitatea calitativa a tuturora, de a insamanta in cultura lumina Taborului. *Un om al luminii poarta o lumina care straluceste peste intreaga lume.* Marii duhovnici spun ca orice asceza lipsita de dragoste si care nu este un sacrament al fraternitatii este desarta.

Vorbind despre euharistie, Sf. Ioan Gura de Aur spune: *Aici este odaia inalta in care au sezut ucenicii; de aici au plecat spre Muntele Maslinilor. Sa plecam si noi in cautarea* ***mainilor de saraci,*** *caci ele sunt pentru noi Muntele Maslinilor. Intr-adevar, multimea saracilor este asemenea unui codru de maslin sadit in casa lui Dumnezeu. De acolo curge uleiul de care vom avea nevoie spre a ne infatisa, precum fecioarele cele intelepte purtand lampile pline inaintea Mirelui.*[1]

Problema noastra cea mai mare acum este ca ne aflam intr-o bezna a ignorantei si socotim pacatul nestiintei un mare privilegiu. Generatia aceasta a ajuns la apogeul nihilismului. Si ce daca fac lucrul acesta? A! Nu-i nimic! Iei cipul Ei, n-are nimica!; slujesti cu catolicii: Ei, n-are nimica si tot asa… toate nu au nimic. Nihilismul a nascut acest libertinaj si aceasta stare te indreptateste pe tine cumva sa faci orice, ce vrei, sa amesteci lumina cu intunericul, sa mergi si cu Dumnezeu si cu mamona. In acest caz noi nu mai suntem ucenici al lui Hristos.

THE FLU CASE

Only 7% of the people in Luxembourg intend to get the swine flu jab

The Flu Case, 27 October 2009, 20:49

https://web.archive.org/web/20091231004410/http://theflucase.com/index.php?option=com_content&view=article&id=1422%3Aonly-7-of-the-people-in-luxembourg-intend-to-get-the-swine-flu-jab&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Few wants the "swine flu" vaccine in Luxembourg.

Only 7 % of the people in Luxembourg intend to get the swine flu jab, according to a recent representative poll by TNS ILRES. 77 % have no intention of getting the vaccine while 15 % are undecided.

The number of people who said they were worried about the "swine flu" pandemic was 9 % compared to 42 % who said the were not worried. Another 32 % per cent said they were a little worried.

Altogether 46 % of the people asked said they thought that the swine flu vaccination campaign was out of proportion considering the danger while 41 % expressed concerns about the safety of the vaccine.

The poll will be published this week in Luxembourg media, the contents of it was sent to us today here at www.theflucase.com

THE FLU CASE

"The New 'Twilight Zone' – Obama Declares Swine Flu Emergency"

The Flu Case, 27 October 2009

https://web.archive.org/web/20091029223159/http://www.theflucase.com/index.php?option=com_content&view=article&id=1417:qthe-new-twilight-zone-obama-declares-swine-flu-emergencyq&catid=41:highlighted-news&Itemid=105&lang=en

The shocking truth about why Obama announced a National Public Health Emergency in the US this weekend.

Dr. Mercola Interviews Barbara Loe Fisher, founder of the National Vaccine Information Center.

President Barack Obama declared the swine flu outbreak a national emergency on Friday October 23, empowering the health secretary to suspend federal requirements and speed up treatment.

His declaration authorizes Health and Human Services Secretary Kathleen Sebelius to bypass norm al federal regulations so health officials can respond more quickly to the outbreak, which, allegedly, has killed more than 1,000 people in the United States.

"As a nation, we have prepared at all levels of government, and as individuals and communities, taking unprecedented steps to counter the emerging pandemic," Obama wrote in the declaration, which the White House announced Saturday.

He said the pandemic keeps evolving, the rates of illness are rising rapidly in many areas and there's a potential "to overburden health care resources."

Because of vaccine production delays, the government has backed off initial estimates that 120 million doses would be available by mid-October. As of mid-October, only 11 million doses had been shipped to health departments, doctor's offices and other providers, according to the Centers for Disease Control and Prevention officials said.

The government now estimates to have about 50 million doses of swine flu vaccine out by mid-November and 150 million in December.

Dr. Mercola's Comments:

It would appear that President Obama has not been apprised of the real facts of the situation, and has declared the swine flu a national public health emergency. To read the declaration in its entirety, please see this Los Angeles Times article.

https://www.latimes.com/archives/la-xpm-2009-oct-25-na-national-flu-emergency25-story.html

The intention of this report is to show you with the government's own statistics that there appears to be massive amounts of misinformation and outright deception going on that appear to be designed to panic American people into believing that H1N1 influenza is more serious and widespread than it is.

...

S. Attkisson. *Swine Flu Cases Overestimated?* – CBS News, 21 October 2009

https://web.archive.org/web/20091022182003/http://www.cbsnews.com/stories/2009/10/21/cbsnews_investigates/main5404829.shtml

Brilliant CBS Investigation Gets buried by Media

I just published a major swine flu update on Saturday about how CBS News investigative journalists exposed how misleading statistics are being used to panic the public into complying with the huge H1N1 swine flu vaccination program.

Last week, CBS News published the results from a three-month long investigation into the swine flu. One would think this would have received massive media exposure since their findings are in direct conflict with what the government is publicly stating.

Of major interest, as you can see on the video on the Saturday article, CBS investigative journalists went to the CDC to seek their help in clarifying the situation and answering outstanding questions but CDC officials refused. They would not cooperate and CBS had to do their own investigation.

Even worse, after CBS compiled the data, the CDC refused to comment on it.

What's this all about???

It can only make you wonder if the CDC is really interested in authentically serving the public good, or if, perhaps, it has been heavily influenced by outside corporate interests.

This is not good. The only way that we can have an effective response to the reported H1N1 influenza outbreak is if the government is transparent with the data. We have simply not seen any evidence that government health agencies are willing to be transparent. In fact, all evidence points to the contrary.

The CBS investigative report included state-by-state test results that revealed some very different facts from what the US Centers for Disease Control has been telling the American public.

The CBS report found that H1N1 flu cases are not at all as prevalent as feared. A CBS article even states:

"If you've been diagnosed "probable" or "presumed" 2009 H1N1 or "swine flu" in recent months, you may be surprised to know this: odds are you didn't have H1N1 flu. In fact, you probably didn't have the flu at all.

The results reveal a pattern that surprised a number of health care professionals we consulted. The vast majority of cases were negative for H1N1 as well as seasonal flu, despite the fact that many states were specifically testing patients deemed to be most likely to have H1N1 flu, based on symptoms and risk factors, such as travel to Mexico."

In most states the percentages ranged from 83 to 98 percent not being H1N1 or influenza.

As you can see from this CBS News graphic, not only are most cases of suspected flu-like illnesses not H1N1 influenza, they're not influenza at all, but rather some type of cold or upper respiratory infection that looks like influenza but is caused by another type of virus or bacteria!

Given these facts, there is a huge question in my mind as to whether or not the 1,000 deaths attributed to the swine flu were in fact *confirmed* to be the H1N1 virus.

LewRockwell.com

Bill Sardi

What's Behind the False Flag Flu Emergency?

LewRockwell, 27 October 2009
https://web.archive.org/web/20091029032835/http://www.lewrockwell.com/sardi/sardi129.html

On Friday I stood before an audience in Phoenix, Arizona and attempted to shock them with something similar to a repeat of Orson Welles' *War of The Worlds* radio broadcast, a 1938 Halloween night radio announcement that said, in a series of news bulletins, Martians had landed on the earth. The public cowered in fear then, even when Welles announced it was just a radio drama, not reality.

The contrived crisis I created was the President of the United States had just announced a national emergency because of a massive number of deaths attributed to a fast-spreading strain of flu virus that had combined with a mortal form of flu virus. My hand was shaking as I read the announcement. People in the audience thought it was real. The audience began to squirm and wonder, before I finished my melodrama, just how they were going to return home without having to undergo forced vaccination at the airport.

They were relieved when I told them this crisis was purely fictional. I added the announcement for just such a contrived crisis was probably already programmed into the President's teleprompter. Little did I know how true these words were to become.

To my surprise, on the afternoon of the following day (Saturday), the President of the United States had indeed declared a national emergency due to 1000 reported flu deaths, 100 of them among children. These deaths had occurred over the past eight months.

But 1000 accumulated deaths would be far fewer than the mortality figures the Centers for Disease Control distributes – estimated at 36,000 annual flu deaths. Federal health authorities lump pneumonia deaths among the elderly with flu-related deaths to falsely inflate flu mortality figures. My own guesstimate is that only about 6000 flu-related deaths actually occur each year, but even using this figure for comparison, this year's flu outbreak appears weak. An estimated 20,000 hospitalizations have been reported since this pandemic flu strain began in March of 2009, which amounts to only about 625 hospitalizations per week spread among more than 5 thousand hospitals.

Earlier in the week CBS News reported that, five months after this unique strain of the flu had begun to spread in Mexico in March of 2009, the H1N1 pandemic flu strain only comprised 1–2% of the flu viruses in circulation by July. Yet there were massive preparations being made for a major flu pandemic without sufficient justification. Today the Centers for Disease Control says the H1N1 pandemic flu strain represents 99% of the flu cases that are typed laboratory confirmed. Just exactly which numbers are correct, if any, now come into question.

According to CBS News, only 11 million doses of flu have been administered, with millions more to arrive late, sometime in mid-November. Time Magazine reports about 30 million available doses, so that could mean up to two-thirds of the currently available vaccine is going unused.

A reimbursement crisis, not a health crisis

A follow-up report, published in the Sunday edition of the San Francisco Chronicle, says the emergency declaration issued by The White House has more to do with Medicare and Medicaid regulations dealing with hospitals. With the national emergency declared, hospitals have more flexibility to set up separate or even outdoor treatment areas.

The emergency appears to deal more with hospitals and their ability to get paid by federal health authorities. An article in the New York Times confirms that federal rules do not allow hospitals to establish treatment areas more than 250 yards from emergency rooms. "Tents are 300 yards or more away, typically federal dollars won't go to pay for treatment."

So the emergency appears to be financial – making sure hospitals meet federal requirements so they can get paid by Medicaid or Medicare, rather than any true health crisis.

The San Francisco Chronicle article said "White House officials were quick to note that the emergency declaration does not signify an increase in severity of the national H1N1 outbreak." But the article kept referring to all the deaths, when there appear to be fewer mortal cases of the flu in the past 8 months than prior flu seasons.

Journalists and health officials sound more duplicitous as they attempt to explain the need for the emergency declaration. Here is how the San Francisco Chronicle described it:

"Art Reingold, head of epidemiology at UC Berkeley, said the declaration doesn't mean that the national outbreak is 'any worse than it was yesterday or last week'."

"It's difficult to get the right message across to people," Reingold said. "There's this balance between the flu is important and people should be vaccinated, but you don't want an overreaction."

But once again, according to federal officials, there is little or no vaccine available.

Civil liberties threatened?

An article in the Christian Science Monitor (ASM) was more concerned that such a contrived emergency could be a veiled way to overrun civil liberties. The ASM article quoted Harold Relyea, a specialist in national government with the Congressional Research Service, who said:

"When the President formally declares a national emergency, he may seize property, organize and control the means of production, seize commodities, assign military forces abroad, institute martial law, seize and control all transportation and communication, regulate the operation of private enterprise, restrict travel and, in a variety of ways, control the lives of United States citizens."

Few news sources were critical of the declared emergency, but expect more reporters to express skepticism over its need and to question its intent.

An article in the New Hampshire Union Leader said: "But the way the U.S. government has been handling the new flu strain, technically named H1N1, has been less than reassuring."

What to do now?

Misdirection, overreaction and lack of preparedness by public health officials is a clear indication to the public that they cannot totally rely upon potentially problematic vaccines or anti-viral drugs to defend themselves against the flu.

An ignored approach to controlling infectious disease is to address the immune status of the population. The public should utilize bona fide immune boosters such as vitamin D and vitamin C,

and take nutrients that are documented to reduce the duration and severity of the disease which include vitamin E, the trace mineral selenium, the sulfur compound NAC, and elderberry.

In 2005 researchers in Rome, Italy wondered what backup treatment could be used in the event vaccines were unavailable or were ineffective against a fast mutating flu virus that had developed resistance to vaccines or anti-viral drugs like Tamiflu or Relenza.

Flu viruses require a host cell to replicate. The Italian researchers report that resveratrol, known as a red wine molecule, completely blocks entry of flu viruses into the cell nucleus in animals at a human equivalent dose of ~70 milligrams. [Journal Infectious Disease 2005 May 15; 191(10):1719–29] So the virus would enter the lungs, antibodies would still be generated to produce long-term immunity, but the virus could not duplicate into millions of daughter virions as it normally does. Resveratrol works on closing the cellular doorway rather than destroying the virus itself. Therefore it is a totally non-toxic approach to control of influenza viruses. Furthermore, resveratrol does not provoke viral resistance.

In contrast, anti-viral drugs like oseltamivir (Tamiflu) allow viruses to enter cellular machinery to produce copies of the flu virus and then inhibits their exit from the cell via inhibition of the enzyme neuraminidase. So host cells are flooded with copies of the virus. This approach is not ideal as it can lead to drug-induced side effects which have been widely reported.

INDEPENDENT

Canadians wary of swine flu vaccine

Independent, 27 October 2009, 01:00 GMT
https://www.independent.co.uk/life-style/health-and-families/health-news/canadians-wary-of-swine-flu-vaccine-5503240.html

Most Canadians are skeptical of the swine flu threat and of the vaccine to fight it, a survey suggested on Monday as the country's largest-ever vaccination program in Canada got underway.

Fifty-one percent of 1,000 Canadians surveyed by polling firm Strategic Counsel for the daily Globe and Mail newspaper said they would not get vaccinated against the deadly A(H1N1) flu virus, while 49 percent said they wanted a flu shot.

The poll gave no margin of error because the respondents answered voluntarily through an online survey. A similar survey in July showed 62 percent saying they planned to get a swine flu shot.

The split reflects lingering concerns that the vaccine developed by GlaxoSmithKline has not been fully tested and that the influenza outbreak is not very serious, pollster Tim Woolstencroft told the newspaper.

"There has been a real drop-off in the desire to have the vaccination shot," he said, due mostly to safety concerns and the view that health officials "have been crying wolf too many times" about the threat posed.

The swine flu has so far contributed to 86 deaths in Canada, more than 1,500 hospitalizations and close to 300 critical care ward admissions, according to Health Canada.

Even so, 59 percent of respondents said they believe the swine flu is no more dangerous than the common cold. Only seven percent thought it could be life-threatening.

Aboriginals, youths and medical staff – groups believed to be most at risk of serious infection – received the first round of swine flu shots on Thursday.

A national vaccination campaign kicked off Monday.

In Germany, a Better Vaccine for Politicians?

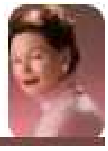
Time, 27 October 2009, 12:00 AM EDT
https://time.com/archive/6933944/in-germany-a-better-vaccine-for-politicians/

Critics are calling it a two-tier health system – one for the politically well connected, another for the hoi polloi. As Germany launched its mass-vaccination program against the H1N1 flu virus on Monday, the government found itself fending off accusations of favoritism because it was offering one vaccine believed to have fewer side effects to civil servants, politicians and soldiers, and another, potentially riskier vaccine to everyone else. The government had hoped that Germans would rush to health clinics to receive vaccinations against the rapidly spreading disease, but now rising anger over the different drugs may cause many people to shy away.

Amid growing fears of a possible global flu pandemic, the German government prepared for its mass-vaccination campaign earlier this year by ordering 50 million doses of the Pandemrix vaccine, enough for a double dose for 25 million people, about a third of the population. The vaccine, manufactured by GlaxoSmithKline, contains an immunity-enhancing chemical compound, known as an adjuvant, whose side effects are not yet entirely known. Then, after a report was leaked to the German media last week, the Interior Ministry confirmed that it had ordered a different vaccine, Celvapan, for government officials and the military. Celvapan, which is made by U.S. pharmaceutical giant Baxter, does not contain an adjuvant and is believed to have fewer side effects than Pandemrix.

Anger at the news was widespread in Germany. "If mass vaccination is considered to be necessary, then everyone should be treated the same way," says Birgitt Bender, health spokeswoman for the Green Party. Ulrike Mascher, head of the VdK social-welfare association, says giving government officials a vaccine that's different from that given to the rest of the population sent the "wrong signal" and gives many people "the impression that they are second-class patients." A story on the front page of the mass-circulation Bild newspaper accused the government of giving "second-class medicine" to regular Germans.

Doctors and medical experts are divided over the safety of Pandemrix. While some say it's the best vaccine available, others have serious misgivings about it. "The Pandemrix vaccine can't be recommended for pregnant women or young children because it has an increased risk of side effects. Pandemrix has an adjuvant which hasn't been tested sufficiently up until now," Alexander Kekulé, a virologist at the University of Halle, tells TIME. "Celvapan is a whole-virus vaccine, which has fewer side effects than Pandemrix, but it leads more often to fever or local swelling when compared with the normal seasonal-flu vaccine," he adds. Although Kekulé calls the government's handling of the vaccination program a "scandal," he says government officials and soldiers are not necessarily getting a better deal with Celvapan. "Neither Celvapan nor Pandemrix are ideal," he says.



The Interior Ministry hit back at suggestions of preferential treatment, saying it had ordered about 200,000 doses of the Celvapan vaccine from Baxter before the differences between the two vaccines were documented, and the government was bound by the terms of its contract. The government also

points out that both Pandemrix and Celvapan have been approved by the European Union and that other countries, such as Britain and Sweden, are using the Pandemrix vaccine. In an attempt to put a lid on the simmering controversy, Chancellor Angela Merkel's spokesman, Ulrich Wilhelm, said the German leader would consult with her doctor in the next few days, and if she decided to receive a jab, it would be Pandemrix.

At least 26,000 people have been infected with swine flu in Germany, resulting in three deaths. Although the majority of patients have experienced only mild flulike symptoms, a steady increase in the number of cases of H1N1 in recent months has raised alarm across the nation. In its latest report, the Robert Koch Institute, the federal agency for infectious diseases, said new cases in Germany have jumped to about 1,600 each week, double the 700 to 800 weekly cases reported in early autumn. With the onset of winter, when seasonal-flu infections typically peak, many experts are concerned that H1N1 infections will spike dramatically. Klaus Osterrieder, a virologist at the Free University of Berlin, now fears that with the worries over the possible risks associated with Pandemrix, many people will avoid getting a vaccine altogether. According to a survey conducted on Oct. 23 by the Emnid Institute, only 13% of Germans said they wanted to receive a swine-flu vaccine this winter.

"The public debate is bad because it raises questions about the whole vaccination program," Osterrieder says. If the government doesn't find some way to remedy the current public relations disaster and clear up the confusion over the different swine-flu vaccines, it could be faced with an even greater emergency, especially if the country's hospital wards start overflowing with flu patients in the coming months.

"Schweinegrippe der geplante Genozid"
It is an interview of Jane Burgermeister

by Christian Köhlert

Secret TV, 28 October 2009 (in German)
https://www.youtube.com/watch?v=5_R5EHn9lOY
http://www.youtube.com/watch?v=NdVSytKCC78

Mit einer Reihe von Anzeigen gegen das Pharmaunternehmen Baxter, die Weltgesundheits-organisation WHO und die UNO hat die investigative Journalistin Jane Bürgermeister weltweit auf die Gefahren im Zusammenhang mit der geplanten Massenimpfung gegen die Schweinegrippe hingewiesen. Mit bedrückendem Insiderwissen zeichnet sie das Bild eines gewaltigen Verbrechens gegen die Menschheit, das offenbar nur ein Ziel verfolgt: Den Genozid breiter Teile der Bevölkerung.

Mittlerweile hat ihre unermüdliche Aufklärungsarbeit Jane Bürgermeister den Job gekostet. Trotzdem macht sie weiter. Ihre eigene Website theflucase.com gilt mittlerweile als eine zentrale Sammelstelle im Internet, auf der sämtliche Informationen zur Impfung gegen die Schweinegrippe zusammenlaufen. Im Gespräch mit Thomas Kirschner erläutert die renommierte Wissenschafts-journalist in im exklusiven secret.TV-Interview aber auch, dass es noch einen weiteren schrecklichen Verdacht gibt. Über einen möglichen Genozid hinaus könnte es noch einen viel bedrückenderen Grund für die konstatierter Aktion der Staatengemeinschaft geben, möglichst viele Menschen mit den extrem problematischen Impfstoffen zu kontaminieren.

A new video interview has been placed in our YouTube video archive (under "Summary" in the main menu). It is an interview of Jane Burgermeister made by Secret TV and is made in German.

Steve Watson

Mass rejection of Swine Flu vaccine continues throughout Europe
French revolt as less than ten Austrians show up at clinics in major city

Prison Planet, 28 October 2009
https://web.archive.org/web/20091216124344/http://www.prisonplanet.com/mass-rejection-of-swine-flu-vaccine-continues-throughout-europe.html

The mass rejection of the H1N1 flu shot continues in Europe, prompted by fears over the vaccine's safety, with extremely low percentages of people saying they intend to take it.

In France, a poll published in the Dimanche Ouest-France newspaper and reported on by the country's biggest newspaper Le Monde, reveals that just 17% of the population now intend to get vaccinated.

A rough translation of the article reads:

According to a poll published Sunday in West-France, only 17% of the French will consider getting vaccinated against influenza H1N1. In Mid-September, 55% of respondents said they would get vaccinated. Nearly one in two surveyed is clearly opposed to the vaccine.

The evolution of these figures can be explained by the reduction of anxiety felt over the virus. A month ago, 32% of respondents said they were "worried", that figure has dropped to 16%.

The figures come in the wake of efforts on behalf of nine individuals who have filed formal charges in the French courts claiming that the H1N1 mass vaccination campaign is a deliberate attempt to poison the French population.

The drop in numbers willing to take the vaccine mirrors that in Germany where just 13% now say they are willing to take the shot, down from 51% in July.

Meanwhile, state media in Austria reports that yesterday, on the first day the H1N1 vaccine became available, less than ten people attended vaccine centers in the country's fourth largest city, Salzburg. "The organisational situation is the same as if you invite people to a party and you don't know whether to make three or 5,000 sandwiches." Norbert Muss, the head doctor of the regional health insurance association commented.

The Flu Case website reports that a poll to be published later this week in Luxembourg indicates that 77% of the country has no intention of getting the vaccine, while 15 % are undecided.

In addition, the site suggests that radio reports out of Poland have revealed only 3% of the population of Kraków, one of the countries largest cities, plan on taking the vaccination.

Mass rejection of the vaccine has been reported throughout Europe, with large portions of Danes, Finns, Spanish, Belgians and Dutch and British people also saying they do not intend to take the shot.

The number of refusniks is set to increase following reports late last week of severe side effects and even deaths in Sweden and Bulgaria that may have been linked with the vaccine.

Significant refusal of the vaccine is also rife among populations of the U.S., Canada and China.

Only swine flu jab trials on children not to be completed for a year

The Flu Case, 28 October 2009

https://web.archive.org/web/20091101125920/http://www.theflucase.com/index.php?option=com_content&view=article&id=1434%3Aonly-swine-flu-jab-trials-on-kids-not-to-be-completed-for-a-year&catid=1%3Alatest-news&Itemid=64&lang=en

The first clinical trial on children of a vaccine against the swine flu vaccine has begun in Oxford, but the trial is not expected to be completed until September 2010.

The trial started in September and involves 1000 children between 6 months and 12 years old, who are to be given Baxter's and GlaxoSmithKline's swine flu jabs, according to a US government clinical trials database.

GSK's Pandemrix contains the adjuvant, squalene, but Baxter appears to have dropped the adjuvant and mercury from its Celvapan after pressure from the German army, who refused to give the jab to their soldiers.

The Estimated Primary Completion Date or final data collection date for primary outcome measure is December 2009. But the results will not be available for Oxford University for another nine months or September 2010.

Also, the study will recruit only healthy children 6 months to 12 years of age.

"Children with previously laboratory confirmed infection with swine flu will be excluded, as will those that have received a treatment course of oseltamivir."

Children with immune deficiencies are to be excluded, even though large numbers of children are estimated to have immune deficiencies.

The contact person for the trial is listed as Dr Andrew Pollard, leader of the Oxford Vaccine Group and a participant in the Jenner group. Pollard has already carried out trials on the bird flu drug.

The study will be conducted as a collaboration between the Health Protection Agency and the Oxford Vaccine Group (OVG), Bristol Children's Vaccine Centre (BCVC), the Royal Devon and Exeter Hospital, St George's Vaccine Institute (SGVI) and the University of Southampton Wellcome Trust Clinical Research Facility (USWTCRF).

Among the sponsors of the Jenner group are the European Commission, the Gates Foundation, the US NIH, the Foundation for the NIH, International AIDS Vaccine Initiative, and the UK Department of Health.

THE FLU CASE

Only swine flu vaccine trial on pregnant women not set to finish until July 2010 and have no adjuvants

The Flu Case, 28 October 2009
https://web.archive.org/web/20091101125920/http://www.theflucase.com/index.php?option=com_content&view=article&id=1434%3Aonly-swine-flu-jab-trials-on-kids-not-to-be-completed-for-a-year&catid=1%3Alatest-news&Itemid=64&lang=en

Governments are saying that the swine flu jab is safe for pregnant women but the US government's clinical trials database reveals that the H1N1 jab has not been tested on this group.

The only clinical trial for the swine flu jab on pregnant women started in September 2009 and the trial is not expected to be completed until July 2010, long after the swine flu jabs have been administered.

In addition, the trial on pregnant women involves only 120 women and Sanofi Pasteur vaccines that do not have an adjuvant as the official clinical trials title reveals, even though vaccines with adjuvants are recommended for pregnant women.

"Official Title: A Phase II Study in Pregnant Women to Assess the Safety and Immunogenicity of an Unadjuvanted Sanofi Pasteur H1N1 Inactivated Influenza Vaccine Administered at Two Dose Levels."

The trials, which are sponsored by the National Institute of Allergy and Infectious Diseases are "ongoing, but not recruiting participants". "Healthy" pregnant women are sought for the trials:

H1N1 Vaccine in Pregnant Women [NCT00963430]
This study is currently recruiting participants.
Verified by National Institute of Allergy and Infectious Diseases (NIAID), August 2009
First Received: August 20, 2009   Last Updated: September 10, 2009

This purpose of this study is to evaluate an investigational 2009 H1N1 influenza vaccine to determine vaccine safety in pregnant women and how the body reacts to different strengths of the H1N1 influenza vaccine. In this study 2 strengths of the H1N1 influenza vaccine will be tested (given 3 weeks apart). Participants will include approximately 120 healthy pregnant women, ages 18-39 years, in their second or third trimester of pregnancy (14-34 weeks gestation). Study procedures will include 2 doses of vaccine, blood samples, umbilical cord blood samples at delivery, and recording temperature and vaccine side effects in a memory aid for 8 days following each vaccination. Participants will be involved in study related procedures for about 7 months.

Jason Pearl ... comments:

"How the hell can they categorically say that the H1N1 is safe for pregnant women and the baby they are carrying. The tests only started in September 2009 and the end results will be out in July 2010. So they have got NO idea what it is doing to the fetus or maybe they have and that is the idea. I am absolutely disgusted with our governments and the propaganda they have been using to scare the population into getting a fast tracked H1N1 swine flu vaccine. And now that the USA is under a National Emergency that allows hospitals and doctors to use drugs and treatments which have NOT been approved by the FDA and have not gone through all the necessary tests to find out whether they are safe for public use. For example *squalene* and another point I would like to make: *It would not be until a baby is old enough* to show developmental delay for them to know that the H1N1 vaccine has had any effect on the fetus ! Come on people.

Salzburg ORF.at

Geringes Interesse an Schweinegrippe-Impfung

Salzburg, 28 October 2009
https://web.archive.org/web/20100205075955/http://salzburg.orf.at/stories/399216/

Gesundheit

Die Salzburger Gebietskrankenkasse verzeichnet vorerst geringes Interesse an der Impfung gegen die Schweinegrippe. Am ersten Impftag am Dienstag kamen nicht einmal zehn Personen.

"Andrang hält sich in Grenzen"

Dennoch sei die Krankenkasse auf einen Ansturm vorbereitet, genug Impfstoff gegen den H1N1-Virus sei vorhanden, sagt Gebietskrankenkassen-Chefarzt Norbert Muß.

"Die organisatorische Situation ist insgesamt so, wie wenn Sie zu einer Party einladen und nicht wissen, ob sie drei oder 5.000 Brötchen herrichten sollen", sagt Muß, "Derzeit hält sich der Andrang des medizinischen Personals relativ in Grenzen."

Chefarzt sieht "gewisse Impfmüdigkeit"

Muß sieht zwei Hauptgründe für das geringe Interesse an der Impfung: "Auf der einen Seite ist eine gewisse Impfmüdigkeit zu erkennen und andererseits hat's doch auch eine Diskussion über den Impfstoff gegeben. Vor allem wissen wir nicht, wie die Pandemie verlaufen wird. Wer ist der liebe Gott, der weiß, was uns noch blühen wird."

In den kommenden zwei Wochen werden nur jene geimpft, die in Gesundheitsberufen arbeiten - also Ärzte, Krankenschwestern oder Pflegepersonal.

Impfung für alle ab 9. November

Ab 9. November können sich dann alle Salzburgerinnen und Salzburger gegen die Schweinegrippe impfen lassen. Die Impfung kostet knapp fünf Euro.

Fewer than 10 people turn up for swine flu jab on first day in Salzburg, Austria

The Flu Case, 28 October 2009
https://web.archive.org/web/20091104041524/http://www.theflucase.com/index.php?option=com_content&view=article&id=1430%3Afewer-than-10-people-turn-up-for-swine-flu-jab-on-first-day-in-salzburg-austria&catid=1%3Alatest-news&Itemid=64&lang=en

Fewer than ten people turned up to get the swine flu jab in the Salzburg's vaccine centers on Tuesday, the first day when the jabs were available, reports Austria's state-run TV, the ORF.

Norbert Muss, the head doctor of the regional health insurance association, said that the organisation had prepared for a run on the jabs.

"The organisational situation is the same as if you invite people to a party and you don't know whether to make three or 5,000 sandwiches, he said.

"Right now the demand among health personnel is not overwehlming," he said.

He attributed the low turn out to a "certain tiredness with being vaccinated on the one hand and on the other hand there has been a discussion about the vaccine."

In the next two weeks only doctors, nurses and other health care workers in Austria are to get the swine flu jab under government plans with the rest of the population due to be vaccinated from November 9th.

HÄLSA&SKÖNHET

Av David Lillemägi

Nytt bråk om svenska influensavaccinet

Expressen, 28 Oktober 2009
https://web.archive.org/web/20091031062935/http://www.expressen.se/halsa/1.1759472/nytt-brak-om-svenska-influensavaccinet

Det vaccin vi har i Sverige har vållat debatt i Tyskland. Där finns ett annat vaccin, utan tillsatser, tillgängligt för regeringen.

Socialstyrelsen försvarar dock vaccinet.
- Tillsatsen kan ge mer lokala biverkningar men det finns inget som säger att det ger långvariga effekter, säger Anders Tegnell på smittskyddsenheten.

I Tyskland har debatten om vaccinet varit stor efter efter att Der Spiegel avslöjat att regeringen fått tillgång till ett vaccin, Celvapan, medan folket får Pandemrix som också används i Sverige. Det som skiljer de båda åt är att Pandemrix innehåller ett så kallat adjuvans som stärker immunförsvaret.

Värk och feber

- De biverkningar som orsakas av förstärkaren, eller adjuvansen, är värk, huvudvärk, feber och rodnad runt vaccinationsstället. Det är biverkningar vi förväntat oss. Vaccinet har visat sig verka väldigt bra och det är ytterst viktigt att vi fortsätter vaccinera, säger Annika Linde, statsepidemiolog på Smittskyddsinstitutet.

Time Magazine rapporterar att inrikesministeriet beställde doserna av Celvapan innan skillnaderna mot Pandemrix var dokumenterade.

Men Tysklands största tidning Bild anklagade tyska regeringen för att ge andra klassens-medicin till medborgaren.

Försöker döva kritik

I försöken att döva kritiken har regeringen i Tyskland påpekat att EU godkänt Pandemrix och att bland annat Sverige använder det vaccinet.

Förbundskanslern Angela Merkel har också försökt lugna stormen genom att meddela att om hon vaccinerar sig, så blir det med folkets vaccin Pademrix.

- Vaccinet är godkänt och jag har väldigt svårt att se att det finns någon grund i den kritik som tagits upp i Tyskland, säger Anders Tegnell, enhetschef för smittskyddsenheten på Socialstyrelsen.

"Mer vaccin"

Men världshälsoorganisationen (WHO) rekommenderar ändå användande av Pandemrix för att öka tillången på vaccinet runt om i världen.

Anders Tegnell menar att det finns en solidarisk aspekt i varför man valt Pandemrix i Sverige.

- Man får fram väldigt mycket mer vaccin genom att använda den här adjuvansen. Om alla skulle producera vaccin så som man producerar Celvapan skulle man kanske bara kunna vaccinera en femtedel så mycket som i dag.

THE FLU CASE

Johan Niklasson

Swedish authorities facing more resistance against poisonous "swine flu" vaccine

The Flu Case, 28 October 2009
https://web.archive.org/web/20091103112248/http://www.theflucase.com/index.php?option=com_content&view=article&id=1429%3Aswedish-government-in-more-trouble-over-poisonous-qswine-fluq-vaccines&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Today, Expressen writes that the critical news about the deadly "German second class" vaccine, the poisonous Pandemrix. which is the only vaccine "offered" to the Swedish population, is being met with stubborn denial from the Swedish authorities. Just yesterday, they refused to acknowledge the fact that the German government ordered a less poisonous vaccine, Celvepan, for themselves while the population is supposed to get what is now called a second class vaccine, the very poisonous Pandemrix. They made statements that it was a false rumor and a myth. Today the Swedish authorities have to reluctantly admit that it is a fact.

Even after having been confronted with the articles in the German news paper Bild and the german magazine Der Spiegel, Swedish authorities are in complete denial about the dangers of the poisonous vaccines and Anders Tegnell, the Chief of communicable disease prevention in The National Board of Health and Welfare says: "- The vaccine has been approved and I have a very difficult time seeing that there is any validity in the criticism brought up in Germany."

He states that there is solidarity involved. "- One can produce very much more vaccine by using this adjuvant. If everyone made vaccine the way Celvepan is produced it would only be possible to maybe vaccinate a fifth of the number we do today."

Annika Linde, Statsepidemiolog in The Swedish Institute for Infectious Disease Control (SMI) says: "- The vaccine have proven to be very effective and it is extremely important that we continue to vaccinate."

The article writer, David Liliemägi, also manages to claim that the adjuvant squalene, one of the most criticized substances in the deadly vaccine mix, is supposedly strengthening the immune system!

update - I wrote him to make him aware of the mistake and he now says he realizes his article was edited by someone unknown to him during the night (!) and that this false statement has appeared afterwards. he will try to make the editor in chief make the change and correct the statement! - *update*

This fact raises the question of who actually controls and run the media in Sweden and what is really going on behind the scenes regarding the massive propaganda for mass vaccinations in Sweden.

The official line in Sweden is bordering to madness and the biggest medical scandal in the history of the nation has just started.

CTV NEWS

To vaccinate or not? Healthy adults debate swine flu shot

CTV News, 29 October 2009 10:05AM EDT
https://www.ctvnews.ca/to-vaccinate-or-not-healthy-adults-debate-swine-flu-shot-1.448716?cache=yes%3FautoPlay%3Dtrue%2F7.324407

To get the swine flu shot or not? That's certainly the question racking the minds of many Canadians this week.

While many at higher risk of swine flu complications are planning to get the vaccine, a lot of healthy adults are still wondering whether they really need it.

Juliet Guichon, a bioethicist who teaches at the University of Calgary argues that all Canadians should get vaccinated, if not to protect themselves, then to protect those around them and the health care system in general. – "People who don't get the vaccine are acting against their self-interest," she told Canada AM Thursday.

"The vaccine is safe and efficacious and it can protect them from what is a mild disease in most people but what can cause sudden death in some people."

Guichon noted in an opinion piece in The Globe and Mail this week: "Every vaccinated person increases the likelihood that health-care professionals will be free to treat other people... If unvaccinated people make health-care workers sick, they cannot look after other patients."

But Arthur Schafer, the director of the Centre for Professional and Applied Ethics at the University of Manitoba, says he just doesn't understand why those who are not at particular risk of swine flu complications are being advised to get the shot anyway.

"There's been a very hard sell from Canadian public health officials of the vaccine and I'm not sure I quite understand why," he told Canada AM.

"Perhaps a year ago, we thought this was going to be a highly infectious and highly dangerous disease. But as we saw in the spring, it hasn't been particularly lethal. It's the flu."

He noted the Southern Hemisphere made it through its winter flu season during our summer long before a vaccine was developed and approved. And yet the death rates there were surprisingly low.

"As one example: in New Zealand, they predicted 18,000 deaths from swine flu, but at the end of the flu season, it was 17," he noted. "So why so much of a fuss? Do we make so much of a fuss every flu season?"

Guichon argues that if most Canadians chose to be vaccinated, we could increase the "herd immunity," and thereby decrease the demand on the public health system.

She notes that health experts from Health Canada, the CDC in the U.S., the public health departments in the U.K. and Europe all recommending universal vaccination, except for those few people who cannot be vaccinated.

"These are people who are not in a conflict of interest. They're not in the pocket of Big Pharma. They're specialists in epidemiology and infectious disease. They have the data. On their best advice, we should get vaccinated," she says.

But Schafer continues to insist that most people really don't need to be vaccinated; only those with severely compromised immune systems are at risk of serious complications from swine flu.

"Now it's true that we haven't had a swine flu strain in North America for more than 50 years, so we haven't been exposed to it and so more people will be infected, including more young people," he says.

But he notes that higher infection doesn't mean higher death rates. He thinks the reason flu vaccine clinics this week are being overwhelmed by crowds has a lot to do with the sudden death of 13-year-old Evan Frustaglio, the healthy Toronto-area hockey player, who succumbed quickly to a swine flu infection.

"A young hockey player is much more at risk of dying of a hockey injury than he is from the flu," Schafer said. – "I think people are unduly worried. And the media is, of course, focusing on the few deaths of young people that do occur."

Le site du Dr Marc Girard

Une interview du Dr Marc Girard

Le site de Dr Marc Girard, 30 October 2009
https://web.archive.org/web/20100102030908/http://theflucase.com/index.php?option=com_content&view=article&id=1612%3Adr-marc-girard-urges-fierce-resistance-to-any-forced-vaccinations-for-profit&catid=1%3Alatest-news&Itemid=64&lang=en
[www.rolandsimion.org - deleted]

Q1) Comment comprendre la réticence des français à se faire vacciner?

MG-Les Français ont le souvenir cuisant et extrêmement douloureux de la campagne de vaccination contre l'hépatite B. Ils se rendent bien compte également que les alarmistes du jour sont ceux qui, depuis des années, les ont bassinés avec une grippe «aviaire» dont on attend toujours la moindre manifestation tangible.

Q2) Pourquoi Roseline Bachelot a t-elle décrit cela comme un «un réflexe d'enfant gâté»?

MG-J'ai entendu plutôt « gosse de riches ». Comme je l'explique dans ma série Les perles de la campagne, on a plutôt l'impression que ce sont les «riches» ou les «gâtés» de l'industrie pharmaceutique (le plus lucratif des secteurs industriels) qui sont derrière elle.

Q3) Doit-on contraindre le personnel de santé à se faire vacciner ?

MG-A partir du moment où les vaccins deviennent l'objet d'enjeux lucratifs faramineux (cf. question précédente), il faut se défier comme de la peste de toutes les obligations vaccinales. En tout état de cause, une «obligation» ne pourrait se discuter que si nous avions à notre disposition un vaccin efficace et bien toléré, ce qui n'est certainement pas le cas avec les vaccins contre la grippe porcine, développés et autorisés dans des conditions scandaleuses d'amateurisme.

Q4) Pourquoi va-t-on proposer des vaccins sans adjuvants aux personnes les plus «à risques» ?

MG-La dérive du débat vers la question des adjuvants (qui rappelle celle vers l'aluminium dans le scandale de l'hépatite B) illustre l'irresponsabilité de certains antivaccinalistes.

Evoquer la question des adjuvants, c'était permettre à l'autorité sanitaire d'introduire de nouvelles spécialités dépourvues d'adjuvants – et c'était donc lui ouvrir une avenue pour crédibiliser sa prudence et sa discrimination. Se trouvent du même coup évacuées les deux questions centrales de toute cette histoire:

1/ Elle est où, cette fameuse pandémie dont on nous avait prédit qu'elle allait faire des ravages à la rentrée?
2/ Comment est-il possible d'autoriser la commercialisation de vaccins (avec ou sans adjuvants) à ce point bâclés?

Q5) Les chiffres sur le nombre de personnes infectées par le virus sont-ils si discutables?

MG-Ils ne sont pas « discutables », ils sont inexistants : l'OMS et les autorités sanitaires assument parfaitement, depuis juin dernier, qu'ils ne comptent plus les cas. C'est bien cette situation incroyable qui justifie ma question précédente: elle est où, cette pandémie ?

Q6) Dans le cas d'une personne dite « à risque », le virus de la grippe A est-il plus virulent que celui de la grippe saisonnière?

MG-Même les alarmistes ne contestent pas que ce nouveau virus est a priori moins virulent que celui de la grippe saisonnière : leur argument porte simplement sur un risque hypothétique de mutation. Le problème, c'est que ce risque existe avec tous les virus, qu'il a toujours existé avec la grippe saisonnière et que rien, dans la situation actuelle, ne justifie un alarmisme et une allocation de ressources aussi extravagants.

Q7) L'annonce de ces décès (avec virus grippe A + «facteurs aggravants») sont-ils critiquables dès lors que l'on ne peut pas imputer la mort qu'au seul virus de la grippe A?

MG-Les Français ne sont pas idiots: ils ont parfaitement compris que la grippe saisonnière était liée à une surmortalité (aucune personne grippée n'a l'idée d'aller voir son grand-père, cela relève d'un élémentaire bon sens). Désormais, quand on leur dit «il y a des morts », ils répondent à juste raison: «davantage que d'habitude?»

Q8) Pourquoi la grippe A(H1N1) fait-elle peur au gouvernement?

MG-Je ne crois pas que la grippe porcine fasse peur au gouvernement. En revanche, je suis inquiet de voir nos responsables (gouvernementaux, mais administratifs également) encourager de toute leur autorité un alarmisme dont les déterminants lucratifs sont identifiables depuis longtemps.

Q9) Peut-on parler d'un emballement médiatique / d'un emballement politique?

MG-La plupart des journalistes de la grande presse auront été au-dessous de tout sur ce coup. Je relève avec amusement que de plus en plus d'articles sur la grippe sont diffusés sur le net sous forme de dépêche, sans signature: sans être mégalo, je me demande si certains journalistes n'en ont pas marre de se faire joyeusement étriller sur mon site pour leur bêtise ou leur incompétence… Quant aux politiques, j'ai déjà répondu (cf. question précédente).

FRANCE 24

La France cède t'elle à la panique?

France 24, 16 September 2009 // 15 November 2009
https://www.youtube.com/watch?v=eirFSXTaZPQ
https://www.youtube.com/watch?v=_5VI-sLyHZE

Le Dr Marc Girard est médecin et pharmacologue. Après un passage aussi bref que mouvementé comme salarié d'une grande firme pharmaceutique, il a développé, en France, la première activité libérale de conseil en pharmacovigilance (étude des effets secondaires des médicaments) et en pharmaco-épidémiologie (application des méthodes épidémiologiques à lévaluation des effets médicamenteux, qu'ils soient bénéfiques ou indésirables), tout en pratiquant comme psychothérapeute.

Peu après la première loi sur la recherche biomédicale (« Loi Huriet », déc. 1988), il a demandé et obtenu son inscription sur la liste des experts judiciaires dans une spécialité alors inédite (Médicament et recherche biomédicale) : à ce titre, il a été missionné dans de nombreuses affaires de santé publique (hormone de croissance, diéthylstilbestrol, anorexigènes, cérivastatine, vaccin contre l'hépatite B, éthers de glycol), avant de se voir sa réinscription refusée à la suite dun harcèlement judiciaire (cf. L'expert dans les prétoires) qui a fait lobjet d'une certaine médiatisation.

Malgré cette éviction, il reste expert européen (AEXEA) et, outre son activité interdisciplinaire (recherche, consulting, expertise, psychothérapie), il poursuit son dialogue avec les juristes par voie de publication ou d'enseignement.

Schwindel mit der Schweinegrippe:
Ist die Aufregung ein Coup der Pharmaindustrie?

Profil, 31 Oktober 2009, 16:42
https://web.archive.org/web/20091102112547/https://www.profil.at/articles/0944/560/254615/schwindel-schweinegrippe-ist-aufregung-coup-pharmaindustrie

Schweinegrippe. Die Ausrufung der Pandemie durch die WHO ist wissenschaftlich heftig umstritten. Ein Gutteil der Ärzte glaubt nicht an die Gefahr der neuen Grippe und damit nicht an die Impfung.

Seit einer Woche werden in den Spitälern die Angehörigen der Gesundheitsberufe gegen die neue H1N1-Influenza geimpft. Ab nächster Woche ist die Normalbevölkerung an der Reihe. Doch die Vorbildwirkung der Ärzte ist nicht gerade enorm. Johann Machula, Betriebsarzt im Wiener AKH mit insgesamt knapp 9000 Beschäftigten, hatte für seine im ganzen Haus bekannt gegebenen Impftermine vergangene Woche zweimal nachmittags geöffnet. Und obwohl er wegen der Erkrankung seines Kollegen allein war, kam er mit dem Ansturm zurecht. "Es war bislang eine bedauernswert geringe Anzahl Impfwilliger hier", sagt er. Seinen Vorrat von 2400 Impfdosen wird er "bestenfalls zur Hälfte" verbrauchen können.

In Oberösterreich wollen sich nach einer Erhebung von Landessanitätsdirektor Stefan Meusburger nur 3000 von 55.000 Ärzten, Krankenschwestern, Apothekern und sonstigen Spitalsmitarbeitern impfen lassen. Auch in den anderen Bundesländern sieht es derzeit nicht so aus, als ob die 10-Prozent-Rate übertroffen werden könnte. "Viele Ärzte sehen sich als Versuchskaninchen", sagt Wilhelm Sedlak, Impfreferent der österreichischen Ärztekammer. "Schuld daran ist die mangelnde Vorbildwirkung der Abteilungsvorstände."

Tatsächlich ist in den Führungsetagen der Krankenhäuser die Skepsis groß, ob Margaret Chan, die Generaldirektorin der WHO, richtig gehandelt hat, als sie am 10. Juni die höchste Pandemie-Alarmstufe 6 verkündete und damit den Impfstoffproduzenten weltweit grünes Licht gab. Werner Aberer etwa, Vorstand der Grazer Universitätsklinik für Dermatologie, war bislang erst ein einziges Mal bei der Influenza-Impfung – vor zwei Jahren, als die Grazer Klinikleitung jedem der 4000 Bediensteten, der zur Impfung kam, eine Autobahn-Vignette schenkte. "Da habe ich mich kaufen lassen", gesteht Aberer. "Aber ansonsten sehe ich die Bedeutung nicht. Die WHO hat hier ordentlich übers Ziel geschossen."

Ähnlich die Haltung des Wiener Gynäkologen Werner Grünberger. Er sieht die Pandemie eher als Ergebnis von heftigem Lobbying denn als medizinische Notwendigkeit. "Weder dem Fetus noch dem Embryo noch der Frau selbst entsteht im Normalfall ein Schaden, wenn eine Schwangere an Schweinegrippe erkrankt", glaubt Grünberger. "Ich habe mich als Primar der Rudolfstiftung zweimal vorbildhaft impfen lassen", erzählt er. "Danach war ich jedes Mal für Wochen krank. Nein danke, so was brauche ich nicht mehr." Eine Beobachtung, die auch Hellmut Samonigg, Vizerektor der Medizinischen Universitätsklinik Graz und Leiter der Abteilung für Onkologie, teilt. "In

meinem Umfeld habe ich beobachtet, dass die Geimpften eher anfällig für Infekte sind", erklärt Samonigg. "Ich habe mich nie gegen Influenza impfen lassen und werde das auch bei der neuen Grippe nicht tun."

Hartmut Glossmann, Vorstand des Instituts für Biochemische Pharmakologie an der Medizinischen Universität Innsbruck, rät seinem Umfeld statt zur Influenza-Impfung lieber zu Vitamin-D-Präparaten, um das Immunsystem zu stärken. "Denn die Influenza ist nur dann ein Problem, wenn die Abwehrkräfte wegen des winterlichen Mangels an Sonnenlicht darniederliegen." Sylvia Schwarz wiederum, Leiterin der Abteilung Anästhesie und Intensivmedizin im Krankenhaus Hietzing, ging zwar zur normalen Grippe-impfung. Die empfohlenen zwei Injektionen mit dem Pandemie-Impfstoff verweigert sie hingegen. "Ich finde die ganze Aktion für sehr übertrieben und halte es hier, so wie viele Kollegen, mit Wolfgang Graninger."

Bärendienst. Bereits im September hatte der Leiter der Infektionsabteilung am Wiener AKH der Impfbewegung einen Bärendienst erwiesen, als er statt der Impfung die Viren selbst als "Wohltat für die Menschheit" bezeichnete. Zumindest für jene, die keiner Risikogruppe angehören. "Wer sich mit der neuen Grippe ansteckt", verkündete Graninger im Ö1-"Mittagsjournal", "baut eine bessere Immunität gegen zukünftige und gefährlichere Formen der Grippe auf."

Die Pandemie als eine Art heilsamer Lebendimpfung? Ingomar Mutz, Leiter des Impfausschusses im Obersten Sanitätsrat, zeigt sich erschüttert über diese und ähnliche ärztliche Stellungnahmen. "Da wird gesagt, sie halten die Impfung für unnötig, sie schützen sich mit Homöopathie, oder sie gehören nicht zur Risikogruppe", schimpft Mutz. "Dass sie dadurch aber ihre Patienten gefährden, vergessen viele." Auch Heinz Ludwig, Vorstand der Onkologie am Wiener Wilhelminenspital, hält die Impfung, speziell für Mitarbeiter auf Krebsstationen, für ein Muss. Dass die Geimpften wegen der neuartigen Impfstoffe zu Versuchskaninchen werden, weist er zurück. "Je kleiner der Horizont, desto größer ist anscheinend die Angst vor Innovationen."

Immer stärker thematisiert wird in den letzten Jahren die finanzielle Verflechtung vieler Impfexperten mit den Herstellern. Erstmals wurde im Pandemie-Beirat nun eine Erklärung von den 46 Mitgliedern verlangt, in der sie ihre finanziellen Beziehungen offenlegen mussten. "Etwa ein Drittel hat solche potenziellen Interessenkonflikte angegeben", sagt Franz Leisch, der als Vertreter des Gesundheitsministers Alois Stöger an den Besprechungen teilnahm.

"Von vielen Experten der alten Schule wird so etwas aber überhaupt noch nicht als Problem gesehen", sagt Franz Piribauer, Österreich-Sprecher der Anti-Korruptions-Organisation transparency international. -Ingomar Mutz finde etwa nichts dabei, als ehrenamtlicher Präsident des ÖGK zu fungieren, einer Organisation, die sich seit vielen Jahren als Vereinigung vehementer Impf-Lobbyisten versteht. Hinter dem ÖGK verbirgt sich der in Salzburg ansässige Verein Österreichisches Grünes Kreuz für Gesundheit. "Wir organisieren seit nunmehr 19 Jahren den Österreichischen Impftag in Salzburg", sagt Ulrike Geosits, eine von vier ÖGK-Angestellten. Gleichzeitig betreibt der Verein eine kommerziell tätige GmbH gleichen Namens, die gewinnorientiert arbeitet und deren Auftraggeber vor allem Impfstoffhersteller sind. Konfrontiert mit diesem potenziellen Interessenkonflikt meint Mutz: "Ich bin kein Ideologe, mein Engagement für Impfungen kommt eben aus der langjährigen Erfahrung als Klinikarzt, wie schlimm es ungeimpften Kindern ergehen kann." Sicher, sagt Mutz, nehme er von allen Herstellern Honorare. Je nach Aufwand, den er für einen Vortrag betreiben müsse, liege das aber höchstens bei tausend Euro. "Und Einfluss auf das, was ich sage, hat der Sponsor nie." Piribauer hält dem entgegen, dass es bedenklich ist, "wenn ein Vorsitzender des Impfausschusses gleichzeitig einer Vereinigung wie dem Grünen Kreuz vorsteht".

Impfmuffel. Der Graben zieht sich also tief durch die ärztliche Zunft. Ein Gutteil der Ärzte hält die Influenza für eine ziemlich risikolose, leichte Erkrankung. Die Impfung sei hingegen schlecht

wirksam, dafür nebenwirkungsreich. Und demgemäß zögerlich geben sich die medizinischen Laien. Nur etwa jeder fünfte Österreicher erklärt in Meinungsumfragen die Absicht, "wahrscheinlich" oder "sicher" zur Impfung zu gehen. Und das trotz tausender von Menschen, die laut Sozialmediziner Michael Kunze und anderen Impfexperten jährlich in der kalten Jahreszeit der Influenza zum Opfer fallen.

Doch auch diese Zahlen sind heftig umstritten. Stefan Breyer, Infektionsexperte am Wiener AKH, kann sich trotz mehr als drei Jahrzehnten Berufserfahrung an keinen Patienten erinnern, der an der Influenza gestorben wäre. "Ich habe auch auf Kongressen und Tagungen gefragt, ob vielleicht einer der Kollegen so einen Fall hatte", erzählt Breyer. "Bislang habe ich keinen getroffen." Das Problematische an den Influenza-Viren sei, dass sie bei geschwächten Personen den Boden für bakterielle Nachfolgeinfektionen bereiten. "Das machen aber auch etliche andere Viren", sagt Breyer.

Lebensgefährliche Verläufe wie bei dem elfjährigen Mädchen aus Südtirol, das in Innsbruck wegen Lungenversagen behandelt werden musste, geschehen durch eine unvorhergesehen heftige Reaktion des Immunsystems auf die Infektion. Die Hintergründe dieser Fehlreaktion werden bis heute nicht hinreichend verstanden. Klaus Connert aus Köstendorf bei Salzburg ist als erfahrener Sprengelarzt für die Impfung der niedergelassenen Kollegen zuständig. Und auch er sah in seiner langen Karriere noch nie einen Grippetoten, obwohl er als Landarzt viel mit Sterbenden befasst ist. "Diese alten Menschen wissen, dass sie problemlos übers Jahr kommen, wenn sie eine bestimmte Kälteperiode im Jänner oder Februar überstehen", erzählt Connert. "Ob jetzt gerade eine Grippewelle durchs Land zieht oder andere Viren umgehen, spielt dabei gar keine Rolle." Die Sterbezahlen seien jedes Jahr ähnlich.

Allzu hoch dürfte der Effekt der Grip-pe-impfung tatsächlich nicht sein. So bringt eine Analyse der gesamten Sterblichkeit in den USA über die letzten beiden Jahrzehnte nicht das geringste Indiz dafür, dass die Influenza-Impfung auch nur einen kleinen günstigen Einfluss auf das Sterberisiko hat. Obwohl sich die älteren Menschen heute viel öfter impfen lassen und die Impfrate von 15 Prozent im Jahr 1980 auf zuletzt mehr als 65 Prozent gestiegen ist, ergab sich kein Rückgang bei den influenzabedingten Sterbefällen. Im Gegenteil – die Zahl nahm sogar leicht zu. Wie viel die Impfung bringt, sei schon bei der normalen Grippe ein Rätsel, noch viel mehr gelte das für den Pandemie--Impfstoff. "Ob die Impfung wirkt, ist leider bis heute eine Glaubensfrage geblieben", sagt die Wiener Sozialmedizinerin Claudia Wild, "es gibt dafür wenig Belege." Der Verdacht liege nahe, meint zumindest Wild, dass die Pandemie vor allem als Konjunkturbelebungsprogramm für die Impfstoff-industrie inszeniert wurde.

Schwachsinn. Angesichts von Malaria, Tuberkulose und Durchfallkrankheiten, die vor allem in den Entwicklungsländern Abermillionen an Todesfällen verursachen, wundern sich viele Experten über die enorme Bedeutung, welche die Weltgesundheitsorganisation WHO vergleichsweise harmlosen Erregern wie den Influenza-Viren zumisst. Immer wieder wird hier zur Rechtfertigung der Gefahr die katastrophale Pandemie des Nachkriegswinters 1918/19 zitiert. "Das ist allerdings ein ziemlich schwachsinniger Vergleich", sagt Infektionsexperte Breyer. "Damals herrschte in weiten Teilen der Welt Hungersnot, es gab keine Intensivtherapie nach heutigem Standard, und die Antibiotika waren noch gar nicht erfunden."

Den Zeitgeist der letzten Jahre bestimmten dennoch Experten wie das "Influenza-Mastermind" Michael T. Osterholm vom Zentrum für Infektionskrankheiten der Universität Minnesota, der im Jahr 2005 im "New England Journal of Medicine" prophezeite: "Sogar in einer milden Pandemie wird der Verlust an Menschenleben gewaltig sein, und die Weltwirtschaft wird für viele Jahre in Scherben liegen." Ähnliche Kassandrarufe kamen weltweit in beeindruckender Regelmäßigkeit. Und auch die WHO definierte eine Pandemie viele Jahre lang als Ausbruch einer neuen Krankheit,

"die eine enorme Anzahl von Kranken und Toten fordert". Nur einen Monat bevor die Generaldirektorin der WHO, Margaret Chan, die höchste Pandemie-Warnstufe verkündete, verschwand diese Definition jedoch plötzlich von der Website der WHO. Nun galt als Pandemie nur noch die Voraussetzung einer "breiten räumlichen Ausdehnung einer neuen Infektionskrankheit".

Doch nicht einmal das Kriterium einer neuen Virenmutation scheint wirklich erfüllt. Weltweit zeigt sich, dass ältere Menschen zu einem hohen Anteil immun gegen die Schweinegrippe sind, diesen Viren also in der Vergangenheit schon begegnet sind. In Österreich kam es nach der Statistik des Gesundheitsministeriums bisher erst zu sechs Erkrankungsfällen bei Personen im Alter von über 60 Jahren. Peter Pachner, der seit 1980 als Public-Health-Experte in verschiedenen Dienststellen der WHO von Genf bis Jakarta tätig war, glaubt nicht an einen Zufall. "Wir haben eine fatale Wechselwirkung von Pharmaindustrie und Profilierungssucht, alles unterstützt von Medien, die den nahen Weltuntergang prophezeien." Anstatt sich weltweit für Fairness in der Gesundheitsversorgung einzusetzen, sei der Weg immer mehr in Richtung Aktionismus gegangen. "Politik braucht eben spektakuläre Ereignisse, und die Ausrottung der Pocken war diesbezüglich wesentlich eindrucksvoller als die mühsamen Investitionen in medizinische Versorgung."

Spätestens nach dem Ende der Ära von Gro Harlem Brundtland als WHO-Chefin im Jahr 2003 seien Konzepte zur langfristigen systematischen Verbesserung der Gesundheitslage in den Mitgliedsstaaten verloren gegangen, klagt Pachner. "Wir haben nun in vielen Ländern Seuchenkontrolle mit militärischen Szenarien, gespickt mit permanenten Anschuldigungen, dass nicht genug kontrolliert wird." Eindrucksvoll bestätigt wurde dieses Bild bei einem Frankreich-Besuch der WHO-Chefin Margaret Chan. Der Versuch, sie auf die Wange zu küssen, kam bei ihr gar nicht gut an. Gegenüber TV France sagte sie verärgert, dass diese Eigenheit der französischen Kultur vollständig ihrer Vorstellung von Seuchenkontrolle widerspreche.

Lobbyismus. Durch die Etablierung von Partnerschaften wuchs der Anteil der -"gespendeten" finanziellen Mittel am WHO-Haushalt im letzten Jahrzehnt überpro-portional. War das Verhältnis 1998 von 842 Millionen US Dollar regulärem -Haushalt zu 804 Spendermillionen noch halbwegs ausgeglichen, so betrugen die -privaten Zuwendungen bereits 2004 mehr als das Doppelte des regulären Haushalts. Und damit standen den Vertretern der Industrie Tür und Tor offen. Bei allen Besprechungen zur Pandemie waren – wie selbstverständlich – auch die Impfstoffhersteller geladen.

Während in Europa zumindest noch keine Rede von einer Impfpflicht ist, preschen die Amerikaner hier stark vor. Im Bundesstaat New York wurde vergangenen August ein Gesetz erlassen, das die Beschäftigten in den Gesundheitseinrichtungen zwingt, sich sowohl gegen Schweinegrippe als auch die normale Influenza impfen zu lassen. Andernfalls droht ihnen die Entlassung. Im September gingen die Ärzte, Schwestern und Pfleger wütend auf die Straße und demonstrierten gegen diese Zwangsmaßnahmen. Dass das Gesetz zurückgenommen wird, glaubt jedoch niemand. Im Gegenteil: Auch einige größere Kliniken in anderen Bundesstaaten haben ihren Mitarbeitern bereits mitgeteilt, dass eine Verweigerung der Grippeimpfung als Entlassungsgrund gewertet wird. Von den Gesundheitsbehörden wird derzeit offen darüber nachgedacht, diese Maßnahme als Bundesgesetz für die gesamten USA zu übernehmen.

Wie verträglich nun die drei derzeit in Europa im Eilverfahren zugelassenen Impfstoffe sind, ist im Detail nicht bekannt. Die Zulassungsstudien waren kurz und hatten zu wenige Teilnehmer, um seltene oder später auftretende Nebenwirkungen erfassen zu können. Heftige Empörung kam in Deutschland auf, als bekannt wurde, dass für die Mitglieder von Heer und Bundesregierung der Baxter-Impfstoff Celvapan bestellt wurde, für die "Normalbevölkerung" hingegen mit Pandemrix des Konzerns Glaxo-SmithKline und Focetria von Novartis andere Impfstoffe eingekauft wurden. Beide Impfstoffe enthalten das quecksilberhaltige Konservierungsmittel Thiomersal. Damit erlebt im Zuge der Pandemie eine problematische Substanz ihr Comeback, die vor beinahe zehn Jahren aus den üblichen Impfstoffen verbannt worden ist.

Das im Vergleich wie ein Bio-Impfstoff anmutende Celvapan beruht auf einer Technik, die erstmals bei einem am Markt erhältlichen Influenza-Impfstoff angewendet wurde. "Im Gegensatz zu den beiden anderen Impfstoffen, die auf bebrüteten Hühnereiern gezüchtet werden, stellen wir Celvapan durch eine neuartige Zellkulturtechnologie her", erklärt Hartmut Ehrlich, Vorstand der Baxter AG. Damit sei endlich auch das Problem vermieden, dass Menschen mit Allergien gegen Hühnereiweiß nicht geimpft werden können.

Nebenwirkungen. Im tschechischen Baxter-Werk in Bohumil wachsen die Viren auf Zellkulturen in riesigen Fermentern heran. Diese aus den Nieren der afrikanischen Grünen Meerkatze gewonnene Zelllinie ist theoretisch unsterblich und wächst, solange sie bei richtiger Temperatur gefüttert wird. Bei einem ersten saisonalen Grippeimpfstoff, der vor einigen Jahren mithilfe dieser Technik entwickelt wurde, zeigte sich in den Zulassungsstudien eine erhöhte Fieberrate bei den Teilnehmern, und er kam daraufhin nicht auf den Markt. Diese "Kinderkrankheit" der Verozell-Technologie ist mittlerweile jedoch behoben.

In den aktuellen Studien zeigt sich – nach einer Auswertung aller Nebenwirkungen bis zu drei Wochen nach dem Impftermin keine Häufung im Vergleich zu saisonalen Impfstoffen. 11,6 Prozent der Erwachsenen im Alter zwischen 18 und 59 Jahren berichten über Kopfschmerzen. Bei den Kindern kommt es manchmal zu Übelkeit. Fieberreaktionen über 38 Grad gab es bei den 52 Kindern überhaupt nicht. "Ich war wirklich erstaunt, wie verträglich Celvapan ist", erklärt der Wiener Impfexperte Wolfgang Maurer. "Ich habe mich gestern impfen lassen, und bereits heute spüre ich die Einstichstelle nicht mehr."

Das fehlende Konservierungsmittel in Celvapan kann hingegen zu logistischen Schwierigkeiten führen, weil das Mittel kostensparend in 10-Dosen-Behältern bestellt wurde. Diese müssen binnen drei Stunden nach dem Öffnen verbraucht werden. Gelingt dies nicht, ist der Impfstoff laut Anweisung sofort zu entsorgen. "Ich hoffe sehr, dass sich die Ärzte hier nicht als Sparmeister hervortun und den Impfstoff über Nacht in den Kühlschrank stellen", sagt Maurer. "Sonst könnte es zu problematischen Kontaminationen mit Bakterien kommen."

Baxters Celvapan ist im Gegensatz zu den beiden anderen in Europa zugelassenen Spaltvirus-Impfstoffen ein Ganzvirus-Vakzin. Dadurch bleibt die Virusoberfläche erhalten und erzielt eine bessere Immunantwort. "Celvapan kommt deshalb im Gegensatz zu den beiden anderen Impfstoffen ohne Immunverstärker aus", sagt Ehrlich. Die langfristigen Wirkungen dieser Hilfsstoffe auf das Immunsystem sind bislang kaum bekannt. Man weiß lediglich, dass sie etwa doppelt so viele lokale Nebenwirkungen auslösen wie Impfstoffe ohne Wirkverstärker. Erste praktische Erfahrungen dazu -liegen nun aus Schweden vor. Dort wurde bereits vor drei Wochen mit der H1N1-Impfkampagne begonnen. Etwa 500.000 Impfungen mit dem auch in Deutschland verwendeten Impfstoff Pandemrix von -GlaxoSmithKline wurden bisher durchgeführt. In nahem zeitlichem Zusammenhang zum Impftermin traten rund 200 Nebenwirkungen und fünf Todesfälle auf.

Das liege im Bereich des Üblichen, teilten die schwedischen Gesundheitsbehörden mit. Die Todesopfer waren zwischen 53 und 90 Jahre alt und bereits vorher schwer krank. Dass die Impfung die Todesfälle ausgelöst habe, sei unwahrscheinlich. Kritiker wenden ein, dass dieses Argument jedoch genauso auf die angeblichen Opfer der Schweine-grippe anwendbar sei. Und hier wurden in Schweden erst zwei gezählt – also nicht mal halb so viele Todesfälle wie nach der Impfung.

CFR recording suggests creating false scarcity to drive up demand for H1N1 Vaccine

Infowars, 3 November 2009
https://web.archive.org/web/20100105200618/http://www.infowars.com/cfr-recording-suggests-creating-false-scarcity-to-drive-up-demand-for-h1n1-vaccine
Pandemic Influenza: Science, Economics, and Foreign Policy
Council on Foreign Relations, 16 October 2009
https://www.cfr.org/event/pandemic-influenza-science-economics-and-foreign-policy

A recording of a recent Council On Foreign Relations symposium reveals attendees discussing ways and means of getting the public to take the H1N1 flu vaccine in spite of the mass resistance that has arisen due to questions over it's safety.

The recording dates from October 16 when the CFR held a Symposium in New York entitled Pandemic Influenza: Science, Economics, and Foreign Policy.

The meeting was held in order to encourage a consensus for policy to present to the federal government concerning the so called swine flu pandemic.

In attendance were professors and doctors from several influential universities and medical schools, along with media representatives fromScience Magazine, The Canadian Press and The Financial Times.

Other notable attendees included Robert E. Rubin, Former U.S. Secretary of the Treasury and current Co-Chair of the CFR, along with John Lange, Senior Program Officer of the Bill and Melinda Gates Foundation's Global Health Program.

During part of the discussion (see transcript) on whether or not the vaccine should be made mandatory for health workers and school children, Lone Simonsen, Research Professor and Research Director at the Department of Global Health, George Washington University, suggests creating an artificial scarcity in order to ramp up demand for the vaccine.

"I think what would work better would be to say that there was a shortage and people tend to buy more of something that's in demand. (Laughter.) We saw that – there was one season where, really, people lined up all night to get a flu shot." Simonsen says, much to the amusement of the other attendees at the symposium.

The entire recording is on the CFR website here, but an edited version appears in the following short video:

The audio is certainly very interesting given that the mainstream media is now rampantly hyping a shortage of the vaccine and stories are being published daily about thousands of people being turned away from clinics.

All this despite the fact that several scientific polls have recorded that upwards of 60% of Americans have said they do not want the shot because they believe it is unsafe and untested.

During another part of the discussion, Andrew Jack, Pharmaceutical Correspondent for the Financial Times compares people wary of the vaccine with political extremists:

"I think we're all aware that the anti-vaccine movement is having a field day on the internet and on media outlets like Fox News, causing reductions in vaccine uptake and it appears to be a pretty unholy alliance of the ultra right and the ultra left working together in a sort of Hitler-Stalin pact." Jack states, again raising chuckles amongst the other delegates.

"I'm not sure that we're countering these people very well." Jack concludes before suggesting that the CFR put out soundbites about there being more mercury in a Tuna sandwich than in the H1N1 vaccine in order to convince "the crazy people" that it is safe.

The fact is however, you do not directly inject a tuna sandwich into your bloodstream. Is it more likely that a two fold increase in autism over the last six years is directly related to thimerosal in vaccines or to tuna sandwiches?

Mr Jack suggests following the lead of the New York Times to dispel so called "myths" over the vaccine – not a wise move given that their paltry efforts have already been thoroughly debunked and overturned.

Parents: Send this note to your school principal to protect your child from swine flu vaccinations

Natural News, 4 November 2009
https://web.archive.org/web/20100105020611/http://www.naturalnews.com/027394_swine_flu_vaccines_health.html

After reading about the forced vaccination of a Brooklyn schoolgirl who ended up in the hospital, many parents are concerned about how they might protect their own children from school-based vaccination schemes.

To help parents protect their children, I've written a letter that you may copy, modify and use as a warning to the principal of the school(s) where your own children are students. This letter will serve as a warning to the school principal that if your child is vaccinated without your permission, you will unleash a hellstorm of legal action and media attention that every school principal desperately wishes to avoid. (Feel free to modify this letter to tone down the language a bit if you already have a friendly relationship with your local school principal.)

Once you're satisfied with the language, print and sign this letter, then have it notarized so the signing date can be proven in court. When that's complete, mail a copy to your school using registered mail (so you have proof it was delivered), then print off another copy for your child to carry with them at all times.

Instruct your child that if they are called to the nurse's office to be injected with the vaccine, they should produce this note and show it to the nurse. You may also instruct your child to protect themselves by running from the nurse's office and calling you at home or work (print your phone number on the back of the note).

Role-play this scenario to make sure your child understands exactly what you're asking them to do. Otherwise, they will usually just do what they're told at school, especially if they are threatened with getting into trouble by school teachers or nurses.

This letter hasn't been reviewed by a lawyer. If you want a stronger legal angle for your letter, take this to your lawyer and ask them to beef it up with more "lawyer language."

This letter, by the way, is offered as-is, with no guarantees. It's simply being published here on NaturalNews as a public service to give concerned parents something they can use to help protect the health of their children from overzealous vaccination schemes.

(Note: You may need to alter the gender references in the letter below if your child is a girl. The note is written using "he.")

A letter for your school principal (and nursing staff)

From: (Your name here)

Date: (Insert date here)

RE: Request for NON-vaccination of my child (insert child's name here)

Dear Principal Johnson (and the nursing staff),

This letter is to inform you that as a parent of a child in your school, I do not consent to any H1N1 (Swine Flu) vaccination of my child, (insert child's name here), and that if my child is subjected to such a vaccine without my permission, I will consider that a gross violation of not only my parental rights, but the civil rights of my child.

The H1N1 swine flu vaccines currently being given to schoolchildren in America were approved by the FDA using an unlawful waiver that allowed the vaccines to be approved with absolutely no credible scientific testing. No adequate safety or efficacy testing has been conducted on any of the swine flu vaccines, and those children who are being injected with the vaccines are being treated as human guinea pigs.

H1N1 swine flu has also turned out to be so mild that it can be easily overcome with a healthy immune system aided by healthy levels of circulating vitamin D. My child takes vitamin D supplementation and therefore has an extremely healthy, active immune system that can easily mount its own antibody response against swine flu or other forms of influenza. Because of his immune system health and nutritional regimen, my child poses no health threat as a "carrier" of the swine flu, even without being vaccinated.

Schweinegrippe-Impfung: Tote, Proteste, Mangel

Süeddeutsche Zeitung, 4 November 2009
https://www.sueddeutsche.de/wissen/schweinegrippe-impfung-tote-proteste-mangel-1.135151

Die meisten Bundesbürger sehen die Impfung gegen die Schweinegrippe mit Skepsis und Verdruss. Ein typisch deutsches Phänomen? Erfahrungen aus anderen Ländern.

Todesfälle in Schweden verunsichern die Welt

Schweden startete als eines der ersten Länder die Massenimpfung mit Pandemrix - jenem Serum, das auch in Deutschland für die breite Bevölkerung vorgesehen ist. Für Verunsicherung sorgten Meldungen über Todesfälle im Anschluss an die Impfung. Nach offiziellen schwedischen Angaben starben fünf Menschen, die Behörden gehen allerdings davon aus, dass die Impfung nicht die Ursache der Todesfälle ist und verweisen darauf, dass jeden Tag mehr als 200 Schweden sterben.

In einem Fall schloss eine Autopsie die Impfung als Todesursache bereits aus, die anderen Untersuchungen laufen noch. Sicher ist, dass alle fünf Betroffenen an chronischen Grunderkrankungen wie Herzkrankheiten und Diabetes litten. Drei von ihnen waren über 75 Jahre alt, die beiden anderen 54 und 65 Jahre.

Mehr als 600 Schweden meldeten bislang Nebenwirkungen der Immunisierung. 20 Fälle stuften die Behörden als schwerwiegend ein. Dabei handele es sich vor allem um allergische Reaktionen.

Insgesamt wurden bislang 1,4 Millionen Dosen Pandemrix in dem skandinavischen Land verteilt, wie viele davon in den Oberarmen der Schweden landeten, ist nicht bekannt.

Schweiz lässt Impfung an Schwangeren und Kindern nicht zu

Die Schweizer Behörden sehen den Impfstoff Pandemrix derart skeptisch, dass sie ihm nur eine eingeschränkte Zulassung erteilten. Das Serum darf nicht bei Schwangeren, Kindern unter 18 Jahren und Erwachsenen über 60 angewandt werden.

Die Zulassungsbehörde Swissmedic begründete ihre Entscheidung damit, dass ihr keine Forschungsergebnisse zur Verträglichkeit in der Schwangerschaft und nur sehr wenige Daten zu Kindern vorlägen.

Der Impfstoff des britischen Pharmakonzerns Glaxo Smith Kline ist umstritten, weil er verstärkende Zusätze enthält, die stärkere Nebenwirkungen als herkömmliche Influenza-Impfungen verursachen können.

Manche Schweizer setzen unterdessen auf eine andere Prophylaxe: Händeschütteln ist in einigen Firmen tabu. Ein Button an der Kleidung weist auf diese Praxis hin.

Österreich lässt nur Amtsärzte impfen

Wien setzt bei der Massenimpfung ausschließlich auf den Impfstoff Celvapan des Anbieters Baxter - jenen Stoff, der in Deutschland Regierung und Bundeswehr vorbehalten ist. Diesem Serum fehlt die Quecksilberverbindung für die bessere Haltbarkeit, die Pandemrix zugesetzt wurde. Die Folge: Das Serum muss nach Anbruch der Flasche innerhalb von nur drei Stunden verbraucht sein.

Das stellt die Alpenrepublik vor erhebliche logistische Herausforderungen. Die Impfung wird daher ausschließlich von Amtsärzten vorgenommen, Hausärzte kommen nicht zum Zug. Wie die österreichische Ärzte Woche berichtet, sind ein Teil der Hausärzte und einige der Patienten wenig begeistert von dieser Lösung.

Für Deutsche ist es prinzipiell möglich, sich in Österreich mit dem Impfstoff ohne Wirkverstärker und ohne Quecksilberverbindung impfen zu lassen, sie müssen allerdings die Kosten selbst tragen.

USA: Impfstoffmangel bringt Obama in die Bredoullie

Fast alle Amerikaner, die derzeit mit Verdacht auf Influenza getestet werden, erhalten die Diagnose Schweinegrippe.

Schon hat die US-Seuchenbehörde CDC Notfall-Reserven an Tamiflu freigegeben, dem antiviralen Medikament, das knapp geworden war. Knapp sind auch die Impfstoffe: Eigentlich sollten bis Anfang November 120 Millionen Dosen Impfstoff ausgeliefert sein, tatsächlich sind aufgund von Produktionsverzögerungen erst 25 Millionen verfügbar.

Vor einigen Impfzentren bildeten sich lange Schlangen. Medien berichteten von aufgebrachten Eltern, die ihre Kinder schnelltstmöglich impfen wollen, aber am Mangel der Seren scheitern. Obgleich es auch in den USA viele Impfgegner gibt, hat der Impfstoffmangel bereits die politische Debatte erreicht. Präsident Barack Obama will sich in Sachen Schweinegrippe keine Versäumnisse vorwerfen lassen und rief Ende Oktober vorsorglich den Notstand aus.

Die USA setzen komplett auf Impfstoffe ohne die umstrittenen Wirkverstärker. Verabreicht werden sie durch eine Spritze oder ein Nasenspray.

Britische Impfgegner machen mobil

Auch Großbritannien, die Heimat des Pandemrix-Produzenten Glaxo Smith Kline, ist noch nicht gut mit Impfstoffen ausgerüstet. Ehe alle Ärzte das Serum erhalten, wird der November weit fortgeschritten, wenn nicht vorbei sein.

In dem Land, das innerhalb Europas am stärksten von der Schweinegrippe betroffen ist, ist auch der Widerstand gegen die Impfung heftig. Eine Protestorganisation hängte in Birmingham Poster auf, die verkündeten: "Die Schweinegrippe ist nicht die größte Gefahr. Es ist die Impfung".

Italien wartet auf Impfstoffe

In Italien läuft die Impfung noch schleppender an. Erst im neuen Jahr können sich nach Stand der Planungen gesunde Kinder und jüngere Erwachsene impfen lassen. Viele Ärzte halten dies für zu spät, vor allem etliche Kinderärzte wollen aus diesem Grund die Immunisierung gar nicht erst anbieten. Nach Medienberichten bleiben in italienischen Schulklassern derzeit rund ein Drittel aller Bänke frei, die Kinder sind wegen Grippeerkrankungen zu Hause. Das Land beklagt bislang insgesamt 17 Todesopfer durch die Schweinegrippe.

Franzosen sind äußerst skeptisch

Das Pharmaunternehmen Sanofi Pasteur profitiert mit seinen Impfstoffen prächtig von der Schweinegrippe. Doch in seiner Heimat Frankreich ist die Skepsis gegenüber der Impfung mindestens so groß wie in Deutschland. Nur 17 Prozent der Bevölkerung wollen sich impfen lassen, sieben Prozent sind sich dieser Entscheidung "sehr sicher". Anfang September wollten noch 55 Prozent zum Impfen gehen.

Indes wird der französischen Gesundheitsministerin Roselyne Bachot vorgeworfen, mit ihrem Impfplan übertrieben, der Pharmabranche zu nahe zu stehen, und die Skepsis in der Bevölkerung heraufbeschworen zu haben. Die Ministerin wies die Beschuldigungen mit dem Hinweis zurück, in Frankreich habe es immer "eine starke Anti-Impfbewegung" gegeben.

Saudi Arabien schreibt Pilgern die Impfung vor

Wenn am 18. November die diesjährige Hadsch beginnt, sollen nach dem Willen der saudi-arabischen Regierung alle zwei bis drei Millionen Gläubige immun gegen die Schweinegrippe sein. Das Gesundheitsministerium erließ Bestimmungen, wonach kein Pilger älter als 65 Jahre oder jünger als 12 sein darf. Auch Menschen mit chronischen Grunderkrankungen wie Herz-, Nieren-, Leberkrankheiten oder Immunschwäche sollen bis auf Weiteres nicht an der Pilgerreise teilnehmen. Vorgeschrieben sind Impfungen gegen die saisonale Influenza und gegen die Schweinegrippe. Beide müssen zwei Wochen vor Beantragung des Visums erfolgt sein.

Ruhe in Argentinien

In Argentinien sollen sich nach Schätzungen 20 Prozent der Bevölkerung mit dem neuen H1N1-Virus infiziert haben. Das wären acht Millionen Menschen. 580 Menschen starben an der Schweinegrippe, proportional zur Bevölkerung waren das mehr als irgendwo sonst. Obwohl in den Wintermonaten auf der Südhalbkugel noch kein Impfstoff vorhanden war, überstand das Land die erste Grippewelle. Das Thema ist inzwischen völlig aus der öffentlichen Diskussion verschwunden.

LADEPECHE.fr

Grippe A: Roselyne Bachelot admet que la vaccination est «timide»

La Depeche, 5 Novembre 2009, à 11:49
https://www.ladepeche.fr/article/2009/11/05/708707-grippe-a-roselyne-bachelot-admet-que-la-vaccination-est-timide.html

La ministre de la santé Roselyne Bachelot a admis jeudi que le mouvement de vaccination contre la grippe H1N1 était encore "timide", se réjouissant cependant que d'ores et déjà "50.000 personnes" se soient fait vacciner à l'hôpital.

"A l'Assistance publique-Hôpitaux de Paris 10% des personnels sont vaccinés", a indiqué la ministre sur RTL. Elle a affirmé qu'il y avait "une très bonne accélération".

Mme Bachelot a rappelé que le processus de vaccination commencerait pour la population générale le 12 novembre et que "six millions de personnes seront convoquées" à cette date, au premier chef les personnes les plus fragiles et l'entourage des nourrissons.

En ce qui concerne le vaccin lui-même, elle a réitéré que "peut-être une seule dose sera nécessaire". "Cette information a besoin d'être confirmée", a-t-elle dit, rappelant que pour les enfants en particulier il faudrait toujours deux doses.

La ministre a indiqué encore que "beaucoup de pays" qui "n'ont pas pris leurs précautions" demandaient à la France de leur "revendre des vaccins". Mais, a-t-elle dit, "je ne veux pas leur vendre tant que je ne suis pas sûre par une constatation clinique que l'immunité donnée par la première dose et qui est déjà importante est bien durable".

THE FLU CASE

Less than 0.1% of French population has taken "swine flu" jab so far, admits French Health Minister

The Flu Case, 5 November 2009, 12:26
https://web.archive.org/web/20100102024009/http://theflucase.com/index.php?option=com_content&view=article&id=1620%3Aless-than-01-of-french-population-has-taken-qswine-fluq-jab-so-far-admits-french-health-minister&catid=1%3Alatest-news&Itemid=64&lang=en

The French Health Minister, Roselyne Bachelot, has indicated today, Thursday, that so far only 50,000 people have taken the swine flu jab in France since the launch of the mass vaccination campaign.

There are an estimated 65 million people living in France.

50,000 people is less than 0.1 per cent of the total population.

In a report by AFP, she admitted that the vaccination campaign had been "timid".

However she was pleased that "50,000" people have been vaccinated in hospitals.

She said that at the 10 % of the health personnel in those hospitals in Paris which belong to the public health system had been received the swine flu jab.

Bachelot said that six million people in France would be summoned for their swine flu vaccinations at vaccine centers when the campaign moves from health personnel to the general public on November 12th, with pregnant women, children and the sick as the first targets.

What H1N1 swine flu? Majority of Californians intend to ignore the late vaccine:
Times/USC poll

Los Angeles Times, 6 November 2009, 5:14 pm
https://web.archive.org/web/20091110005255/http://latimesblogs.latimes.com/washington/2009/11/la-times-poll-h1n1-swine-flu-vaccine.html

A new poll confirms that the Obama administration and federal health officials have failed to convince Americans – at least those in the most populous state of California – of the seriousness of a H1N1 swine flu pandemic.

A majority of those registered voters polled by a new survey team involving The Times and the University of Southern California said they believed the new, delayed vaccine was safe.

But a majority also said they had no intention of getting it.

The findings come from a new Los Angeles Times/University of Southern California College of Letters, Arts & Sciences Poll. The survey, which interviewed 1,500 registered voters from Oct. 27 through Nov. 3, was conducted for The Times and USC by two nationally prominent polling firms, the Democratic firm Greenberg Quinlan Rosner and the Republican firm Public Opinion Strategies.

Today's results have a margin of error of plus or minus 2.6 percentage points.

Only 5% of those polled said they had already been vaccinated. Of the rest, 52% said they didn't plan to get vaccinated. Of the 40% who said they wanted the vaccine, 12% said they already had attempted to find it but couldn't.

Of those polled, 70% said they think the H1N1 vaccine is safe for most people, and only 17% said there was a strong chance the vaccine is unsafe.

Last month the Obama administration declared a national emergency over the H1N1 pandemic, as The Ticket reported here. But the government program has come under fire for long delays in deliveries of the vaccine.

Rep. **Ron Paul** has even called the federal program a "total failure." Obama officials, who are overseeing the vaccine distribution, have blamed the delays on manufacturers.

A previous national poll, as The Ticket reported here, found a large majority of Americans also intended to skip the recommended medical action.

Anti-vaccine movement infiltrated by Big Pharma?

The Flu Case, 12 November 2009, 10:16
https://web.archive.org/web/20100102050719/http://theflucase.com/index.php?option=com_content&view=article&id=1755%3Aanti-vaccine-movement-infiltrated-by-big-pharma&catid=1%3Alatest-news&Itemid=64&lang=en

Since actively involving myself in the flu case, I have been personally attacked many times. This is of course expected and a common tactic among those who have something to lose when truth about vaccines and especially the so called "swine flu" and "bird flu" vaccines is being exposed and published. Attack the messenger and try to discredit the person instead of dealing with the message - I get it.

To be attacked by individuals invested in Big Pharma, The New World Order, and the sick medical practices today common in the western world was expected. It is not new to me and is something that comes with the job. There are very many individuals that feel threatened when the vaccination cult is exposed for a variety of reasons. It may be prestige, money, positions, fear of questioning what is part of a belief system or even religious type of belief in published junk science.

When working towards exposure of the truth behind the flu case, I was fully prepared and ready to deal with such attacks. They are in a way understandable and therefor I forgive those involved, they don't know better.

What is more difficult to explain are the attacks coming from several so called anti-vaccine activists who seem determined to stop the information we present on this site. We are aware of several attempts being made to discredit us, slander us and defame us. We have even received death threats from such individuals. Friends tell us that they have been contacted by anti-vaccine activists, pretending to be someone else, asking personal questions about us and eventually, after days of snooping around revealing that their intent is to shut this site down.

This raises a series of interesting questions but most of all shows how difficult it is for many in humanity to accept free speech, free thought and the right to have a different opinion.

If these people who now are out to attack us and our site instead put their efforts into stopping the mass vaccinations, I think it would make much more sense to everyone. The anti-vaccine individuals that attack us personally often claim they have "so and so many years of activism against vaccination" as if it would be proof of their good intentions and as if it would give them right to stop us from exercising our right to free speech.

To me, instead, it is just a sad admittance to their complete ineffectiveness in stopping vaccinations.

I also often get feedback that essentially say "don't say that and don't say this" because then "we" would "loose credibility" and "you have to only use facts accepted by the Big Pharma or you will not win" and similar statements.

To me it sounds as if these people are used to make deals with the devil and to compromise about what is truth and what is not to avoid confrontation with the mighty Big Pharma. My stance is that

this has been going on long enough and need to be stopped completely. The whole theory behind vaccination is based on bad science and incorrect assumptions made in the past regarding our bodies immune system.

We have a golden opportunity to reveal the madness behind the mass vaccination campaign since it now for the first time concerns all of us, not just the many who have been victimized in the past by vaccines.

My wish is that anyone who feels that the mass vaccinations are wrong, based on their best knowledge and honest intentions, takes action against them. I wonder why the "professional" anti-vaccine activists that now prepare attacks against this site do not use their time and energy to stop the mass vaccinations? Which are their real motives? What is it that we have published that scares them or is "forbidden" to mention?

It seems that there are holy cows that we are not allowed to criticize or point at, like WHO, UN and Mr Obama. It is also not "playing by the rules" to point to the intent behind mass vaccinations as a part of a depopulation plan. It seems as if that possibility is too scary to look into.

What if all evidence and logic points to these depopulation plans and organizations? What if the depopulation plan makes everything else, that otherwise looks completely insane, suddenly make sense in a very dark way? It must be allowed to be said, discussed, exposed and investigated openly. That is the job for journalists and that is what we are.

It certainly raises many questions about the real intentions and motives of those who want to stop us. We have heard from several well informed individuals that most of the anti-vaccine movement is in fact infiltrated and controlled (and indirectly financed) by Big Pharma - which we, having had the experiences we have had, find to be highly likely.

Out of fear of being sued, media and organizations seem to bow and crawl in front of Big Pharma as if there was no option.

The ones we see who really make an effort and seem to achieve real results against the vaccine madness are those who by themselves take action and do not team up with such organizations or groups who only allow the resistance to be done "the right way" - the "safe" way. To me, much of that "work" has proven to be utterly ineffective so far. Possibly because the power of the truth is not used?

My wish is that everyone sincerely against the mass vaccinations take acton now in the best way they can, to their best knowledge and understanding. We all still have the opportunity to save millions from damages due to the poisonous vaccines. If the vaccines are safe, it will be proven. If there is no depopulation plan, it will be proven. And the opposite is also true.

Grosse Skepsis gegenüber Schweinegrippe-Impfung

SWI, 12 Novembre 2009, 08:23
https://www.swissinfo.ch/ger/wissenschaft/grosse-skepsis-gegenueber-schweinegrippe-impfung/1308284

Der Aufruf der Schweizer Regierung, besonders mit einem hohen Krankheitsrisiko behaftete Personen sollten sich gegen den H1N1-Virus impfen lassen, verhallt bisher ziemlich ungehört im Land.

Die Schweizer stellen sich gegenüber dem behördlichen Aufruf recht taub. Viele sind nämlich der Ansicht, die Bedrohung durch diese Grippe werde übertrieben.

Swissinfo.ch hörte sich in einem Mütterzentrum in Bern um, wo sich aber keine Eltern finden liessen, die sich oder ihre Kinder impfen lassen wollten.

"Sicher nicht", sagte eine Mutter. "Die Nebeneffekte dieser Impfung sind aus meiner Sicht zu wenig eingehend geprüft. Ich habe von Leuten mit Eiweiss-Allergien gehört, die nach der Impfung in einen Schockzustand fielen."

Bei der Produktion des Impfstoffs werden Virus-Versionen in Hühnereier-Embryos eingespritzt, wo sie während mehrerer Monate ausgebrütet werden. Das Eiweiss wird dann entnommen und dem Impfstoff beigegeben.

Laut dem Pharmaunternehmen Novartis haben die deutschen Behörden ihre Bewilligung für eine neue Schweinegrippe-Impfung gegeben, auf Basis von Zellkulturen statt Eier-Embryonen.

Die Registrierung dieser Zellkultur-Methode wird nun auch für die Schweiz vorangetrieben.

"Es ist schon verrückt, wie das Ganze von den Medien hochgespielt wurde, im Vergleich zu anderen Krankheiten, die man im Vergleich dazu beinahe schon tabuisiert", argumentiert die befragte Mutter weiter. "Zum Beispiel bei der Hepatitis. Niemand schreibt über diese Krankheit, die mir gefährlicher als die Grippe zu sein scheint."

Sie wüsste niemanden in ihrem Freundeskreis, der seine Kinder impfen liesse, "einfach weil der Impfstoff nicht genügend durchgetestet wurde. Wir haben auch schwangere Frauen hier. Sie lassen sich auch nicht impfen, weil sie die Auswirkungen auf das Baby nicht kennen."

Weshalb bleibt die Skepsis trotz behördlichem Impfaufruf weitverbreitet? "Die Regierung selbst scheint sich nicht sicher zu sein. Der Impfstoff wurde nicht genügend getestet. Wir wissen nicht, wie die Leute auf den Impfstoff reagieren werden."

Ausserdem sei bei jedem neuen grossen Impfstoff viel Geld zu verdienen. Dies könne zu Manipulationen führen. Und das ärgere sie.

Argwohn im ganzen Land

Ein gewisser Argwohn gegenüber den grossen Pharmafirmen zeigt sich auch in den Antworten der anderen Mütter.

"Bei mir hinterlässt einen schalen Geschmack, dass die Behörden so eng mit Daniel Vasella zusammenarbeiten", sagt ein Vater. Vasella ist CEO von Novartis. "Dies diskreditiert für mich bereits das ganze Thema Impfen."

"Ausserdem finde ich, Vasellas Bonus ist schon hoch genug!" (Im abgelaufenen Geschäftsjahr verdiente der Novartis-CEO insgesamt 40,3 Mio. Franken).

Auch er will sein Kind nicht impfen lassen: "Ich fragte nochmals die Kinderärztin. Sie befand es nicht für notwendig." Er glaube, am Ganzen sei viel Panikmache dabei.

Eine andere Mutter sagte, sie sei "grundsätzlich gegen Grippe-Impfungen".

Diese skeptischen Meinungen spiegeln einen landesweiten Argwohn. Eine kürzlich gemachte Umfrage der Zeitung SonntagsBlick ergab, dass fast neun von zehn Antwortenden sich keine Impfung machen lassen wollen.

Ähnliche Relationen ergeben sich, wenn es um die saisonale Grippe geht: Rund 9 von 10 Befragten haben sich nicht gegen die Saisongrippe impfen lassen. Knapp die Hälfte lässt sich impfen, wenn eine Reise in entfernte Länder ansteht.

Fast 60% denken, die Regierung habe mit den Schweinegrippe-Warnungen übertrieben.

Noch keine Todesfälle

Jacques de Haller von der Verbindung der Schweizer Ärzte (FMH) hat zugeben müssen, dass weitere Überzeugungs-Arbeit nötig sei.

Denn die Schweinegrippe-Toten in der ganzen Welt sprächen eine ganz andere Spache, sagt er. Mehr als Tausend allein seien in den USA gestorben, einige Hundert in Grossbritannien. Und die Grippewelle würde Kontinental-Europa bald erreichen.

Statistisch hat die Schweiz bisher mehr als 1550 registrierte Fälle registriert. 30 davon mussten hospitalisiert werden. Aber bisher gab es noch keine Toten – ein Umstand, den der Direktor des Bundesamtes für Gesundheit, Thomas Zeltner, als "doch recht erstaunlich" einschätzt.

Schweizerischer Nachteil

Anfang Woche sah sich Zeltner gezwungen, den nationalen Impfplan zu verteidigen. Er verneinte ein angebliches Chaos und bestätigte, dass die Impf-Programme nach vorgesehenem Zeitplan verliefen – mit einem Immunisierungsbeginn in den meisten Kantonen ab Mitte November.

Er trat damit Kritiken in den Medien und seitens einiger Ärzte entgegen, wonach der Landes-Impfplan unkoordiniert abgelaufen sei. Moniert wurde auch der Umstand, dass die Behörden zu lange gebraucht hätten, die beiden Impfstoffe freizugeben, die benutzt würden.

Gegenüber dem Tages-Anzeiger vom 10. November gab Zeltner zu, dass die Schweiz als Land gegenüber anderen benachteiligt sei. Das Gesundheitswesen sei zu komplex: Alle 26 Kantone des Landes könnten autonom über Massnahmen im Gesundheitswesen entscheiden.

Am gleichen Tag gebrauchte der oberste Apotheker des Kantons Bern, Samuel Steiner, harte Worte für die Beschreibung des Impf-Verteilungs-Plans: Dieser leide unter einem gedanklichen Defizit.

Laut Steiner ist der Impfstoff in viel zu grosse Einheiten von 500 Stück verpackt worden – einmal aufbereitet, könne er nur während 24 Stunden gelagert werden.

Es besteht eine gewisse Furcht, dass die Ärzte abgelaufene Impfstoffe wegwerfen müssen.

Quatre Femmes Enceintes en Justice Contre L'etat

RTBF Info, 13 November 2009, 15:59
https://web.archive.org/web/20091116102634/http://www.rtbf.be/info/belgique/judiciaire/vaccin-grippe-a-des-femmes-enceintes-contre-letat-160414

Quatre femmes enceintes ont intenté une action en référé contre l'État belge pour réclamer la mise à disposition de vaccins sans adjuvant. Ce n'est pas le cas du Pandemix, seul vaccin disponible en Belgique, un contrat d'exclusivité ayant été signé entre le gouvernement et GSK.

Cette action en référé nous a été communiquée par Initiative Citoyenne qui soutient la démarche. Initiative citoyenne est une association qui réclame plus de transparence et d'informations sur l'efficacité et les risques du vaccin. Elle rappelle que "la Belgique a conclu un contrat exclusif avec le fabricant de vaccins GSK pour l'achat du vaccin pandémique adjuvanté (avec squalène) Pandemrix" alors que "des critiques s'élèvent partout dans le monde pour dénoncer l'absence totale d'évaluation sérieuse d'un vaccin avec ce type d'adjuvant, notamment chez les femmes enceintes". Et de citer l'exemple du Canada qui a acheté 200 000 doses de vaccins sans adjuvants pour les femmes enceintes.

Des recommandations contre le Pandemrix

Initiative Citoyenne explique également qu'en France, le Haut Conseil de Santé publique recommande d'utiliser un vaccin sans adjuvant pour les femmes enceintes. Quant à l'agence suisse du médicament Swissmedic, elle n'autorise pas l'usage du vaccin adjuvanté Pandemrix pour les moins de 18 ans, les femmes enceintes et les plus de 60 ans, est-il écrit.

Un manque d'impartialité

Dans son communiqué, l'association critique la ministre de la Santé, Laurette Onkelinx, qui "*n'a cessé de vanter le squalène pour son absolue sécurité. Elle a continué de confondre les effets de cette molécule prise par voie orale avec ceux de la même molécule quand elle est injectée*".

Le 3 novembre dernier, le Groupement des Gynécologues Obstétriciens de Langue Française de Belgique a fait savoir "*qu'il recommande vivement, à l'instar de la cellule Influenza, l'usage du vaccin avec adjuvant de GSK chez les femmes enceintes estimant que les risques sont faibles et non chiffrables*". "Mais", écrit Initiative Citoyenne, ce que tout le monde ne sait pas, "*c'est que cette association professionnelle compte la firme GSK parmi ses "sponsors 2009*"".

Un courrier sans réponse

Un courrier a été envoyé le 3 novembre dernier à la ministre Onkelinx par des deux femmes enceintes. "*N'ayant pas reçu de réponse dans les délais habituels et estimant qu'elles encouraient un préjudice pour leur santé, ces femmes ont décidé, rejointes par deux autres femmes enceintes, d'intenter une action en référé contre l'état belge. Ce qu'elles demandent c'est la mise à disposition de vaccins sans adjuvant. Au nom du principe de précaution, tout simplement*", est-il écrit.

Une démarche soutenue par Initiative Citoyenne qui "*estime que le choix de ces femmes doit pouvoir être respecté*".

Notons qu'Initiative Citoyenne précise qu'elle n'est pas un groupement anti-vaccins mais avant tout "*un collectif partisan du libre arbitre*".

Expectant mothers take legal action in Belgium over swine flu jab with adjuvants

The Flu Case, 14 November 2009, 14:16
https://web.archive.org/web/20100102035444/http://theflucase.com/index.php?option=com_content&view=article&id=1800%3Aexpectant-mothers-take-legal-action-in-belgium-over-swine-flu-jab-with-adjuvants&catid=1%3Alatest-news&Itemid=64&lang=en

Four Belgian expectant mothers are intending to file legal action against the Belgium government for ordering GlaxoSmithKline Pandemrix swine flu jabs with the adjuvant, squalene, for pregnant women in spite of the lack of clinical data on safety and in spite of the scientific evidence squalene is dangerous, according to RTBF.

Canada has ordered 200,000 doses of the swine flu jab without adjuvants for pregnant women over safety concerns.

THE FLU CASE

About 1.2% of Austrians take swine flu jab in first week

The Flu Case, 14 November 2009, 14:25

https://web.archive.org/web/20100102041523/http://theflucase.com/index.php?option=com_content&view=article&id=1801%3Aabout-12-of-austrians-take-swine-flu-jab-in-first-week&catid=1%3Alatest-news&Itemid=64&lang=en

According to the Austrian newspaper, the Kurier, about 100,000 people have taken the swine flu jab since Monday, representing about 1.2% of the total population of 8,300,000.

30,000 people took the jab in the first week in Vienna, about 2% of the population of 1,600,000, says the local media.

The figures are low if you consider the huge amount of swine flu scare stories that currently saturate Austria's mainstream media. If the newspapers are not telling us how lethal the swine flu virus is, they are reporting the Baxter swine flu jab is in such short supply and so much in demand that queues are forming to get it.

What the Austrian newspapers don't report, however, is that Baxter contaminated 72 kilos of seasonal flu with the live bird flu virus in February and so nearly triggered a global bird flu pandemic. Because Baxter has to adhere to biosafety level 3 regulations, the contamination was almost certainly deliberate.

Leading Croatian Priest: Don't get the H1N1 Vaccine

MINA, 14 November 2009
https://web.archive.org/web/20100121022548/http://macedoniaonline.eu/content/view/9440/54/

Controversy in Croatia after famous Croatian priest Miroslav Bustruk appealed to Croatians not to get vaccinated against the Swine flu vaccine.

In a church ceremony dedicated to St Martin, father's Bustruk statement caused an avalanche of reactions in Croatia.

What is it that he said?

"I appeal to you, to not get vaccinated for the so called Swine Flu under any circumstance. There is a plan for massive destruction of humanity worldwide. For this purpose we will see new diseases springing up everywhere" reports Croatian daily "Jutarnji List", quoting father Bustruk.

"The H1N1 vaccine itself is a very sophisticated weapon whose implanted microchip will control the health of the human being" added the Croatian priest which prompted a great deal of disagreement by Croatian officials.

In defense of his colleague stood Don Jure Zubovik who said father Bustruk's statement only defended the Church, adding - "certain people who have spoken out or warned against the vaccine are already in jail".

More will be known in few weeks when the Vatican is expted to issue a press release addressing all World's Governments.

Croatian Priest Says Vaccine for Destruction of Humanity Worldwide

SACCSIV – blog ortodox

Cunoscuti preoti croati indeamna populatia sa refuze vaccinul anti AH1N1.
In curand Vaticanul se va adresa guvernelor lumii in aceasta privinta

SACCSIV, 17 Noiembrie 2009
https://saccsiv.wordpress.com/category/miroslav-bustruk/

Citez din articolul Leading Croatian Priest: Don't get the H1N1 Vaccine:

Controversa in Croatia dupa ce faimosul preot croat Miroslav Bustruk a facut un apel catre poporul croat sa nu se vaccineze impotriva gripei porcine.

Intr-o ceremonie religioasa dedicate Sfantului Martin, declaratia fratelui Bustruk a cauzat o avalansa de reactii in Croatia.

Dar ce a spus el mai exact?

"Fac apel la voi, sa nu va vaccinati impotriva asa numitei gripe porcine, sub nici o circumstanta. Exista un plan pentru distrugerea masiva a populatiei la nivel mondial. Pentru aceasta vom asista la noi boli ce vor aparea peste tot" relateaza ziarul "Jutarnji List", citandu-l pe fratele Bustruk.

"Vaccinul H1N1 in sine este o foarte sofisticata arma al carei microcip implantat va controla sanatatea fiintei umane" a adaugat preotul croat ceea ce a suscitat un prompt si larg dezacord din partea oficialitatilor croate.

In apararea colegului sau a stat Don Jure Zubovik care a spus ca declaratia fratelui Bustruk a fost doar in apararea bisericii, adaugand – "anumiti oameni care au vorbit impotriva vaccinului sunt déjà in inchisoare".

Mai multe se vor sti in cateva saptamani cand Vaticanul este asteptat sa faca o declaratie de presa in care se adreseaza guvernelor lumii.

Vulnerable patients shunning swine flu vaccine, GPs warn

Telegraph, 18 November 2009, 7:30PM GMT
https://web.archive.org/web/20091121111409/http://www.telegraph.co.uk/health/swine-flu/6590185/Vulnerable-patients-shunning-swine-flu-vaccine-GPs-warn.html

More than half of patients being offered the swine flu vaccine are turning it down over safety concerns and the perception that the disease is mild, according to a survey.

People were concerned about possible side-effects of the jab, it found.

Family doctors are currently vaccinating people at high risk from swine flu, including pregnant women, health workers and those with asthma, heart disease and diabetes.

The poll of 107 GPs in England, for Pulse magazine, found resistance to the jab was particularly high among pregnant women and, overall, only 46 per cent of patients offered the vaccine have said yes.

One family doctor estimated that as few as one in 20 pregnant women were opting to have the vaccine.

Last week, the Government published online information and leaflets aimed at persuading pregnant women to have the vaccine.

Some reports have also suggested that frontline health workers may be reluctant to be vaccinated as well.

Fears have been raised on the internet about the contents of the vaccine, Pandemrix, made by GlaxoSmithKline, which includes Thiomersal as a preservative and Squalene, a fish oil based additive which boosts the immune system allowing lower doses of the active ingredient to be used.

Doctors have been given a target to vaccinate just over half of people in the priority groups in order not to lose income, but fear they will not be able to hit this.

The number of new swine flu infections is currently hovering around 64,000 a week in England and there have been 124 deaths linked to the disease since the outbreak began in April.

A low uptake of the vaccine could hamper efforts to control the outbreak and increase pressure on the NHS during the winter.

Officials are currently deciding whether the vaccine should be offered to other groups once those with long-term diseases, pregnant women, people living with immuno-compromised patients and the over 65s with other illnesses.

Dr Andy Rose, a GP in Kensington, London, said his practice was encountering "considerable scepticism" from pregnant women.

Dr Sharon Shmueli, a GP in Swindon, said that "fewer than 25 per cent" of pregnant patients at her practice had chosen to be vaccinated.

Dr Toby Davies, a GP in Tidworth, Wiltshire, said his practice had received its initial 500 doses last week, and was already running low.

"We're irritated that small practices received the same number of vials as large practices.

"We are told deliveries will take one to two weeks from that date. We have had to delay our programme."

GPs who immunise more than 50.7 per cent of people in high-risk groups will have the amount of work they are required to do in other areas – such as diabetes or asthma clinics – reduced while still receiving the same amount of cash.

A spokesman for the Department of Health said: "We have not set a target for vaccination – there is no target.

"We recommend that people in the at-risk groups accept the offer of vaccination.

"This is because people in the risk groups are more likely to be severely ill if they catch swine flu, and the vaccine provides the best protection against the disease.

"It is too early to speculate on uptake rates. GPs are working as quickly as they can to reach as many patients as possible with their initial supplies – some of which were still being delivered last week."

REUTERS

Doctors say most Britons reject swine flu vaccine

Reuters, 18 November 2009, 8:09 PM GMT+8
https://www.reuters.com/article/idUSLI105140/

Summary:
- *Poll shows only 46 pct of those offered vaccine accept*
- *Doctors say pregnant women particularly reticent*
- *Health officials say "too early to speculate" on uptake*

London, Nov 18 (Reuters) - More than half of Britons being offered vaccination against pandemic H1N1 flu are turning it down because they fear side-effects or think the virus is too mild to bother, a survey of doctors showed on Wednesday.

Many of the 107 family doctors polled by Britain's Pulse magazine said there was widespread resistance from patients and on average only 46 percent of those offered the vaccination agree to have it.

Doctors reported particular difficulties in persuading pregnant women to be vaccinated against the virus, according to Pulse, a trade newspaper for doctors.

"In all the pregnant women we've offered it to, I think only about one in 20 has agreed," Dr Chris Udenze, a family doctor based in Nottingham, central England, said in the survey.

Scepticism has been growing in Britain and other European countries about health authorities' handling of the H1N1 pandemic because the number of people infected has been lower than originally feared.

Britain began a vaccination programme on Oct. 21 for high-risk hospital patients, front-line health-care workers, children in seasonal flu risk groups, pregnant women and people with compromised immune systems.

British health authorities have twice revised down their worst-case scenarios for H1N1 flu, which was declared a pandemic in June and has killed more than 7,000 people worldwide, according to latest data from the European Centre for Disease Prevention and Control.

Original estimates that as many as 65,000 could die from H1N1 in Britain have now been cut to a prediction of around 1,000 deaths -- way below the average annual toll of 4,000 to 8,000 deaths from seasonal winter flu.

Richard Hoey, Pulse's editor, said his survey showed that many patients, and a substantial number of doctors were "unconvinced there is sufficient evidence that swine flu vaccination is safe and necessary".

A spokesman for the government's health department said it was "too early to speculate on uptake rates" for H1N1 vaccines but that doctors were working hard to reach as many patients as possible with their initial supplies.

"We recommend that people in the at risk groups accept the offer of vaccination," he said. "People in the risk groups are more likely to be severely ill if they catch swine flu, and the vaccine provides the best protection against the disease."

NEWS

Swine flu vaccination 'concerns'

BBC, 18 November 2009, 11:52 GMT,
http://news.bbc.co.uk/go/pr/fr/-/2/hi/europe/jersey/8366104.stm

Jersey's health department is urging adults under 40 with conditions such as asthma and diabetes to have the swine flu vaccine.

Doctors in the island are organising vaccination clinics for at-risk groups.

An official "outbreak" of the virus was declared in Jersey on Monday following a sharp rise in cases.

Dr Susan Turnball, the deputy medical officer of health, is concerned about the "low attendance levels" by young adults at some vaccination sessions.

She told BBC News: "I realise people in this age group are probably busy with their working lives, but it really is very important that they make the time to have the vaccine.

"Most people infected with swine flu worldwide have been under 40.

"I would urge anyone with an underlying health condition who hasn't been vaccinated to contact their GP's surgery for an appointment as soon as possible."

Sharp rise

GPs are making appointments to fit in with the amount of vaccine arriving in the island in weekly deliveries.

People in at-risk groups include those with heart, lung, liver, kidney or neurological diseases, impaired immunity, asthma and diabetes.

Pregnant women, who are also at higher risk, are being offered their vaccines via the hospital's midwifery department.

The number of people with swine flu in Jersey more than tripled last week, with 119 confirmed cases compared to 34 the previous week.

Following the sharp rise a Tamiflu distribution centre has been set up in St Saviour for children in affected schools.

70 000 Hamburger sind geimpft

The Flu Case, 21 November 2009
https://web.archive.org/web/20100102033412/http://theflucase.com/index.php?option=com_content&view=article&id=2011%3Aless-than-4-of-people-in-hamburg-have-taken-swine-flu-jab-since-october-26th&catid=1%3Alatest-news&Itemid=64&lang=en

Bei der Schweinegrippe, die seit Wochen auch die behördlichen Katastrophenschützer beschäftigt, gehen die Experten inzwischen nicht mehr von den schlimmsten Befürchtungen aus. "Die laufende Pandemie ist keine Katastrophe und kann meiner Einschätzung nach auch keine Katastrophe mehr werden", sagte Dr. Peer Rechenbach, Leiter der Abteilung für Katastrophen- und Bevölkerungsschutz der Hamburger Innenbehörde, am Freitag beim 2. Hamburger Influenza-Pandemie-Symposium in der Handelskammer. Dennoch schrecken die meisten Fachleute vor einer Entwarnung zurück. Denn niemand weiß, ob die Viren in einer zweiten oder dritten Ansteckungswelle mit mehr Todesopfern im Gefolge daherkommen, wie es etwa bei der Spanischen Grippe (1918-1920) war, bei der weltweit mindestens 25 Millionen Menschen umkamen.

Damals gelang es den Stadtvätern von St. Louis (USA), durch Schulschließungen die Zahl der Todesopfer im Vergleich zu anderen Städten deutlich zu senken. Dass diese Maßnahme in der gegenwärtigen Schweinegrippewelle nicht eingesetzt wird, obwohl sie in den Notfallplänen vorgesehen ist, liegt allein an dem harmlosen Verlauf der Erkrankung.

In Deutschland sind bisher 30 Menschen an der Schweinegrippe gestorben. Nur bei vier waren keine schwerwiegenden Vorerkrankungen bekannt. Jedes Jahr sterben allein in Deutschland bis zu 12 000 Menschen an den Folgen der "normalen", der saisonalen Grippe.

Hat die Weltgesundheitsorganisation also zu früh und zu übertrieben den Alarmplan gestartet? "Nein", sagt Rechenbach, die WHO müsse frühzeitig "die Hand heben", damit auf nationaler Ebene Vorsorge getroffen werden könne für den Ernstfall. Für den sind die 70 000 Hamburger gut gerüstet, die sich seit Impfbeginn am 26. Oktober haben impfen lassen. Für ein Drittel der Bevölkerung hat Hamburg Impfdosen geordert. Ausdrücklich aufgerufen, sich schützen lassen, sind bisher nur sogenannte Schlüsselpersonen, zu denen Polizei, Feuerwehrleute und medizinisches Personal zählen, sowie die chronisch Kranken. Wenn im weiteren Verlauf alle anderen Bürger zur Impfung aufgerufen werden, will sich auch Gesundheitssenator Dietrich Wersich (CDU) impfen lassen.

Aber selbst wenn die Hamburger das Angebot zur kostenlosen Impfung, die bis Ende März vorgesehen ist, mit der bisherigen Intensität nutzen, werden mehrere 100 000 Impfdosen übrig bleiben, die bestellt und aus Krankenkassen- und Steuerbeiträgen bezahlt werden müssen. Damit diese noch vor Ablauf des Verfallsdatums genutzt werden können, überlegt man in der Innenbehörde, diese an Entwicklungsländer zu geben. Denn denen fehlt das Geld zu groß angelegten Impfaktionen.

=>

Less than 4% of people in Hamburg have taken swine flu jab since October 26th

The Flu Case, 21 November 2009 13:42

In spite of corporate mainstream media fear mongering about the swine flu pandemic, only 70,000 people in Hamburg, Germany, have taken the swine flu jab since the start of the mass vaccination programme, on October 26th.

This represent less than 4% of the total population of 1,775,333 people or about 1% per week.

Europeans Shun Swine Flu vaccine as deaths from virus increase

Voice of America News, 25 November 2009, 7:58 AM
https://www.voanews.com/a/article-2009-11-25-europeans-shun-swine-flu-vaccine-as-deaths-from-virus-increase-73852787/415917.html

A European medical society has expressed alarm at the widespread opposition in Europe against the swine flu vaccine. Meanwhile, experts say the number of deaths in Europe from the H1N1 virus are doubling every two weeks.

A European medical society has expressed alarm at the widespread opposition in Europe against the swine flu vaccine. Meanwhile, experts say the number of deaths in Europe from the H1N1 virus are doubling every two weeks.

Concern that Europeans are shunning the vaccine against the H1N1 virus was raised this week by the European Society of Clinical Microbiology and Infectious Diseases. The Swiss-based nonprofit says that as European countries roll out their vaccine campaigns, they face opposition from anti-vaccine lobbyists. It says some of these groups are deliberately spreading misinformation. Guiseppe Cornaglia is the society's former president.

"We have strong bodies of evidence from most countries in Europe in which people, including doctors, public health professionals are disseminating doubts about the validity of the vaccine," said Cornaglia. "They are worried about the possible side effects, about what they listen to from friends and the Internet because there is no official source. And they claim the need for a vaccination is not so great to afford these risks."

In France, where a government vaccine campaign kicked off in public schools on Wednesday, a recent survey found only 21 percent of French said they planned on getting vaccinated.

European skepticism about the vaccine comes as the Stockholm-based European Center for Disease Control and Prevention reports the number of deaths in Europe due to the H1N1 virus has been doubling every two weeks since mid-October. Altogether, the center says, about 670 deaths have been reported in Europe since April.

Cornaglia, of the Microbiology society, says doctors and health authorities need to campaign more strongly to get the right information out about the vaccine.

"If the authorities cannot convince the doctors and if the doctors don't advise their own patients, the battle is lost. Because the transmission is not efficient," The problem is possibly that the information isn't efficient enough," said Cornaglia.

If the vaccine campaign fails to take off in Europe, the society says, the swine flu pandemic may even spread more widely and cause more deaths, particularly among children and young adults.

THE FLU CASE

Novartis sponsored Swiss Disease Society
complains Europeans are shunning untested jab

The Flu Case, 27 November 2009, 12:08

https://web.archive.org/web/20100102014213/http://theflucase.com/index.php?option=com_content&view=article&id=2090%3Anovartis-sponsored-swiss-disease-society-complains-europeans-are-shunning-untested-jab&catid=1%3Alatest-news&Itemid=64&lang=en

The European Society of Clinical Microbiology and Infectious Diseases, based in Basel, Switzerland, which counts swine-flu-jab manufacturer Novartis as a corporate member, has issued a press release, complaining that people in Europe are refusing to take the untested swine flu jab.

"We have strong bodies of evidence from most countries in Europe in which people, including doctors, public health professionals are disseminating doubts about the validity of the vaccine," said Cornaglia. "They are worried about the possible side effects, about what they listen to from friends and the Internet because there is no official source."

As if EMEA documents saying the swine flu jabs from Novartis and GSK have not been proven for safety and efficacy and are being approved under "emergency" guidelines are not official sources!

RHEINISCHE POST

Impf-Kampagne wirkt nicht mehr

Rheinische Post, 25 Novembre 2009, 11:27
https://web.archive.org/web/20091127011845/http://www.rp-online.de/duesseldorf/duesseldorf-stadt/nachrichten/Impf-Kampagne-wirkt-nicht-mehr_aid_787319.html

Düsseldorf (RP) 17.500 Impfdosen hatte die Stadt Düsseldorf für diese Woche bestellt, weil die Nachfrage so groß war. Nun bleiben die Patienten aus. In der kommenden Woche soll es neue Sprechstunden geben. Auch die ersten niedergelassenen Ärzte werden der Impfung überdrüssig.

Gerade einmal 426 Düsseldorfer haben sich gestern in der zentralen Impfstelle der Stadt gegen die Schweinegrippe immunisieren lassen – so wenige wie am Anfang der Kampagne. Entsprechend groß ist die Ratlosigkeit in der Impfstelle. Nur noch drei Ärzte sind vor Ort und auch sie nicht mehr ausgelastet.

Der einzig positive Effekt für Patienten: Sie müssen nicht mehr Schlange stehen. Zufrieden aber ist niemand mit dem Einbruch. Ratlos zucken die Verantwortlichen des Gesundheitsamtes mit den Schultern. Sie denken bereits über eine neue Logistik nach.

Ab Montag soll es geänderte Sprechstunden für die zentrale Impfstelle geben, die sich stärker an den Bedürfnissen der Bürger orientierten. Am Samstag soll die Sprechstunde sogar ausfallen.

Auch die Verteilung der Impfdosen wird neu diskutiert. "Wir werden eine Lösung finden, bei der keine Vorräte gehortet werden", erklärt Gesundheitsamts-Chef Heiko Schneitler zuversichtlich. Allen voran hatte er sich beim NRW-Gesundheitsministerium dafür eingesetzt, dass die Stadt mehr Impfstoff erhält, weil der Andrang bisher so groß war. 17.500 Dosen Pandemrix kamen daraufhin am vergangenen Donnerstag an. Wie bisher wurden sie zur Hälfte an die niedergelassenen Ärzte verteilt und zur Hälfte an die zentrale Impfstelle gegeben. Mehr als 6500 Dosen sind dort noch übrig, und morgen kommt bereits die nächste Lieferung.

"Ich glaube, dass die Leute Angst haben", sagt Schneitler. Es seien zu viele Bedenken geschürt worden. "Jeder kann erzählen, was er will und muss nichts belegen", kritisiert er. Gemeint sind unter anderem Mediziner in einigen Krankenhäusern der Stadt und manche Kinderärzte, die weiterhin vor der Impfung warnen. "Ich rate diesen Kollegen, dass sie ihre Staatsexamen noch einmal wiederholen", sagt Hausarzt Collin Blume, der die Kampagne seit Beginn als niedergelassener Arzt unterstützt.

THE FLU CASE

Swine Flu propaganda machine falls apart in Germany

The Flu Case, 25 November 2009, 12:49;
https://web.archive.org/web/20100102023418/http://theflucase.com/index.php?option=com_content&view=article&id=2065%3Aswine-flu-propaganda-machine-falls-apart-in-germany&catid=1%3Alatest-news&Itemid=64&lang=en

Heiko Schneitler, the head of Düsseldorf's swine flu jab campaign, can only shake his head when he sees the figures showing the plummeting numbers of people getting their jab at the city's special vaccine centers.

"Vaccine campaign has no more impact," says a headline in RP Online.

"I think people are afraid. Everyone can say whatever they want without proving it," Schneitler griped.

He is not referring to so-called "conspiracy theorists", but to the many doctors in the city who have been outspoken in their criticism of the untested Pandemrix swine flu jab that has already been connected with deaths, damage and abortions throughout Europe.

"I advise these colleagues to do their State Exam again," chides Collin Blume, one of the few GPs in Dusseldorf to support the swine flu campaign from the start.

But even Blume admits that the GPs who decided not to participate in the swine flu jab campaign have no regrets.

Something has happened Schneitler and the many other planners of the biggest biological experiment in history never reckoned with.

People are ignoring the hysteria in the mainstream media and exhortations of the government, thinking for themselves and refusing to turn up for their untested jab.

The German newspaper Bild reported on November 3rd "an explosion in infections".

On 21 October, Bild predicted "35,000 dead."

And yet people are not flocking to vaccine centers to get their untested swine flu jab on reading the Bild headlines, leaving Schneitler sitting on thousands of unused doses of the toxic Pandemrix already.

Schneitler is thinking of other ways to get people to take the jabs, including a new "logistics" plan, involving distributing them to GPs.

But will this plan work when people like Günter Jonitz, the President of the Doctor's Chamber in Berlin tells NDR Magazin "Zapp" that the "picture that is being drawn of the swine flu is crassly exaggerated"?

"The swine flu is being represented as an omnipresent deadly threat, especially to the young, where you should go and get your vaccine as soon as possible so as not to get sick," Jönitz said.

More and more people are waking up to the fact that the mainstream media is being used as an instrument by corporations to drive them to actions that are not in their own interests but in the interests of those corporations.

Making the jabs compulsory in Germany would meet with huge resistance according to a recent poll by Bild. 90 % of Germans are against forced swine flu jabs.

THE FLU CASE

More people in Germany file criminal charges over the swine flu

The Flu Case, 30 November 2009 11:43
https://web.archive.org/web/20100102052134/http://theflucase.com/index.php?option=com_content&view=article&id=2121%3Amore-people-in-german-file-criminal-charges-over-the-swine-flu&catid=41%3Ahighlighted-news&Itemid=105&lang=en

More people in Germany have filed criminal charges over the swine flu scam, including Stefan Sigler from Backnang.

He filed comprehensive charges with his local police against the German government and those doctor's associations and university faculties recommending the swine flu jab for corruption (accepting bribes), fraudulent misuse of tax funds, membership of terrorist organizations, illegal manufacture and possession of bioweapons, with the suspicion of using them with the intention of causing death and bodily harm and also genocide.

Marie-Rose Cavalier, Sophie Meulemans, Muriel Desclée
https://www.psiram.com/fr/index.php/Initiative_citoyenne

Chers signataires,

a) En pièce jointe, vous trouverez tout d'abord une lettre pour vous tenir informés. Prenez le temps de la lire, même si elle fait 5 pages car elle fait le point sur des éléments extrêmement importants:
- sur les actions en justice déjà menées (NB: les plaidoiries en appel ont lieu demain, mardi 1° décembre à 10H place Poulaert à Bruxelles au 1° étage, salle 1.32; audience publique ouverte à tous)
- sur ce qui reste à mener
- sur la loi d'exception
- sur la mutation et la situation en Ukraine
- le bilan d'Initiative Citoyenne jusqu'à présent

b) Vous trouverez également en pièce jointe de ce mail, les 2 derniers communiqués de presse d'Initiative Citoyenne qui concernent plus spécifiquement les risques du vaccin adjuvanté Pandemrix:
- pour les femmes enceintes
- pour les patients transplantés

c) Initiative Citoyenne sollicite votre soutien. C'est en effet grâce à la solidarité et à vos dons que nous pouvons au mieux, et en toute indépendance, assurer ce rôle de vigilance citoyenne.

Si vous aussi vous avez saisi toute l'importance et l'enjeu de ce dossier en terme de liberté de choix en santé et de démocratie, surtout, n'hésitez pas, soutenez-nous!

Vous pouvez faire un don, quelque soit le montant et quelque soit le pays: même des dons de 5 euros mis bout à bout, ça peut faire toute la différence!

Pour aller à la Cour constitutionnelle, il faut 4000 euros. Quand on sait que l'OMS et l'ONU ont dit que la pandémie et le degré d'alerte allaient perdurer plusieurs années, il y a tout lieu de craindre un renouvellement de cette loi d'exception, raison pour laquelle il faut s'opposer à celle-ci, tous ensemble, sans plus attendre! Nous comptons sur votre aide!!!! Toutes les infos pratiques pour nous soutenir financièrement se trouvent également en pièce jointe, Merci.

d) Nous souhaitons diffuser largement un questionnaire afin de mener une enquête indépendante sur les effets secondaires du vaccin Pandemrix, n'hésitez pas à lire ce questionnaire également en pièce jointe et à le diffuser tout autour de vous!

Only every second person returns for Swine Flu Jab in Styria, Austria

Steiermark.orf.at, 1 December 2009 11:14

http://steiermark.orf.at/stories/406724/ (deleted)

https://web.archive.org/web/20100329195147/http://www.theflucase.com/index.php?option=com_content&view=article&id=2141%3Aonly-every-second-person-returns-for-swine-flu-jab-in-styria-austria&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Only every second Austrian who took the first swine flu jab appears to be returning to vaccine centers for their second shot, which is supposed to be taken after an interval of 3 weeks, according to a report in the ORF.

As few as 105 people turned up to take their second jab in the main vaccine center in city of Graz, the capital of Styria, on Monday. Another 30 people went to a different center in the city.

Numbers of people showing up for their second jab throughout the state of Styria – population about 1,200,000 – were very low.

Health official Marianne Wassermann-Neuhold said that the authorities „had to stick to the authorisation documents and they said a second dose was necessary.“

A new study that is supposed to find out whether the second jab is "needed" is not expected to be ready until 3 weeks at the earliest.

Only 15,300 people took the first swine flu jab in Styria as of Tuesday last week joining 6000 health care workers.

THE JERUSALEM POST

Only 1.3% of Israelis have received swine flu vaccination

The Jerusalem Post, 1 December 2009
https://www.jpost.com/israel/only-13-percent-of-israelis-have-received-swine-flu-vaccination

An 11-year-old girl, and two women aged 25 and 77 - all suffering from serious chronic illnesses - died on Monday after being infected with the H1N1 virus, the Health Ministry said.

The first died at Haifa's Rambam Medical Center, the second at Tel Aviv Sourasky Medical Center and the third at Wolfson Medical Center in Holon. They were the 61st, 62nd and 63rd Israelis listed as victims of the H1N1 flu strain, though none of deaths could be conclusively linked to the virus as there have been no autopsies.

Meanwhile, although Prime Minister Binyamin Netanyahu, who is also health minister, has ordered 7.3 million doses of H1N1 vaccine - enough for every resident except for newborns - the average Israeli does not seem interested in getting the shot.

According to the latest figures of the Center for Disease Control, only 1.3 percent of residents - or 96,772 people - have received the H1N1 vaccination about a month after the first 350,000 doses became available. Many of those who were vaccinated work in the health system.

Around the world, some 8,200 people have died of swine flu, according to the latest report.

The ordinary seasonal flu, which is less infectious than the H1N1 strain but causes more deaths, also does not seem to be scaring the average Israeli. Only 15% of the population - or 1,103,000 people - has been vaccinated since September with seasonal flu shot, with which the health system has much experience. Included in those vaccinated are just 55% of the high-risk group over the age of 65.

Only One Third turn up for second Swine Flu jab in Salzburg

The Flu Case, 2 December 2009, 13:09
https://web.archive.org/web/20100102004918/http://theflucase.com/index.php?option=com_content&view=article&id=2159%3Aonly-one-third-turn-up-for-second-swine-flu-jab-in-salzburg&catid=1%3Alatest-news&Itemid=64&lang=en

Only about 300 people turned up in the federal state of Salzburg in Austria on Monday for their second swine flu jab, roughly a third of the 900 people who went for their jab on the first, peak day of the mass vaccination campaign, according to a report in the ORF.

The population of the federal state of Salzburg is about 530,000.

Nur 12 Prozent wollen sich impfen lassen

20 Minutes Channel, 3 Dezember 2009, 15:05.
https://web.archive.org/web/20120211194008/http://www.20min.ch/news/schweiz/story/Nur-12-Prozent-wollen-sich-impfen-lassen-11267429

Impfen oder nicht impfen, das ist hier die Frage. Doch die Anzahl derer, die sich für die Schweinegrippe piksen lassen wollen, sinkt rapide.

Die Impfbereitschaft der Schweizer Bevölkerung hat offenbar unter der Diskussion um die Verteilung von Impfstoffen sowie deren Sicherheit gelitten. In einer im vergangenen November durchgeführten Umfrage haben 73 Prozent angegeben, sich nicht impfen lassen zu wollen, wie das Bundesamt für Gesundheit (BAG) am Donnerstag bekannt gab.

...

Zwölf Prozent wollen impfen

Nur gerade zwölf Prozent, 15 Prozent weniger als bei der letzten Befragung gaben an, sich impfen zu wollen. Die Verunsicherung in der Bevölkerung habe zugenommen, erklärt Koch das Ergebnis. So sei die Botschaft, dass der Impfstoff sicher sei, offenbar zu wenig angekommen.

...

Fünf Todesfälle nach Impfungen

Zwei von 28 Meldungen betreffen einen intrauterinen Fruchttod - also ein Absterben des Fötus - nach Impfung mit Focetria. Swissmedic hat zudem die Untersuchung eines intrauterinen Fruchttodes abgeschlossen. Der kausale Zusammenhang mit der Impfung werde als unwahrscheinlich eingestuft. Swissmedic wurden zudem fünf Todesfälle nach der Impfung gemeldet. Ein Zusammenhang mit der Impfung könne in vier Fällen ausgeschlossen werden. Der fünfte gemeldete Todesfall betrifft einen über 80 Jahre alten Patienten. Diese Meldung wird zur Zeit noch weiter abgeklärt.

Only 12% of Swiss plan to get the Jab, Five vaccine deaths reported already

The Flu Case, 3 December 2009 13:53
https://web.archive.org/web/20100102030843/http://theflucase.com/index.php?option=com_content&view=article&id=2174%3Aonly-12-of-swiss-plan-to-get-the-jab-five-vaccine-deaths-reported-already&catid=1%3Alatest-news&Itemid=64&lang=en

Only 12 % of the Swiss intend to take the swine flu jab, according to a poll conducted in early to mid November.

73% said they did not want the jab largely because of concerns over its safety.

The numbers willing to take the jab in December in Switzerland could be even lower, in the meantime, since five deaths have been reported among people who took the jab, even though the Swiss vaccination campaign has barely started.

Občané za zastavení očkování

Nyxu.Cz, Obrana Občana, 3 December 2009, 10:21:21
https://nyx.cz/discussion/13509/id/27150130

Občané za zastavení očkování

Jako občané České republiky nesouhlasíme s očkováním proti tzv. prasečí chřipce vakcínou Pandemrix. K tomuto nesouhlasu nás vedou následující důvody:
- vakcína nebyla předem dostatečně otestována co do své bezpečnosti a účinnosti;
- mnohé nasvědčuje tomu, že očkování touto vakcínou bude mít pro lidské zdraví závažnější negativní důsledky než samotná tzv. prasečí chřipka;
- tzv. prasečí chřipku nepovažujeme za skutečné ohrožení zdraví naší populace;
- výrobce vakcíny nenese odpovědnost za případné poškození zdraví očkováním, což považujeme za neslučitelné s naším právním řádem a lidsky nepřijatelné;
- je nám krajně podezřelý způsob vyhlášení pandemie prasečí chřipky WHO a podezříváme tuto organizaci ze spolčení s farmaceutickými koncerny.

Odmítáme proto nejen očkování nás samých a našich dětí, za které jsme jako rodiče zodpovědní, ale vyzýváme tímto rovněž orgány odpovědné za ochranu veřejného zdraví k bezodkladnému zastavení očkování Pandemrixem v celé ČR.

Dále tyto orgány vyzýváme, aby při informování o situaci uváděly jen ověřená čísla a žádné statistické odhady.

Vyzýváme novináře, aby objektivně a vyváženě informovali o šíření, resp. ústupu tzv. prasečí chřipky, aby nezveličovali případy nakažení a neopomíjeli případy poškození zdraví očkováním a aby čísla o počtu nakažených dávali do souvislosti s jinými relevantními čísly (srovnání s počty nemocných chřipkou v uplynulých letech, srovnání s počty nemocných sezónní chřipkou v tomto roce atd.). Důrazně vyzýváme novináře, aby nezamlčovali skutečnosti, které jsou jim známy, a aby zbytečně nešířili paniku.

Vyzýváme občany, aby se nenechali nutit do očkování Pandemrixem a aby v případě nesouhlasu s očkováním i se způsobem informování o tzv. pandemii prasečí chřipky svůj nesouhlas dávali hlasitě a slyšitelně najevo, aby oslovovali orgány odpovědné za ochranu veřejného zdraví, své zastupitele na celostátní i krajské úrovni, lékaře, novináře.

Jde o naše zdraví a zdraví našich dětí. Jediný, kdo za ně nese skutečnou zodpovědnost, jsme my ami.
Při šíření prosím zvažte, zda připojíte svůj podpis.

Vaccine choice movement starts in Chechya

The Flu Case, 4 December 2009, 16:24
https://web.archive.org/web/20100102004305/http://theflucase.com/index.php?option=com_content&view=article&id=2182%3Avaccine-choice-movement-starts-in-chechnya&catid=1%3Alatest-news&Itemid=64&lang=en

THE FLU CASE

Bürgerinitiative Stoppt die Impfung

The Flu Case, 4 December 2009, 16:24
https://web.archive.org/web/20100102004305/http://theflucase.com/index.php?option=com_content&view=article&id=2182%3Avaccine-choice-movement-starts-in-chechnya&catid=1%3Alatest-news&Itemid=64&lang=en

Als Bürger der Tschechischen Republik lehnen wir die Impfung gegen die sog. Schweinegrippe mit dem Pandemrix-Impfstoff ab. Zu dieser Ablehnung führen uns folgende Gründe:

- der Impfstoff wurde hinsichtlich seiner Sicherheit und Wirksamkeit nicht genügend getestet;
- Vieles deutet darauf hin, dass die Impfung mit diesem Impfstoff für die Menschengesundheit schwerwiegendere negative Folgen als die sog. Schweinegrippe an sich haben wird;
- die sog. Schweinegrippe halten wir nicht für eine tatsächliche Bedrohung der Gesundheit unserer Bevölkerung;
- der Impfstoffhersteller trägt keine Verantwortung für die eventuelle durch die Impfung bewirkte Beschädigung der Gesundheit, was wir für nicht vereinbar mit unserem Rechtssystem und für menschlich nicht akzeptabel halten;
- die Art der Pandemieausrufung durch die WHO ist uns äußerst verdächtig und wir verdächtigen diese Organisation, dass sie mit den Pharmakonzernen verbündet ist.

Wir lehnen daher nicht nur die Impfung uns selbst und unserer Kinder ab, für die wir als Eltern verantwortlich sind, sonder wir rufen hiermit auch die Behörden, die für den Schutz der öffentlichen Gesundheit Verantwortung tragen, dazu auf, die Impfung mit Pandemrix in ganz Tschechien unverzüglich zu stoppen.

Ferner rufen wir diese Behörden auf, bei der Informierung über die Situation nur geprüfte Zahlen und keine statistischen Schätzungen anzugeben.

Wir rufen Journalisten auf, objektiv und ausgewogen über die Verbreitung bzw. den Rückgang der sog. Schweinegrippe zu informieren, die Fälle der Ansteckung nicht aufzubauschen und die Fälle der Gesundheitsbeschädigung durch die Impfung nicht zu unterlassen. Ferner rufen wir sie auf, die Zahlen der Angesteckten in Zusammenhang mit anderen relevanten Zahlen zu stellen (Vergleich mit der Zahl der Grippenkranken in den vergangenen Jahren, Vergleich mit den Zahlen der durch die saisonale Grippe Erkrankten in diesem Jahr etc.). Nachdrücklich rufen wir sie auf, die ihnen bekannten Tatsachen nicht zu verschweigen und keine unnötige Panik zu verbreiten.

Wir rufen Bürger auf, sich zur Impfung mit Pandemrix nicht zwingen zu lassen und im Fall ihres Nichteinverständnisses mit der Impfung und mit der Art der Informierung über die sog. Schweinegrippepandemie dieses Nichteinverstandensein lauf und hörbar zu äußern, die für den Schutz der öffentlichen Gesundheit verantwortliche Behörden, ihre gewählten Vertreter auf der Bezirk- und Landesebene, die Ärzte und Journalisten in dieser Sache anzusprechen.

Es geht um unsere Gesundheit und die Gesundheit unserer Kinder. Der Einzige, der dafür eine wirkliche Verantwortung trägt, sind wir alleine.
Bei der Verbreitung dieses Appells erwägen Sie, bitte, ob Sie Ihre Unterschrift zufügen wollen.

Le Parisien

Les futurs infirmiers contre les réquisitions

Le Parisien, 5 Décembre 2009, 07h00
https://www.leparisien.fr/paris-75/paris-75007/les-futurs-infirmiers-contre-les-requisitions-05-12-2009-733625.php

VII e . «Etudiants réquisitionnés, on n'est pas des boulets», «la vaccination tue la formation».

Blouse blanche et masque chirurgical sur le visage, plusieurs centaines d'étudiants infirmiers, venus de toute l'Ile-de-France, ont manifesté hier devant le ministère de la Santé, dans le VII e.

Objectif: dénoncer les conditions dans lesquelles ils sont réquisitionnés pour participer à la campagne de vaccination contre la grippe A/H1N1.

«Des cours et des stages sont supprimés, alors que nous passons les examens dans quelques mois», détaille Edouard, 24 ans, élève de troisième année à la Pitié-Salêpetrière (XIII e).

Une délégation a été reçue par le cabinet de Roselyne Bachelot dans l'après-midi.

«On nous a promis que la participation se ferait uniquement sur la base du volontariat. Mais nous restons vigilants», estimait un délégué syndical à l'issue de l'entretien.

Grippe: collégiens et lycéens rechignent à se faire vacciner

Les Echos, 4 Décember 2009 à 01:01
https://www.lesechos.fr/2009/12/grippe-collegiens-et-lyceens-rechignent-a-se-faire-vacciner-469527

Seuls quelque 10 % des élèves des collèges et lycées *«demandent effectivement à être vaccinés»* contre la grippe A (H1N1), a indiqué hier le ministre de l'Education, Luc Chatel. Au 1er décembre, une semaine après le début de la campagne dans les établissements, *«nous étions à plus de 30.000 collégiens et lycéens vaccinés»,* a-t-il précisé. Face à ces chiffres décevants, Luc Chatel a rappelé *«l'importance pour les parents de solliciter la vaccination de leurs enfants».*

L'épidémie, elle, gagne du terrain, avec près de 1 million de personnes (993.000) ayant consulté pour des infections liées au virus la semaine dernière. En une semaine également, 24 nouveaux décès ont été enregistrés et 481 personnes ont été hospitalisées. *« Cette hausse semble ralentir un peu»,* a toutefois déclaré la ministre de la Santé, Roselyne Bachelot, hier. Le nombre d'établissements scolaires complètement fermés a d'ailleurs été ramené à 190 hier, contre 219 mercredi.

Recrutements express

Les 1.080 centres de vaccination sont désormais tous ouverts. 1,33 million de Français ont été vaccinés en dix-huit jours. L'objectif gouvernemental est flou : le Premier ministre, François Fillon, avait indiqué qu'il s'agissait de vacciner 12 millions de Français dans les semaines qui viennent, Roselyne Bachelot affirmant dans « Le Monde » viser 30 millions d'ici à février.

Une chose est sûre, les 94 millions de doses de vaccins achetées ne seront pas nécessaires (une dose suffit pour les plus de 10 ans). Pour pallier l'engorgement persistant dans certains centres de vaccination, en particulier dans les grandes agglomérations (Paris, Lyon, Toulouse), le secrétaire d'Etat à l'Emploi, Laurent Wauquiez, a annoncé hier le recrutement express en contrats aidés spécifiques de 5.000 personnes. Les contrats d'une durée de six mois seront subventionnés à 100 % par l'Etat, et ils seront proposés par les associations (dont la Croix-Rouge) et les collectivités locales, afin d'aider à l'accueil dans les centres.

« Réquisitions intolérables »

La tension entre le gouvernement et les médecins libéraux reste vive. Le syndicat des médecins libéraux (SML) a dénoncé hier certaines *«réquisitions intolérables »*de praticiens, en région parisienne, car ne *«respectant pas les plages de disponibilités indiquées par les médecins volontaires».* Roselyne Bachelot, de son côté, a déclaré qu'elle *« ne voyait pas d'argument qui nous ferait revenir en arrière»* sur le choix de ne pas autoriser la vaccination dans les cabinets médicaux. *«La vaccination coûterait beaucoup plus cher en cabinet »,* affirme-t-elle.

Uusi Suomi Blogit

Riikka Söyring

An open letter to all members of the WMA, World Medical Association, and healthcare personnel all over the world

Uusi Suomi, 6 December 2009
https://puheenvuoro.uusisuomi.fi/riikkasoyring/24669-an-open-letter-to-all-members-of-the-wma-world-medical-association-and-healthcare-personnel-all-over-the-world/

My name is Riikka Söyring.
I am from Finland.
I write to you as I think it is necessary to share this information about the swineflu and vaccinations.

A couple of days ago there was "news" in the paper that STM (finnish Social- and Health Ministry) is monitoring chats, blogs and netforums to keep a track of discussions concerning Swineflu.

Hospital personnel has told us -anonymously- that THL (finnish Health- and Wellbeing-department) has forbidden to keep a register of the symptoms people get after vaccination and the dead are neither to be registered.

Private clinics are forbidden by THL to take Swineflutests.

How can it be said that we have a pandemic going on if it is not followed with records?
How does this fits in with democracy, transparency and the spirit of the WMA declaration of Helsinki?

It does not, in my humble opinion.
It is a breach of a Constitution in many countries.

I personally have contacted the finnish health-committee, MEPs, Chancelor of Justice, Ministers but I am not getting any answers. Not even one. I have contacted Transparency Finland, I have contacted media. No answers.

I have seen a document GlaxoSmithKline demands it´s employees to undersign. By signing it they release GSK from the responsibility of the all harmfull effects this Pandemrix might cause them.

We suspect that Pandemrix is a nanovaccine. They are not patented, licensed, tested yet. If this is so, it is extremely dangerous for pregnant women as it causes irreversible changes in the mitochondryo of the phoetus.

There is a person who is demanding in the court that THL submit the papers revealing the real substance of Pandemrix. So far they have refused to do so.

I ´ll enclose a link, it´s a graphic so that even if you do not understand the language you´ll understand the names (some familiar among them…) and euro-marks

here´s the link http://www.svd.se/nyheter/utrikes/artikel_3866223.svd?service=graphic

Juhani Eskola and Pekka Puska, chief of finnish THL, both do get money from BigPharma. There are others too in the THL. Also, Terhi Kilpi from THL, actually admits that this H1N1-vaccine was, and is, untested and therefore I conclude that this vaccination-campaign because of "pandemy" was, and is, a large scale test of the vaccine on humans.

http://www.infosota.fi/2009/11/17/terveyden-ja-hyvinvoinnin-laitos-hallinto-oikeuteen-salaisten-h1n1-sopimuspaperien-takia/

Pekka Puska undersigned, as a head of THL, also his acceptance to a law that would allow minors to be used in medical experiments with their own consent only; no written agreement is needed after/if this law passes, no consent of the parents.

The pharmaseutical companies are to have no responsibility of the side-effects or deaths which may result of these medical experiments if this law passes.

I suggest that everyone now, immediately, checks if a law similar to this is on a round and waiting to be accepted in your country.

We are communicating with Sweden also and they tell us that the media in Sweden ignores information about the Swineflu and vaccines as if they were told to do so. Netherland confirms that Pandemrix is a nanovaccine:

"Our gouverment has declared they will shut down web-site's about the true information about the vaccine and the flu. Today our minister of health told about theire interactions on blog's and forum's; so they'll know how the opnions are. We are aware of that, so we have to be carefull. I can confirm that Pandemrix is a nano-vaccine.

We are still in court with our minister of health, to give the information about the ingredients in the vaccine. Further more; our advisor of our health minister is Ab Osterhaus who has 13 side-jobs in the farmaceutical industry. Read this:

WHO announced the swine flu pandemic under pressure from a panel of advisers, headed by a Dutch doctor, Albert Osterhaus, nicknamed 'Dr. Flu' (from the name 'Tamiflu') because he was active in promoting mass vaccination of the population through WHO and the Western media.

Ever since I've been investigating the HPV-vaccine's I'm no longer on the gouverment mail-list. They've blocked me.

I have daily information about so many terrible affects of this vaccine. Woman who miscarriage, GBS.

We know now, since the vaccinations took place a week ago at least 7 people died. We only know that by internet -sources. Our media is absolutely quiet about that.

*I have proof that our so called Health Commite, lie's about the people who'll have this flu-shot. People were stuck in lines for TV as if they were all there for a Mex. flu-shot. In fact, it was a shot of people in line for a sale and had nothing to do with the Mex. flu shot. They've announced special openings in the weekend, because of the overwhelming amount of people standing in line for the Mex. flu sho*t."

I have a report from Germany. Vaccine was analyzed and found containing particles that do not belong into them. Same in Belgium.

Vaccines could be used as a bioterrosrism weapon. It is against this
http://ec.europa.eu/social/BlobServlet?docId=3852&langId=en

I am thinking about how a 72 kg of Avian flu-medication got mysteriously contaminated.

The afore mentioned portion was made by Baxter Biopharma, a company with a biosafetylevel3.

Dr. Joseph Moshe tried to warn people but got arrested (and probably ended up in a mental hospital).

Also Ukrainian happenings are most alarming and weird.
###

Here a little something other as an example:

"Who has been developing infertility vaccines since 1974? The answer is WHO.

"In 1998 a Patent Application was made for a system which uses a person's own immune system to render them permanently infertile, sterile, unable to have children. The system is irreversible, once injected." (See Squalene: Be Very Afraid Part I)

see the link:
https://puheenvuoro.uusisuomi.fi/riikkasoyring/24669-an-open-letter-to-all-members-of-the-wma-world-medical-association-and-healthcare-personnel-all-over-the-world/

THE FLU CASE

Joseph Mercola

Most Britons reject Swine Flu vaccine

The Flu Case, 8 December 2009, 14:52
https://web.archive.org/web/20100102041202/http://theflucase.com/index.php?option=com_content&view=article&id=2208%3Amost-britons-reject-swine-flu-vaccine-reports-dr-mercola&catid=1%3Alatest-news&Itemid=64&lang=en

More than half of Britons being offered vaccination against pandemic H1N1 flu are turning it down because they fear side effects or think the virus is too mild to bother.

A survey of more than 100 family doctors indicated that there was widespread resistance from patients, and that on average only 46 percent of those offered the vaccination agree to have it.

Doctors reported particular difficulties in persuading pregnant women to be vaccinated against the virus.

Skepticism has been growing in Britain and other European countries about health authorities' handling of the H1N1 pandemic, because the number of people infected has been lower than originally feared.

Further, rates of infection by the 2009 H1N1 influenza virus may have peaked in late October, according to a new report by Quest Diagnostics.

As U.S. health officials struggle to vaccinate tens of millions of Americans against the pandemic of swine flu, some are now even looking regretfully at one easy way to instantly double or triple the number of doses available – by using an immune booster called an adjuvant.

These additives broaden the body's response to a vaccine, reducing the amount of active ingredient called antigen needed. They are widely used in European flu vaccines as well as in Canada. But not in the United States – even though the federal government has spent nearly $700 million buying them.

The reason – people might not trust them.

Polls show that only about half of Americans plan to be vaccinated against H1N1. Of those who do not, about half say they worry about safety.

Further, The World Health Organization is looking into reports in Britain and the United States that the H1N1 flu may have developed resistance to Tamiflu in people with severely suppressed immune systems.

Britain's Health Protection Agency (HPA) said five cases have been confirmed in Wales of patients infected with H1N1 resistant to Tamiflu.

…

The massive swine flu vaccination propaganda push seems to be falling on deaf ears, or perhaps more accurately, is being squelched by informed people making the wise, common sense decision to avoid becoming an H1N1 vaccine guinea pig.

Echoing the majority of Britons who have decided to skip the swine flu vaccine, nearly 7 out of 10 Americans in the 18-29 age bracket said they will not get the H1N1 vaccine, according to an ABC News-Washington Post poll on October 22. Ditto for 62 percent of those aged 30-64, and 53 percent of seniors, aged 65 and over.

But this doesn't mean the hard-sell vaccine push is over. Far from it.

Even as Quest Diagnostics' Health Trends Report showed that H1N1 cases appear to have peaked in October, with rates of positive H1N1 test results declining in nearly all age groups and most U.S. regions since late October, the CDC still recommends getting vaccinated.

If you are one of those people still on the fence, trying to decide whether or not you should get the H1N1 vaccine for yourself or your child, I urge you to read my previous article, CBS Reveals that Swine Flu Cases Seriously Overestimated, if you have not already done so, to get a much clearer picture of this overhyped threat.

For example, according to the CBS News investigation, when you come down with chills, fever, cough, runny nose, malaise and all those other "flu-like" symptoms, the likelihood of the illness being caused by influenza is, at most, 17 percent of the time, and as little as 3 percent!

The other 83 to 97 percent of the time it's caused by other viruses or bacteria.

Based on this fact, and the fact that the CDC changed the way they count "H1N1 cases" as of the end of August, to now include any and all "flu-like symptoms," it's quite possible that current mortality statistics are exaggerated by as much as 80-90 percent, or more!

Is the Vaccine Even Effective?

If you read through the package inserts for the injectable, inactivated flu vaccines, you will find the following paragraph:

"Specific levels of HI antibody titers post-vaccination with inactivated influenza virus vaccine have not been correlated with protection from influenza virus. In some human studies, antibody titers of 1:40 or greater have been associated with protection from influenza illness in up to 50% of subjects."

What that paragraph explains is that, to the best of our knowledge, the vaccine only works in half, or less, of those individuals who attain the specified level of seroconversion after vaccination.

The FDA defines seroconversion as achieving an antibody titer of 1:40.

This means that if a vaccine was 100 percent effective at achieving this level of seroconversion, it would protect up to 50 percent of the recipients of the vaccine.

But none of the vaccines are 100 percent effective at achieving seroconversion.

CSL's vaccine insert, for example, states that their H1N1 vaccine provides seroconversion for:

48.7 percent of people aged 18-65
34 percent for seniors, 65 and older

That means that, at best, their vaccine produces antibody levels in one out of every four people!

Which, of course, means that the vaccine does NOT work in three out of every four people…

Is a 25 percent chance of reaping any sort of benefit worth the risk? For a mild, over-hyped illness?

The Heartbreaking Side Effects of the H1N1 Vaccine are Beginning to Surface

This past article contains personal stories of heartbreak – pregnant women who lost their babies just hours or days after getting the H1N1 vaccine this year.

Naturally, the standard comeback is that miscarriages are commonplace, and surely have nothing to do with the vaccine. However, to simply dismiss these events as "coincidences" is a serious mistake.

Perhaps some of the 20 women on one of the blogs would have miscarried anyway, but when a number of women have healthy, uneventful pregnancies up until they're injected with a vaccine, and then suddenly miscarry, it most certainly warrants investigation!

Meanwhile, Jordan McFarland, a 14-year-old boy from Virginia, is weak and struggling to walk after coming down with a reported case of Guillain-Barre syndrome (GBS) within hours after receiving the H1N1 vaccine for swine flu.

At the beginning of November, a 42-year-old Quebec woman died two days after receiving the H1N1 vaccine. But did authorities report it as an adverse reaction to the vaccine?

No! Instead, they attributed her death to complications resulting from the H1N1 virus!

I suppose they did this because she developed flu-like symptoms. What they didn't say was that flu-like symptoms are also some of the adverse reactions you get from receiving a flu shot.

They also didn't say that other reactions can include Guillian-Barre Syndrome (GBS) convulsions, syncope (fainting), blood and lymphatic system disorders, and immune disorders such as anaphylaxis, just to name a few – all events that can be life-threatening enough to end in death.

It's no surprise, then, that when an 80-year-old man died in Quebec after getting his H1N1 vaccine, health officials dismissed that too, saying it was too soon to link his death to the shot.

Get the Facts Before You Get the Vaccine

The mainstream press just keeps plugging the same old propaganda, disregarding what is actually happening.

The truth is, while the mortality rate of swine flu is extremely low, what is happening is that people are dying or suffering life-altering disabilities shortly after receiving the flu vaccine, whether it's seasonal or H1N1 – and officials accept this as the cost of doing business.

But do you?

I suggest that before you take this shot, ask your doctor to supply you with a package insert from the vaccine, and to discuss all the possible adverse reactions with you. Any health professional should be able to do this – in fact, it is part of something called "informed consent," which is required for any medical procedure, including each and every vaccination.

But just in case your doctor doesn't have the insert handy, or has forgotten about informed consent, you can find four of the five inserts here. I predict that what you learn there will not be something you read in your local newspaper.

Nachrichten.ch

Beat Schlatter lässt sich selbst nicht impfen

Nachrichten, 9. Dezember 2009, 16:06 h
http://www.nachrichten.ch/detail/418900.htm

Beat Schlatter, Sprecher des Schweinegrippe-TV-Spots, will sich selbst nicht impfen lassen, obwohl er dies dem Fernsehpublikum monatelang empfohlen hat.

«Ich liess mich nicht impfen», sagte Schlatter zum «Blick» am Mittwoch. «Der Impfstoff ist für Amerikaner und Österreicher besser geeignet». Das habe ihm der Hausarzt empfohlen, wird der Zürcher Volksschauspieler witzelnd im Boulevardblatt zitiert. Im November hatte Schlatter gegenüber news.ch versichert, er werde sich impfen lassen, sobald sein Hausarzt den Impfstoff habe. Schlatters Auftragsgeber, das Bundesamt für Gesundheit, betont, es sei wichtig, dass sich all jene, die zu einer Risikogruppe gehören, impfen lassen. Wer nicht krank werden will, kann sich impfen lassen, so das BAG. Das BAG hält fest, es sei ein persönlicher und individueller Entscheid, ob man sich impfen lassen will oder nicht.

Das gelte auch für Herr Schlatter.

Bereitschaft nicht sehr gross

Die Bereitschaft der Schweizerinnen und Schweizer, sich impfen zu lassen, ist nicht sehr gross. Bei einer zwischen dem 9. und dem 24. November durchgeführten Befragung gaben nur 12 Prozent an, sich impfen zu lassen. Bei Umfragen im Juni und im August hatten sich noch mehr Menschen impfbereit erklärt.

THE FLU CASE

Swiss Actor in Swine Flu ad says won't take jab

The Flu Case, 10 December 2009, 12:56
https://web.archive.org/web/20100102035652/http://theflucase.com/index.php?option=com_content&view=article&id=2228%3Aswiss-actor-in-swine-flu-ad-says-wont-take-jab&catid=1%3Alatest-news&Itemid=64&lang=en

The Swiss comedian Beat Schlatter, who featured in TV ads promoting the swine flu jab, has said he is not taking the jab.

"The vaccine material is better suited to Americans and Austrians," he quipped in an interview with Blick newspaper.

In November, Schlatter said he intended to take the jab but like other Swiss he has changed his mind leading to the closure of vaccine clinics across Switzerland, including in Biel and Bern, just a couple of weeks after they opened.

THE FLU CASE

People of Hawaii pass Resolution against forced vaccination Laws

The Flu Case, 10 December 2009, 11:42
https://web.archive.org/web/20100102052008/http://theflucase.com/index.php?option=com_content&view=article&id=2223%3Apeople-of-hawaii-pass-resolution-against-forced-vaccination-laws&catid=1%3Alatest-news&Itemid=64&lang=en

Hawaii H1N1 Resolution Advances Vaccination Exemptions Favoring Americans' Growing Demand for Health Freedoms

Hilo, HI-Department of Health officials in Hawaii were overruled by County of Hawaii directors supporting a resolution favouring First Amendment constitutional rights and vaccination exemptions for everyone demanding them.

The nearly unanimous 7-1 Big Island of Hawaii Council vote sent a strong message to State and Federal policy makers to consider a majority of people who solidly distrust risky vaccines in general, and health officials' claims of safety regarding H1N1 vaccines in particular.

The vote demonstrated the power of local community activists to rebuke "top down" policies advancing "mandatory" vaccinations during declared emergencies. The Council's decision backed the majority of people unwilling to lose health freedoms to Federal governors directing State health officials on behalf of BigPharma special interests.

The Resolution (237-09) urges State and Federal legislators in Hawaii "to amend vaccine laws to include medical, religious, and philosophical exemptions from any vaccine program," including those declared urgent by health officials.

Proponents declared this a victory for health freedom--a warning to health officials seeking mandatory vaccination authorizations under Federal "national emergency" codes that expand State health official powers under the Model State Emergency Health Powers Act.

The vote reflects a nationwide trend of increasing public distrust of official proclamations of vaccination safety and efficacy. A solid majority of medical doctors, and nearly 70% of parents polled by Consumer Reports, feared the new vaccines and were determined not to recommend them.

After exhaustive research conducted by Council researchers and attorneys, and many drafts, the Resolution stated, "there is insufficient scientific evidence proving that vaccines are safe or effective, therefore it is not in the best interest of public health to recommend vaccinations without exemptions."

"WHEREAS, in the wake of potential harm to the individual and the public from vaccinations, and the vacillating interpretation of 'vaccine science,'" the Resolution declares, "it is in the public's best interest to amend the vaccine laws to include the right of medical, religious, and philosophical exemptions from any vaccination program."

The Resolution was advanced by native Hawaiian County Councilwoman, Emily Naeole-Beason, who heard from several constituents concerned about vaccine-injuries. Many complaints received by the Council cited the toxic ingredient mercury linked to neurodevelopmental and behavioural disorders in children denied by public health officials.

"This is a victory for health freedom, common sense, and U.S. Constitutional entitlements," Council Vice Chair Naeole-Beason said. "I am very proud of our Council who put public safety ahead of special interests."

"We are compelled by science and history to not repeat deadly mistakes," said Rev. RJ Hampton, Legislative Aide to Naeole-Beason. "Our office studied vaccine science, and edited the Resolution to read, 'that any vaccine known to contain harmful viruses or any materials known to prompt autoimmune diseases or cancer risks shall provide cause for exemption for any person in the State of Hawai'i who so desires such exemption.'"

"This is a win for 'We the People,'" said Dr. Leonard Horowitz, a Harvard-trained authority in vaccinations and emerging diseases who advised the research committee that considered opinions of several leading U.S. Constitutional attorneys.

Opposition came from the Department of Health Director, Chiyome L Fukino, along with Sarah Y. Park, Chief of the State's Disease Outbreak Control Division. The two medical doctors, heavily supported by the Honolulu Star Bulletin, wrote that "a number of inaccuracies pertaining to immunization were cited in the Resolution . . . ," but failed to show any or send anyone to the County meeting to defend their views.

Dr. Horowitz responded to the Park-Fukino indictment by encouraging Council members to resist health officials' gross conflicting interests and perverse pseudoscientific, and otherwise baseless, testimony.

In an Affidavit to be mailed to Hawaii's State and Federal lawmakers who will vote on the Resolution next, Dr. Horowitz revealed a "conspiracy to cover-up media relations between FUKINO's press officers and agents for the Honolulu Star Bulletin . . ." The Bulletin feeds and publishes Associated Press (AP) propaganda advancing vaccination agendas on behalf of AP director, Rupert Murdoch, and his politically-powerful partners in the Partnership for New York City (PFNYC), the world's wealthiest biotechnology investment group.

Besides this conflicting interest, Murdoch's son James directs GlaxoSmithKlein that markets one of the best selling H1N1 vaccines, and Tamiflu, also purchased by the Fukino's department.

Plus, Rupert Murdoch's Co-Chairman of PFNYC, Lloyd Blankfein, owns a majority share of MedImmune that produces the H1N1 FLUMIST vaccine that Dr. Fukino additionally stockpiled for Hawaiian distribution.

"Wow! Now we know why Auntie Emily gets zero support from the state's main newspapers," replied Rev. Hampton after reading Dr. Horowitz's discoveries. "It's an age old battle between 'We the People' versus corrupt corporations that pollute our minds, bodies, and environments for profit."

Before the 7-1 vote, Dr. Horowitz urged the Council to "limit Hawai'i health officials' grossly overstepped authority, and protect those of us intelligent enough to see the forest of reality through the trees of media propaganda, pseudoscientific fraud, and pharmaceutically administered pangenocide."

The Resolution moves on to Honolulu where health officials have greater legislative support from lobbyists, and the media, advancing drug industry special interests.

China worries swine flu vaccine campaign faltering

Reuters, 11 December 2009, 2:24 PM GMT+8
https://www.reuters.com/article/us-flu-china/china-worries-swine-flu-vaccine-campaign-faltering-idUSTRE5BA0G320091211/

Beijing (Reuters) – China's vaccination campaign against the H1N1 flu strain is not preceding as fast as it should be partly because people are needlessly worried about the safety of the vaccine, officials said on Friday.

Some 125 people in China have died of swine flu, but the country began a mass vaccination program in September and has inoculated more than 32 million people to date.

That campaign, however, seems to be floundering just as the country heads into winter and ahead of the Lunar New Year holiday in February, when millions of people travel back to their home towns – potentially taking flu with them. – "Generally speaking, vaccination work has been proceeding smoothly, but recently progress has been quite slow in some areas," Health Ministry spokesman Deng Haihua told a news conference.

"Experts expect that the next one to two months will be key in the fight to prevent H1N1," he added. "After new year comes the lunar festival, where people will be on the move in large numbers across the country, which will put yet more pressure on preventing the spread of the virus."

Liang Wannian, head of the ministry's health emergency office, said there were several reasons for the slower-than-expected progress in vaccinations, though he did not say how many people they had hoped to reach by this time. – "I don't rule out that some people have worries over the safety of the vaccine," Liang said. "Perhaps our publicity work about the safety and effectiveness of the vaccine has not reached everyone it should have.

"We will lose the opportunity to effectively prevent and control the disease if we don't accelerate this campaign," he added.

The government has repeatedly said that the vaccine is safe, as has the World Health Organization.

Deng, the spokesman, said that "abnormal reactions" to the vaccine were at about one in one million, well within internationally accepted norms and parameters.

Another concern which has been expressed is that China may have had more flu deaths than has been officially reported. China's death toll of 125 compares with nearly 10,000 in the United States.

Well-known Chinese doctor Zhong Nanshan said last month that he doubted the official death numbers from the influenza strain, saying some areas had not been testing deaths from severe pneumonia and treating them as cases of ordinary pneumonia.

Zhong is respected by many people in China for his candor and work in fighting SARS in 2003, when nationwide panic and international alarm erupted after it emerged that officials hid or underplayed the spreading epidemic.

Ministry official Liang said they had been rigorously enforcing laws against cover-ups of disease outbreaks. – "To date, we have not received any information about cover-ups. If such a thing happens, the Health Ministry will take severe steps under the law," he added.

THE SCOTSMAN

Edinburgh protesters march against swine flu vaccine

The Scotsman, 12 December 2009, 00:00 GMT
https://www.scotsman.com/news/edinburgh-protesters-march-against-swine-flu-vaccine-2443088
Video
https://www.youtube.com/watch?v=Z3MhOU2V9HM

Demonstrators marched through Scotland's capital today to protest against swine flu vaccination.

The group believe H1N1 is not as serious as it is claimed, and have concerns about the safety and usefulness of the vaccine.

Around 80 people took part in today's march along Edinburgh's Royal Mile from St Giles' Cathedral to the Scottish Parliament.

Organiser Claire Knox said they hope the protest encourages people to think twice about getting the vaccine.

She believes that figures for the numbers of people suffering swine flu are not accurate and questioned why vaccination is necessary.

She said: "We're not sure that there is a pandemic as it seems the numbers are exaggerated.

"It appears that swine flu is very mild and there are very few cases and I would like to know why they are trying to enforce this vaccination campaign on us.

"The vaccine has not gone through full length testing so there are safety concerns, definitely.

"We just want to highlight the discrepancies and highlight the manipulation of numbers and get people to question whether they need the vaccine when and if it's offered to them."

The 33-year-old said she would not have her seven-month-old daughter vaccinated against swine flu because she fears the vaccine poses more risk than the illness.

She said that campaigning medical journalist Jane Burgermeister travelled from Austria to take part in the march.

Figures released by the Scottish Government this week showed that the swine flu vaccine has been taken by just over one-quarter of Scots most at risk from the virus.

Vaccine uptake for pregnant women was 36.7%, while it was 33.2% for under-65s and 20.3% for over-65s, giving an average of 25.5% for the entire at-risk group.

The estimated uptake rate for front-line health and social care staff was 45.7% and 29.5% respectively – both increases on the previous week.

Chief Medical Officer Dr Harry Burns said: "The H1N1 vaccination is not mandatory. However, vaccination is our best defence against the pandemic and I urge everyone invited for vaccination to take up the offer – particularly pregnant women, who we know are more at risk of developing complications if they contract this illness.

"Both H1N1 vaccines have been licensed by the European Medicines Agency and the European Commission. We have always stated that we would only use the vaccine if we have confidence in its safety."

YouTube MY

Protest against Swine Flu Vaccine Edinburgh 12th Dec

Youtube Video, 12/14 December 2009
https://www.youtube.com/watch?v=Z3MhOU2V9HM

Swine Flu Vaccine protest in Edinburgh on 12th December starting off at St Giles moving down towards the Scottish Parliament building at Holyrood.

The father of Anna discusses the role vaccines have of inducing a heightened reactive response and how he believes the live virus in the MMR caused Anna's death.

The swine flu vaccine with aluminium and squalene as adjuvant will cause harm in the long term but illness and death in the short term also if underlying virus condition exists that includes the mild swine flu virus. This has been said to have been produced in a laboratory.

Squalene is used in the human body to produce natural steroids. Squalene introduced by needle piercing carries proven risk of the body attacking its own steroidal hormone manufacturing capabilty.

Father of Anna believes that soon kids playing football may have to use a steroidal inhaler device to make them aggressive enough to partake in physical sport.

The swine flu vaccine also contains mercury as a preservative. Mercury Poisoning is associated with premature greying hair especially in woman it has also been linked as a cause of Autism.

The book mentioned by Father of Anna is actually called the 'Genome The Autobiography Of A Species' and is written by Matt Ridley not Andrew Ridgeley. Andrew Ridgeley was actually a member of Wham an 80's pop band. Father of Anna denies that he ever voluntaraly listened to Wham which he describes as pap. Father of Anna has been vaccinated many times as he has

travelled to many countries including India, Africa and the Middle East as an explorationist which explains his confusion with Andrew Ridgeley pop star and Matt Ridley the author. Aluminium poisoning is associated with alzheimer's disease.

Father of Anna is currently trying to add up the quantity of toxic ingredients that he has had pumped into him and forced him to give up working offshore in the Seismic Exploration Industry. Many of his ex fellow workmates have had cancer and are possibly dead.

Father of Anna amongst his many shots was vaccinated with separate Cholera, Typhoid and Yellow fever virus and adjuvants at the same time.

Father of Anna has the rare blood type AB -ve he shares with JFK, Marilyn Monroe, Mick Jagger, Jackie Chan and if the Turin shroud is to be believed Jesus Christ. Apparently according to Matt Ridley blood type AB -ve people can drink water from the Ganges and not suffer severe cholera.

Father of Anna has no intention of trying out this theory because he does not know the role vaccines have had of confusing his immune system and that now it might actually not be a good idea to drink cholera infested water. Anna who died ten days after the MMR vaccine aged 17 months was blood type B.

Ten percent of the population in the UK are blood type B. blood types B have specific issues dealing with viruses.

THE FLU CASE

Phil Segrave

The great Swine Flu virus and vaccine Patent conspiracy

The Flu Case, 12 December 2009, 17:35.
https://web.archive.org/web/20100102054205/http://theflucase.com/index.php?option=com_content&view=article&id=2244%3Athe-great-swine-flu-virus-and-vaccine-patent-conspiracy-&catid=1%3Alatest-news&Itemid=64&lang=en

It has been said, 'to catch a white-collar thief, follow the paper or money trail'. In this case, the patent trail is hard evidence of premeditated criminal intent:

The H1N1 virus:
H1N1 Swine Flu Virus Patented by Medimmune Back in 2008 a Year Ahead of Outbreak (http://current.com/1b6tu4c)
http://current.com/items/90938347_h1n1-swine-flu-virus-patented-by-medimmune-back-in-2008.htm

(Patent US 20081006921 A1)
According to WHO on April 2009, H1N1 was identified as a natural virus, but Medimmune got a patent for a manmade H1N1 virus in 2008.
Genetically Engineered Swine Flu Virus Patent Filed January 2009
Private Inventors
(Patent Application 20090010962)

THE H1N1 VACCINES:
Baxter (Kistner Pharm) files Swine Flu vaccine 2008 Patent a Year Ahead of Outbreak
http://www.globalresearch.ca/index.php?9Acontext=va&aid=14430
(Patent US 20090060950 A1)

Novartis of Switzerland ...applied for it's Swine Flu vaccine patent on Nov. 6, 2006 3 Years Ahead of Outbreak
http://ahrcanum.wordpress.com/2009/09/18/swine-flu-vaccine-patent-conspiracy/
(Patent US 20090047353) for a 'split Influenza Vaccine with Adjuvants

GlaxoSmithKline's 2006 Pandemrix H1N1 flu virus vaccine filed 3 years ahead of Outbreak
http://www.theoneclickgroup.co.uk/news.php?start=2900&end=2920&view=yes&id=3825#newspost
(Patent WO2006100109 A1) to GSK Filed 21st March 2006

These four virus and vaccine producers; Medimmune, Baxter, Novartis and GlaxoSmithKline, as well as many others, including in China, have each filed for and received patents to produce H1N1 vaccines before the WHO declared the H1N1 pandemic of 2009.

However, it is important to note that in order to apply for and receive a patent on an 'invention' it is necessary to have a distinctly different product, otherwise, what is the purpose of a patent? This means each vaccine allegedly has different immunological properties that are safe and effective at treating the current H1N1 virus strain.

In other words, these companies have applied for and received patents on vaccines with different immunological properties that are alleged to have a safe and effective universal application to the hundreds of known H1N1 virus strains. If they are so sure their vaccines are safe and effective, why did these companies demand immunity from prosecution for producing a product that may cause severe adverse reactions and even death?

How scientific is that?

See the articles 'There are many variants to the H1N1, Says CFR1' and 'H1N1 vaccine Patent filed (2007) long before the Flu virus was Spread!' posted at www.theflucase.com.

https://web.archive.org/web/20100102054205/http://theflucase.com/index.php?option=com_content&view=article&id=2244%3Athe-great-swine-flu-virus-and-vaccine-patent-conspiracy-&catid=1%3Alatest-news&Itemid=64&lang=en

Developing biological agents (viruses) and 'testing' them on the public in the U.S. is legal under the regulatory code below:

US CODE
TITLE 50, Chapter 32, Section 1520
§ 1520a. Restrictions on use of human subjects for testing of chemical or biological agents
(a) Prohibited activities
The Secretary of Defense may not conduct (directly or by contract) -
(1) any test or experiment involving the use of a chemical agent or biological agent on a civilian population;
(2) any other testing of a chemical agent or biological agent on human subjects.
(b) Exceptions
(1) Any peaceful purpose that is related to a medical, therapeutic, pharmaceutical, agricultural, industrial, or research activity.
(2) Any purpose that is directly related to protection against toxic chemicals or biological weapons and agents.
(3) Any law enforcement purpose, including any purpose related to riot control.

Winnipeg Free Press

Vaccine shouldn't be wasted

Winnipeg Free Press, 14 December 2009, 01:00 AM
https://web.archive.org/web/20091217085522/http://www.winnipegfreepress.com/opinion/editorials/vaccine-shouldnt-be-wasted-79202027.html

Manitobans appear to be losing interest quickly in protecting themselves against the H1N1 pandemic virus and for obvious reason: Although it spreads quickly and makes some people very ill, the virus has not had the virulence that immortalized the plagues of the past. Many people feel very little threat from H1N1.

That may be a problem in two ways. First, if the flu infections surge again, the low rate of immunization puts people at risk. Second, if the pandemic peters out, there will be a whole lot of expensive medicine sitting around in the provincial warehouse as the best-by date approaches. Every crisis presents opportunity and this pandemic experience is instructive, particularly for pandemic and emergency planners.

Manitoba last summer signed a contract with the federal government and vaccine producer GSK to buy 1.3 million doses of vaccine. There is no escape clause; Manitoba is committed to paying for the entire order.

Provincial emergency planners are not second-guessing the decision made early to order enough doses to cover the whole population, including non-Manitoban residents. In an abundance of caution, it was decided it would be better to be holding surplus than to be caught short, especially if demand rose out of fear or if the pandemic turned virulent.

Public health planners say we are not out of the woods yet on H1N1. According to them, Manitoba remains at the peak of pandemic activity, based on hospitalizations, ER visits, ICU admissions and reports from community sources, such as nursing homes. But the week of Nov. 30 saw only 40,000 doses of vaccine administered in Manitoba, a dramatic drop compared to three weeks earlier, when 50 per cent more were administered in Winnipeg clinics alone.

Now, with less than 35 per cent of Manitobans vaccinated, this province is cutting the number of clinics while it holds in store 440,000 doses. It is scheduled to take delivery of a whole lot more. At present, no one is thinking of finding a new market for the surplus -- a third wave of H1N1 could send unvaccinated Manitobans scurrying to their doctor's offices for a shot yet.

Along with rethinking the wisdom of using a sole vaccine supplier and of leaving children, the main source of transmission of H1N1, out of the early target group for vaccination, Canadian pandemic strategists should consider negotiating future contracts with flexibility. An option to halt or slow delivery to reflect the circumstances ought to be included, giving the manufacturer the opportunity to look for other buyers around the world, in countries that may be starting to see the virus arrive.

The total cost of the vaccine includes its administration, and so a hefty portion of the $16 million Manitoba budgeted will be unspent if people stop coming in for vaccination. It would be a terrible waste, however, if, as the threat waned here, the surplus doses of vaccine sat in storage, past their "shelf" life of 18 months.

Provincial officials should be starting to identify other countries to take the unused vaccine. They could include developing nations, which may be very grateful, indeed, to benefit from the affluence that allows some countries the privilege of learning lessons that take only a monetary toll.

THE FLU CASE

Joanna Karpasea-Jones

Direct Rebuttal to Health Protection Scotland and Scottish Health Minister Nicola Sturgeon

The Flu Case, 18 December 2009 13:52
https://web.archive.org/web/20100131145340/http://theflucase.com/index.php?option=com_content&view=article&id=2339:direct-rebuttal-to-health-protection-scotland-and-scottish-health-minister-nicola-sturgeon-by-joanna-karpasea-jones-&catid=1:latest-news&Itemid=64&lang=en

Direct Rebuttal to Health Protection Scotland and Scottish Health Minister Nicola Sturgeon re Their Comments on Our Protests

Dear Health Protection Scotland

I would like to directly challenge you after you asserted in a newspaper article in the Scotsman, by Richard Bath, that my organisation was 'persuing a reckless cause' that would lead to the deaths of babies and mothers from swine flu, due to my organisation heading protests against the untested vaccine.

There is *No Proof* for your assertion that my organisation would do any such thing and ample proof that you, Health Protection Scotland, are being reckless with the lives of thousands of unborn infants and their mothers.

According to this NHS training pack for immunisers, here:
http://209.85.229.132/search?q=cache:RbuvyWzwBe4J:www.nes.scot.nhs.uk/hai/pandemic_flu/documents/H1N1v1.003-08-09.pdf+Celvapan+data+sheet&cd=8&hl=en&ct=clnk&gl=uk&client=firefox-a

Both vaccines, Pandemrix and Celvapan *have not been evaluated* for side-effects or contraindications so it is basically a big experiment and you have no idea if the patient you are injecting is contraindicated or what type of side-effects they might experience. It has also NOT been tested on pregnant women so to recommend it for pregnant women is irresponsible, particularly when the Pandemrix version contains mercury which has been detected in evalated levels in autistic children (Journal of American Physicians and Surgeons Volume 8 Number 3 Fall 2003) and Merck, a vaccine manufacturer, say thimerosal can cause 'considerable damage to health and may even be lethal' -
https://web.archive.org/web/20160805021052/http://www.vce.org/mercury/thimerosal-usp.pdf

My question would be why you are injecting a potentially lethal substance into a pregnant woman?
Another study found that even tiny injections of thimerosal can cause autism - 'As a result of the present findings, in combination with the brain pathology observed in patients diagnosed with autism, the present study helps to support the possible biological plausibility for how low-dose exposure to mercury from thimerosal-containing vaccines may be associated with autism' - (Induction of metallothionein in mouse cerebellum and cerebrum with low-dose thimerosal injection, Cell Biology and Toxicology, 0742-2091 (Print) 1573-6822 (Online), 9 April 2009).

The Journal of Pediatric Infectious Diseases also said that governments should bring in laws that prevent the use of thimerosal in vaccines – [*Journal of Pediatric Infectious Diseases*, 2009, 4(3): 229-232], and in many other countries in the world, H1N1 vaccine is NOT recommended for pregnant women. https://content.iospress.com/articles/journal-of-pediatric-infectious-diseases/jpi00166

In fact, a data sheet for Afluria H1N1 vaccine shows that the vaccine *should not be used in pregnant or nursing mothers* and has not been tested in such groups:

Pregnancy Category C: Animal reproduction studies have not been conducted with Influenza A (H1N1) 2009 Monovalent Vaccine or AFLURIA. It is also not known whether these vaccines can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Influenza A (H1N1) 2009 Monovalent Vaccine should be given to a pregnant woman only if clearly needed.

Neither Influenza A (H1N1) 2009 Monovalent Vaccine nor AFLURIA *has been evaluated in nursing mothers*. It is not known whether Influenza A (H1N1) 2009 Monovalent Vaccine or AFLURIA is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Influenza A (H1N1) 2009 Monovalent Vaccine is administered to a nursing woman.'

https://web.archive.org/web/20160404030359/http://www.afluria.com/docs/pi.pdf

Although this brand is not being used in the UK, they are all very similar H1N1 vaccines.

According to a 10 November government document, plans are in place to mandate H1N1 vaccine and exclude unvaccinated children from school –

https://web.archive.org/web/20100423153715/http://www.parliament.uk/commons/lib/research/briefings/snsc-05164.pdf

This is a violation of human rights and since the drug is clearly experimental, admitted in the NHS document, it is against the nuremburg code. The first directive of the nuremburg code states that:

'The voluntary consent of the human subject is absolutely essential. This means that the person involved should have legal capacity to give consent; should be so situated as to be able to exercise free power of choice, without the intervention of any element of force, fraud, deceit, duress, over-reaching, or other ulterior form of constraint or coercion; and should have sufficient knowledge and comprehension of the elements of the subject matter involved as to enable him to make an understanding and enlightened decision. This latter element requires that before the acceptance of an affirmative decision by the experimental subject there should be made known to him the nature, duration, and purpose of the experiment; the method and means by which it is to be conducted; all inconveniences and hazards reasonable to be expected; and the effects upon his health or person which may possibly come from his participation in the experiment.' –

https://web.archive.org/web/20100102172249/http://ohsr.od.nih.gov/guidelines/nuremberg.html

So even suggesting that vaccines could be coerced is illegal.

The JCVI meeting minutes for 18 February 2009 said that they would only introduce influenza vaccines for pregnant women if it was cost effective and reduced respiratory disease in neonates:

'the vaccination of pregnant women was only likely to be cost-effective if there was evidence to suggest that vaccination in the late stages of pregnancy reduced influenza in neonates.' –

https://web.archive.org/web/20091105185021/http://www.dh.gov.uk/prod_consum_dh/groups/dh_digitalassets/@dh/@ab/documents/digitalasset/dh_097411.pdf

So in actual fact, they introduced a vaccine that had *no evidence* of reducing disease in newborns and were only interested in introducing it if it made enough money. It seems money is more important to this government than the health and wellbeing of mothers and their babies.

A report in Le Parisen newspaper in France told of a mother who lost her baby at term after being vaccinated and the baby had H1N1 in his tissues (*Le Parisien*, 14 December 2009) and another

report in a Swedish paper told of a previously healthy mother who had a brain haemorrhage after vaccination and her baby had to be delivered two months early –

Grippe A: enquête après le décès d'un enfant vacciné. – Le Parisien, 12 décembre 2009, à 07h00
https://www.leparisien.fr/societe/grippe-a-enquete-apres-le-deces-d-un-enfant-vaccine-12-12-2009-741894.php
Fick hjärnblödning efter vaccineringen. – Aftonbladet, 13 December 2009.
https://web.archive.org/web/20091214171115/http://www.aftonbladet.se/nyheter/article6283276.ab

There are dozens of women in the UK writing to the newspapers with similar stories, so you, Health Protection Scotland, are endangering the lives of many, and all for an illness that is as mild as normal flu. If you look at NHS choices flu and swine flu pages, you will see the symptoms are exactly the same: http://www.nhs.uk/Conditions/Flu/Pages/Symptoms.aspx

https://web.archive.org/web/20100105095528/http://www.nhs.uk/Conditions/Flu/Pages/Symptoms.aspx

Doctors are NOT taking swabs for this so they have no idea if the person actually has H1N1 or not and the person gets diagnosed over the phone without even being seen just to boost up swine flu notifications to encourage sales of your untested vaccine and misdiagnoses over the phone line have actually led to children dying of meningitis.

This for an illness that has killed far less than regular flu. One in three people get cancer, yet you don't scream from the roof tops about how everyone is going to die in the same way you have done with swine flu.

You are highly irresponsible and put money, profit and government agenda ahead of the health of mothers and their babies.

You should be ashamed of yourself,
Joanna Karpasea-Jones
Vaccine Awareness Network UK.

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

Anthony Gucciardi

VacciNation: Duped by Medical Quackery

InfoWar, 20 December 2009
https://web.archive.org/web/20120118002444/http://www.infowars.com/vaccination-duped-by-medical-quackery/

Vaccinations are pushed by the news media and other so-called experts as the miracle cure to a variety of conditions, but have you ever examined the science for yourself? Would the very suggestion that vaccinations are harmful incite anger inside of you, causing you to dismiss this article as hogwash? If vaccinations are truly the silver bullet against deadly diseases, and their safety is indeed based upon concrete science, then there should be no fear as to investigating the matter further.

Why then, is mainstream media along with many medical establishments refusing to discuss the science behind vaccinating to a proficient degree? You could argue that it's "so stupid that they don't want to waste their time on it", but if that were the case then why are so many doctors exposing the health hazards of vaccines? Even if it so so stupid that it made absolutely no sense, wouldn't the mainstream media pick it up to get higher ratings? Wouldn't the "loonies" bring some viewers to their station, to laugh at their "insanity"?

The research is out there

Vaccines and Immunization References and Research Citations Vaccines Have Been Linked to Leukemias and Lymphomas:

Bichel, "Post-vaccinial Lymphadenitis Developing into Hodgkin's Disease", Acta Med Scand, 1976, Vol 199, p523-525.

Stewart, AM, et al, "Aetiology of Childhood Leukaemia", Lancet, 16 Oct, 1965, 2:789-790. [Listed under Vaccine Adverse Reactions.]

Glathe, H et al, "Evidence of Tumorigenic Activity of Candidate Cell Substrate in Vaccine Production by the Use of Anti-Lymphocyte Serum", Development Biol Std, 1977, 34:145-148.

These are but a few of the studies. This is not a complete list.

Thimerosal (Mercury) is a toxic additive.
Even if vaccinations were effective outside the realm of additives, they would still be harmful. The title of the toxic additive may have changed from "mercury" to "thimerosal", but it's effects have stayed the same. If you don't believe that thimerosal is in the vaccination, then why don't you take a look at the insert tab for the seasonal flu vaccine. Perhaps the most disturbing fact is that thimerosal is not the only additive. The other additives might churn your stomach.

Other additives:
aluminum hydroxide aluminum phosphate
ammonium sulfate amphotericin B
calf (bovine) serum animal tissues: pig blood, horse blood, rabbit
brain, dog kidney, monkey kidney, chick
embryo, chicken egg, duck egg
betapropiolactone fetal bovine serum
formaldehyde formalin
gelatin glycerol
human diploid cells (originating from
human aborted fetal tissue)
hydrolized gelatin

This is not a complete list. This is but an excerpt from the Physician's Warranty of Vaccine Safety, which is actually supposed convince people that vaccines are good for you.

Disapproval of the truth

With *kids being offered pizza to take the deadly swine flu vaccine*, it's easy to see that vaccinations are not being suggested, but instead we are being pushed to take them as if it were immoral to object.

Fighting Swine Flu With Pepperoni. – WXYZ, 17 December 2009.
https://web.archive.org/web/20091221062628/http://www.wxyz.com/news/local/story/Fighting-Swine-Flu-With-Pepperoni/EhuwIPzsFEK-yh1OqX2eug.cspx?rss=785

The mainstream media acts as if everyone who rejects their vaccination will infect everyone else. How is this possible if the vaccinations work as claimed? If others are vaccinated, shouldn't someone without the vaccinations be a non-issue? Personally, I know quite a few people who received the h1n1 vaccine, yet also came down with h1n1 more than once after the fact.

Once you research the information for yourself, you come to realize that it is quite simple. Just because the mainstream media pushes it as a medical miracle does not make it so. The only way to correctly find the truth in something is to investigate it. Once you go through this process you find out the truth of the matter: the science behind vaccinations is filled with medical quackery.

Richard Gale and Gary Null

The Council of Foreign Relations Enters the Vaccine Biz

Progressive Radio Network // OEN, 23 December 2009

https://www.opednews.com/articles/4/The-Council-of-Foreign-Rel-by-Richard-Gale-091223-162.html

The closure of 2009 marks a unique moment in the history of America's healthcare and national health policies. First we were told that a pandemic of swine flu was upon us, which would make us all susceptible to a ravishing tide of medical complications and death. We were told pregnant women, young children and senior citizens should be first in line to receive the H1N1 vaccine, although no studies provided credible evidence of either the vaccine's efficacy or safety for these groups. We were also persuaded repeatedly by the CDC and the media to place our faith in the heroic attempts of the vaccine industrial complex, our federal health officials and the Obama administration to bring these vaccines to market as quickly as possible. In our state of New York, both the swine flu and seasonal flu vaccines were made mandatory to tens of thousands of healthcare workers. Indeed, as a nation, we rose to the occasion. One of the most prolific and expensive public health initiatives in American history was undertaken, and every major media outlet daily encouraged people to get vaccinated. So far, so good.

Then something odd happened. Physicians, scientists and journalists began to ask fundamental questions. What if the pro-vaccine advocates, the World Health Organization (WHO) and government authorities at the CDC, FDA and HHS are wrong? What hard proof is there that it was a pandemic? And what might happen if the H1N1 vaccine has not been tested thoroughly under sound, scientific protocol by the vaccine makers? Reports started to drift in from Australia, New Zealand and South America from the middle to the end of their flu season. Their data provided evidence that there was no pandemic in the southern hemisphere. In fact, the H1N1 flu virus was milder than their normal seasonal flues. That led to a more fundamental challenge to the universally accepted truth by the medical orthodoxy that vaccines are effective and safe. Once the investigative process was underway, dozens and then hundreds of learned voices from responsible scientists, journalists and activists began a pushback, a counter argument that not only were the H1N1 flu and seasonal flu vaccines not shown to be effective and safe by any reliable gold standard, but rather suspicions arose that the H1N1 scare was an intentionally designed hoax. Numerous articles and critiques appeared to deconstruct the influenza vaccine myths, parceling them into fragments of delusional data that had been paraded as dogma by the government and media.

The sad part of the story, with a few notable exceptions such as Sharry Attkinsson's CBS investigative report, is that the major media refused and continues to refuse to report about this. Instead, a counter-campaign has been launched that posits that anyone who questions the efficacy and safety of vaccines is irresponsible. People have been brought forth from the CDC, FDA, pharmaceutically funded think tanks, and researchers and university professors, many of whom receive consultant fees from vaccine makers, to convince the public in the political correctness of the vaccine hypothesis. Moreover, as the New York Times reports, our government's entire vaccine advisory committee has for years been stacked with medical lackeys invested heavily in the private vaccine industry through a variety of conflicting affiliations.

Later during the autumn months another turn of events occurred. Demonstrations in Albany, New York, with over a thousand healthcare workers, concerned parents and physicians at the steps of the capitol brought forth documentation and testimonials showing the New York health officials and policy makers were wrong about the efficacy and safety of the swine flu vaccine. Articles and commentaries challenging the vaccines filled thousands of blogs and websites. The activists were working together, each was filling in pieces of the

puzzle. Countless emails and phone calls flooded the governor's and health commissioner's offices. Finally New York State blinked. Citing the excuse of a shortage in flu vaccines, state officials rescinded their mandatory vaccine requirement.

We are now at a critical turn of events when citizens are being exposed to the alternative science to vaccines. Adults and parents, not just in the US, but throughout the developed world, are not just saying no to the swine flu vaccine, but to all vaccines in general. Consequently, the vaccine industry and its supporter are starting their counter-charge. This strategy is perhaps best observed in a recent Newsweek article to denounce vaccine critics. This shrill piece of yellow journalism, which we will deconstruct below, turned Newsweek into a national platform for the vaccine industrial complex to salvage what remaining credible evidence there is to validate vaccine campaigns.

Much of contemporary pharmaceutical science and its supporting policies are built upon myths masquerading as facts. Hitler's close confidant in charge of the Nazi propaganda machine, Joseph Goebbels stated, "If you tell a lie long enough eventually it will be believed as truth, and the greater the lie, the more people will believe it." After eight years of lies about Iraq's weapons of mass destruction and Sadaam's involvement in 911, and now the false economic recovery being promulgated by bankers in the Treasury and Fed, Americans are becoming accustomed to the truth behind Goebbels' marketing schemes. And there is perhaps no other area of so-called scientific progress that has relied more on deceptive research and a distortion of facts and statistics than in modern medicine's religious belief in vaccines as a miracle to protect the world's population from infectious diseases. The fabrication, cherry picking and blatant corruption behind the vaccine research relied upon by the medical health complex to further its campaigns and launch inquisitorial assaults on the hundreds of thousands of families with children who have been injured by vaccination and the voices of reason who demand that government settle the heated debates concerning vaccine safety and efficacy with sound science has turned into a media war. And now even the Council of Foreign Relations (CFR) has publicly come to the defense of the vaccine manufacturers. This undoubtedly raises the question, why in the world is the CFR getting involved in the vaccine biz?

The CFR, co-chaired by Robert Rubin from the 2008-2010 Great Recession fame, has a strong interest in promoting Rockefeller's global health program to usurp the sovereignty of individual countries' national health policies. Besides the CFR's commitment to the WHO's global health agenda, among the Council's corporate members are three of the five largest pharmaceutical companies, each a major force in the vaccine industry: GlaxoSmithKline, Merck and Pfizer. GlaxoSmithKline is now on the ropes after it's swine flu vaccine had been found responsible for dozens of deaths in Canada and Mexico with additional untold numbers suffering from further injuries[1]

In mid-October of 2009, the CFR convened an extended symposium moderated by CFR Senior Fellow for Global Health, Laurie Garrett, entitled "Pandemic Influenza: Science, Economics and Foreign Policy." The subtitle reflects what may appear to be an incongruent chain for addressing infectious pandemics. But it can be better appreciated when we realize the Council combines terrorism, nuclear weapon proliferation and infectious diseases under one of its strategic global divisions, "countering transnational threats." Moreover, the CFR is the perfect incubator for forging alliances between large multinational corporations and governmental and multilateral agencies, such as the WHO. After their public relations are swept away from public view, this remains the CRF's ultimate mission. In an interview with British epidemiologist Dr. Tom Jefferson from the prestigious Cochrane Database Collaboration in Rome, he worried about the close alliance between the WHO and vaccine executives who compulsively predict erroneous "apocalyptic forecasts" during every flu season. He noted that there exists a mysterious "swine flu committee of 12 who apparently advises the WHO Director General.[2] The great accommodator for such collaborations and strategic planning is none other than the CFR.

During a question and answer period, Tom Wilson, a self-proclaimed freelance hunter against AIDS dissidents and now scientists, researchers and public interest groups challenging vaccines, called those who refuse vaccination "crazies." Wilson recommended the pro-vaccine community create and launch clear sound-bites to denounce anti-vaccine advocates and organizations in order to convince people to be vaccinated. This summarizes quite well the content of Laurie Garrett's article, "The Long Term Evidence for Vaccines," subsequently appearing in the December 7th issue of Newsweek. The article is a litany of sound-bites, void of substantiating scientific references to support its statements, which the reader is expected to accept faithfully. There is not a single instance where Garrett mentions even a slight possibility that a vaccine might perhaps contribute to any one of a number of growing health epidemics in American children: asthma, compromised immune systems, neuro-degenerative disorders such as autism, cancers, diabetes,

gastrointestinal complications, etc. In Garrett's universe, vaccines are sacred. They are divine gifts of human ingenuity to protect the world's population; therefore nothing sacred can be flawed because the CFR and the World Health Organization take humanity's best interests and vital health to heart. Or so the legend goes.

We may never know the full extent to which the CFR has acted behind the scenes to influence governments' and the World Health Organization's lies about a swine flu pandemic and the false figures of H1N1 infection and morbidity, nor whatever role it may have played in creating strategies to induce public fear as a means to enforce flu vaccination. Yet during the CFR's symposium as the US embarked on its herd inoculation of the American public with a potentially unsafe, fast-tracked H1N1 vaccine, questions were raised about how to best counterattack the citizenry's increasing disregard for health officials' warnings and the media's pro-vaccine assurances. The discussions included the idea of creating "an artificial shortage of the vaccine" because "that should cause people to want to get it." A respondent noted, much to the pleasure of the audience, that that had been tried "before with the flu vaccine and people lined up all night to get it." Was it just coincidence that this is what was to follow? It is not completely unreasonable to suspect the CFR has a role in steering some of the Obama administration's health policies. His cabinet is packed with CFR members, and his first selection for General Surgeon, Dr. Sanjay Gupta, is not only a member of the CFR but an unquestioning supporter of vaccination's war on public health. Even amidst the healthcare bill debate, there is clear evidence the CFR is representing its strong alliances with Big Pharma's financial interests. Only days before the vote in the Senate, an article appeared by CFR staff member Toni Johnson, "Generic Drugs: The Other Drug War," which categorically denounced more affordable generic and imported drugs as being a direct threat to the financial growth and well-being of the pharmaceutical industry.

Garrett calls her vaccines "precious." We could not help but think of the seemingly lost and meandering Golem in Tolkein's Ring Trilogy searching for an object that he was never meant to possess. Such is the history of vaccine efficacy and safety, a quest for a magic bullet to save humanity from infectious diseases. One can twist, turn and trump up the truth of vaccine efficacy and safety all one wishes, but still the statistics, which the pro-vaccine community continuously distorts through sound-bites, show that vaccines have done little to decrease rates of infections.

According to mortality figures from the British Office of National Statistics, measles and pertussis (whooping cough) began their rapid decline at the end of the nineteenth century. Both were down 99 percent from 1838 to the year the vaccines were introduced (pertussis in 1950 and measles in 1968). There is another example of an infectious disease that was far more deadly than smallpox that never had a widely accepted vaccine and yet eventually fell into obscurity. During the nineteenth century, scarlet fever was responsible for more deaths than measles, pertussis and smallpox. An ineffective vaccine was created in 1924 but disappeared after the introduction of penicillin.[2] What is important in the example of scarlet fever is that infectious diseases declined not because of vaccine miracles, but because of many other factors including improved health, cleaner water and sanitation, public utilities, better living and working conditions, improved nutrition and other medical advancements. This is the same for just about every infectious disease during the first half of the twentieth century that was already in rapid decline before the advent of their respective vaccines.

Garrett's vision of a world dominated vaccine dystopia is truly amazing. She is correct to sound-bite a potential relationship between prenatal and infant exposure to influenza and a sharp increase in later cognitive disorders, including schizophrenia. Yet her quip only presents an image of a glass half full. What is missing is another body of research showing that the flu vaccine elevates inflammatory cytokines in the mother's maternal and infant's fetal immune systems, especially IL-1 beta and IL-6, similar to infection by a wild virus. Both of these cytokines have been associated with abnormal brain development, including schizophrenia. Furthermore, IL-1 beta increases are not limited to flu infection or the flu vaccine, but also to hepatitis B, a vaccine that is given immediately after birth frequently when a newborn's brain is most vulnerable to viral and contaminant toxicity.[3]

oe24 BUSINESSLIVE

H1N1: 254.804 Österreicher ließen sich impfen

OE24 Business Life, 23 December 2009, 12:40
https://www.oe24.at/businesslive/oesterreich/pharma/h1n1-254-804-oesterreicher-liessen-sich-impfen/704492

Die Nachfrage nach Impfungen gegen die "Neue Grippe" ("Schweinegrippe") hält sich weiter in Grenzen: 53.239 Menschen ließen sich in Österreich in den vergangenen 2 Wochen eine Spritze gegen die Influenza A(H1N1) verpassen. Insgesamt wurden laut dem Gesundheitsministerium seit Impfstart 254.804 Kinder und Erwachsene immunisiert.

Somit wurde noch nicht einmal die Anfang November gelieferte Initialbestellung von 520.000 Dosen ausgeschöpft. Insgesamt hat Österreich laut Vertrag einen Anspruch auf bis zu 16 Mio. Impfstoffeinheiten, die allerdings nur bei Bedarf geordert werden.

Weiterhin rückläufig ist seit einigen Wochen die Zahl der Neuerkrankungen: In der vergangenen Woche steckten sich etwa 16.000 bis 26.000 Personen mit der Influenza A(H1N1) an, teilte das Gesundheitsministerium mit. In der Vorwoche gab es noch bis zu 34.000 Infektionen. Die Zahlen basieren auf einer Hochrechnung anhand von Daten des Wiener Grippeüberwachungssystems.

140 Patienten mussten vergangene Woche im Spital aufgenommen werden. Zum Vergleich: In den zwei Wochen davor wurden 172 bzw. 209 Infizierte im Krankenhaus stationär behandelt. Die Pandemiewelle setzt sich in Österreich weiter fort, betonte das Gesundheitsministerium. In keiner Probe sei ein anderes Influenzavirus nachgewiesen worden, A(H1N1) bleibe der dominierende Erreger.

Allein in Wien wurden mittels des sogenannten Sentinellasystems 12.700 Infektionen registriert. Das ist gegenüber dem Vergleichszeitraum der Vorwochen erneut ein geringer Rückgang, zuvor gab es 14.500 und 15.300 Ansteckungen. In Graz wurde im Wochenvergleich eine Abnahme von 2.740 auf 2.435 Fälle verzeichnet. Auch in der steirischen Landeshauptstadt kommt das Sentinellasystem zum Einsatz. Es kombiniert Stichproben aus ausgewählten Arztpraxen mit Daten über Krankenstandstage für Hochrechnungen.

Only 3% of Austrians So Far Have Taken The Swine Flu Jab

The Flu Case, 23 December 2009
https://web.archive.org/web/20100102045513/http://theflucase.com/index.php?option=com_content&view=article&id=2398%3Aonly-3-of-austrians-so-far-have-taken-the-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Only 254.804 people in Austria out of a population of more than 8 million have so far taken the swine flu jab according to the government figures, says the newspaper Die Kleine Zeitung.

The low turn out for the jab comes in spite of a very high acceptance rate historically for vaccinations, an unprecedented government pressure and an orchestrated media propaganda campaign on a scale never seen before.

Many people who took the first jab did not go back for their second does. In Tyrol, one third of the 30,000 people who took the first swine flu shot did not return for the second.

Tyrol is now planning to return 50,000 euros worth of vaccines to the federal government.

Mark Adams

2009 in review:
A year of FDA censorship, Big Pharma crimes and H1N1 swine flu

Natural News, 1 January 2010
https://www.naturalnews.com/027851_health_news_Big_Pharma.html

2009 has been a crazy year for health and medicine. It was the year that Congress rammed through a mandatory health "reform" bill that violates the U.S. Constitution in forcing all Americans to buy government-mandated products and services from greedy corporations. Although it hasn't been signed into law yet, the very fact that it has been passed by both the House and the Senate is alarming: America is just one signature away from becoming a medical dictatorship.

But that's not the only big health news that happened in 2009. In all, 2009 was a year of corruption, scientific fraud and health freedom oppression. Here are some of the highlights:

The FDA

The FDA was hit hard in 2009 was accusations of corruption and criminal behavior. In January, the FDA's own scientists accused management of committing crimes. And in August, the FDA abandoned even the appearance of standing up for safety by declaring that mercury fillings are safe for everyone.

https://web.archive.org/web/20090703041111/https://www.naturalnews.com/025298_the_FDA_FDA_scientists_NaturalNews.html
https://web.archive.org/web/20090813015549/https://www.naturalnews.com/026822_mercury_the_FDA_mercury_fillings.html

In order to protect its authority and boost Big Pharma's sales, the FDA also went after numerous natural health companies in 2009. Stephen Heuer was arrested by the FDA in January, and by June, the FDA had threatened to seize all natural products that boost immune health and protect against the swine flu.

https://web.archive.org/web/20100209070711/https://www.naturalnews.com/025347_nutrition_the_FDA_health.html
https://web.archive.org/web/20090621070255/https://www.naturalnews.com/026473_the_FDA_H1N1_natural_products.html

The FTC also joined the tyranny bandwagon, engaged in a war of threatening tactics against a ministry selling anti-cancer herbs and ultimately ordering them to lie to their customers about their products.

https://web.archive.org/web/20090712043412/https://www.naturalnews.com/025303_the_FTC_health_dietary_supplement.html
https://web.archive.org/web/20091215062221/https://www.naturalnews.com/026970_the_FTC_freedom_cancer.html

The FTC even went after Dr. Weil, threatening him with arrest and imprisonment for daring to accurately describe the immune boosting effects of the astragalus herb.

https://web.archive.org/web/20091024062944/https://www.naturalnews.com/027303_the_FTC_America_vaccines.html

Topping off the year of tyranny and oppression, in December the FDA staged an illegal kidnapping of herbal formulator Greg Caton who was threatening the cancer industry with his anti-cancer salve products made from Ecuadorian herbs.

https://web.archive.org/web/20100115065936/https://www.naturalnews.com/027750_Greg_Caton_FDA.html

Big Pharma corruption

2009 was also a bad year for Big Pharma. All kinds of new findings came out that show the dangers of pharmaceuticals. For example, did you know that HRT drugs shrink women's brains?

https://web.archive.org/web/20100115065936/https://www.naturalnews.com/027750_Greg_Caton_FDA.html

The drug industry was also shown to be engaged in blatant scientific fraud. AstraZeneca, for starters, taught its sales reps how to lie to doctors, and throughout the pharmaceutical industry, many clinical trials were exposed as being entirely fraudulent.

https://web.archive.org/web/20090615092302/https://www.naturalnews.com/025744_diabetes_drugs_Astrazeneca.html
https://web.archive.org/web/20090925181334/https://www.naturalnews.com/025833_Big_Pharma_cancer_Bextra.html

On the researcher side, Big Pharma scientist Dr. Scott Reuben was caught fabricating 21 studies - most of which were widely quoted by other doctors to push dangerous pills onto children.

https://web.archive.org/web/20090826172513/https://www.naturalnews.com/025852_anesthesia_drugs_medical_journals.html

Also in 2009, Pfizer actually admitted to committing felony crimes over its marketing of Bextra.

https://web.archive.org/web/20090905081352/https://www.naturalnews.com/026963_Pfizer_Bextra_health.html

Merck was found to have created a "hit list" of doctors targeted for destruction -- doctors who were speaking out against the safety of the company's drugs.

https://web.archive.org/web/20090929042920/https://www.naturalnews.com/027116_Merck_doctors_vaccines.html

The company was also busted over its hiding of data about the dangers of Vioxx.

https://web.archive.org/web/20091127143117/https://www.naturalnews.com/027582_Merck_Vioxx.html

Not to be out-frauded by Merck, Pfizer paid a record $1.3 billion fine in 2009 for intentionally misbranding its drugs.

https://web.archive.org/web/20091020033012/https://www.naturalnews.com/027276_Pfizer_drugs_the_FDA.html

Similarly, the Dept. of Health and Human Services was caught backing a medical device "review board" that was actually led by a dead dog.

https://web.archive.org/web/20100104232201/https://www.naturalnews.com/025955_health_America_medical_devices.html

2009 in summary

Well, there you have it! Those are the highlights of what NaturalNews covered in 2009. It was a year of outrageous quackery, FDA tyranny, censorship and criminal acts on the part of the pharmaceutical industry.

At the same time, it was also a year when more people finally woke up to the dangers of mammograms and CT scans. NaturalNews readership climbed substantially through 2009 as more people got turned on to the truth about natural remedies and the healing power of nutrition.

The FDA and Big Pharma is now increasingly under fire as a result of the events of 2009, and I suspect that in 2010 and beyond, the pharmaceutical industry is going to find itself under increasing scrutiny as more and more of its criminal operations are exposed.

But don't expect the mainstream media to have anything to do with that. All the really smart reporting is now happening on blogs and independent news sites. The mainstream media continues to play its "Truman Show" game of broadcasting a fictional reality to the people, hoping no one will notice what's *really* going on.

Thank you for reading NaturalNews in 2009, and we have a lot more in store for you in 2010 and beyond! With your help, perhaps we can see some real breakthroughs in health freedom in 2010. One day, we might even get to witness the arrest and criminal prosecution of Big Pharma's top executives who are guilty of crimes against humanity for continuing to wage chemical warfare against the people (while poisoning the environment at the same time).

Information

Kristian Villesen, Louise Voller

Seruminstitut tjener millioner på at anbefale vaccination.

Information, 2 Januar 2010
https://www.information.dk/indland/2010/01/seruminstitut-tjener-millioner-paa-anbefale-vaccination?lst_cntrb

Statens Serum Institut rådgiver danskerne om vacciner, men sælger samtidig vacciner for en milliard kroner årligt. Det er en problematisk dobbeltrolle, mener kritikere. Seruminstituttets særlige struktur resulterer desuden i skyhøje vaccine-priser i Danmark.

Statens Serum Institut anbefaler ofte danskerne at blive vaccineret imod eksempelvis børnesygdomme. Samtidig lever instituttet af at producere de selv samme vacciner, som de som statslig myndighed anbefaler til borgerne.

Det er nemlig produktion af egne vacciner og videresalg af udenlandske vacciner, der udgør totredjedele af omsætningen på seruminstituttet. I 2008 drejede det sig om 938 millioner kroner - altså næsten en milliard kroner.

Dobbeltrollen som både rådgiver, producent og importør af vaccinerne er problematisk, mener Margrethe Nielsen, der er forsker på det uafhængige forskningsinstitut Cochrane Center: »Jeg tvivler på, at den brede befolkning er klar over, at seruminstituttet producerer vacciner, og det er problemet - netop fordi de samtidig står for rådgivningen. Befolkningen skal vide, hvilke interesser, der kan ligge bag rådgivningen. Både ud fra et forbrugermæssigt og et samfundsmæssigt synspunkt,« siger Margrethe Nielsen.

Også sundhedsøkonom Jakob Kjellberg fra Dansk Sundhedsinstitut (DIS) mener, at seruminstituttets mange roller er problematiske: »Kasketsammenblandingen bliver en overvejelse værd, når seruminstituttet kommer med anbefalinger af vacciner, som de selv producerer eller tjener penge på at videresælge,« siger Jakob Kjellberg.

Navnet klinger officielt

Også i Forbrugerrådet finder man strukturen uheldig: »Der er en del forskellige kasketter på Statens Serum Institut,« siger afdelingschef Mette Boye.

Og det er problematisk ud fra et forbrugersynspunkt: »Det er vigtigt, at man ved, hvem man står over for og hvilke motiver, der kan være på spil. Er det en offentlig myndighed eller en producent?« spørger Mette Boye, som også mener, at navnet Statens Serum Institut lyder meget officielt - og derfor kan vildlede forbrugerne.

Samme holdning har Margrethe Nielsen fra Cochrane Center: »Statens Serum Institut klinger meget myndigt. Det lyder som en statsmyndighed. Det er det selvfølgelig også, når det kommer til rådgivning, men man forventer nok ikke, at de samtidig lever af at sælge vacciner.«

Statens Serum Institut har formelt til opgave at overvåge og rådgive om forebyggelse af smitsomme sygdomme. Desuden skal instituttet sikre, at danskerne kan få de nødvendige vacciner gennem en såkaldt 'forsyningssikring'. De vacciner, som instituttet ikke selv producerer, kommer derfor i udbud hos de udenlandske producenter - og seruminstituttet tjener så penge på at sælge dem videre i Danmark. De vacciner, som seruminstituttet selv producerer, kommer ikke i udbud, og udenlandske producenter af lignende vacciner har derfor ingen mulighed for at komme ind på det danske marked.

Den monopolagtige konstruktion er helt særlig og findes kun i Danmark. I udlandet har man adskilt den officielle rådgivning fra de økonomiske interesser, der er forbundet med produktion og videresalg af vacciner. Det burde man også gøre herhjemme, mener Margrethe Nielsen: »De to opgaver kan med fordel skilles ad,« siger hun.

Samme holdning har Jørgen Clausen, cheføkonom i Lægemiddelindustriforeningen: »Det vil se kønnere ud, hvis man adskiller dem, der tjener penge på vacciner, fra rådgivningen,« siger han.

Også en tidligere ansat på seruminstituttet - den nuværende overlæge på Center for Forebyggelse i Sundhedsstyrelsen, Tove Rønne, mener, at man i hvert fald bør overveje en ny struktur: »Vacciner er over de seneste år i højere grad kommet til at ligne andre lægemidler. Derfor kan man overveje, om der er brug for en ny struktur - om det eksempelvis er mere hensigtsmæssigt i højere grad at adskille funktionerne. Men det er fortsat vigtigt at holde sig forsyningssikkerheden af de basale vacciner for øje. Der er fordele og ulemper ved begge modeller, men det er i hvert fald noget, man med mellemrum bør tage op og drøfte.«

Den særlige danske struktur er også dyr. En undersøgelse af Rigsrevisionen i 2005 viste, at Statens Serum Instituts 5-valente børnevaccine koster 396 kroner, hvilket er tre gange så meget som i Sverige, hvor myndighederne køber vaccinerne af udenlandske producenter. Tallene er fra 2003, men der er ikke sket markante ændringer siden. En fri konkurrence på området vil derfor formentlig også sikre danskerne billigere vacciner, vurderer Jørgen Clausen fra Lægemiddelindustriforeningen: »Man må formode, at priserne ville være lavere, hvis man lod alle vaccinerne komme i udbud,« siger han.

Fin struktur

Direktør i seruminstituttet, Niels Strandberg, afviser, at der skulle være problemer med den nuværende struktur: »Vi er jo ikke en selvstændig virksomhed som sådan. Vi producerer vacciner, men vi er ejet af den danske stat. Derfor mener jeg ikke, at der er noget problem.«

- Flere af jeres eksperter har været ude i medierne og tale om vigtigheden af, at man lader sig vaccinere. Tror du, at danskerne er klar over, at I selv lever af at producere vacciner?

»Det tror jeg da bestemt, at de er. Det fremgår da helt klart af vores formålsparagraf. Og vores offentlige vejledning er altid i tråd med Sundhedsstyrelsens retningslinjer. Og det ville være meget mærkeligt, hvis vi som statslig myndighed ikke udtalte os om det her.«

- Var det ikke smartere, hvis dem, der producerer vaccinerne ikke samtidig rådgav om brugen af dem?

»Det er også primært Sundhedsstyrelsen, der rådgiver. Men man har jo som medarbejder lov til at udtale sig.«

- Kan du forstå, hvis nogen synes, det er mærkeligt?

»Nej, for vi løser bare de opgaver, vi er blevet pålagt af den danske stat.«

Heller ikke seruminstituttets monopol og de deraf følgende høje priser er et problem, mener Niels Strandberg:

»Det er rigtigt, at man kan få nogle af vaccinerne billigere i udlandet. Men når man har så lille et marked som det danske at producere til, er det klart, at prisen er en anden. Desuden viser Rigsrevisionens undersøgelse fra 2005, at der er andre fordele ved den danske model. Vi har blandt andet en bedre forsyningssikring end mange andre lande,« siger Niels Strandberg.

- Hvad er problemet i at skille vaccineproduktionen fra rådgivningen?
»Så har staten ikke længere kontrol over vaccineproduktionen.«

- Men der er jo masser af vaccineproduktion, staten ikke har kontrol over. Alle de vacciner, som I ikke laver?
»Ja, det er rigtigt, men man har den knowhow, der skal til for at producere vacciner. Vi kunne i princippet producere alle former for vacciner.«

Statens Seruminstitut om børnevacciner i medierne: »Selv om vi stort set har fået bugt med sygdommen, vil der nok på et eller andet tidspunkt komme et mæslingeudbrud igen. Netop derfor er det så vigtigt, at vi fortsat lader vore børn vaccinere.«

Kåre Mølbak, afdelingschef på epidemiologisk afdeling, Statens Serum Institut. Politiken, 2004.

»Jeg er dybt chokeret over, at så mange børn ikke bliver vaccineret. Især mæslinger kan give svære følgesygdomme som hjernebetændelse. Og da børnene ikke vil blive smittet i en tidlig alder, fordi de fleste af deres kammerater er vaccineret, vil risikoen for komplikationer være meget større end før i tiden. Børnesygdomme rammer nemlig generelt hårdere, jo ældre man er, når man bliver syg,« Tove Rønne, overlæge på Statens Serum Institut. Berlingske Tidende, 1998.

»Der er givet millioner af doser af vaccine, og de alvorlige bivirkninger er ekstremt sjældne. Man kan selvfølgelig få lidt hævelser eller en smule rødmen, når man vaccineres mod en børnesygdom, men det er jo kun forventelige bivirkninger. Alligevel bliver myten om eksempelvis en øget autismerisiko ved MFR-vaccination ved at poppe op, skønt den er manet videnskabeligt i jorden.«

Serum Institute in Denmark Earns Millions from Recommending Vaccination

Information// The Flu Case (English), 2 January 2010
https://web.archive.org/web/20100220011952/http://www.theflucase.com/index.php?option=com_content&view=article&id=2449%3Aserum-institute-in-denmark-earns-millions-from-recommending-vaccination-reports-information&catid=41%3Ahighlighted-news&Itemid=105&lang=en

"The State Serum Institute" gives advice to the Danes on vaccines, but it also sells vaccines for one billion Danish "Kroner".

This dual role of vaccine advisor as well as producer is problematic, critics believe.

The specific structure of the Serum Institute also results in higher vaccine prices in Denmark.

"The State Serum Institute" issues recommendations about what vaccines Danes should take, such as against childhood diseases. At the same time, the institute produces the very same vaccines that the state authority then goes on to recommend to the citizens.

It produces its own vaccines and resells foreign vaccines, an activity which represents two thirds of turnover from vaccines of the Foundation.

In 2008, the turnover was about 938 million Danish Kroner - that's almost one billion dollars.

The double role as both adviser, producer and importer of the vaccines is problematic, believes Margrethe Nielsen, a researcher at the independent research Cochrane Center:

"I doubt that the general public are aware that serum institute produces vaccines, and that is the problem - precisely because they also give advice. People need to know what interests there may be behind that advice. From both a consumer and society perspective," says Margaret Nielsen.

Also, health economist Jakob Kjellberg from the Danish Health Foundation (DIS) believes that the Foundation's many roles are problematic:

'The many different caps people wear is worth considering when the serum foundation makes recommendations for vaccines because they themselves produce or earn money from reselling," says Jakob Kjellberg.

The Name Sounds Official

In addition, the Consumer Council finds the structure unhappy.

"There are a lot of different hats at the State Serum Institute," says Head of Department Mette Boye.

And it is problematic from a consumer perspective.

"It is important that you know who you are dealing with and what motives may be at play. Is it a public health authority or a producer? "Asks Mette Boye, who also believes that the name the State Serum Institute sounds very official - and is, therefore, likely to mislead consumers.

Margaret Nielsen of the Cochrane Center holds the same view.

'The State Serum Institute has an authoritative sound. It sounds like a state authority. It is of course when it comes to advice, but you might not expect that it is, at the same time making money by selling vaccines. "

The formal role of the State Serum Institute is monitoring and giving advice on the prevention of infectious diseases. Moreover, the institution is supposed to ensure that Danes can get the necessary vaccines through a so-called 'supply security'. The vaccines, which the institute does not produce itself, are supplied by foreign producers - and the Serum Institute sells them in Denmark for profit. The vaccines, which the serum institution itself produces are not contracted out, and foreign producers of similar vaccines therefore have no opportunity to enter the Danish market.

The monopolistic structure is unique and exists only in Denmark. Other countries have separated the official advice from the economic interests associated with the production and sale of vaccines. It should also be changed at home, thinks Margrethe Nielsen.

'Separating these two tasks can be useful, "she says.

Jorgen Clausen, chief economist of the Pharmaceutical Industry, takes the same poisition as well.

"It will look prettier if those who make money on vaccines from those who give advice were distinguished," he says.

Also a former employee of serum foundation, the current chief of staff at the Center for Disease Prevention in the Health Protection Agency, Tove Rønne, believes that a new structure should be considered.

"Vaccines are increasingly coming to resemble other drugs in recent years. Therefore, one can consider whether there is a need for a new structure; for example, if it is preferable to delineate functions more clearly. But it is still important to keep supplies of basic vaccines. There are advantages and disadvantages to both models, but it is certainly something that should be periodically reviewed and discussed. "

The special Danish structure is also expensive. A study by the National Audit Office in 2005 showed that the State Serum Institute's 5 valent pediatric vaccine cost 396 dollars, which is three times as much as in Sweden, where the authorities buy the vaccines from foreign manufacturers. The figures are from 2003, but there has been no significant changes since then. Free competition in the field will therefore probably result in less expensive vaccines for Danes, believes Jorgen Clausen from the Pharmaceutical Industry:

"One must assume that prices would be lower if all the vaccines were put out to tender," he says.

"Nice Structure"

The Director of Serum Institute, Niels Strandberg, has denied that there are any problems with the current structure: "We are not an independent company as such. We produce vaccines, but we are owned by the Danish government. So I think that there is no problem. "

- Several of your experts have been out in the media and talk about the importance of the vaccination itself. Do you think the Danes are aware that you found yourself producing vaccines?

"I think certainly they are. It appears clearly in our purpose clause. And our public guidance is always in line with the Health Protection Agency guidelines. And it would be very odd if we as a state authority are not held to account. "

- Wouldn't it be smarter if those who produce the vaccines are not advising on their use?

"It is also the main Board of Health that gives advice. But y as an employee, you are allowed to speak. "

- Can you understand if people find this strange?

'No, we just fulfil the tasks we have been instructed to do by the Danish government. "

The Serum Institute's monopoly and consequent high prices are not a problem either, thinks Niels Strandberg.

"It is true that you can get some of the vaccines more cheaply abroad. But when you have such a small market as the Danish to produce for, it is clear that the price is going to be different. Moreover, the National Audit Office study from 2005 said there are other advantages of the Danish model. We have among other things, a better supply security than many other countries, "says Niels Strandberg.

- What is the problem of separating vaccine production from giving advice?

"So the state has no longer control over vaccine production."

- But there's plenty of vaccine production the state has no control over. All the vaccines that you are not doing?

"Yes, it is true, but you have the know-how needed to produce vaccines. We could in principle produce all kinds of vaccines. "

THE FLU CASE

Claudia Calvo

Pandemia y vacunas

a Letter to María L. Avila-Aguero, 5 January 2010.
https://web.archive.org/web/20100220012042/http://www.theflucase.com/index.php?option=com_content&view=article&id=2471%3Aclaudia-calvos-email-exchange-with-costa-rican-health-minister-over-swine-flu-jabs-in-spanish&catid=41%3Ahighlighted-news&Itemid=105&lang=en

From Marie Thérèse Cloward:
Claudia Calvo and the Costa Rican Health Minister María L. Avila-Aguero have entered into an email dialogue (in Spanish) on the merits and drawbacks of instituting a mass vaccination campaign with the untested swine flu jab.

¡Gracias, Señora Ministra!

Al leer su comentario, estoy recordando varias entrevistas en francés al Dr Girard (que tampoco era cualquier bombetas: fue asesor de desarrollo de vacunas para farmacéuticas-OMS en Francia por muchísimos años)... pero dice en una que estas vacunas H1N1 "científicamente hablando, no es que estén mal desarrolladas: lo que pasa es que NO están desarrolladas" ; en otra decía que ¡uno no se inyecta con un sándwich de atún! Y que los efectos de ciertos ingredientes, al ser ingeridos y pasar por el filtro del sistema digestivo (que aún así son muy peligrosos), ¡son muy distintos de los que causan al ser absorbidos sistémicamente! (Los franco-parlantes son muy expresivos al debatir, seguro se me pegó también, jaja.)

Con respecto a Tamiflu, lógico que se evaluó también la molécula oseltamivir misma, no sólo el medicamento patentado por Mr Rumsfeld. (Los informes oficiales aparecen en internet, pero son bastante tediosos) ¡De todos modos, un "genérico", por definición también incluye la misma molécula del "medicamento oficial"! También hay varios artículos en EUA con respecto a los datos de autismo: los niños que se están evaluando ahora tienen una edad entre los 8 y los 12 años... precisamente abocándose a que no haya mayor discrepancia de datos. No olvidemos que el mayor experto oficial pro-vacunas en EUA, el Dr Ofitt, está en polémica por haber declarado oficialmente que a los niños "no les pasa nada ¡y que se les pueden poner 100.000 vacunas en un día!!! Francamente, dudo que ud pueda estar de acuerdo con ESE experto...

Lo que sí me parece grave es la receta ineludible de OMS de dársela -justamente- a la gente que ya está muy fragilizada por enfermedades autoinmunes y demás condiciones problemáticas, ¿cómo van a aguantar semejante invasión química?

Con respecto Al país, de hecho, ayer fue la primera vez que entré ahí: toda la información que he traducido viene del extranjero -y no se refiere específicamente a Costa Rica, sino a la generalidad de esta pandemia. Y si entré ahí, es porque quiero que mi carta sea leída por la mayor cantidad posible de costarricenses: que decidan por ellos mismos. Además, porque ¡no acostumbro "tirar la piedra y esconder la mano"! De todos modos, desde que descubrí la existencia del Dr Páez hace un tiempo, encuentro que sus escritos son MUY congruentes con lo que he encontrado "afuera". Con respecto al periódico mismo, no le podría dar una evaluación: desde la guerra del golfo dejé de ver

noticias (y ud y yo sabemos que el conglomerado oficial -mundial- de noticias es controlado por los señores Rupert y James Murdoch, que tienen ENORMES e inextricables nexos con GSK info@tpuc.org y CFR -ver lista): no es precisamente algo que me incite a confiar en su transparencia .... por lo que no me parece particularmente útil discutir de la validez relativa de los medios alternativos, si ya sabemos ¡lo que son los oficiales!

Por cierto, Cochrane Collaboration también dijo recientemente que le preocupa que ahora le estén enviando los -muchísimos- millones de vacunas no deseadas al "tercer mundo", en que las condiciones -latitudinales- de sol hacen que la gente tenga menos problemas con la gripe misma, que con diversas condiciones más bien relacionadas a malas condiciones generales (yo sé que los costarricenses no comemos tan mal -aparte de los sempiternos agroquímicos que están ¡hasta en la miel de abeja!- y que somos muy higiénicos, relativamente, pero ¿quién no tiene un precario cerca?), y que en tales casos, pues, el tipo de ingredientes en las vacunas arriesgan causar más daño que beneficio.

En fin. Como le decía, ¡tengo mis opiniones, ud tiene las suyas! ... y eso no va a cambiar tan fácilmente, ¿no? Si quiere, podemos seguir así bastante rato, pero personalmente -y con todo respeto- no creo que vayamos a llegar a ninguna parte.

Cordialmente me despido, con un saludo.

Claudia Calvo.

THE FLU CASE

Le ministre français de la Santé convoqué
au tribunal pour la campagne de vaccination contre la grippe porcine

The Flu Case, 6 janvier 2010.
https://web.archive.org/web/20100220012057/http://www.theflucase.com/index.php?option=com_content&view=article&id=2475%3Aeyewitness-account-of-french-health-ministers-appearance-in-court-over-the-swine-flu-jab-campaign-in-english-and-french&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Madame Roselyne Bachelot,
Ministre de la Santé, était assignée à comparaître en référé devant le Tribunal
de Grande Instance de Paris le lundi 4 janvier
The Flu Case, 5 January 2010

Madame Roselyne Bachelot, Ministre de la Santé, était assignée à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier à 9 h, aux fins de mettre un terme dans les plus brefs délais à la campagne de vaccination contre la grippe H1N1.

Cette procédure judiciaire a été engagé, devant le «danger imminent» encouru par la population, par l'Association Cri-Vie (Coordination de Recherche et d'Informations Indépendantes en matière de Santé), présidée par le Dr Marc Vercoutère (Pau, Pyrénées-Atlantiques) et le parti politique d'extrême-centre Politique de Vie, présidé par Christian Cotten (St-Aubin, Essonne), psychosociologue.

Une "grand'mère provinciale" rapporte:

Ayant négocié la circulation du lundi matin jusqu'à Paris, je n'avais de pas de carte professionnelle de journaliste, donc j'ai dû me joindre à la queue de sécurité à l'entrée pour le public au Tribunal de Grande Instance de Paris, où des supporteurs de la cause, des gens de tous horizons, de simples citoyens en bonnets de laine et mitaines, ont fait connaissance pour la première fois dans le froid glacial, et après un délai inexpliqué de 15 minutes environ, nous nous sommes dirigés vers la salle allouée pour cette audience.

Cependant, ayant grimpé les marches du perron du Palais of Justice et traversé l'immense "Salle des Pas Perdus", nous avons découvert que la salle d'audience avait été changée et que tout le monde venait juste de disparaître au bout du couloir vers une quelconque autre salle. Des policiers trapus nous ont empêché de les suivre le long de ce couloir en disant qu'ils ne savaient même pas quelle salle avait été choisie pour l'audience et que nous devions laisser la cour "travailler en paix".

La location de l'audience ayant été identifié au bout de 10 minutes, les mêmes trois policiers trapus nous ont barré le chemin à une autre porte dans la "Salle des Pas Perdus" qui ouvrait sur encore une autre couloir nous séparant effectivement de l'audience, en nous disant qu'il n'y avait plus de place assise (deux personnes y étant restés debout, ce qui était strictement parlant interdit). Une fois qu'une salle était pleine, ils ne pouvaient plus laisser passer personne, même pour s'approcher de la porte, pour des raisons de sécurité (le feu etc) Plusieurs personnes parmi ayant insisté que les portes devaient rester ouvertes pendant l'audience, et que nous avions légalement accès à ces portes OUVERTES, les policiers sont restés fermes en disant que ce n'était pas leur problème, et qu'ils ne faisaient que leur «devoir».

Un avocat qui passait par là est allée gentiment vérifier la chose, et nous a rapporté qu'effectivement 40 personnes environ assistaient à l'audience, et que la salle était donc bien pleine. Mais Maître Ouarti (l'avocate de Christian Cotten) nous a dit plus tard que nous aurions dû tambouriner sur les portes qui étaient censées rester ouvertes et que ce refus de rendre l'audience ouverte au public pouvait être utilisé pour faire prononcer toute décision de la Cour nulle.

Entretemps, en doutant de nos droits, telle une troupe de nains dociles au pied des colonnes imposantes du Palais de Justice, nous avons échangé nos adresses email en discutant de l'affaire avec un journaliste solitaire (du journal mensuel TOP ALERTE) près du kiosque d'accueil surmonté d'un pyramide en verre..

Vers 10h30, Christian Cotten et Marc Vercoutère se sont émergés du couloir «interdit» avec leurs avocats, Maître Malika Ouarti et Maître Jean-Pierre Joseph. Entourés de partisans équipés de caméscopes, Christian Cotten était clairement consterné d'annoncer à ses auditeurs anxieux que l'objectif n'avait pas été atteint, à savoir, que la campagne de vaccination serait poursuivie en France parce que le juge ne s'estimait probablement pas compétent.

Il a ajouté que la décision du tribunal serait le 25 Janvier, donc si les gens n'ont pas tenu compte des avertissements que lui et d'autres ont déjà essayé de communiquer, il y aurait des dégâts dans les semaines à venir, et il ne pouvait rien pour empêcher cela. Absolument exaspérés par ces tactiques typiquement bureaucratiques pour gagner du temps, dans cette situation d'urgence où chaque jour pourrait nuire à la santé du public et même coûter des vies, il s'écria dans son style spontané habituel:

"Tant pis pour eux, ces hauts fonctionnaires qui ont beaucoup de pouvoir ! Que les hauts fonctionnaires stupides se fassent vacciner ! Ca écoulera les doses !"

Après cette effusion de colère démentie par sa détresse visible à l'idée même que les "hauts fonctionnaires" soient vaccinés, en faisant un grand effort pour voir le bon côté des choses, il a constaté tout de même des éléments très positifs :

"Les deux avocats ont très bien fait leur job. Marc a très bien dit ce qu'il avait à dire. J'ai fait passer dans les pièces (puisque c'est une procédure pénale), un texte très clair et très simple au Président [du référé] en mettant en évidence sa responsabilité morale, politique (je ne sais pas si j'ai rajouté « spirituel » mais j'aurais pu), et juridique. Il a une véritable responsabilité, il est interpellé au nom de la santé publique, au nom de la sauvegarde de l'intégrité de la population et de nos corps. C'est bien une liberté fondamentale, l'intégrité du corps de chacun d'entre nous.

Il est interpellé sur un problème qui est un dossier pénal. Nous sommes de toute façon dans un dossier pénal : plusieurs procédures au long cours devant des juges d'instruction à Grenoble, à Nantes, à Paris, à Evry, Pau, à Créteil… (Je n'arrive plus à toutes les suivre, c'est super !) Il y a des procédures au long cours qui sont ouvertes, et qui vont perdurer, enfin qui vont se travailler dans la durée, cinq ans, dix ans, mais ils feront vivre ce dossier. Vraisemblablement un jour il y aura un procès en correctionnelle aux Assises devant la Cour de Justice de la République. Il y aura forcément un procès après une inscription.

Nous sommes dans une affaire pénale parce que nous sommes dans une opération internationale d'utilisation des institutions de la République par des organisations privées qui ont mis en œuvre un plan qui relève du crime organisé, en bande organisée : tentative d'empoisonnement, atteinte à l'intégrité, distribution de produits hautement toxiques.

C'est très clair, les vaccins sont hautement toxiques, de par en particulier les conservateurs, de par en particulier les adjuvants, de par la manière d'utiliser des morceaux de virus, dont on dit qu'ils sont atténués, sauf qu'ils se recombinent à d'autres morceaux de virus et à un moment ils deviennent toute autre chose que des virus atténués.

Le Tamiflu. Il est aujourd'hui très clairement exposé par les scientifiques et les journalistes scientifiques que toutes les études fournies par le Laboratoire Roche ont été intégralement bidonnées de A à Z par les directions marketing et par des sociétés de relations publiques externes qui ont été payées pour fabriquer des études bidons démontrant une pseudo efficacité du Tamiflu. Le Tamiflu non seulement n'est pas réellement efficace, et cela les médecins compétents le démontrent très bien, mais il est hautement toxique. Vraisemblablement, un grand nombre de morts attribués à la grippe H1N1, notamment pour des enfants doivent en réalité être attribués au Tamiflu, qui est utilisé de manière totalement délirante.

Alors, il n'y aurait pas les victimes - parce qu'il y a des victimes des vaccins aujourd'hui, il y a des victimes du Tamiflu - personnellement je trouverait ça très drôle, parce que nous sommes dans une situation ou des gangsters internationaux organisés utilisent les hauts fonctionnaires de l'OMS en les rétribuant. C'est très clair aujourd'hui. Une enquête va être lancée par le Parlement du Conseil de l'Europe. Ce n'est pas le Parlement Européen, contrairement à ce que disent certains journalistes, c'est le Conseil de l'Europe, qui réunit 47 pays. A la tête de la Commission , 61 médecins allemands particulièrement compétents, qui disent les chosent extrêmement clairement. Ils parlent très clairement des liens d'intérêt et de la corruption de l'OMS sur cette opération : vaccins et Tamiflu. Ces gens-là utilisent l'OMS et utilisent les institutions de la République Française dans un détournement du service publique pour gagner de l'argent. Je m'arrête là sur le pourquoi de toute cette opération, mais au minimum, c'est pour gagner beaucoup d'argent.

Et donc nous ne sommes plus dans un état de droit à partir du moment où il y a une utilisation abusive de l'Etat et c'est là que le Président du Référé aujourd'hui de ce Tribunal est interpellé, c'est sur ce point là.

Alors quelle sera sa décision ? Je ne me fais pas plus d'illusion que cela. En même temps il y a parfois des miracles en début d'année. Nous verrons. De toute façon, l'argumentaire juridique qui conduit le parquet et la partie adverse à dire que les parties devraient aller voir la justice administrative, bien entendu, c'est prévu. Nous y allons demain après-midi déposer un référé suspension et une requête en annulation devant le Conseil d'Etat.»

Il était environ 11h00 lorsque M. Cotten et M. Vercoutère ont quitté le tribunal avec leurs avocats et quelques « supporteurs » pour se rassembler dans un café à proximité autour d'une boisson chaude avant d'être interviewé par FR3, interview diffusée le soir même en région Acquitaine (Pau, Toulouse et Bordeaux), car l'Association "Cri-Vie" est basée à Pau.

Maître Malika Ouarti et Maître Jean-Pierre Joseph m'ont alors accordé un bref interview avec mon caméscope pour les gens dans ma ville en province (où certains ont refusé de croire que l'audience allait réellement avoir lieu aujourd'hui même lorsque je leur ai montré le communiqué de presse).

Maître Ouarti a dit que les deux associations avaient assignée Madame Bachelot pour demander :

- via l'Article 809 du nouveau code de procédure civile qu'il y ait un arrêt de la vaccination
- la nomination d'un comité d'experts pour examiner les effets secondaires de Tamiflu
- les possibilités de curatives et préventives naturelles et allopathiques contre la grippe A.

«L'avocat qui représentait Roselyne Bachelot n'a pas évoqué le débat de fond et s'est contenté de répéter que le juge judiciaire n'était pas compétent, qu'il fallait s'adresser au Tribunal administratif, car selon lui il n'y aurait pas d'atteinte aux libertés puisque le juge judiciaire est effectivement compétent uniquement quand il y a une voie de fait, c'est-à-dire une atteinte aux libertés fondamentales, et également, disons, un détachement de la fonction du ministre de l'exercice de son pouvoir normal.

Nous avons plaidé évidemment qu'au contraire, la liberté était menacée puisque, comme vous le savez, il n'y a pas une réelle liberté d'information, il n'y a pas de transparence. Nous avons prouvé que certains mensonges ont été indiqués dans la presse via le ministère. Il y a d'ailleurs un tabou puisque aujourd'hui la presse nationale n'est pas là alors que c'est quand même une audience importante. Le procureur, lui, a considéré que la liberté d'information n'était pas une liberté fondamentale (!!!) Il y a une collusion certaine entre le procureur et l'avocat de Madame Bachelot.

Bien entendu, Madame Bachelot, via son avocat a réitéré deux choses : 1) que les produits avaient reçu l'anm et 2) que les vaccinations étaient facultatives.

Le problème n'est pas là pour nous. Il est évident qu'un choix doit être libre et éclairé. Le choix de se faire vacciner n'est pas éclairé à cause des incohérences concernant le nombre des vaccinations à faire, concernant le contenu des vaccins, concernant la manière dont la vaccination est faite, la réquisition de locaux, des personnes non compétentes pour vacciner ont indiqué aux deux associations Cri-Vie et Politique de Vie que des libertés fondamentales sont en jeu.Ca c'est le premier point.

Quant au Tamiflu, il y a un vrai danger, parce que les effets secondaires du Tamiflu apparaissent de plus en plus difficiles à traiter. Le Docteur Marc Vercoutère, qui dirige l'association Cri-Vie, a établi une notice, où il indique que le Tamiflu est toxique, carrément toxique, et donc il y a un vrai problème puisque actuellement le Tamiflu est prescrit, par des médecins, certes, mais est délivré gratuitement en pharmacie, prescrit par des médecins sans même que le test pour la grippe A soit effectué, parce que ce test coûte cher (200€). Donc les médecins maintenant, quand il y a des symptômes grippaux prescrivent relativement facilement du Tamiflu. A l'hôpital aussi on en prescrit et le Docteur Vercoutère pense que les effets secondaires seront malheureusement importants à moyen et court terme.

La décision sera rendue le 25 janvier prochain. Nous verrons à ce moment là ce que les associations feront face à cette décision. Nous avons argué du fait que le juge judiciaire était le juge des libertés donc nous espérons que la justice nous suivra dans ce domaine car c'est vraiment un enjeu important.»

Maître Jean-Pierre Joseph, auteur de l'ouvrage "Vaccins, on nous aurait menti?" déplore qu'on est dans un dialogue des sourds.

« Les gens qui prônent les vaccins disent que nous sommes dans une religion, ce qui est assez extraordinaire, parce que justement, on a découvert au bout de plusieurs années qu'il y avait un gros problème concernant les vaccins en général, et c'est nous qui sommes taxés d'être dans une religion. Tout cela parce qu'il y a dans ce pays des espèces de dogmes, des certitudes absolues sur lesquelles on ne revient jamais, et on récite des litanies religieuses qu'on ne vérifie jamais de toute façon, malheureusement.

Moi, le message que j'essaye de faire passer, c'est que j'ai découvert, par des dossiers et par mon expérience personnelle, mes voyages et par des lectures nombreuses scientifiques que les vaccins en général sont totalement inefficaces, tous, et je l'affirme. Il y a des dizaines de publications qui sont sorties là-dessus, qui sont très claires et très précises, il suffit de regarder les courbes du Ministère de la Santé de toutes les épidémies du monde entier depuis le début du 20ème siècle, sans aucune exception. Les vaccins ne servent à rien, c'est très clair. Si on n'a pas compris cela, dans cinquante ans on y est toujours. Que ce soit avec ou sans adjuvant, c'est un faux débat, les vaccins ne servent à rien.»

Hier et aujourd'hui, à part FR3 en Acquitaine, il est clair que les médias en France ont boudé cette audience, préférant annoncer la résiliation des commandes de 50 millions de doses de vaccins, ainsi que le recours aux médecins généralistes, et les vaccinations prévues désormais au sein des entreprises, chez Michelin en particulier.

THE FLU CASE

Eyewitness Account of French Health Minister's Appearance in Court over the Swine Flu Jab Campaign

The Flu Case, 6 janvier 2010.

https://web.archive.org/web/20100220012057/http://www.theflucase.com/index.php?option=com_content&view=article&id=2475%3Aeyewitness-account-of-french-health-ministers-appearance-in-court-over-the-swine-flu-jab-campaign-in-english-and-french&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Carolyn Dunning in Paris gives an eyewitness account of the appearance in court on Monday of the French Health Minister Roselyne Bachelot -- represented by a lawyer -- following charges brought by Dr Marc Vercoutere and Christian Cotten concerning the mass swine flu vaccination campaign.

The court is due to give its verdict on January 25th.

Following charges by Maîtres Malika Ouarti (Barreau de Paris) and Jean-Pierre Joseph (Barreau de Grenoble), Mrs. Roselyne Bachelot, Minister of Health was represented by her lawyer at a hearing before the Tribunal de Grande Instance of Paris on Monday, January 4, 2010 at 9 am, the aim of the assignation being for putting an end as soon as possible to the campaign of vaccinations against influenza H1N1".

This litigation was initiated before the "imminent danger" faced by the people, by the Association “Cri-Vie” (Coordination of Research and Independent Information regarding Health), chaired by Dr. Marc Vercoutère (Pau-Pyrenees Atlantiques) and “Politique de Vie”, a political party from the extreme centre, chaired by the psychologist Christian Cotten (St-Aubin, Essonne).

A "provincial grandmother” reports:

Having driven through New Year Monday morning traffic to Paris I did not have a professional reporter's card so had to join the security check queue at the public entry door to the Tribunal de Grande Instance de Paris, where supporters of the cause, people from all walks of life, simple citizens with woolly hats and mittens, met each other for the first time in the bitter cold and after an unexplained standstill of about 15 minutes, we moved on to find the allotted room for the hearing.

However, having climbed the huge steps to the Palais de Justice and traversed the immense "Salle des Pas Perdus", we were informed that the room for the hearing had been changed and that everyone had just disappeared round the bend of the corridor to some other room. Burly policemen prevented us (a sensible group of about 25 polite and peaceable people) from following them down this corridor, saying they did not even know which room had finally been chosen for the hearing and that we should leave the court to carry on its work in peace, I quote: “il faut les laisser travailler en paix”.

The actual location of the hearing having been identified 10 minutes later, the same three burly policemen then barred the way through another door from the "Salle des Pas Perdus" to yet another corridor separating us from the hearing, saying that there were no more seats left and that two people were standing up, which was not strictly allowed. Once a room was full they could not allow anyone else to even approach the door, for security reasons (meaning fire etc). Several people among us insisted that the doors had to remain open to the hearing and that we could legally go up to these OPEN doors, but the policemen were adamant and said it was not their problem, they were only doing their "duty".

A passing lawyer agreed to go through the doors and down to the end of the corridor to check for us, then reported that there were indeed about 40 people present at the hearing and that the room was really full. But Maître Ouarti (Christian Cotten's lawyer) said afterwards that we should have banged on the doors because they are supposed to be left open and that this failure to render the hearing open to the public could be used to nullify the court's decision.

In the meantime, obediently doubting our rights, our little band of docile dwarfs gathered at the foot of the imposing columns of the Court of Justice to exchange email addresses and discuss the case with a lone reporter (from the monthly magazine TOP ALERTE) near the reception kiosk topped by a glass pyramid..

At about 10h30, Christian Cotten and Marc Vercoutère emerged from the "out of bounds" corridor with their lawyers, Maître Malika Ouarti and Maître Jean-Pierre Joseph. Surrounded by friendly supporters filming with their cam recorders, Christian Cotten was clearly dismayed to announce to his anxious listeners that the aim of putting an end to the vaccination campaign had not been achieved, and that it would therefore continue in France because the judge was esteemed to be "incompetent" to deal with the particular nature of the accusations.

He added that the court's decision would be on 25th January, so if people did not heed the warnings he and others have already tried to communicate, there would be casualties in the coming weeks, which he could do nothing to prevent. Absolutely exasperated by these typical bureaucratic tactics of playing for time, in this urgent situation where every day may damage the health of the public and even cost lives, he exclaimed in his usual spontaneous style:

"*Tant pis pour eux, ces hauts fonctionnaires qui ont beaucoup de pouvoir ! Que les hauts fonctionnaires stupides se fassent vacciner ! Ca écoulera les doses !" (Too bad for the bureaucrats wielding power at the top! Let the stupid high ranking officials (civil servants) go and be vaccinated themselves! That will get rid of the doses*!)

After this angry explosion belied by his visible distress at the idea of even the "high ranking bureaucrats" having to be vaccinated, making a considerable effort to look on the positive side of things, he admitted that:

"The two lawyers did a very good job. Marc said everything he had to say very well. I presented the evidence (since this is a penal procedure), a very clear and simple text, to the interim president [of the Tribunal de Grande Instance]

highlighting his moral, political (I do not know if I added "spiritual" but I could have done), and legal responsibility. He has a real responsibility; he is challenged on behalf of public health, in the name of preserving the integrity of the population and our bodies. That is a fundamental freedom, the bodily integrity of each one of us.

He is challenged on an issue that is a criminal case. We are dealing with a criminal case: multiple procedures of lengthy duration before magistrates in Grenoble , Nantes , Paris , Evry, Pau , Créteil .. (I can no longer keep up with them all, which is just great!) These lengthy procedures are now launched and will continue, that is to say, work will be engaged in the long term, five years, ten years, but they will keep this issue alive. Most probably one day there will be a trial in the correctional Assize Court of Justice of the Republic. For after registration, there will necessarily be a trial.

We are in a criminal case because we are witnessing an international operation using the Republic's institutions for private organizations who have implemented a plan that is organized crime, by an organized gang: attempted poisoning, damage to integrity and distribution of highly toxic products.

It is very clear, the vaccines are highly toxic, especially due to the preservatives, due to the adjuvants and due to the way of using pieces of viruses, which are said to have been attenuated, except that they recombine with other pieces of virus and after a while they become anything but attenuated viruses.

It is now clearly exposed by scientists and science journalists that all the studies provided by Roche Laboratory were fully rigged from start to finish by the Marketing Department and external PR companies paid to make studies demonstrating Tamiflu's pseudo effectiveness. Tamiflu is not only ineffective (and competent doctors demonstrate that very well), but it is also highly toxic. We can presume that a large number of deaths hitherto attributed to H1N1 influenza, particularly those of children, should actually be attributed to Tamiflu, which is used in a completely delusional manner.

If it weren't for the victims - because there are victims of vaccines today, there are victims of Tamiflu - personally I would find it laughable because we're in a situation where organized international gangsters use senior WHO officials and remunerate them. It's very clear today. An investigation will being launched by the Parliament of the Council of Europe. This is not the European Parliament, contrary to what some journalists say, it is the Council of Europe, which brings together 47 countries.

At the head of the Commission, 61 particularly competent German doctors, who say things quite clearly. They speak very clearly of links of interest and of the corruption of the WHO in this operation: vaccines and Tamiflu. These people use the WHO and institutions of the French Republic, diverting public service to earn money. I shall refrain to go further as to the reason behind this whole operation, but at the very minimum, it is to earn lots of money.

And so we're not in a state of law from the moment there is a misuse of the State and that is why the interim President of this Court is challenged today, it is on that precise point.

So what will be his decision? I am under no illusion about that. At the same time a miracle can happen, at the start of the New Year."

Mr Cotten and Mr Vercoutère left the Court around 11h15 with their lawyers and several supporters to gather in a nearby café around a warm drink before an interview for FR3 TV channel which was diffused the same evening in the Acquitaine region (Pau, Toulouse and Bordeaux), because the Association "Cri-Vie", chaired by Marc Vercoutère is based in Pau.

Maître Malika Ouarti and Maître Jean-Pierre Joseph agreed to let me interview them with my camrecorder for people in my provincial bourgeois home town (where people refused to believe that a real court hearing would be held today even though I showed them the press release).

Maître Ouarti said that the two associations had assigned Madame Bachelot to request:
- via Arti cle 809 of the new Code of Civil Procedure, that the vaccinations should cease;
- that a committee of experts be appointed to examine the side effects of Tamiflu;
- possibilities for curative and preventive, natural and allopathic remedies against influenza A.

Me Ouarti noted that the lawyer who represented Roselyne Bachelot "did not address the case in depth and simply repeated that the judge had no jurisdiction, that they should contact the Administrative Tribunal, because he said there is no infringement of freedom, and that the judge is competent only when there is an assault, that is to say an attack on fundamental freedoms, or a detachment from the Minister's function in the exercise of his normal power.

We argued that on the contrary, freedom is threatened because, as you know, there is no real freedom of information, no transparency. We have proved that certain lies were indicated in the press via the Ministry. There is, moreover a taboo today as the national press is not here today, at an

important audience. The prosecutor asserted that freedom of information was not a fundamental liberty (!!!) There is some collusion between the prosecutor and counsel for Ms. Bachelot. Of course, Ms Bachelot, via her lawyer, reiterated two things: 1) that the vaccines were ANM and 2) that the vaccinations were voluntary.

The problem does not lie there for us. It is obvious that a choice must be free and informed consent. The choice to be vaccinated is not informed because of inconsistencies in the number of vaccinations to be done, in the content of vaccines, in how the vaccine is made, the requisitioning of premises and of persons who are not competent to vaccinate, all of which have indicated to the two associations Cri-Vie and Life Policy that fundamental freedoms are an issue. That is the first point.

As for Tamiflu, the danger is real, because the side effects of Tamiflu are becoming more difficult to treat. Dr. Marc Vercoutère, who heads the association Cri-Vie, has established a notice in which he indicates that Tamiflu is toxic, downright toxic, and therefore there is a real problem now because Tamiflu is prescribed by doctors, without even testing for influenza A, because this test is expensive (200 €) and Tamiflu is sold over the counter by chemists. So when there are flu-like symptoms, doctors now prescribe Tamiflu relatively easily. At the hospital they also prescribe Tamiflu and Dr. Vercoutère believes that side effects will unfortunately be significant in the medium and short term.

The decision will be published on January 25. We shall see then how the associations face this decision. We have argued that this judge (juge judiciaire) was the judge of freedom so we hope that justice will follow us in this area because it is really an important issue."

Maître Jean-Pierre Joseph, author of "Vaccins on nous aurait menti?" regrets that everyone is speaking at cross purposes.

"People who favour the vaccine say that we are in a religion, which is extraordinary because it was discovered after several years that vaccines in general were problematic, and yet we are the ones who are accused of being in a religion. All that because in this country there are dogmas and certainties no-one ever goes back on, and people recite religious litanies that are never checked anyway, unfortunately. The message I'm trying to convey is that I have discovered through my files and personal experience, my travels and extensive scientific reading that all vaccines in general are totally ineffective. There are dozens of publications which are very clear and very precise. Just look at the curves of the Ministry of Health of any epidemic outbreaks worldwide since the early 20th century, without exception and you'll see that vaccines are useless, it's very clear. If you do not understand that, in fifty years we'll have made no progress. Whether with or without adjuvant, is a false debate, vaccines are simply useless."

Blind eye on this hearing, preferring to announce the cancellation of the orders for 50 million doses of swine flu vaccine, as well as the permission for GPs to vaccinate in their surgeries, and that vaccinations could begin within firms, such as Michelin.

Grippe: Roselyne Bachelot répondra aux députés devant la commission des affaires sociales, selon Accoyer

Fr.News, Yahoo, 6 janvier 2010, 10h52

https://web.archive.org/web/20100220012115/http://www.theflucase.com/index.php?option=com_content&view=article&id=2480%3Afrench-health-minister-to-be-grilled-by-parliamentary-committee&catid=1%3Alatest-news&Itemid=64&lang=en
http://fr.news.yahoo.com/3/20100106/r_t_ap_pl_other/tpl-grippe-a-h1n1-vaccination-bachelot-a-cfb2994_1.html?printer=1 (deleted)

La ministre de la Santé Roselyne Bachelot sera interrogée sur la grippe A/H1N1 à l'occasion de la prochaine réunion de la commission des affaires sociales qui se tiendra sur l'évolution de la pandémie, annonce le président de l'Assemblée nationale.

Alors que le Parti socialiste et le Nouveau centre ont réclamé une commission d'enquête parlementaire sur le sujet, Bernard Accoyer souligne dans un communiqué que la commission des affaires sociales a déjà auditionné la ministre sur cette question à trois reprises, en septembre, novembre et décembre derniers.

Roselyne Bachelot a fait savoir mardi qu'elle était prête à accepter le principe d'une commission et s'est dite à la disposition des députés pour répondre à leurs questions.

Le président de l'Assemblée nationale précise que la prochaine réunion de la commission des affaires sociales sur la grippe "sera élargie à l'ensemble des députés et ouverte à la presse. D'autres réunions identiques pourront être organisées". AP

THE FLU CASE

French Health Minister to be Grilled by Parliamentary Committee

The Flu Case, 6 January 2010, 12:04

https://web.archive.org/web/20100220012115/http://www.theflucase.com/index.php?option=com_content&view=article&id=2480%3Afrench-health-minister-to-be-grilled-by-parliamentary-committee&catid=1%3Alatest-news&Itemid=64&lang=en

French Health Minister Roselyne Bachelot is set to be cross-examined by a parliamentary committee to answer questions about the swine flu pandemic and the mass vaccination campaign, the president of the National Assembly has said.

Bachelot's appearance in front of the committee on social affairs will be open to all deputies and also to the media, reports AP.

THE FLU CASE

Le ministre français de la Santé convoqué au tribunal pour la campagne de vaccination contre la grippe porcine

The Flu Case, 6 janvier 2010.
https://web.archive.org/web/20100220012057/http://www.theflucase.com/index.php?option=com_content&view=article&id=2475%3Aeyewitness-account-of-french-health-ministers-appearance-in-court-over-the-swine-flu-jab-campaign-in-english-and-french&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Madame Roselyne Bachelot, Ministre de la Santé, était assignée à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier
The Flu Case, 5 January 2010

Madame Roselyne Bachelot, Ministre de la Santé, était assignée à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier à 9 h, aux fins de mettre un terme dans les plus brefs délais à la campagne de vaccination contre la grippe H1N1.

Cette procédure judiciaire a été engagé, devant le «danger imminent» encouru par la population, par l'Association Cri-Vie (Coordination de Recherche et d'Informations Indépendantes en matière de Santé), présidée par le Dr Marc Vercoutère (Pau, Pyrénées-Atlantiques) et le parti politique d'extrême-centre Politique de Vie, présidé par Christian Cotten (St-Aubin, Essonne), psychosociologue.

Une "grand'mère provinciale" rapporte:

Ayant négocié la circulation du lundi matin jusqu'à Paris, je n'avais de pas de carte professionnelle de journaliste, donc j'ai dû me joindre à la queue de sécurité à l'entrée pour le public au Tribunal de Grande Instance de Paris, où des supporteurs de la cause, des gens de tous horizons, de simples citoyens en bonnets de laine et mitaines, ont fait connaissance pour la première fois dans le froid glacial, et après un délai inexpliqué de 15 minutes environ, nous nous sommes dirigés vers la salle allouée pour cette audience.

Cependant, ayant grimpé les marches du perron du Palais of Justice et traversé l'immense "Salle des Pas Perdus", nous avons découvert que la salle d'audience avait été changée et que tout le monde venait juste de disparaître au bout du couloir vers une quelconque autre salle. Des policiers trapus nous ont empêché de les suivre le long de ce couloir en disant qu'ils ne savaient même pas quelle salle avait été choisie pour l'audience et que nous devions laisser la cour "travailler en paix".

La location de l'audience ayant été identifié au bout de 10 minutes, les mêmes trois policiers trapus nous ont barré le chemin à une autre porte dans la "Salle des Pas Perdus" qui ouvrait sur encore une autre couloir nous séparant effectivement de l'audience, en nous disant qu'il n'y avait plus de place assise (deux personnes y étant restés debout, ce qui était strictement parlant interdit). Une fois qu'une salle était pleine, ils ne pouvaient plus laisser passer personne, même pour s'approcher de la porte, pour des raisons de sécurité (le feu etc) Plusieurs personnes parmi ayant insisté que les portes devaient rester ouvertes pendant l'audience, et que nous avions légalement accès à ces portes OUVERTES, les policiers sont restés fermes en disant que ce n'était pas leur problème, et qu'ils ne faisaient que leur «devoir».

Un avocat qui passait par là est allée gentiment vérifier la chose, et nous a rapporté qu'effectivement 40 personnes environ assistaient à l'audience, et que la salle était donc bien pleine. Mais Maître Ouarti (l'avocate de Christian Cotten) nous a dit plus tard que nous aurions dû tambouriner sur les portes qui étaient censées rester ouvertes et que ce refus de rendre l'audience ouverte au public pouvait être utilisé pour faire prononcer toute décision de la Cour nulle.

Entretemps, en doutant de nos droits, telle une troupe de nains dociles au pied des colonnes imposantes du Palais de Justice, nous avons échangé nos adresses email en discutant de l'affaire avec un journaliste solitaire (du journal mensuel TOP ALERTE) près du kiosque d'accueil surmonté d'un pyramide en verre..

Vers 10h30, Christian Cotten et Marc Vercoutère se sont émergés du couloir «interdit» avec leurs avocats, Maître Malika Ouarti et Maître Jean-Pierre Joseph. Entourés de partisans équipés de caméscopes, Christian Cotten était clairement consterné d'annoncer à ses auditeurs anxieux que l'objectif n'avait pas été atteint, à savoir, que la campagne de vaccination serait poursuivie en France parce que le juge ne s'estimait probablement pas compétent.

Il a ajouté que la décision du tribunal serait le 25 Janvier, donc si les gens n'ont pas tenu compte des avertissements que lui et d'autres ont déjà essayé de communiquer, il y aurait des dégâts dans les semaines à venir, et il ne pouvait rien pour empêcher cela. Absolument exaspérés par ces tactiques typiquement bureaucratiques pour gagner du temps, dans cette situation d'urgence où chaque jour pourrait nuire à la santé du public et même coûter des vies, il s'écria dans son style spontané habituel:

"Tant pis pour eux, ces hauts fonctionnaires qui ont beaucoup de pouvoir ! Que les hauts fonctionnaires stupides se fassent vacciner ! Ca écoulera les doses !"

Après cette effusion de colère démentie par sa détresse visible à l'idée même que les "hauts fonctionnaires" soient vaccinés, en faisant un grand effort pour voir le bon côté des choses, il a constaté tout de même des éléments très positifs :

"Les deux avocats ont très bien fait leur job. Marc a très bien dit ce qu'il avait à dire. J'ai fait passer dans les pièces (puisque c'est une procédure pénale), un texte très clair et très simple au Président [du référé] en mettant en évidence sa responsabilité morale, politique (je ne sais pas si j'ai rajouté « spirituel » mais j'aurais pu), et juridique. Il a une véritable responsabilité, il est interpellé au nom de la santé publique, au nom de la sauvegarde de l'intégrité de la population et de nos corps. C'est bien une liberté fondamentale, l'intégrité du corps de chacun d'entre nous.

Il est interpellé sur un problème qui est un dossier pénal. Nous sommes de toute façon dans un dossier pénal : plusieurs procédures au long cours devant des juges d'instruction à Grenoble, à Nantes, à Paris, à Evry, Pau, à Créteil… (Je n'arrive plus à toutes les suivre, c'est super !) Il y a des procédures au long cours qui sont ouvertes, et qui vont perdurer, enfin qui vont se travailler dans la durée, cinq ans, dix ans, mais ils feront vivre ce dossier. Vraisemblablement un jour il y aura un procès en correctionnelle aux Assises devant la Cour de Justice de la République. Il y aura forcément un procès après une inscription.

Nous sommes dans une affaire pénale parce que nous sommes dans une opération internationale d'utilisation des institutions de la République par des organisations privées qui ont mis en œuvre un plan qui relève du crime organisé, en bande organisée : tentative d'empoisonnement, atteinte à l'intégrité, distribution de produits hautement toxiques.

C'est très clair, les vaccins sont hautement toxiques, de par en particulier les conservateurs, de par en particulier les adjuvants, de par la manière d'utiliser des morceaux de virus, dont on dit qu'ils sont atténués, sauf qu'ils se recombinent à d'autres morceaux de virus et à un moment ils deviennent toute autre chose que des virus atténués.

Le Tamiflu. Il est aujourd'hui très clairement exposé par les scientifiques et les journalistes scientifiques que toutes les études fournies par le Laboratoire Roche ont été intégralement bidonnées de A à Z par les directions marketing et par des sociétés de relations publiques externes qui ont été payées pour fabriquer des études bidons démontrant une pseudo efficacité du Tamiflu. Le Tamiflu non seulement n'est pas réellement efficace, et cela les médecins compétents le démontrent très bien, mais il est hautement toxique. Vraisemblablement, un grand nombre de morts attribués à la grippe H1N1, notamment pour des enfants doivent en réalité être attribués au Tamiflu, qui est utilisé de manière totalement délirante.

Alors, il n'y aurait pas les victimes - parce qu'il y a des victimes des vaccins aujourd'hui, il y a des victimes du Tamiflu - personnellement je trouverait ça très drôle, parce que nous sommes dans une situation ou des gangsters internationaux organisés utilisent les hauts fonctionnaires de l'OMS en les rétribuant. C'est très clair aujourd'hui. Une enquête va être lancée par le Parlement du Conseil de l'Europe. Ce n'est pas le Parlement Européen, contrairement à ce que disent certains journalistes, c'est le Conseil de l'Europe, qui réunit 47 pays. A la tête de la Commission , 61 médecins allemands particulièrement compétents, qui disent les chosent extrêmement clairement. Ils parlent très clairement des liens d'intérêt et de la corruption de l'OMS sur cette opération : vaccins et Tamiflu. Ces gens-là utilisent l'OMS et utilisent les institutions de la République Française dans un détournement du service publique pour gagner de l'argent. Je m'arrête là sur le pourquoi de toute cette opération, mais au minimum, c'est pour gagner beaucoup d'argent.

Et donc nous ne sommes plus dans un état de droit à partir du moment où il y a une utilisation abusive de l'Etat et c'est là que le Président du Référé aujourd'hui de ce Tribunal est interpellé, c'est sur ce point là.

Alors quelle sera sa décision ? Je ne me fais pas plus d'illusion que cela. En même temps il y a parfois des miracles en début d'année. Nous verrons. De toute façon, l'argumentaire juridique qui conduit le parquet et la partie adverse à dire que les parties devraient aller voir la justice administrative, bien entendu, c'est prévu. Nous y allons demain après-midi déposer un référé suspension et une requête en annulation devant le Conseil d'Etat.»

Il était environ 11h00 lorsque M. Cotten et M. Vercoutère ont quitté le tribunal avec leurs avocats et quelques « supporteurs » pour se rassembler dans un café à proximité autour d'une boisson chaude avant d'être interviewé par FR3, interview diffusée le soir même en région Acquitaine (Pau, Toulouse et Bordeaux), car l'Association "Cri-Vie" est basée à Pau.

Maître Malika Ouarti et Maître Jean-Pierre Joseph m'ont alors accordé un bref interview avec mon caméscope pour les gens dans ma ville en province (où certains ont refusé de croire que l'audience allait réellement avoir lieu aujourd'hui même lorsque je leur ai montré le communiqué de presse).

Maître Ouarti a dit que les deux associations avaient assignée Madame Bachelot pour demander :

- via l'Article 809 du nouveau code de procédure civile qu'il y ait un arrêt de la vaccination
- la nomination d'un comité d'experts pour examiner les effets secondaires de Tamiflu
- les possibilités de curatives et préventives naturelles et allopathiques contre la grippe A.

«L'avocat qui représentait Roselyne Bachelot n'a pas évoqué le débat de fond et s'est contenté de répéter que le juge judiciaire n'était pas compétent, qu'il fallait s'adresser au Tribunal administratif, car selon lui il n'y aurait pas d'atteinte aux libertés puisque le juge judiciaire est effectivement compétent uniquement quand il y a une voie de fait, c'est-à-dire une atteinte aux libertés fondamentales, et également, disons, un détachement de la fonction du ministre de l'exercice de son pouvoir normal.

Nous avons plaidé évidemment qu'au contraire, la liberté était menacée puisque, comme vous le savez, il n'y a pas une réelle liberté d'information, il n'y a pas de transparence. Nous avons prouvé que certains mensonges ont été indiqués dans la presse via le ministère. Il y a d'ailleurs un tabou puisque

aujourd'hui la presse nationale n'est pas là alors que c'est quand même une audience importante. Le procureur, lui, a considéré que la liberté d'information n'était pas une liberté fondamentale (!!!) Il y a une collusion certaine entre le procureur et l'avocat de Madame Bachelot.

Bien entendu, Madame Bachelot, via son avocat a réitéré deux choses : 1) que les produits avaient reçu l'anm et 2) que les vaccinations étaient facultatives.

Le problème n'est pas là pour nous. Il est évident qu'un choix doit être libre et éclairé. Le choix de se faire vacciner n'est pas éclairé à cause des incohérences concernant le nombre des vaccinations à faire, concernant le contenu des vaccins, concernant la manière dont la vaccination est faite, la réquisition de locaux, des personnes non compétentes pour vacciner ont indiqué aux deux associations Cri-Vie et Politique de Vie que des libertés fondamentales sont en jeu.Ca c'est le premier point.

Quant au Tamiflu, il y a un vrai danger, parce que les effets secondaires du Tamiflu apparaissent de plus en plus difficiles à traiter. Le Docteur Marc Vercoutère, qui dirige l'association Cri-Vie, a établi une notice, où il indique que le Tamiflu est toxique, carrément toxique, et donc il y a un vrai problème puisque actuellement le Tamiflu est prescrit, par des médecins, certes, mais est délivré gratuitement en pharmacie, prescrit par des médecins sans même que le test pour la grippe A soit effectué, parce que ce test coûte cher (200€). Donc les médecins maintenant, quand il y a des symptômes grippaux prescrivent relativement facilement du Tamiflu. A l'hôpital aussi on en prescrit et le Docteur Vercoutère pense que les effets secondaires seront malheureusement importants à moyen et court terme.

La décision sera rendue le 25 janvier prochain. Nous verrons à ce moment là ce que les associations feront face à cette décision. Nous avons argué du fait que le juge judiciaire était le juge des libertés donc nous espérons que la justice nous suivra dans ce domaine car c'est vraiment un enjeu important.»

Maître Jean-Pierre Joseph, auteur de l'ouvrage "Vaccins, on nous aurait menti?" déplore qu'on est dans un dialogue des sourds.

« Les gens qui prônent les vaccins disent que nous sommes dans une religion, ce qui est assez extraordinaire, parce que justement, on a découvert au bout de plusieurs années qu'il y avait un gros problème concernant les vaccins en général, et c'est nous qui sommes taxés d'être dans une religion. Tout cela parce qu'il y a dans ce pays des espèces de dogmes, des certitudes absolues sur lesquelles on ne revient jamais, et on récite des litanies religieuses qu'on ne vérifie jamais de toute façon, malheureusement.

Moi, le message que j'essaye de faire passer, c'est que j'ai découvert, par des dossiers et par mon expérience personnelle, mes voyages et par des lectures nombreuses scientifiques que les vaccins en général sont totalement inefficaces, tous, et je l'affirme. Il y a des dizaines de publications qui sont sorties là-dessus, qui sont très claires et très précises, il suffit de regarder les courbes du Ministère de la Santé de toutes les épidémies du monde entier depuis le début du 20ème siècle, sans aucune exception. Les vaccins ne servent à rien, c'est très clair. Si on n'a pas compris cela, dans cinquante ans on y est toujours. Que ce soit avec ou sans adjuvant, c'est un faux débat, les vaccins ne servent à rien.»

Hier et aujourd'hui, à part FR3 en Acquitaine, il est clair que les médias en France ont boudé cette audience, préférant annoncer la résiliation des commandes de 50 millions de doses de vaccins, ainsi que le recours aux médecins généralistes, et les vaccinations prévues désormais au sein des entreprises, chez Michelin en particulier.

THE FLU CASE

Eyewitness Account of French Health Minister's Appearance in Court over the Swine Flu Jab Campaign

The Flu Case, 6 January 2010 11:34

https://web.archive.org/web/20100220012057/http://www.theflucase.com/index.php?option=com_content&view=article&id=2475%3Aeyewitness-account-of-french-health-ministers-appearance-in-court-over-the-swine-flu-jab-campaign-in-english-and-french&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Carolyn Dunning in Paris gives an eyewitness account of the appearance in court on Monday of the French Health Minister Roselyne Bachelot -- represented by a lawyer -- following charges brought by Dr Marc Vercoutere and Christian Cotten concerning the mass swine flu vaccination campaign.

The court is due to give its verdict on January 25th.

Following charges by Maîtres Malika Ouarti (Barreau de Paris) and Jean-Pierre Joseph (Barreau de Grenoble), Mrs. Roselyne Bachelot, Minister of Health was represented by her lawyer at a hearing before the Tribunal de Grande Instance of Paris on Monday, January 4, 2010 at 9 am, the aim of the assignation being for putting an end as soon as possible to the campaign of vaccinations against influenza H1N1".

This litigation was initiated before the "imminent danger" faced by the people, by the Association "Cri-Vie" (Coordination of Research and Independent Information regarding Health), chaired by Dr. Marc Vercoutère (Pau-Pyrenees Atlantiques) and "Politique de Vie", a political party from the extreme centre, chaired by the psychologist Christian Cotten (St-Aubin, Essonne).

A "provincial grandmother" reports:

Having driven through New Year Monday morning traffic to Paris I did not have a professional reporter's card so had to join the security check queue at the public entry door to the Tribunal de Grande Instance de Paris, where supporters of the cause, people from all walks of life, simple citizens with woolly hats and mittens, met each other for the first time in the bitter cold and after an unexplained standstill of about 15 minutes, we moved on to find the allotted room for the hearing.

However, having climbed the huge steps to the Palais de Justice and traversed the immense "Salle des Pas Perdus", we were informed that the room for the hearing had been changed and that everyone had just disappeared round the bend of the corridor to some other room. Burly policemen prevented us (a sensible group of about 25 polite and peaceable people) from following them down this corridor, saying they did not even know which room had finally been chosen for the hearing and that we should leave the court to carry on its work in peace, I quote: "il faut les laisser travailler en paix".

The actual location of the hearing having been identified 10 minutes later, the same three burly policemen then barred the way through another door from the "Salle des Pas Perdus" to yet another corridor separating us from the hearing, saying that there were no more seats left and that two people were standing up, which was not strictly allowed. Once a room was full they could not allow anyone else to even approach the door, for security reasons (meaning fire etc). Several people among us insisted that the doors had to remain open to the hearing and that we could legally go up to these OPEN doors, but the policemen were adamant and said it was not their problem, they were only doing their "duty".

A passing lawyer agreed to go through the doors and down to the end of the corridor to check for us, then reported that there were indeed about 40 people present at the hearing and that the room was really full. But Maître Ouarti (Christian Cotten's lawyer) said afterwards that we should have banged on the doors because they are supposed to be left open and that this failure to render the hearing open to the public could be used to nullify the court's decision.

In the meantime, obediently doubting our rights, our little band of docile dwarfs gathered at the foot of the imposing columns of the Court of Justice to exchange email addresses and discuss the case with a lone reporter (from the monthly magazine TOP ALERTE) near the reception kiosk topped by a glass pyramid..

At about 10h30, Christian Cotten and Marc Vercoutère emerged from the "out of bounds" corridor with their lawyers, Maître Malika Ouarti and Maître Jean-Pierre Joseph. Surrounded by friendly supporters filming with their cam recorders, Christian Cotten was clearly dismayed to announce to his anxious listeners that the aim of putting an end to the vaccination campaign had not been achieved, and that it would therefore continue in France because the judge was esteemed to be "incompetent" to deal with the particular nature of the accusations.

He added that the court's decision would be on 25th January, so if people did not heed the warnings he and others have already tried to communicate, there would be casualties in the coming weeks, which he could do nothing to prevent. Absolutely exasperated by these typical bureaucratic tactics of playing for time, in this urgent situation where every day may damage the health of the public and even cost lives, he exclaimed in his usual spontaneous style:

"*Tant pis pour eux, ces hauts fonctionnaires qui ont beaucoup de pouvoir ! Que les hauts fonctionnaires stupides se fassent vacciner ! Ca écoulera les doses !" (Too bad for the bureaucrats wielding power at the top! Let the stupid high ranking officials (civil servants) go and be vaccinated themselves! That will get rid of the doses*!)

After this angry explosion belied by his visible distress at the idea of even the "high ranking bureaucrats" having to be vaccinated, making a considerable effort to look on the positive side of things, he admitted that:

"The two lawyers did a very good job. Marc said everything he had to say very well. I presented the evidence (since this is a penal procedure), a very clear and simple text, to the interim president [of the Tribunal de Grande Instance]

highlighting his moral, political (I do not know if I added "spiritual" but I could have done), and legal responsibility. He has a real responsibility; he is challenged on behalf of public health, in the name of preserving the integrity of the population and our bodies. That is a fundamental freedom, the bodily integrity of each one of us.

He is challenged on an issue that is a criminal case. We are dealing with a criminal case: multiple procedures of lengthy duration before magistrates in Grenoble , Nantes , Paris , Evry, Pau , Créteil .. (I can no longer keep up with them all, which is just great!) These lengthy procedures are now launched and will continue, that is to say, work will be engaged in the long term, five years, ten years, but they will keep this issue alive. Most probably one day there will be a trial in the correctional Assize Court of Justice of the Republic. For after registration, there will necessarily be a trial.

We are in a criminal case because we are witnessing an international operation using the Republic's institutions for private organizations who have implemented a plan that is organized crime, by an organized gang: attempted poisoning, damage to integrity and distribution of highly toxic products.

It is very clear, the vaccines are highly toxic, especially due to the preservatives, due to the adjuvants and due to the way of using pieces of viruses, which are said to have been attenuated, except that they recombine with other pieces of virus and after a while they become anything but attenuated viruses.

It is now clearly exposed by scientists and science journalists that all the studies provided by Roche Laboratory were fully rigged from start to finish by the Marketing Department and external PR companies paid to make studies demonstrating Tamiflu's pseudo effectiveness. Tamiflu is not only ineffective (and competent doctors demonstrate that very well), but it is also highly toxic. We can presume that a large number of deaths hitherto attributed to H1N1 influenza, particularly those of children, should actually be attributed to Tamiflu, which is used in a completely delusional manner.

If it weren't for the victims - because there are victims of vaccines today, there are victims of Tamiflu - personally I would find it laughable because we're in a situation where organized international gangsters use senior WHO officials and remunerate them. It's very clear today. An investigation will being launched by the Parliament of the Council of Europe. This is not the European Parliament, contrary to what some journalists say, it is the Council of Europe, which brings together 47 countries.

At the head of the Commission, 61 particularly competent German doctors, who say things quite clearly. They speak very clearly of links of interest and of the corruption of the WHO in this operation: vaccines and Tamiflu. These people use the WHO and institutions of the French Republic, diverting public service to earn money. I shall refrain to go further as to the reason behind this whole operation, but at the very minimum, it is to earn lots of money.

And so we're not in a state of law from the moment there is a misuse of the State and that is why the interim President of this Court is challenged today, it is on that precise point.

So what will be his decision? I am under no illusion about that. At the same time a miracle can happen, at the start of the New Year."

Mr Cotten and Mr Vercoutère left the Court around 11h15 with their lawyers and several supporters to gather in a nearby café around a warm drink before an interview for FR3 TV channel which was diffused the same evening in the Acquitaine region (Pau, Toulouse and Bordeaux), because the Association "Cri-Vie", chaired by Marc Vercoutère is based in Pau.

Maître Malika Ouarti and Maître Jean-Pierre Joseph agreed to let me interview them with my camrecorder for people in my provincial bourgeois home town (where people refused to believe that a real court hearing would be held today even though I showed them the press release).

Maître Ouarti said that the two associations had assigned Madame Bachelot to request:
- via Arti cle 809 of the new Code of Civil Procedure, that the vaccinations should cease;
- that a committee of experts be appointed to examine the side effects of Tamiflu;
- possibilities for curative and preventive, natural and allopathic remedies against influenza A.

Me Ouarti noted that the lawyer who represented Roselyne Bachelot "did not address the case in depth and simply repeated that the judge had no jurisdiction, that they should contact the Administrative Tribunal, because he said there is no infringement of freedom, and that the judge is competent only when there is an assault, that is to say an attack on fundamental freedoms, or a detachment from the Minister's function in the exercise of his normal power.

We argued that on the contrary, freedom is threatened because, as you know, there is no real freedom of information, no transparency. We have proved that certain lies were indicated in the

press via the Ministry. There is, moreover a taboo today as the national press is not here today, at an important audience. The prosecutor asserted that freedom of information was not a fundamental liberty (!!!) There is some collusion between the prosecutor and counsel for Ms. Bachelot. Of course, Ms Bachelot, via her lawyer, reiterated two things: 1) that the vaccines were ANM and 2) that the vaccinations were voluntary.

The problem does not lie there for us. It is obvious that a choice must be free and informed consent. The choice to be vaccinated is not informed because of inconsistencies in the number of vaccinations to be done, in the content of vaccines, in how the vaccine is made, the requisitioning of premises and of persons who are not competent to vaccinate, all of which have indicated to the two associations Cri-Vie and Life Policy that fundamental freedoms are an issue. That is the first point.

As for Tamiflu, the danger is real, because the side effects of Tamiflu are becoming more difficult to treat. Dr. Marc Vercoutère, who heads the association Cri-Vie, has established a notice in which he indicates that Tamiflu is toxic, downright toxic, and therefore there is a real problem now because Tamiflu is prescribed by doctors, without even testing for influenza A, because this test is expensive (200 €) and Tamiflu is sold over the counter by chemists. So when there are flu-like symptoms, doctors now prescribe Tamiflu relatively easily. At the hospital they also prescribe Tamiflu and Dr. Vercoutère believes that side effects will unfortunately be significant in the medium and short term.

The decision will be published on January 25. We shall see then how the associations face this decision. We have argued that this judge (juge judiciaire) was the judge of freedom so we hope that justice will follow us in this area because it is really an important issue."

Maître Jean-Pierre Joseph, author of "Vaccins on nous aurait menti?" regrets that everyone is speaking at cross purposes.

"People who favour the vaccine say that we are in a religion, which is extraordinary because it was discovered after several years that vaccines in general were problematic, and yet we are the ones who are accused of being in a religion. All that because in this country there are dogmas and certainties no-one ever goes back on, and people recite religious litanies that are never checked anyway, unfortunately. The message I'm trying to convey is that I have discovered through my files and personal experience, my travels and extensive scientific reading that all vaccines in general are totally ineffective. There are dozens of publications which are very clear and very precise. Just look at the curves of the Ministry of Health of any epidemic outbreaks worldwide since the early 20th century, without exception and you'll see that vaccines are useless, it's very clear. If you do not understand that, in fifty years we'll have made no progress. Whether with or without adjuvant, is a false debate, vaccines are simply useless."

Blind eye on this hearing, preferring to announce the cancellation of the orders for 50 million doses of swine flu vaccine, as well as the permission for GPs to vaccinate in their surgeries, and that vaccinations could begin within firms, such as Michelin.

THE FLU CASE

H1N1: 4 députés centristes pour une commission d'enquête, le PS veut une mission

The Flu Case, 6 January 2010

https://web.archive.org/web/20100220012145/http://www.theflucase.com/index.php?option=com_content&view=article&id=2490%3Alikelihood-of-french-parliamentary-inquiry-into-swine-flu-vaccination-grows&catid=1%3Alatest-news&Itemid=64&lang=en

Quatre députés du Nouveau centre ont déposé une proposition de résolution demandant une commission d'enquête parlementaire sur la grippe H1N1, tandis que leurs collègues socialistes ont réitéré leur demande de mission d'information sur ce sujet.

Le groupe Nouveau centre décidera mardi prochain d'utiliser ou non, son droit de tirage, un nouveau droit constitutionnel permettant à un groupe de demander, une fois par session, une commission d'enquête, a précisé l'auteur de la proposition de résolution, Jean-Christophe Lagarde, lors d'un point de presse.

En principe, la demande de commission d'enquête ne peut être refusée que si les 3/5e des députés s'y opposent.

Le texte co-signé par M. Lagarde, Jean-Luc Préel, Maurice Leroy et Jean Dionis du Séjour, et déposé mardi soir, explique que "la France s'est montrée clairement en difficulté dans le dossier" de la vaccination contre la grippe H1NI.

Les 4 député jugent donc une commission d'enquête nécessaire, afin d'effectuer un "travail d'analyse transparent, public et contradictoire" pour "comprendre les dysfonctionnements du plan de vaccination et les améliorations à lui apporter".

"Il y aura un jour une pandémie plus mortelle, soyons prêt pour la prochaine fois", a expliqué M. Lagarde.

En revanche, le député centriste a jugé que la "polémique sur le nombre de vaccins était déplacée".

"La polémique du PS c'est une histoire de pognon", a-t-il dit. Mais le travail des parlementaires "c'est de dire que nous avons choisi la mauvaise voie et qu'il faut changer", a-t-il ajouté.

Mardi, Roselyne Bachelot (Santé) a indiqué qu'elle accepterait une commission d'enquête parlementaire et Jean-François Copé, le patron du groupe UMP "a dit qu'il ne s'opposerait pas" à son principe, a souligné M. Lagarde.

Il a par ailleurs critiqué la demande des députés PS d'une simple mission d'information, moins contraignante qu'une comission. Lundi, le porte-parole du PS, Benoît Hamon, avait demandé une "commission d'enquête" sur la grippe H1N1, tandis que le député PS de Paris Jean-Marie Le Guen avait réitéré sa demande de constitution d'une mission d'information.

A l'Assemblée, le groupe PS, qui a déjà utilisé son droit de tirage pour demander une commission sur les sondages, ne peut l'utiliser pour la grippe H1N1. "Mais les sénateurs PS pourraient le faire" sur la grippe H1N1, a fait valoir M. Lagarde.

"Il faut faire la clarté", a déclaré de son côté M. Ayrault lors de ses voeux à la presse. Selon lui, "il est urgent que l'Assemblée nationale et le Parlement fassent leur travail et que le gouvernement accepte une mission d'information parlementaire et pas seulement l'audition d'un ministre".

"Il faut l'installer dans les jours qui viennent", a-t-il lancé.

Pour sa part, le président de l'Assemblée nationale Bernard Accoyer (UMP) s'est dit "personnell-ement opposé" à une commission d'enquête, dans une interview au Quotidien du médecin.

Mercredi, il a simplement annoncé que Mme Bachelot répondrait aux questions de l'ensemble des députés à l'occasion de la "prochaine réunion de la commission des Affaires sociales".

"Il faudra que les gens qui refusent expliquent pourquoi", a répondu M. Lagarde.

THE FLU CASE

Likelihood of French Parliamentary Inquiry into Swine Flu Vaccination Grows

The Flu Case, 7 January 2010 11:20

https://web.archive.org/web/20100220012145/http://www.theflucase.com/index.php?option=com_content&view=article&id=2490%3Alikelihood-of-french-parliamentary-inquiry-into-swine-flu-vaccination-grows&catid=1%3Alatest-news&Itemid=64&lang=en

A parliamentary inquiry into the swine flu vaccination campaign in France looks increasingly likely after four deputies belonging to the Nouveau Centre (New Centre) party deposited a submission on Tuesday evening, according to AFP.

Under the procedural rules, each political party is allowed to intitiate one parliamentary inquiry for every session.

The Nouveau Centre deputies Jean-Christophe Lagarde, Jean-Luc Préel, Maurice Leroy and Jean Dionis du Séjour said in their deposition that "France is clearly showing itself to be in difficulty in the matter of the vaccination against the swine flu."

The deputies said they considered a commission of inquiry necessary for a "transparent analysis" to "understand the disfunctions of the plan of vaccination and the improvements to be brought to it."

Jean-François Copé, head of the ruling UMP party headed by Nicolas Sarkozy, has said that he is not opposed to the inquiry in principle, according to Lagarde.

A parliamentary inquiry can only be blocked if three fifths of the deputies vote against the submission.

The Nouveau Centre centre-right party has 22 deputies in the national assembly and is part of the ruling coalition.

LA DÉPÊCHE

Vaccin contre la grippe A : Roselyne Bachelot sur le gril

La Dèpèche, 7 January 2010, 08:22
https://www.ladepeche.fr/article/2010/01/07/750323-vaccin-contre-la-grippe-a-roselyne-bachelot-sur-le-gril.html

Début d'année sous pression pour Roselyne Bachelot. Sa gestion de la grippe H1N1 n'en finit pas de susciter des remous. Quatre députés du Nouveau centre, dont Jean Dionis du Séjour, ont déposé une proposition de résolution demandant une commission d'enquête parlementaire sur la grippe H1N1, tandis que leurs collègues socialistes ont réitéré leur demande de mission d'information. Le Nouveau centre décidera mardi prochain d'utiliser ou non son droit de tirage qui permet à un groupe de demander, une fois par session, une commission d'enquête. Mardi, Roselyne Bachelot a indiqué qu'elle accepterait une commission d'enquête parlementaire. « Il faut faire la clarté », a déclaré de son côté le socialiste Ayrault lors de ses vœux à la presse.

Pour sa part, le président de l'Assemblée nationale Bernard Accoyer s'est dit «personnellement opposé» à une commission d'enquête. Hier, il a annoncé que Roselyne Bachelot répondrait aux questions de l'ensemble des députés à l'occasion de la «prochaine réunion de la commission des Affaires sociales».

De son côté, la commission des Affaires sociales du Sénat a indiqué hier qu'elle souhaitait elle aussi « entendre rapidement » la ministre de la Santé.

Costa Rica: Carta Abierta de una Ciudadana preocupada

The Flu Case, 7 January 2010 21:53
https://web.archive.org/web/20100324230216/http://www.theflucase.com/index.php?option=com_content&view=article&id=2499%3Acosta-rica-carta-abierta-de-una-ciudadana-preocupada-por-claudia-calvo&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Curridabat, Costa Rica, 1 de enero 2010.
De Parte de una Ticasolidaria - Preocupada por sus Compatriotas.

¡*Por Favor*! tómense el tiempo de leer esto, y reenviénlo a todos los que conozcan, a blogs, a donde sea: que cada ciudadano de Costa Rica tome su propia decisión libre… pero que sea una decisión *Informada*: esta carta es acerca de lo que dice en el folleto informativo de Panenza -la vacuna de gripe porcina que nos llega al país esta semana, como nos lo informó hoy Al Día. (Casi todos los enlaces marcados están traducidos al español en los adjuntos que vienen junto a esta carta, junto con unos más -resultó que esto coicidía con las últimas tandas… ¡por suerte!)

NOTA PRELIMINAR: Soy plenamente consciente de que esta cartita NO va ser del agrado de ciertos dirigentes -y de que en este país (y este mundo) nada es un secreto, por lo que el tratar de ocultar mi nombre sería totalmente absurdo ; (de por sí, el hecho de que yo soy la que he estado traduciendo toda esta información desde hace meses… es un secreto a voces.) Si no firmé mis envíos anteriormente, es porque todo lo que he estado mandando era traducción literal de lo escrito por otras personas ; pero esta carta es personal.

Ahora, hasta donde yo sé; y a menos que en algún momento hayan cambiado la Constitución Política sin avisarnos -que nunca se sabe en este siglo y milenio-… que yo sepa, pues, en Costa Rica tenemos aún Libertad de Expresión. Así que la voy a aprovechar ; ahí disculpen.

A Mucha Honra, Soy Costarricense, y de paso, NO me interesa particularmente la política. (Aunque, habiendo aclarado eso (y ¡hablando de decisiones informadas!… puede valer la pena exigir que Tu candidato preferido exprese -claramente- su posición oficial al respecto… porque -obviamente- Liberación Nacional ya mostró la suya.)

No soy médico; soy simplemente una guía turística.

Me involucré en este asunto porque trabajo con turistas extranjeros, y éstos (tanto los recientes como los de todos estos años -que permanecen en comunicación) me han estado contando desde hace meses de su preocupación por lo que está pasando en Europa, Canadá y EUA con respecto a estas vacunas -y a mandarme toneladas de información… pero no había nada en español para advertirles a los demás. Fue entonces cuando libremente decidí … que era mi responsabilidad no dejar que esto siga ignorándose, máxime tomando en cuenta la actitud “ignorantista” de nuestros medios de ¿comunicación? De ahí, las traducciones voluntarias de www.theflucase.com Gracias infinitas al Dr Agustín Páez -y a tantos otros- ¡por tomarlas en cuenta! Y -ni hablar- mil gracias a Jane Bürgermeister por confiar en mí.

En fin, quiero creer que la Libertad de Expresión todavía existe en mi adorado país -fuera de las clases de cívica… pero de no ser así, elijo saberlo ya -que de todos modos, siempre es algo que es importante saber, ¿o no? Muchas gracas a UDS por leerlo y compartirlo..

Claudia Calvo Louward, Curridabat, cédula 1-758-609, licencia ICT 436.

Nota adicional: si alguien del bando "vacunador" leyera esto, quiero que se sepa que aprecio a su justo valor, y de todo corazón, la preocupación de nuestra Ministra de Salud ¡por lograr conseguirnos a todos la "menos mala" de todas las vacunas de gripe porcina, Panenza, de Sanofi-Pasteur! ; no le debe haber sido nada fácil, y sé que las presiones globalistas de OMS-ONU-FMI, CFR, etc, son incomparablemente peores de lo que se piensa, máxime en los países en vías de desarrollo. Así que mis gracias infinitas y sinceras, Señora Ávila, por intentar no envenenarnos -tanto- y créame en verdad que entiendo su predicamento.
(Gracias, sí, pero aún así… ¡No, Gracias!)

Es Cierto que se supone que Panenza es la "menos peor" de todas las vacunas H1N1.

Pero también tiene su "tela que cortar", como verán. Y recuerden también que fueron las vacunas (pediátricas) de Sanofi, las 800.000 que fueron sacadas de circulación en EUA este diciembre…. http://www.cdc.gov/h1n1flu/vaccination/syringes_qua.htm porque -diz que- "ya no eran lo bastante fuertes"; ahora, la gente de Estados Unidos tiene que cambiar la segunda vacuna de sus hijos por un veneno tremendo.

De cualquier modo, por favor tómense unos minutos en hacerle números a esto:
El folleto informativo de Panenza está en http://www.who-umc.org/DynPage.aspx?id=85898 , buscar Panenza (casi al fondo) Está en francés, pero es bastante comprensible. De todas maneras, lo que sigue lo resume a grosso modo. Claro que todo esto le es muy rentable a Sanofi: se anotaron un sabroso aumento de "sólo" $500 Millones ¡para el último cuatrimestre del 2009! [See: Sanofi aims to double vaccine sales by 2013. – Reuters, 17 December 2009; http://www.reuters.com/article/idUSLDE5BG1RT20091217] y esperan que el 2010 siga creciendo a la misma tasa… Me alegra mucho por ellos que la crisis mundial no les esté afectando, ah dichosos… pero ¿tiene la Caja Costarricense de Seguro Social -léase todos nosotros- que pagarles tan feliz aumento?

Pero es que, cuando bajé el folleto para ver el detalle de "la vacuna más segura de todas las H1N1" resulta que tiene algunas contradicciones bastante raras…

Rareza 1: El mismo folleto que dice que "se puede usar sin ningún problema en embarazadas -en cualquier etapa- y en madres lactando"… te dijo una frase antes -en el mismo párrafo- ¡que no hay NINGÚN estudio sobre embarazadas o madres lactando! Ni hablar de que de ninguna manera se puede poner en niños menores de seis meses. (Lindo, pero… ¿uds conocen a muchos fetos que tengan… más de 6 meses de nacidos?)

Rareza 2: En los ingredientes te dice -y te repite más adelante- que es "sin adyuvantes ni productos tóxicos", y que básicamente, sólo contiene proteína de huevo con virus atenuado y agua destilada ; por ningún lado menciona formaldehído ni nada por el estilo. Sí, pero... en las contraindicaciones -un par de páginas después- te dice que no se te ocurra ponértela si sos hipersensible a los huevos (ok, es lógico) ¡pero también… al formaldehído (formalina), a la neomicina (antibiótico bactericida, pero que no sale listado en los ingredientes), o al octoxinol-9 (fuerte espermicida, según wikipedia)!

(Y ¿de dónde salió todo eso, entonces? Ahora bien, comprendo que la idea -de momento- NO es vacunar a las embarazadas o niños (gracias, INAMU y PANI -y AGECO, de paso- por entender la carta del dr Páez) ; pero la policía y demás gente de respuesta ¿querrán inyectarse con formalina y espermicidas? Porque lo más probable es que no les digan que vienen ahí… ya que ¡no los listan! Pero si "no están", ¿cómo es que te pueden causar alergia? ¿Qué más NO nos dirá el folleto, y que SI trae la vacuna?)
Rareza 3: También dice que no hay ninguna evaluación de la interacción de Panenza con otros medicamentos o vacunas, pero que sí te dará resultados falsos durante un par de meses en cualquier prueba -del virus que sea, no sólo de gripe- y que, al ser mezclado con otras medicaciones, los efectos negativos de ambos serán mucho más fuertes. Más adelante, te dice que no te vacunés con Panenza si esás tomando algún medicamento, recetado o no.
(Pero ¿quién no toma algún tipo de medicamento, hoy en día -aparte de mí?)

Rareza 4: Dice además que todo centro que las aplique debe imperativamente tener un equipo de resuscitación completo, por aquello de una severa reacción alérgica o de algún shock anafiláctico inesperado.
(Menos mal que es ¡¡¡"inofensiva"!!!)

Rareza 5: En otro lado dice que las dosis, o partes de dosis no-usadas deberán de ser muy cuidadosamente desechadas, al tratarse de material bacteriológico ; no vaya a ser que se nos contamine el medio ambiente.

(¡Excelente por el ambiente, gracias! Pero… ¿uds están seguros de que quieren meterse en el cuerpo algo… que de ninguna manera puede ir a dar al pobre río Tárcoles?)

Rareza 6: Advierte fuertemente que por ningún motivo puede entrar al sistema vascular.
(¡Qué salvada: los que se vacunan ¡seguro no tienen vasos sanguíneos en sus bíceps!)

Rareza 7: Aclara bien que NO hay datos de tolerancia después de su comercialización…
(¡Obvio: los datos los darán los Humanillos de Indias que se vacunen -si es que alguien permite que sus datos se reporten oficialmente ; como sea, esos datos todavía no existen!)

Rareza 8: Habla de que son muy frecuentes (1 en cada 10 vacunados)… migrañas, alergias, irritaciones, llanto continuo, dolor, mialgias, problemas circulatorios "transitorios", fuerte fiebre, eritema y cosas "leves" de ese tipo, por varios días.

Luego dice que -al ser similar en ingredientes a otras vacunas- siempre hay el riesgo de que "en algunos casos, pero sin tenerse datos reales de su frecuencia" -hablemos de eufemismos-, puede haber: trombocitopenia transitoria (tu sangre no coagula -ojo que si esto se te vuelve autoinmune, estás FRITO) y linfadenopatía transitoria (¡qué bonito! andar con TODOS los ganglios inflamados durante un par de semanas -si es que se quita).

También dice que se podrían dar casos de neuralgias, parestesia, convulsiones febriles, encefalomielitis, neuritis o Guillain-Barré (Sillas de ruedas ; buenas, bonitas y baratas, ¡2x1!) O a lo mejor vasculitis, a veces asociada con trastornos renales graves. (¿Voluntarios para una placentera diálisis?) Y reacciones cutáneas fuertes (muy sexy, andar con "sarna"…).

OJO: dice que las "pruebas clínicas exhaustivas" que sí se hicieron fueron ¡¡¡sobre 24 personas!!! Pero entonces, ¿qué va a pasar cuando nuestros 1.800.000 paisanos más confiados se dejen vacunar? Puede que se trate de una "selección natural" por criterio de inteligencia, pero NO es justo, máxime cuando la prensa nos tiene en la Luna y que la gente confía desde siempre en su amada Caja, cuyos miembros -a veces- ni siquiera saben lo que les están ordenando ponerles…

Rareza 9: Te dice todo esto en el folleto de la vacuna de jeringa de dosis única… que cuesta bastante más que $7.5 cada una -que es lo que está pagando la Caja. La que sí tiene un costo parecido a eso es la *multidosis* … pero resulta que esa, además, tiene… timerosal -léase mercurio, ¡una de las sustancias más tóxicas que se conocen en el mundo!

(*Qué bueno saber que ahora ¡por fin! nos vamos a poder poner al día con los EUA, en que los niños pasaron de 1 caso de autismo en 100.000… a 1 en 64 en 2009 ¡gracias al mercurio de sus vacunas! Porque en adultos también tiene cualquier cantidad de efectos deliciosos…*)
=> Vaccines are one Big Experiment causing Hundreds of Diseases in the Modern World. – Prevent Disease, 21 September 2009 http://preventdisease.com/news/09/092109_vaccines_responsible_for_all_diseases.shtml

Rareza 10: Te dice que hay que vacunarse dos veces -aunque NO existe estudio diferencial de anticuerpos entre gente vacunada una o dos veces ; en otro lado dice que NO está establecido si es necesario dar la segunda dosis…pero que tiene que darse después de 3 semanas. *(????)*

Y recalca bien claro que DE NINGUN MODO se puede hacer la segunda dosis con NINGUNA otra vacuna H1N1 que no sea Panenza…
(¿Será por el posible riesgo de recombinación de virus, usando a sus maltrechos cuerpos -ya debilitados por las vacunas- como incubadora? Ojo, conjetura mía: puede que me equivoque. Pero se basa en lo que dice el website de Jean-Jacques Crèvecoeur, y suele tener razón.)

*OK, pero ¿dice en algún lado de nuestros transparentísimos medios,de comunicación… si las otras dosis que llegarán en febrero y marzo… también serán Panenza? ¡Si ni siquiera se molestaron en decir que la "panacea" que nos llega esta semana es del laboratorio Sanofi-Pasteur -y que se les ocurrió sacar la noticia **EL** día que todos están en la playa -y "de goma" o borrachos todavía- (o sea, el peor día del año para vender periódicos)! Y también, recuerden lo que pasó al respecto en EUA (que no era primera vez con Sanofi).*

…

etc.

En Cuanto A Ustedes… Investiguen un Poco, Y Decidan Uds Mismos, A Consciencia.
Feliz Año… Y de Todo Corazón: Muy Buena Suerte.
Claudia Calvo.

Sammelklage in Italien wegen Schweinegrippe-Impfstoff

Nachrichten, 16 Januar 2010, 18:22 h
https://web.archive.org/web/20100121152156/http://www.nachrichten.ch/detail/423990.htm
http://www.nachrichten.ch/detail/423990.htm

Rom - Der italienische Konsumentenschutzverband Codacons hat eine Sammelklage gegen das Gesundheits- und Wirtschaftsministerium eingeleitet. Der Grund ist die grosse Menge von unverkauftem Schweinegrippe-Impfstoff.

Der Konsumentenschutzverband forderte die sofortige Auflösung der mit Pharmagesellschaften abgeschlossenen Verträge zur Lieferung des Serums an Italien. Den Italienern solle das Geld zurückerstattet werden, welches das Gesundheitsministerium für den Erwerb von 24 Millionen Dosen des Impfstoffs ausgegeben habe, da die Nachfrage deutlich unter den Erwartungen liege, so der Verband.

Lediglich 875'000 Personen liessen sich in Italien impfen. Codacons verlangt die Rückerstattung von 186 Millionen Euro, die Summe, die für nicht verkaufte Dosen ausgegeben wurden. Der Verband fordert hinzu eine «symbolische» Entschädigung von 50 Euro für jeden Italiener für einen Gesamtwert von 9,3 Milliarden Euro.

THE FLU CASE

Italy's consumer Protection group demands 9.3 billion Euros damages over Swine Flu jab scam

The Flu Case, 17 January 2010 14:51
https://web.archive.org/web/20100401142038/http://www.theflucase.com/index.php?option=com_content&view=article&id=2583%3Aitalys-consumer-protection-group-demands-93-billion-euros-damages-over-swine-flu-jab-scam&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Italy's Codacons consumer protection group has taken legal action against the health and economic ministries to force them to cancel orders with pharmaceutical companies for swine flu jabs.

The group is also demanding 9.3 billion euros in compensation -- or 50 euros for every Italian -- as "symbolic" damages in addition to the reimbursement of all the money paid to the pharmaceutical companies as part of the swine flu jab scam.

Only 875,000 people in Italy took the swine flu jab leaving the government sitting on about 24 million swine flu jabs.

V armádě začalo očkování proti prasečí chřipce, vojákům se nelíbí

České Noviny, 26 ledna 2010, 17:16
https://web.archive.org/web/20100129121700/http://www.ceskenoviny.cz/zpravy/v-armade-zacalo-ockovani-proti-praseci-chripce-vojakum-se-nelibi/426210

Praha – Náčelník generálního štábu Vlastimil Picek nařídil několika tisícům vojáků a civilních zaměstnanců armády povinné očkování proti prasečí chřipce. Do života tak uvedl vládní usnesení z 11. ledna, které hovoří také o očkování policistů a hasičů. Pokud některý z vojáků neuposlechne, čeká jej trest včetně možného snížení platu. Vojákům se podobné nařízení nelíbí, napsal server iDnes.cz.

"*Nejsme pokusní králíci. Ať to nechají na naší volbě, jestli chceme být očkováni, či ne*," citoval server jednoho z vojáků.

"V rámci resortu obrany se očkování bude týkat přibližně 16.000 osob, jak vojáků, tak občanských zaměstnanců," sdělila ČTK mluvčí generálního štábu Jana Růžičková. O začátku očkování rozhodl podle ní hlavní vojenský hygienik. Současné období poklesu nákazy totiž označil za vhodnou dobu před možnou druhou vlnou chřipkových onemocnění. Picek a jeho nejbližší podřízení si pro injekci vakcíny přišli už minulý pátek.

Česká vláda v reakci na možnou pandemii prasečí chřipky rozhodla už loni o očkování osob nezbytných pro zajištění chodu státu. Očkováni jsou ale především lidé s nemocemi, které by chřipka mohla výrazně zkomplikovat. V lednu pak vláda okruh očkovaných osob rozšířila.

Česká veřejnost není očkování příliš nakloněna. Zatím se podle ministerstva zdravotnictví nechalo očkovat asi 30 procent lidí vybraných k očkování.

Vojákům se povinné očkování proti chřipce nelíbí

Denik.cz, 26 ledna 2010, 17:16
https://web.archive.org/web/20210506170743/http://www.denik.cz/z_domova/vojakum-se-povinne-ockovani-proti-chripce-nelibi.html

Praha - V armádě začalo povinné očkování proti prasečí chřipce. Některým z těch, jichž se to týká, však protestují. V případě neuposlechnutí je však může stihnou trest.

THE FLU CASE

Leif Arnold

Calls for protest against swine flu vaccination

The Flu Case, 18 February 2010, 12:11
http://www.vaccinationsfaran.se/pdf/A%20protest%20against%20vaccination.pdf

"A Protest Against Vaccination

The public ought to protest. In March 2009 the World Health Organisation (WHO) and the Centers for Disease Control and Prevention (CDC) reported an outbreak of swine flu in Mexico and southern California. A few months later the outbreak spread, as a result of which the WHO declared a "Stage 6 pandemic" alert.

The WHO is required to act in such a way as to safeguard the health of all human beings. There is evidence that the WHO has abused its authority and is using its position in an improper way for the benefit of pharmaceutical companies and other interests. Governments and authorities all over the world have shown an unprecedented lack of competence by allowing themselves to be manipulated by the WHO and its ill-willed accomplices.

The experimental swine flu vaccine, which was produced in great haste and put into mass production without the usual procedures and tests, is a potential cause of DNA mutations, cancer, autoimmune diseases, mass death of cells, autism, schizophrenia and much more.

Alleged and poorly researched evidence of a pandemic frightened honest and unsuspecting people into having themselves and their children vaccinated with an experimental vaccine containing new substances that have not been tested to any significant extent or for a sufficient period of time. Furthermore, information that the vaccine consists of components of nano size, which means that the vaccine could have undesirable side effects on DNA levels, was withheld from the general public.

The National Institute for Occupational Safety and Health in England has demonstrated that components nano size can be extremely dangerous. In animal testing, where animals have inhaled nano particles, it was found that the animals developed inflammation of the lungs similar to that caused by asbestos fibre.

A recent article published in Der Spiegel magazine of October 22nd 2009 states that new EU directives are necessary for the registration of chemicals in products and that the same registration should also be applicable to products that consist of nano particles, the reason given being: "so that people have the freedom of choice". The article also states that studies show that components the size of nano can constitute a risk and that there is a hypothetical theory that nano particles may affect a person's DNA, which could lead to science fiction scenarios in the future. In addition, it has recently been discovered that a nano particle that comes into contact with tissue causes oxidative stress and various inflammatory processes, which, could as such lead to oxidative stress in the future. Animal testing has also demonstrated that nano particles that are injected or inhaled have passed the blood-brain barrier and reached the brain.

The WHO and its academic experts, the European Medicines Agency (EMEA), governments and authorities all over the world have, by duping people into taking this experimental vaccine, breached ethics policy for research, the Nürnberg Convention, the Helsinki Declaration of the World Medical Association (WMA), the Biological Weapons Convention, national constitutions, respect for the integrity of the individual and the basic human right of respect for a person, established ethical practice and social aspects. These breaches provide sufficient grounds for immediately prosecuting the WHO and those involved.

The HPV vaccine "Gardasil" is another vaccine that has been approved for use on children. This vaccine has been produced by means of a hybrid DNA technology, the use of which can alter and combine DNA molecules. Bits of DNA can be cut out and mutated and transferred to other organisms or reintroduced into the genetic material of the host organism and become what is known as a transgenic organism. It is also unlawful from an ethical standpoint to dupe honest and unsuspecting people into taking this hybrid vaccine.

Certain people, in positions of authority, have demonstrated total callous ruthlessness, with respect to their indifference, toward the welfare of our most precious asset…our children. Our civilization is paying dearly for our indifferent acceptance of inadequately tested medical "advances". The safety and efficacy of vaccination has not been demonstrated by reliable, independent, unbiased, and competent scientific evidence. Vaccines are loaded with heavy metals, cancercausing substances, foreign DNA and RNA fragment, different viruses and proteins, prions and oncogenes, toxic chemicals, dangerous neurotoxins etc. Some are so deadly that they were used in Auschwitz-Birkenau to kill mentally ill people during World War II. The vaccine has also a host of unknown particles which come from the cells of chickens, monkeys and even from cancer cells.

Vaccines are extremely toxic and can have a numerous and unpredictable side effects, including behavioural disorders, learning disabilities, central nervous system disorders, autism, hyperactivity, dyslexia, depression, kidney disorders, liver and blood disorders, allergic reactions, mental retardation and epilepsy, diabetes, anaphylactic shock, nerve death, genetic damage, reproductive defects, mitochondrial dysfunction, impaired oxidative-reduction activity, degeneration, death in human neuronal and fetal cells, Alzheimer's and much more. Why are we vaccinating our children without enough scientific consensus? It is time to terminate the childhood vaccinations program, and start to investigate how our government and health agencies could cover-up this duplicity. The government and health agencies, which should protect our health, have obviously another agenda and have totally abdicated any semblance of professional integrity and ethical conduct.

The purpose of the protest is to disseminate valuable information and invoke public opinion against this onerous deception and prosecute those who are responsible, as was the case with the war criminals at the Nürnberg trials between 1945 and 1949.

The protest will continue until the goal has been achieved, that is until this odious vaccination farce has been resolved and those who are responsible are brought to trial at an international criminal court and prosecuted to the full extent of international law.

For this reason I urge you to support this protest by joining this group. It is an effective way to achieve change. Invite all your friends to join.

Application forms and information can be found on www.cmef.eu

THE FLU CASE

Legal action filed in Chile to stop Swine Flu Jabs
in Spanish

The Flu Case, 10 April 2010, 12:46
https://web.archive.org/web/20100613225221/http://www.theflucase.com/index.php?option=com_content&view=article&id=3254%3Alegal-action-filed-in-chile-to-stop-swine-flu-jabs&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Recurso de Protección
Recurrente: Miryam Andrea Salazar Gutierrez
Rut: 13.703.222-8
Recurrido: Miinisterio de Salud
Abogado: Margarita Cecilia Barberia Miranda
En Lo Principal: Recurso De Protección.
Primer Otrosí: Orden de no Innovar.
Segundo Otrosí: Acompaña Documento.
Tercer Otrosí: Solicita Diligencia.
Cuarto Otrosí: Téngase Presente.

Iltma. Corte
Margarita Cecilia Barberia Miranda, Abogada, con domicilio en Avenida Diagonal Paraguay número 461 oficina 4° E, Comuna de Santiago, a US. Itma. digo:

Que de acuerdo a las facultades concedidas por la Constitución Política de la República, interpongo recurso de protección en favor de doña ***Myriam Andrea Salazar Gutiérrez***, dueña de casa, con domicilio en Antonio Varas número 2171, departamento número 801, comuna de Ñuñoa, y dirijo esta acción en contra del Ministerio de Salud en atención a los antecedentes de hecho y de derecho que paso a exponer:

Los Hechos
Es de público conocimiento la crisis de salud que vivió el país, replicando la preocupación internacional por el desarrollo de una cepa de virus de gripe que los expertos epidemiólogos identificaron como A H1 N1, conocida como "Influenza Humana". El organismo internacional que se encarga de centralizar y orientar políticas públicas en el ámbito sanitario, la Organización Mundial de la Salud, calificó el evento como "Pandemia", grado que posteriormente bajó.

Diversos Estados en el mundo reclamaron por la inexistencia de un antídoto efectivo en contra del flagelo, situación que cambió a los dos meses de decretada la alarma mundial con la comercialización de un compuesto bioquímico que desarrolla y comercializa el laboratorio internacional "Sanofi Pasteur".

En ese contexto, la autoridad sanitaria nacional, el Ministerio de Salud, encargó un stock de dos millones de dosis, que se amplió en el mes de marzo del año en curso con otros dos millones, y se preparó una campaña para iniciar la vacunación haciendo especial hincapié en los sectores vulnerables como son las mujeres embarazadas, menores de edad y tercera edad, criterio que se refuerza en las zonas devastadas por la catástrofe de febrero de 2010.

Es un hecho de vasto conocimiento científico que la aplicación de la vacuna no es recomendable en el caso de las mujeres embarazadas, a menos que se trate de un caso de extrema necesidad.

La autoridad ha actuado de manera apresurada al implementar esta campaña y no entregar toda la información que de manera contundente ha circulado en distintos lugares del mundo y su actuar ha lesionado los derechos de la recurrente como se expondrá.

El Derecho

De acuerdo al artículo 20 de La Constitución Política, El Recurso de Protección procede respecto de los derechos que la protegida consideran vulnerados por el actuar de la autoridad, estos son el derecho a la libertad de información, reconocida por el numeral 12 del artículo 19 de La Carta Fundamental, el derecho a la vida y a la integridad física del que está por nacer, reconocidos estos por el primer numeral de la norma citada, así como el derecho de propiedad, consagrado por el numeral 24 y la prerrogativa que concede el numeral 26 del artículo en comento que garantiza la seguridad de que los preceptos legales que por mandato de la Constitución regulen o complementen las garantías que esta establece o que las limiten en los casos en que ella lo autoriza, no podrán afectar los derechos en su esencia, ni imponer condiciones, tributos o requisitos que impidan su libre ejercicio

En El Folleto de Información al Profesional de la Vacuna Monovalente Influenza A (H1N1), acompañado en otrosí de esta presentación, se señala en el primer numeral de la octava parte, referida al Uso en Poblaciones Específicas que se desconocen las consecuencias de la vacuna en mujeres embarazadas, pues no se sabe si la misma puede causar daño fetal.

Con la llegada del invierno, en el formato de la campaña de vacunación a los grupos de riesgo no se ha prevenido en forma adecuada a las mujeres embarazadas de la circunstancia en que se funda el recurso. Dañándose el derecho de las

Así mismo, la lesión de estos derechos, perturba el ejercicio del derecho de propiedad que tienen las protegidas sobre los derechos conculcados y perturba la seguridad que entrega la carta fundamental en el mencionado numeral 26 del artículo 19 en cuanto a que el ejercicio de los derechos reconocidos por la constitución no pueden ser afectados en su esencia.

En consecuencia, solicito en representación de la protegida que se ordene a la máxima autoridad Ministro de salud don JAIME MAÑALICH MUSÍ informe veraz y claramente, lo que a su vez el Instituto de salud Pública informa a los profesionales médicos sobre las recomendaciones a que hace alusión el folleto acompañado, en el que expresamente se informa que no existen estudios en mujeres embarazadas, por lo que las consecuencias de una vacunación masiva en este grupo, son inciertas

Por tanto de conformidad a lo establecido en el artículo 20 de la Constitución Política y de conformidad con lo establecido en el Auto Acordado de la E. Corte Suprema de 24 de junio de 1992 sobre tramitación y fallo del recurso de protección de las garantías

Sírvase Us. I. admitir a tramitación este recurso de protección y -previo el informe pedido en el segundo otrosí acogerlo, adoptando todas las medidas necesarias para restablecer el imperio del derecho y asegurar la debida protección de los derechos de la protegida.

Primer Otrosí. - *Sírvase Us* Itma. decretar Orden de no Innovar, a objeto de que se suspenda la vacunación masiva de mujeres en estado de gravidez, hasta tanto se informe adecuadamente de que no hay estudios respecto de las consecuencias que pudiera tener en la vida y la integridad física del que está por nacer.

Segundo Otrosí.- Sírvase Us. I. oficiar a la autoridad correspondiente del Ministerio de Salud, Ministro señor don Jaime Mañalich Musí, para los efectos de que señale como se fiscaliza que en los centros de salud, se de la información correspondiente al uso de la vacuna cuestionada en las mujeres grávidas.

Tercer Otrosí.- Sírvase Us. I. tener presente que acompañado, con citación el siguiente documento: Copia simple del folleto de Información al Profesional Vacuna Monovalente del la Influenza A(H1N1) Suspensión Inyectable.

Cuarto Otrosí.-. Sirvase Us. I tener presente que en mi calidad de abogado asumo personalmente el patrocinio de esta presentación.

<= See a copy of the legal action in Spanish above:

Legal action filed in Chile to stop Swine Flu Jabs

Andrea Santandar and a group of lawyer yesterday filed legal action in Chile to stop the mass swine flu vaccination campaign.

Lawyers filed a petition on behalf of a pregant woman, arguing that Chile's public health bodies have not given adequate information about the risk of the swine flu vaccines and so are violating a right of information anchored in the country's constitution.

The legal action asking for court protection against the dangerous jab has attracted significant media coverage in Chile where the mass swine flu jab campaign has just started.

Schizophrenia & Autism are the effects of Vac' stimulation in unborn – 19 April 2014
http://rinf.com/alt-news/latest-news/schizophrenia-autism-effects-vaccine-stimulation-unborn-children/
U.S.A. – Dr. Russell Blaylock, MD is one of the most knowledgeable neurosurgeons in the world and he is also one of the most outspoken ones when it comes to explaining the dangers that vaccines pose to children, women & everyone else. Dr. Blaylock has made it his mission, purposely or not, to warn people about the damage that vaccines cause on children's brains & how such damage affects neurological development. Some of the points Dr. Blaylock makes whenever he appears in public or during interviews with news media is that vaccines are indeed neuro-disruptors, and that the damage on the brain is more severe on children, because *their brains are not fully developed*. Brain tissue in children is more sensible to mercury, adjuvants, formaldehyde, and aluminum **used in vaccines**, than the average adult.

...

800 more children permanently harmed by vaccines – 15 February 2013
https://www.naturalnews.com/039116_children_harmed_vaccines.html
U.S.A. – More evidence has emerged showing that the GlaxoSmithKline (GSK) vaccine Pandemrix, which was widely administered throughout Europe during the 2009-2010 H1N1 influenza "pandemic," was responsible for causing serious and permanent side effects in many of the children that received it. At least 800 children, it turns out, many of whom live in Sweden, now have narcolepsy because of the vaccine, and some government officials are demanding answers.

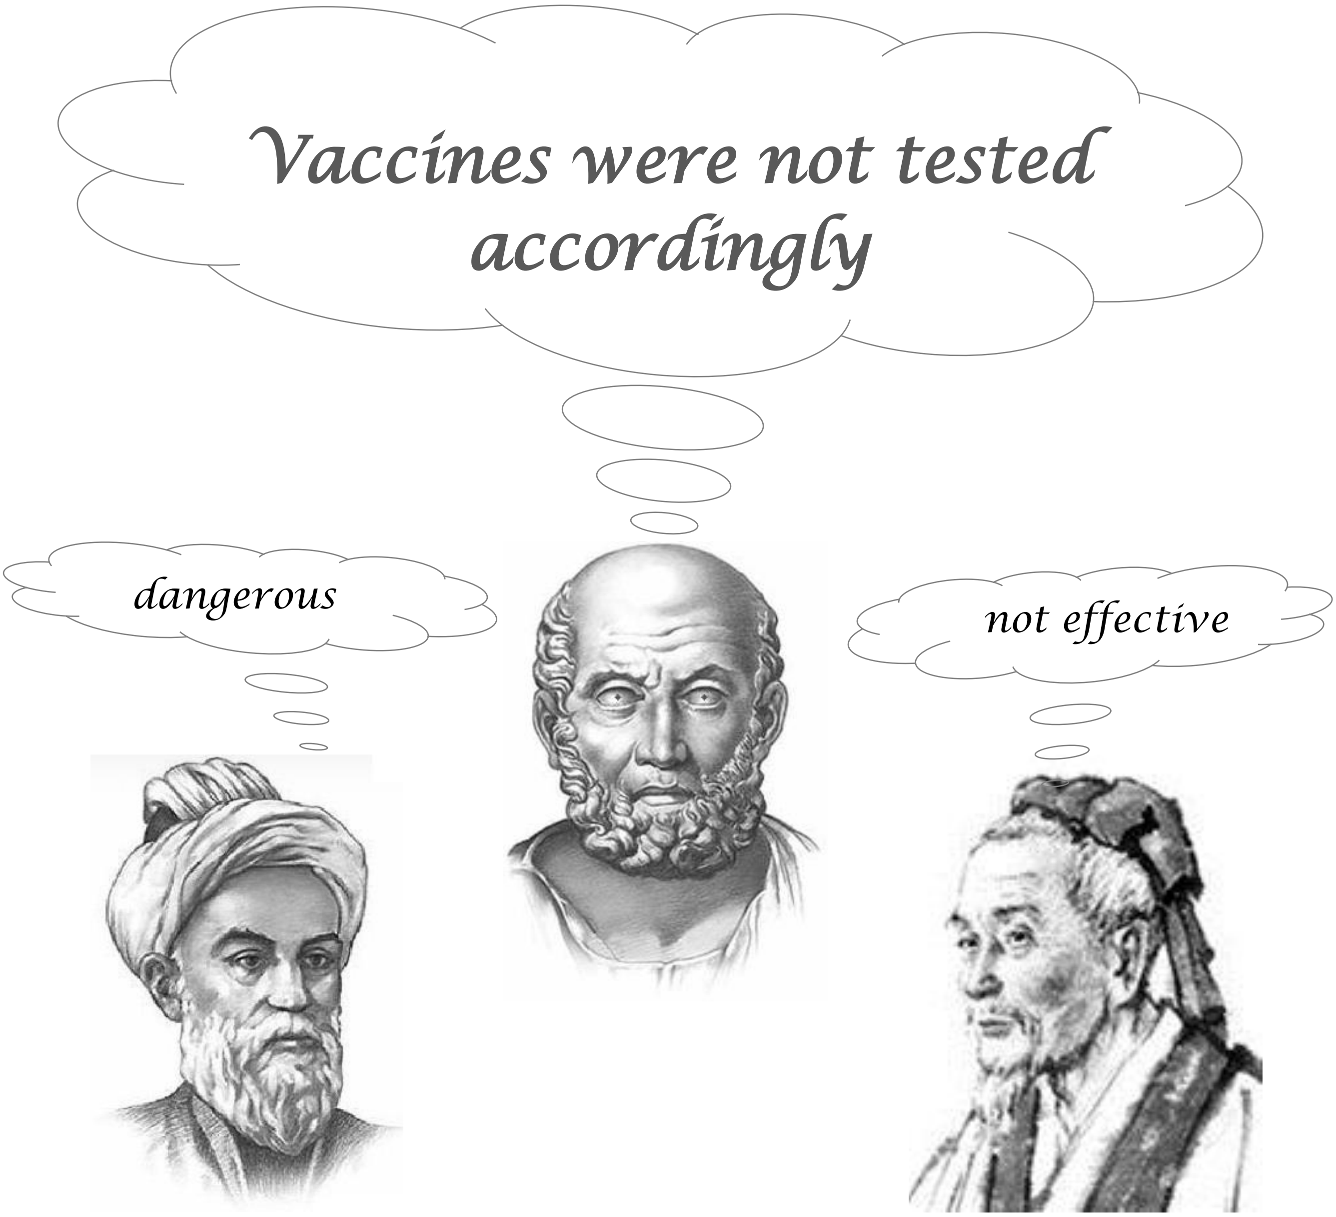
...

H1N1 Vaccine Tied to Spike in Narcolepsy – 28 March **2012**
https://www.medpagetoday.com/infectiousdisease/uritheflu/31904
Finland – Cases of childhood narcolepsy spiked in Finland in 2010, and researchers there are suggesting the adjuvanted vaccine against the H1N1 pandemic flu might have been a trigger. Two related studies, appearing online in PLoS ONE, found that the incidence of narcolepsy rose markedly in children and adolescents, while remaining unchanged in those 20 and older. Most of the cases in children occurred after vaccination with the ASO3-adjuvanted flu vaccine Pandemrix, which was the only vaccine used in Finland during the pandemic.

Vaccine Propaganda Continues Despite Evidence of Harm – 2 September **2011**
https://web.archive.org/web/20150928111037/http://www.activistpost.com/2011/09/vaccine-propaganda-continues-despite.html
U.S.A. – A comprehensive evaluation of eight common childhood vaccines has found that any adverse effects from vaccines are very rare or very minor. The report, issued last week by a panel of experts assembled by the Institute of Medicine (IOM), said there is no evidence that childhood vaccines cause autism, diabetes, facial palsy or episodes of asthma. *They Are Lying* because scientifically it's impossible to conclude this. Several of the chemicals or heavy metals that are in vaccines are independently known to cause severe disease.

...

9 month old twins die minutes after measles vaccination – 13 December **2010**.
https://web.archive.org/web/20101216014640/http://www.naturalnews.com/030712_measles_vaccination.html#ixzz187mywh8d
India – A pair of nine-month old twin girls died within minutes of being given a measles vaccine at a private clinic in Ghaziabad, India. The girls were taken by their uncle, Akhil Sharma, to receive a measles vaccine at the Divya Nursing Home. "I took them for the vaccination around 6 p.m. on Wednesday," Sharma said. "They were given the vaccination around 7:15 pm. In 15 minutes, the children started breathing heavily."



...

Profit Driven Swine Flu Propaganda – Pump up the Volume - Part 5. – 30 October **2009**
https://www.naturalnews.com/027372_mercury_flu_vaccine.html
U.S.A. - In the video commentary titled, Mild Swine Flu & Over-Hyped Vaccine, on the website for the National Vaccine Information Center, the group's co-founder and president, Barbara Loe Fisher, reports: "We are witnessing a roll-out of the largest, most expensive mass vaccination campaign in the history of our nation. A rollout that is bigger than even the polio vaccine campaigns of the 1950's." "If you or your child are injured from getting a flu swine flu shot, you are on your own," Fisher warns. "Because Congress shielded the vaccine manufacturers and any person giving swine flu shots from lawsuits if people get hurt," she says. "There is no funded government vaccine injury compensation program for swine flu vaccine."

Influenza Part 1:
Sorting Out the Flu Confusion

Our Firm Foundation, August 2009, 24(6): 26-29
https://dn720001.ca.archive.org/0/items/2009-olson-influenza-part-1-4/2009_Olson_Influenza_Part%201-4.pdf

Over the course of these next 3 articles, I would like to clear up some confusion surrounding the "normal" yearly flu, flu vaccination, swine flu, and take a look at some previous flu pandemics.

Just a couple weeks ago a new viral flu strain emerged, and already officials are concerned of a possible global pandemic. For those of you unfamiliar with the term, a pandemic is an epidemic (a disease that spreads rapidly and extensively) that reaches throughout an entire continent or possibly the entire globe. In less than 3 weeks according to the World Health Organization (WHO), 1,419 people are already confirmed infected in at least 21 countries and there are 30 confirmed deaths.

Define "Confirmed"

First, let's take a look at this "confirmed" business. For the record, just because some cases are "confirmed" in a lab does NOT mean that those are the only cases. So, according to the CDC's methods, if someone contracts what appears to be the swine flu (H1N1) or dies from what appears to be the swine flu, unless it has been confirmed in the labs of the CDC (Centers for Disease Control), it does not count. Ok, that's fair. So, forget about all the other possible swine flu infections and deaths, let's go with the CDC numbers and say that at least 1,419 people are infected and at least 30 people have died so far.

Well that's not bad, you say! All the reports going around are saying that the "regular" yearly flu kills 36,000 each year! But where does this number even come from? Interestingly enough, these 36,000 cases are "estimated" not "confirmed". Wait; didn't we just say that the CDC only counts cases based on a confirmation in their lab? Then those 36,000 must not count, right? That's not what they're saying. But it gets worse.

Turns out, even the "estimate" is pretty deceptive. "According to the CDC's own official records documented in National Vital Statistics Reports, only a few hundred people die from influenza (flu) on an average year. And many of these deaths occur in people with preexisting conditions, weakened immune systems, and the elderly... In 2001, just 257 people died from the flu. (Fifty-nine percent of these deaths occurred in people 75 years or older; 75 percent occurred in people 55 years or older.) To put these numbers in perspective, 3,454 Americans died from malnutrition in 2001 – 13 times greater than the number of flu deaths!" (1)

Only a few hundred? How did the number skyrocket from 257 to 36,000 and why? To bulk the number up, they have to count more deaths than what are actually caused by the flu. They add deaths from other causes. More than 34,000 of the 36,000 "flu deaths" are what officials estimate are "influenza-associated" pneumonic and cardiovascular deaths.

Keep in mind that the flu is a viral infection, while pneumonia is bacterial. So, even though people with the flu can get pneumonia, these are two totally different diseases and therefore should be listed as separate numbers on the death tally. But the pneumonia deaths far outweigh the flu deaths, so they add the number together to make the flu deaths seem more than they really are.

Billion-Dollar Products

So who would want the public to think they were more at risk for death from the flu than they actually are? Actual flu deaths each year typically range between 200-800, so why would someone want us to think it's 180 times higher? Who stands to benefit from this ridiculously inflated number of deaths? Think flu vaccine. Take a look at these quotes:

"Just a few years ago, the pharmaceutical industry was fleeing the vaccine field in droves because it just didn't pay. Global vaccine sales in 2004 were a mere $8 billion, less than those of some individual blockbuster drugs. But since then, the economics have changed dramatically.

"Vaccines used to be unprofitable, but they've now demonstrated they can be billion-dollar products," says Rahul Singhvi, CEO of Rockville (Md.) vaccine startup Novavax (NVAX)." (2)

"Vaccine sales are a bright spot in the drug industry, growing faster than sales of other prescription medicines." (3)

"The vaccine business segment currently generates the majority of our revenues and gross profit and has become an increasingly important part of our business model. Vaccine business segment revenues totaled $17.9 million, an increase of 278% over the prior year period when we initially launched vaccines." (4)

"Already vaccines have become big business for pharmaceutical giants like GlaxoSmithKline, Sanofi Pasteur and Merck & Co.. For e.g., GSK Bio, GSK's vaccines arm, accounted for 8.4 percent of GSK's pharmaceutical turnover in 2006. And it is expected that by 2012 companies like GSK, Sanofi-Aventis, Merck & Co., and Wyeth vaccines arm will fetch them more than 10 percent of sales from vaccine as a percentage of overall pharma sales." (5)

Sanofi-Aventis SA expects global vaccine sales to double to $34 billion by 2016 and will invest 6.2 billion by then to expand its production capacity to meet soaring demand, the head of the company's vaccine unit said. (6)

With this much money at stake, it would obviously benefit the pharmaceutical companies to cause patients (a.k.a. customers) to believe that there is more of a need for a vaccine than there actually is. More people taking the vaccine equals more sales for the company.

Harmful Ingredients

To make matters worse, not only are the numbers inflated and deceptive in order to generate profits, but flu shots actually contain a number of substances which may have adverse effects on health:

Mercury: Two-thirds of the vaccines made for the 2008-09 flu season contain full-dose thimerosal, an organomercury compound, 49% mercury by weight. It is used to disinfect the vaccine. Each of these flu shots contain 250 times more than the Environmental Protection Agency's safety limit. Mercury is a neurotoxin, with a toxicity level 1,000 times that of lead.

Formaldehyde: A known cancer- causing agent is used to inactivate the virus.

Aluminum: Added to promote an antibody response, is a neurotoxin that may play a role in Alzheimer's disease.

One investigator has reported that people who received the flu vaccine each year for 3 to 5 years had a ten-fold greater chance of developing Alzheimer's disease than people who did not have any flu shots. (7) The reason being that the flu vaccine contains aluminum and mercury. As these heavy

metals gradually build up in the brain they cause difficulty in multi-tasking, trouble with arithmetic, difficulty with thinking and language skills, and memory loss.

Who Really Needs a Flu Shot?

Not only are there harmful ingredients, but there is also a lack of evidence that young children and the elderly (those most susceptible to the illness) even benefit from flu shots.

“A systematic review of 51 studies involving 260,000 children age 6 to 23 months found no evidence that the flu vaccine is any more effective than a placebo”. (8)

“The influenza vaccine, which has been strongly recommended for people over 65 for more than four decades, is losing its reputation as an effective way to ward off the virus in the elderly. A growing number of immunologists and epidemiologists say the vaccine probably does not work very well for people over 70, the group that accounts for three-fourths of all flu deaths.” (9)

Is Flu Vaccine Effective?

And while these pertain to the young children and the elderly, it is becoming a more widely accepted view that the flu vaccine is often ineffective across the board for all ages.

The reason being this: “there are three main types of flu virus, and each type can mutate, or change, from year to year. Thus, there are literally thousands of possible strains. (Each strain is thoroughly analyzed and given a proper name, often a title associated with the place where it was initially discovered.) Every year health officials produce a new flu vaccine containing three mutated strains of flu virus. To determine which strains to use, officials travel to China at the beginning of the year to assess circulating flu viruses in that region of the world. They try to guess which strains will reach the United States by the end of the year.

Production begins, and the new vaccine is usually available by October. Flu “experts” often guess wrong. For example, in 1994 they predicted that Shangdong, Texas, and Panama strains would be prevalent that year, thus millions of people were vaccinated with a flu shot that contained these viruses. However, when winter arrived, the Johannesburg and Beijing strains of influenza circulated through society. The vaccine was ineffective. This happened again in 1996, and again in 1997.

More recently, the vaccine created for the 2003-2004 flu season contained flu strains that did not circulate through society that year. Officials were once again forced to admit that millions of people were vaccinated with an ineffective vaccine. Yet, flu fatalities did not increase during these years.” (10)

So if the vaccine was admittedly completely ineffective, how was there no increase in flu deaths from previous years when the vaccine was supposedly “effective”? Unless, it really has little to no effect.

Who Really Benefits from the Flu Shots?

So, knowing all this information, why would the CDC continue to not only promote the flu shot heavily, but widen the “recommended” ages for the shot? “The CDC's 15-member Advisory Committee on Immunization Practices (ACIP) makes recommendations each year on who should be vaccinated. Ten years ago, for the 1999-2000 season, the committee recommended that people over age 65 and children with medical conditions have a flu shot. Seventy-four million people were vaccinated.

Next season (2000-01) the committee lowered the age for universal vaccination from 65 to 50 years old, adding 41 million people to the list. For the 2002-03 season, the ACIP added healthy children 6 months to 23 months old, and for 2004-05, children up to 5 years old. For the 2008-09 season the committee has advised that healthy children 6 months to 18 years old have a flu shot each year. Its recommendations for influenza vaccination now cover 256 million Americans – 84 percent of the U.S. population. Only healthy people ages 19-49 not involved in some aspect of health care remain exempt.”

So we're looking at a possibly completely ineffective vaccine, now being suggested for 84% of the U.S. population. So the question is asked, why? The answer: Turns out, almost all the ACIP members who make these recommendations have financial ties to the vaccine industry.

Are Doctors and Nurses Immune?

“The CDC mounts a well- orchestrated campaign each season to generate interest and demand for flu shots. Along with posters for the public, flyers, and health care provider materials, it encourages doctors to “recommend/urge flu shots.” Medical groups, non-medical organizations (like the YMCA), and the media trumpet CDC-released messages on influenza, notably: “Flu kills 36,000 per year,” “This could be a bad/serious flu year,” and “Flu vaccine is the best defense against flu.” (11)

“Every fall, the public is barraged by messages from doctors, nurses and other health care providers to get a flu vaccination to protect against the influenza virus. But the truth is, some doctors and nurses might talk the talk without walking the walk.

According to the most recent data from the Centers for Disease Control and Prevention, a significant chunk of health care professionals declined to get vaccinated against the influenza virus during the 2006-07 flu season, with only about 40 percent opting for a jab.” (12)

Why in the world would doctors and nurses being exposed to the flu virus on a regular basis turn down a flu shot? We’re not talking a few here and there, but 60% of our doctors and nurses. Unless, they know something they’re not telling us.

This national mass vaccination policy reaps millions in profits for drug companies. In fact flu vaccine makers depend heavily upon the success of the CDC’s marketing campaign, which instills fear and anxiety in the population as its main strategy for persuading all Americans to grab their children, run to the nearest hospital, and beg for the shot.

Was There Life before Flu Vaccine?

So what did people do before flu vaccines? From the way the medical world makes you feel each year about the shot, you’d think that without it humankind would most certainly go extinct! But of course, that’s not true.

“In the old days, everybody got the flu that was going around that year and developed antibodies the old fashioned way. And then when that type of flu came around again a few years or decades later, immunological memory served as buffer so those who had already had experience with it either didn’t get it again or it was a lot milder. The flu vaccine marketers are using fear tactics to try to take away all immunological memory with type A and type B flu from our population. What will that make us? Vaccine dependent, of course.” (13)

If all this isn’t enough, not only are they recommending getting one flu shot this year, but since the recent Swine Flu outbreak, “the Obama administration is considering an unprecedented fall vaccination campaign that could entail giving Americans three flu shots – one to combat annual seasonal influenza and two targeted at the new swine flu virus spreading across the globe. If enacted, the multibillion-dollar effort would represent the first time that top federal health officials have asked Americans to get more than one flu vaccine in a year, raising serious challenges concerning production, distribution and the ability to track potentially severe side effects.” (14)

If 3-5 flu shots over a 10 year period increases your chances of Alzheimer’s 10% (as quoted above), can you imagine what all 3 together at the same time might do? Keep in mind the numerous reported side effects from taking the flu shot (including the paralytic illness Guillain-Barre) and the ever-present possibility of tainted drugs [like the batch just weeks ago produced by pharmaceutical company, Baxter, that was found tainted with live Avian Flu virus (15)]. Does anyone know what would happen if we took 3 shots at once? No. There hasn’t been enough time or testing to tell, yet the government (along with the pharmaceutical industry) is considering doing this. Can you say “guinea pig”?

What to Do, What to Do?

So, what should you do this year? If you are one of the many people opting out of a (possibly completely ineffective) flu shot, is there anything you can do? Of course! There are many natural ways (without harmful chemicals, side effects, or live virus) that will actually boost your immune system and help stave off the influenza virus. Making sure you get plenty of rest, eating plenty of fresh fruits & vegetables, getting out in the fresh air and sunshine, staying hydrated with pure water, whole food vitamin C supplements like C-Blast, immune boosters like Mighty Immune Plus, and, if you do start to come down with something, natural antivirals like Ultra Fighter can help your body to heal faster and get you back on the road to health in no time.

Oh, and remember I said a batch of flu vaccines made by Baxter were tainted with live virus a few weeks ago? Guess who has been chosen to head up efforts to produce a new vaccine for the recent Swine Flu? You guessed it, our pals at Baxter. But I'm sure that wouldn't happen again. Or would it...?

Wait! What about the Swine Flu? Is it the same as the "regular" flu that goes around each year? Is there really anything to worry about? Stay tuned next month to find out!

*Ask your health provider (MD, Naturopath, or other health professional) about flu shots, and make your decision based on that. Hope For Health does not dispense medical advice. The point of the article is to show that there are conflicting opinions about vaccines, flu shots, and other treatments.

Dr. J. Anthony Morris, former Chief Vaccine Control Officer and research virologist, US FDA, the whistle on the first swine flu vaccine, has warned about the dangers of harmful vaccines being pushed on a population to make profit

Canadian Arm Against Forced Vaccination, 6 August 2009
https://whoflu666canada.wordpress.com/category/uncategorized/

Dr. J. Anthony Morris, former Chief Vaccine Control Officer and research virologist, US FDA, the whistle on the first swine flu vaccine, has warned about the dangers of harmful vaccines being pushed on a population to make profit.

"There is a great deal of evidence to prove that immunization of children does more harm than good." – Dr. J. Anthony Morris, former Chief Vaccine Control Officer and research virologist, US FDA

"There is no evidence that any influenza vaccine thus far developed is effective in preventing or mitigating any attack of influenza. The producers of these vaccines know that they are worthless, but they go on selling them, anyway." – Dr. J. Anthony Morris (formerly Chief Vaccine Control Officer at the FDA)

Does virus vaccine increase the risk of cancer?

Bild, 7 August 2009, 15:29 UHR

https://www.bild.de/news/bild-english/does-virus-vaccine-increase-risk-of-cancer-9295686.bild.html

The swine flu vaccine has been hit by new cancer fears after a German health expert gave a shock warning about its safety.

Lung specialist Wolfgang Wodarg has said that there are many risks associated with the vaccine for the H1N1 virus.

He has grave reservations about the firm Novartis who are developing the vaccine and testing it in Germany. The vaccination is injected "with a very hot needle”, Wodarg said.

The nutrient solution for the vaccine consists of cancerous cells from animals and "we do not know if there could be an allergic reaction".

But more importantly, some people fear that the risk of cancer could be increased by injecting the cells.

The vaccine - as Johannes Löwer, president of the Paul Ehrlich Institute, has pointed out - can also cause worse side effects than the actual swine flu virus.

Wodrag also described people’s fear of the pandemic as an "orchestration": "It is great business for the pharmaceutical industry,” he told the ‘Neuen Presse’.

Swine flu is not very different from normal flu. "On the contrary if you look at the number of cases it is nothing compared to a normal flu outbreak,” he added.

The chairman of the health committee in the European Council has urged for a careful and calm reaction to the virus.

Up until now, the producers of the vaccine did not know how many orders they would have by the autumn, but the German Government is now a guaranteed customer.

Even the pharmaceutical companies are trying to exploit the fear of the swine flu pandemic.

Half of health workers reject swine flu shot

NBC News, The Associated Press, 26 August 2009, 7:01 AM +08
https://www.nbcnews.com/id/wbna32558789

About half of Hong Kong's health workers would refuse the swine flu vaccine, new research says, a trend that experts say would likely apply worldwide.

In a study that polled 2,255 Hong Kong health workers this year, researchers found even during the height of global swine flu panic in May, less than half were willing to get vaccinated.

Most said they would pass on the swine flu shot, which is not yet available, because they were afraid of side effects and doubted how safe and effective it would be.

Doctors and nurses are on the swine flu front lines — and if they become infected, they may not only spread the disease to patients, but their absence from work could cripple health systems.

The World Health Organization recommends countries vaccinate their health workers. Many Western countries including Britain, Spain, and the U.S. have said doctors and nurses will be among the first to get swine flu shots.

The study results, published online in BMJ, formerly known as the British Medical Journal on Wednesday, suggest that carrying out those plans may be tricky.

"A good argument can be made that health workers have an ethical obligation to be vaccinated, not to protect themselves, but to protect their patients," said George Annas, a bioethics expert at Boston University. "But if they don't believe that vaccine to be safe and effective, it will be a hard sell."

Several drug makers are testing their swine flu vaccines. So far, officials say that among the few thousand people who got the injections no one has reported anything more serious than a sore or swollen arm.

It is unlikely any rare side effects will pop up until the vaccine is given to millions. That might include things like Guillain-Barre syndrome, a temporary paralyzing disorder, which was seen after the 1976 swine flu vaccination campaign, and happens fewer than once every 1 million vaccinations

Researchers at the University of Hong Kong surveyed doctors and nurses in public hospitals this year from January to May, asking them if they would get a pandemic vaccine based either on bird flu or swine flu. About 35 percent of health workers were willing to get a bird flu vaccine, versus 48 percent for swine flu.

Experts were surprised *so few of Hong Kong's health workers were willing to be vaccinated*, since the city was hit hard during the 2003 outbreak of SARS, or Severe Acute Respiratory Syndrome.

Paul Chan of the Chinese University of Hong Kong, one of the study authors, thought the results would be similar elsewhere. Fewer than 60 percent of health workers in most countries get vaccinated against regular flu, thought to be a reliable indicator of whether they might get a swine flu shot. In the U.S., about 35 percent of health workers get a regular flu shot, while in Britain, only about 17 percent do.

Annas said health workers were ultimately like everyone else when it comes to getting vaccines. "Like the lay population, they assume they won't need the shot because they don't think they will get the flu."

Willingness of Hong Kong healthcare workers to accept pre-pandemic influenza vaccination at different WHO alert levels: two questionnaire surveys

BMJ, 26 August 2009; 339 doi:
https://doi.org/10.1136/bmj.b3391

Abstract

Objective To assess the acceptability of pre-pandemic influenza vaccination among healthcare workers in public hospitals in Hong Kong and the effect of escalation in the World Health Organization's alert level for an influenza pandemic.

Design Repeated cross sectional studies using self administered, anonymous questionnaires

Setting Surveys at 31 hospital departments of internal medicine, paediatrics, and emergency medicine under the Hong Kong Hospital Authority from January to March 2009 and in May 2009

Participants 2255 healthcare workers completed the questionnaires in the two studies. They were doctors, nurses, or allied health professionals working in the public hospital system.

Main outcome measures Stated willingness to accept pre-pandemic influenza vaccination (influenza A subtypes H5N1 or H1N1) and its associating factors.

Results The overall willingness to accept pre-pandemic H5N1 vaccine was only 28.4% in the first survey, conducted at WHO influenza pandemic alert phase 3. No significant changes in the level of willingness to accept pre-pandemic H5N1 vaccine were observed despite the escalation to alert phase 5. The willingness to accept pre-pandemic H1N1 vaccine was 47.9% among healthcare workers when the WHO alert level was at phase 5. The most common reasons for an intention to accept were "wish to be protected" and "following health authority's advice." The major barriers identified were fear of side effects and doubts about efficacy. More than half of the respondents thought nurses should be the first priority group to receive the vaccines. The strongest positive associating factors were history of seasonal influenza vaccination and perceived risk of contracting the infection.

Conclusions The willingness to accept pre-pandemic influenza vaccination was low, and no significant effect was observed with the change in WHO alert level. Further studies are required to elucidate the root cause of the low intention to accept pre-pandemic vaccination.

Mass H1N1 vaccination program could cost $18 billion

Lake Land Times, 28 August 2009, 11:01 AM
https://web.archive.org/web/20160418114548/http://www.lakelandtimes.com/main.asp?SectionID=9&SubSectionID=9&ArticleID=10046

British doctors question safety, balk at taking shot.

The United States government is set to undertake the most extensive vaccination program in American history this fall as it prepares to inoculate at least 160 million Americans against the swine flu, at a cost of as much as $18 billion in a worst-case scenario.

Inoculating half the population - the Obama administration's current goal - could still cost taxpayers about $9 billion.

Meanwhile, as the American government steps up its campaign, two surveys last week in the United Kingdom showed doctors decidedly reticent about taking the shots themselves - almost 50 percent in one poll said they would not take the shot, based on fears about safety and inadequate testing - and other physicians and experts have cautioned the public "to take a deep breath" about the swine flu pandemic.

The White House was doing anything but taking a deep breath. On Tuesday, the Obama administration fired off its latest salvo to persuade Americans to take the shot when it becomes available, releasing an assessment by the President's Council of Advisors on Science and Technology that up to 90,000 Americans could die from the virus this season.

"As the nation prepares for what could be a challenging fall, it is crucial that our public health decisions are informed by the very best scientific and technological information," said John P. Holdren, Assistant to the President for Science and Technology and a co-chair of PCAST.

The group's prime recommendations include accelerating the preparation of flu vaccine for distribution to high-risk individuals and pursuing "communication strategies" to broadcast public health messages. Those dispatches include a $4.8 million multimedia campaign to encourage people to get vaccinated, delivered in radio and television public service announcements, print ads, and on the Internet.

Harold Varmus, a PCAST co-chair and president of Memorial Sloan-Kettering Cancer Center, praised the administration for its efforts so far.

"The federal government's response has been truly impressive and we've all been pleased to see the high level of cooperation among the many departments and agencies that are gearing up for the expected fall resurgence of H1N1 flu," Varmus said.

The PCAST report to Obama said the H1N1 virus would likely infect 30 to 50 percent of the U.S. population this fall and winter, with symptoms occurring in approximately 20 to 40 percent, or 60 to 120 million people. The scientists also warned the virus could lead to as many as 1.8 million hospital admissions, and cause between 30,000 and 90,000 deaths in the United States, primarily among children and young adults.

Even before the report was released, the Obama administration had wasted no time in mass producing a vaccine. The government has already paid in the neighborhood of $2 billion to purchase 195 million doses, officials reported in July, and is prepared to buy enough vaccine for the entire population, if necessary.

That's 608 million doses - experts say two shots will be needed - and could push the vaccine costs alone to almost $6 billion.

And that doesn't include the cost of delivery. According to the Association of State and Territorial Health Officials and the National Association of County and City Health Officials, an extended and severe flu outbreak would cost public health agencies up to $3 billion for a 12-week response and another $9 billion in mass vaccination costs.

The $12-billion estimate does not include the cost of the vaccine or of tracking the vaccines administered, maintaining reminder/recall systems to ensure second doses are administered, or following up with individuals who experience an adverse event, the organizations stated.

Calmer heads

Despite the crisis-like environment brewing within the medical establishment and within the administration, others are not jumping on the bandwagon so readily.

In a Pulse Magazine survey last week of 115 general practitioners in Great Britain, 49 percent said they had decided against vaccination, 41 percent said they would take the shot and just under 10 percent were undecided.

In a separate GP newspaper survey of 216 general practitioners, 29 percent said they would not take the shot, and another 29 percent were undecided. Of those not getting the shot, 71 percent cited concerns about safety and lack of adequate testing.

Barbara Loe Fisher, president of the National Vaccine Information Center, has also weighed in, saying the vaccine has had less testing than Gardasil, the HPV vaccine given to young girls to prevent cervical cancer. A government report recently inked Gardasil to 32 deaths and other serious side effects, such as blood clots and fainting.

"And now, today, we have swine flu vaccines that are being rushed to market with even less testing that the fast-tracked Gardasil vaccine had, with the justification that there is a public health emergency," Fisher said on the NVIC website. "What public health emergency?"

Fisher said drug companies and the government were pushing the public toward hysteria.

"Why are we letting employees working for government agencies and pharmaceutical companies stampede us into taking vaccines that may not be necessary, safe or effective and - certainly - are not properly monitored for safety after they are given to tens of millions of children and adults?" she asked. "It is time to demand that government officials and drug companies stop conducting national vaccine experiments on the American people."

Others make more explicit claims about the links between the pharmaceutical industry and the government's stark assessments about the disease's potential deadliness and the need for mass vaccinations.

For example, Obama's co-chair of PCAST, Harold Varmus, has consulted with pharmaceutical companies, and as head of the National Institutes of Health in the 1990s dismantled the firewall between government research and pharmaceutical companies.

According to the Los Angeles Times, in late 1995, Varmus allowed agency directors to accept consulting payments from pharmaceutical companies, and ended a $25,000 annual cap on the amount of money an NIH employee could accept from outside employers, reporter David Willman wrote. Willman also said Varmus permitted NIH employees to accept stock or stock options from the industry.

Varmus is a well-known supporter of vaccinations. He is featured in a video on the Pfizer company website discussing, according to the company, "how a wider use of the new HPV vaccine could lower death rates."

How about the virus itself

Conflicts aside, just how dangerous is the H1N1 virus? So far, by all accounts, about as dangerous as any other influenza virus.

Some medical experts, such as Peter Collignon, an infectious diseases physician, microbiologist and professor at the School of Clinical Medicine at the Australian National University, says everyone should take a deep breath.

"Swine flu is not hyper-virulent," Collignon wrote in May. "While it spreads relatively easily it does not appear to be any more virulent that the strains we have circulating every year around the world."

Collignon has also said he believes the swine flu death rate is inflated - so far, it officially has been slightly higher than that of the regular flu, and the White House estimates the death rate will be between one in 1,000 and three in 1,000 - simply because many states reduced or stopped consistently testing for swine flu earlier this year and because many people with the disease never sought treatment.

The CDC itself estimates that there may have already been more than 1 million swine flu infections in the U.S., which would lower the death rate dramatically.

But will it mutate and become far more lethal this time around?

"It is argued by some that this strain could change tomorrow and become much more virulent," Collignon wrote. "This is always possible, but so can the strains that recirculate very year now."

So far, CDC officials said this week, the virus has not shown any signs of mutation.

The CDC had been concerned about mutation as the virus made its away across the Southern Hemisphere during its flu season, which is underway now, but in a briefing officials said that had not happened, and the number of cases seems to be dropping.

Meanwhile, concerns continue about the vaccine itself. The U.S. says it won't use doses containing additives called adjuvants, which boost immune system response, unless they are vitally necessary. Adjuvants have been linked to dangerous side effects and are not approved for use in the United States.

However, the U.S. has purchased 120 million doses just in case.

The lack of sustained clinical trials is also a concern, as the British doctors survey responses indicated.

Clinical trials of the vaccines only began July 22, and only then in adults, and while officials said last week they saw no red flags, they also acknowledged it was much too soon to assess long-term implications.

Taken seriously, after all these years

At least one epidemiologist, Tom Jefferson of the Cochrane Collaboration, a nonprofit group that studies the effects of health care interventions, says he's amazed at how bad pandemic predictions have been, and yet the media takes them seriously over and over again.

"One of the extraordinary features of this influenza - and the whole influenza saga - is that there are some people who make predictions year after year, and they get worse and worse," he told the publication Spiegel International in July. "None of them so far have come about, and these people are still there making these predictions. For example, what happened with the bird flu, which was supposed to kill us all? Nothing. But that doesn't stop these people from always making their predictions. Sometimes you get the feeling that there is a whole industry almost waiting for a pandemic to occur."

And just who might that industry include?

"The WHO and public health officials, virologists and the pharmaceutical companies," he said. "They've built this machine around the impending pandemic. And there's a lot of money involved, and influence, and careers, and entire institutions. And all it took was one of these influenza viruses to mutate to start the machine grinding."

Asked if he was worried about the swine flu and if he and his family were taking precautions, Jefferson said he was taking no chances.

"I wash my hands very often," he said.

Local Nurse Won't Comply with State Vaccination Order

Your News Now, 6 September 2009
https://www.youtube.com/watch?v=sRpI3TDYCdQ
https://educate-yourself.org/cn/stearnsletternysna06oct09.shtml

A vaccine for the H1N1 virus, or swine flu, is still a month away at best. But health care workers are already being bumped to the front of the line.

Those who work in health care are being strongly urged by the federal government to get immunized once the swine flu vaccine is available. The state of New York is taking it one step further by making vaccination a requirement.

Health care professionals do have an obligation to protect their patients, but at what cost? For one health care worker the new state directive intended to stop the spread of H1N1 goes too far.

Just a word like pandemic is enough to scare anyone in the health care field. For registered nurse Deborah Gerhardt, there are words even scarier.

"*Whenever you hear mandatory required, you start to get a little bit anxious*," says Gerhardt.

She's been a nurse for 15 years and has never had a flu shot.

"I feel that everyone should have a choice," says Gerhardt.

She recently learned she doesn’t have a choice.

"It was just one day we were told you will receive the flu injection," says Gerhardt.

The New York State Department of Health is ordering tens of thousands of health workers be immunized against seasonal and swine flu.

"As a parent, as a doctor, as a public health professional please get your vaccine," New York State Commissioner of Health Dr. Richard Daines asked during a news conference last week.

The commissioner says refusal to be immunized against H1N1 could increase the spread of the virus and stress and already overwhelmed medical system. He says when a vaccine is approved, there's no reason to believe it won't be safe.

"It goes through that same system and the testing so I'll have every confidence the Food and Drug Administration and the Centers for Disease Control put in it," says Daines.

After her own research, Gerhardt isn't as confident in a potential vaccine.

"It's left a lot of questions for me," she says.

Questions that have left her with one final decision.

"I so strongly don't want a vaccine that I'm not comfortable having injected into my body," says Gerhardt. "If I refuse I can' work in nursing."

It's a choice she wishes she didn't have to make.

"This is just so surreal right now," says Gerhardt. "I don't know what I will do."

Gerhardt says she's never had the flu and practices simple preventative measures like hand washing and simple sanitation techniques. She believes that's even more effective.

She realizes she could lose her job for speaking out, but says it's important since she knows others in the health care field have the same concerns.

CTV NEWS

Could seasonal flu vaccine increase H1N1 risk?

CTV News // The Canadian Press, 23 September 2009, 9:01PM PDT
https://bc.ctvnews.ca/could-seasonal-flu-vaccine-increase-h1n1-risk-1.437108?cache=zviomxnayn%2F7.632366

Unpublished Canadian data are raising concerns about whether it's a good idea to get a seasonal flu shot this fall and fuelling a drive by some public health officials in Canada to delay, reduce or scrap altogether campaigns to vaccinate against seasonal flu this year.

Drawn from a series of studies from British Columbia, Quebec and Ontario, the data appear to suggest that people who got a seasonal flu shot last year are about twice as likely to catch swine flu as people who didn't.

A scientific paper has been submitted to a journal and the lead authors -- Dr. Danuta Skowronski of the British Columbia Centre for Disease Control and Dr. Gaston De Serres of Laval University – are consequently constrained about what they can say about the work. Journals bar would-be authors from discussing their results before they are published.

=> D. Skowronski, et al. https://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.1000258

Skowronski, who initially declined to speak after news of the findings leaked to the media, said it's important that the work gets the expert scrutiny the journal peer-review system provides.

"Good scientists know that methods can influence results," she said Wednesday night from Vancouver.

"For me, it's very important that we respect the peer-review process as good scientists. Because the implications ... are important. And if there are methodologic flaws, we need to be assured that every stone was turned over to make sure what we're reporting is valid."

"Epidemiologists are taught there a limited number of explanations for results," she continued. "Either they're real, they're due to chance or they're due to bias or to confounding. And so it's going to have to be in one of those categories and that's true of any study conducted anywhere."

While few people appear to have actually seen or read the study, the puzzling findings have been a poorly kept secret and many in the public health community in Canada have heard about them.

The findings are causing consternation abroad as well, with officials at public health agencies and even at the World Health Organization worried the alleged link will deter people from getting vaccinated in a fall when many are being urged to get both seasonal and pandemic flu shots.

The Public Health Agency of Canada was informed of the findings some time ago and has been seeking help here and internationally to try to figure out if the effect is real or if the studies are flawed.

"An arms-length review of the various methods is currently underway to assess the validity of the studies relative to that observation," Dr. David Butler-Jones, Canada's chief public health officer, said via email.

"We are also examining other data that will help to understand what if any association there is. We look forward to the results of the review and other data to inform our recommendations as we go forward."

The U.S. Centers for Disease Control also knows of the work. It said it has looked for similar evidence in the United States but sees none.

"It is difficult to speak about a study that has yet to be published, however, as this is an important issue involving the subject of seasonal influenza and the fast moving global pandemic of 2009 H1N1 influenza it is important to note the scientists at the Centers for Disease Control and Prevention have not seen this effect in systems we have reviewed in the United States," spokesperson Joe Quimby said by email.

A number of influenza and infectious diseases experts know of but are unwilling to speak publicly about the paper. But several were quick to note that British and Australian researchers haven't seen the phenomenon either. The lack of corroboration in other jurisdictions is "a red flag," said one expert, who believes the findings will be shown to be due to a study flaws.

Another flu expert who was willing to speak on the record said they do not make sense to him either.

"I cannot think of a good reason why this is biologically likely, especially since we have sufficient evidence now that ... there is priming in the population by the way the vaccine is working," said Dr. Arnold Monto, of the University of Michigan.

He was referring to the fact that studies of swine flu vaccine show a single dose induces a strong and likely protective response in teens and adults. That suggests humankind's long exposure to seasonal H1N1 viruses has "primed" or awakened our immune systems to recognize the new virus and fight it off.

Dr. Donald Low, chief microbiologist at Toronto's Mount Sinai Hospital, was reserving judgment on the findings. But he said this kind of effect of previous exposure raising the risk of future illness is seen in some diseases, like dengue fever.

"We don't see that in flu," Monto countered.

Low said it is important to get to the bottom of the issue, but in the meantime, delaying the use of seasonal flu vaccine makes sense for logistical reasons. Swine flu activity is on the upswing in the U.S. and in parts of British Columbia, and focusing on speeding delivery of that vaccine makes more sense now, he said.

"If we're going to try to protect people, this is the virus we should be trying to protect them against," Low said, suggesting decisions on whether to try to vaccinate against seasonal flu can be done later in the season.

He admitted the controversy could undermine the public's willingness to be vaccinated against influenza.

"This is obviously difficult for public to be able to digest this," he said. "There's a crying need here for a prospective randomized controlled study."

That type of study – which is not the kind on which the findings are based -- is considered the gold standard of medical evidence. They are also costly and Skowronski said it wouldn't be feasible to mount one in time to help public health officials faced with the current dilemma of whether to push seasonal flu vaccine this year or not.

"If it was possible, we would have attempted it," she said.

=> D. M. Skowronski, etc. Association between the 2008–09 Seasonal Influenza Vaccine and Pandemic H1N1 Illness during Spring–Summer 2009: Four Observational Studies from Canada. - PLOS Medicine, 6 April 2010 // https://doi.org/10.1371/journal.pmed.10002

Study raises questions about flu shot

CTV News // The Canadian Press, 24 September 2009, 8:05 AM PDT // Last May 18, 2012
https://bc.ctvnews.ca/study-raises-questions-about-flu-shot-1.437356?cache=xceuacapshbcr%3FclipId%3D104059

An unpublished scientific study is raising questions about whether getting a seasonal flu shot raises the risk of contracting H1N1, but the evidence is unconfirmed and few have actually read the report.

"It appears to be that for people who got seasonal influenza vaccine last year, they were at greater risk of getting H1N1 disease this year," Dr. Donald Low, an infectious diseases expert at Toronto's Mount Sinai Hospital, told CTV News.

The study is based on research in British Columbia, Ontario and Quebec. Health organizations around the world are watching the results carefully, including the U.S. Centers for Disease Control.

"It is difficult to speak about a study that has yet to be published, however, as this is an important issue involving the subject of seasonal influenza and the fast-moving global pandemic of 2009 H1N1 influenza it is important to note the scientists at the Centers for Disease Control and Prevention have not seen this effect in systems we have reviewed in the United States," spokesperson Joe Quimby told The Canadian Press in an email.

The study is still being peer reviewed in an unnamed journal, and it's not clear when it will be published.

It could change how health officials in Canada and around the world plan their responses to a potential swine flu outbreak.

Need for seasonal flu shot questioned

As it stands, it appears that swine flu will likely "crowd out" all other flu viruses this fall, meaning Canadians are more likely to get the H1N1 virus. As such, some health officials wonder if a seasonal flu shot is still necessary.

Is it realistic, they say, to expect Canadians to head to flu clinics twice for two different vaccines, one for seasonal flu and one for swine flu? Young children might even be recommended to get four flu shots, since children usually need two flu vaccinations given a few weeks apart, to give their immature immune systems full protection. This year, they'd need to double up twice.

However, Ontario health officials tell CTV News that the province will provide a seasonal flu vaccination in the next few weeks for anyone aged 65 or older. An announcement is expected Thursday.

Officials also say they will provide H1N1 shots for high-risk groups – including pregnant women, children and health workers – in November. Then, the rest of Ontario's population can be vaccinated.

In Quebec, health officials say they're putting the seasonal flu shot program on standby.

"For the moment, it's on hold," said Karine White, a media relations liaison with the Ministry of Health and Social Services in Quebec told The Canadian Press.

Delaying the seasonal flu shot program would allow health workers to concentrate on getting swine flu vaccine into the arms of those who most at risk of complications from swine flu.

Another option would be a more limited seasonal flu shot campaign, one that would target seniors and those with weakened immune systems, who are traditionally at highest risk of seasonal flu, but allow younger Canadians to skip it.

A third option would be to scrap the seasonal flu program altogether.

"All that is being studied now. But it should be decided rapidly," White told the Montreal Gazette.

She added that the decision will affect all Canadians: "It's not like Quebec won't vaccinate and Ontario will. It will be a pan-Canadian decision."

Provincial plans

Most provinces had planned to go ahead with their seasonal flu vaccination programs this October, as scheduled. Swine flu vaccination programs likely wouldn't begin until mid-November, the earliest that the vaccine manufacturer will have it ready, tested and approved.

But infectious disease expert Dr. Neil Rau wonders whether having two vaccine programs will confuse patients, who might wonder about which shot they need and which shots they've already gotten. He says holding off on seasonal flu vaccines might be the best way to go.

"I think the people in Quebec are making a good decision because if you start going after seasonal and swine flu all at once, you end up giving – especially kids – a huge number of needles," Rau told CTV News Channel Wednesday.

"I have a feeling that all of Canada is going to go this way and maybe other countries will do the same."

Meanwhile, there are still worries that the swine flu vaccination program won't be effective, since the vaccine is expected to arrive at clinics and doctors' offices after the flu's long-discussed "second wave" has already peaked. Swine flu activity is already picking up again in the southern United States and parts of Canada, including Vancouver Island.

And, it's still not certain whether seasonal flu viruses will continue to be "crowded out" by swine flu. While World Health Organization laboratories report they are not receiving many reports of seasonal flu infections, it may be too soon to say whether that will remain the case.

The dilemma of whether to advise Canadians to get two flu shots will likely take care of itself by next year. Flu experts who advise the World Health Organization are now urging vaccine manufacturers in the Southern Hemisphere to drop one of the older strains of flu from the seasonal flu vaccine for next year's winter, to include the new swine flu pandemic H1N1 strain.

Manufacturers in the Northern Hemisphere would likely follow suit, depending on the flu activity by then.

Study linking flu shots, swine flu raises concern abroad, prompt changes at home

The Canadian Press, 25 September 2009
https://web.archive.org/web/20090928040118/http://www.google.com/hostednews/canadianpress/article/ALeqM5g-jBo3N9xWt8pxrXRQvzljFetL0g

Toronto – An unpublished Canadian study that suggests seasonal flu shots raise a person's risk of catching swine flu is raising concern abroad and triggering changes to flu vaccine program schedules at home.

The data, referred to as "the Canadian problem" by some scientists outside this country, are reported to link getting a flu shot last year with double the risk of contracting swine flu this year.

The link, if real, is to mild disease. One person who has seen the study says it seems to suggest that those who got a seasonal flu shot were less likely to develop severe disease if they became infected than those who hadn't received the shot.

Though few people appear to have seen the data, word of the findings has spread like ripples in a pond in recent weeks. Provincial and territorial public health authorities planning two mass vaccination programs for this fall have been struggling with whether to let the unconfirmed findings influence the timing of their flu shot delivery efforts.

Earlier this week some expressed hope of a pan-Canadian approach. But that hope faded by Thursday as it became clear Canada's various jurisdictions were headed in a variety of different directions.

Ontario announced it would vaccinate seniors against seasonal flu in October, but delay the bulk of its seasonal program until later in the winter. Saskatchewan said it may cancel its seasonal campaign altogether. And Manitoba said it is planning for the seasonal program to run as scheduled, but building in the capacity to change course if need be.

"When we look at the overall big picture, we believe that the strategy that we are offering is the safest and (most) effective strategy in terms of moving forward," Dr. Arlene King, Ontario's chief medical officer of health, said as she unveiled Ontario's approach.

Her counterpart from Manitoba, Dr. Joel Kettner, said his province would prefer not to go that route. "The start-stop, start-stop process is not my favourite option," he said from Winnipeg. "What I say is: Keep going boldly forth, ready to stop on a dime."

Kettner voiced what is likely a commonly held sentiment - a regret that the whole matter has come up at all. "This is not my favourite way to do public health practice - in the middle of an evolving outbreak, to have to consider preliminary research as an influence on decision making," he said, though he added that he appreciates that if scientists think they've found something of public health significance, they have a duty to air it.

"I fully understand why the authors decided to share this with some people and some people decided to share it with other people. I understand why they might have thought that was an important or good thing to do. But it does create problems."

And not just in Canada. The work, which has been the topic of hours of teleconferences, is causing consternation internationally as well, a senior official of the World Health Organization said Thursday.

Dr. Marie-Paule Kieny, who heads the WHO's vaccine research initiative, said there's a keen interest, internationally, to go through the data in the study and see whether the research is correct or flawed. "There's really intense international discussions on that," Kieny told The Canadian Press in an interview. "Because now that it's out, everybody feels that we must go to the bottom of it and see what's real there."

She noted in a news conference that Canadian officials are putting together an expert panel to assess the data. Dr. David Butler-Jones, Canada's chief public health officer, said the panel is being conducted at arms-length from the agency and the work is already underway.

Health Minister Leona Aglukkaq acknowledged the data are troubling.

"Of course it's a concern," she said in Winnipeg, where she was meeting with First Nations leaders.

"We'll continue to look at the situation and monitor the situation. Once we have the information, we'll share that information with Canadians."

Drawn from a series of studies from British Columbia, Quebec and Ontario, the work is led by Dr. Danuta Skowronski of the British Columbia Centre for Disease Control and Dr. Gaston De Serres of Laval University.

They have submitted the paper to an unnamed scientific journal and are therefore constrained about what they can say about the work. Journals bar would-be authors from discussing their results before they are published. "For me, it's very important that we respect the peer-review process as good scientists. Because the implications ... are important," Skowronski said in an interview Wednesday.

"And if there are methodologic flaws, we need to be assured that every stone was turned over to make sure what we're reporting is valid."

Complicating the issue is the fact that scientists elsewhere have looked for a similar effect but have failed to see it. The U.S. Centers for Disease Control has said it finds no evidence of this and Kieny said British and Australian researchers have also drawn a blank when they searched their data.

Kieny said it is important to study the data with an open mind. "If there is something, it's better that it comes out. I think one needs to keep open eyes and a fresh mind and look in all fairness to the results."

Still, she, like others, struggled to come up with a reason for why getting a seasonal flu shot would elevate a person's risk of catching swine flu, noting there is no evidence to suggest that getting the flu shot one year raises a person's risk of catching flu the next.

"The plausibility seems sort of in question," she said.

"It may be a study bias. It may be that something is real," Kieny said during the news conference.

"But certainly the WHO as well as the regulators in all of these countries are looking forward to be able to see the data, to study the data and come with a better understanding of whether this has any chance of indeed putting people at risk, the fact that they have received a seasonal vaccination."

Evidence emerges that seasonal flu vaccine increases risk of H1N1 swine flu

Natural News, 25 September 2009
https://web.archive.org/web/20101015053934/http://www.naturalnews.com/027102_vaccines_H1N1_flu_shot.html

To hear it from the vaccine makers, their vaccines are perfectly safe and have no side effects. A person can receive an unlimited number of vaccines (10, 100 or even 1000) and have absolutely no ill effects, they claim. This is the quack science mythology upon which mass vaccination policies are currently based. But new evidence is emerging that people receiving a *seasonal flu shot* are made *more susceptible to H1N1 swine flu* as a result.

CBC News in Canada is now reporting disturbing findings you need to know about: "Four Canadian studies involved about 2,000 people, health officials told CBC News. Researchers found people who had received the seasonal flu vaccine in the past were more likely to get sick with the H1N1 virus."

The story doesn't cite the percentage increase in H1N1 virus risk, but it's apparently enough to give pause to many doctors and infectious disease experts. "We don't know with this year's flu shot how it interacts with the pandemic flu shot, so it's a worry," said Dr. Michael Gardam in the CBC News article quoted below. He's the director of infectious diseases prevention and control at the Ontario Agency for Health Protection and Promotion.

The upshot of all this is that Canadian health officials are now scratching their heads, wondering whether the seasonal flu vaccines will actually make the H1N1 pandemic *worse!*

It's fascinating that this data is coming out of Canada, not the U.S. In the United States, the mainstream media has engaged in a virtual blackout of any information that questions the safety of vaccines, even while openly pushing outrageous lies about the swine flu vaccine
https://web.archive.org/web/20101005022331/http://www.naturalnews.com/027055_swine_flu_vaccines_swine_flu_vaccine.html

Vaccines weaken your immune system

What this information reveals is further evidence that flu shots damage or weaken your immune system, making you more susceptible to subsequent infections. Flu shots don't even work to reduce your risk of getting the flu that they're targeting! Most people who get the flu are the very same people who routinely receive flu shots.

This will hold true with H1N1 swine flu as well: The people getting the swine flu virus will be primarily those who routinely receive flu vaccinations.

You know why? Because a flu shot trains your immune system to be lazy. It exposes your immune technology to an artificially weakened virus, resulting in a lazy adaptive response from your immune technology. In much the same way that your leg muscles atrophy if you stop walking, your immune system begins to weaken if you don't exercise it. And this leads to an increased risk of being unable to defend against future exposure to infectious disease, which is exactly what we're seeing with this Canadian study.

Vaccines are the quackery of modern medicine. They not only don't work to protect people from the diseases they target; they also *increase* the risk of being infected with other diseases. And that doesn't even include the ways in which vaccine ingredients (adjuvants or preservatives) can cause permanent damage to your nervous system.

Supermarkets' bloody vaccination campaign by Lethal Injections

Rense, 26 September 2009
https://web.archive.org/web/20100104193729/http://rense.com/general87/superm.htm

Wondering why food stores and pharmacies have replaced doctors offices and clinics as vaccination stations? Ask Steve Burd, the wizard behind Obama's Health Care Reform plan. Burd, the Chairman of Safeway Supermarkets (VONS, Pavilions, and more) is also the founder of the Coalition to Advance Healthcare Reform (CAHR) in the US, and Burd has his fingers in more pies than healthcare.

...

Experts believe that foul play is obviously behind the current pandemic as evidenced by the virus's genetics. The feared flu is a laboratory-recombinant of swine from Mexico, avian (bird) from Asia, and a human corpse contaminated with flu genes from the 1918 Spanish pandemic unearthed despite protests from scientists worldwide. The official explanation alleges an impossible, natural mating of genes from some Asian chicken, Mexican pig, and a dead-corpse buried for nearly a century.

Common sense and chilling documents sent to the FBI by these authors discredit official explanations for this pandemic, and this is not the first time this kind of accident has happened. The laboratory sourced 1977 outbreak of H1N1, a virus that went extinct for 20 years was recently acknowledged in the esteemed New England Journal of Medicine.   Boycott Safeway Now!

In many Safeway stores, persuasion begins at the door. A teen, knowing nothing about vaccines, hands you a flier encouraging you to visit the pharmacy for your "impulse flu shot." He excuses himself for his ignorance using the Nuremberg defense, "I'm just doing my job."

Safeway customers never learn their pharmacists know little about the H1N1 vaccine. Proprietary ingredients in these vaccines are purposely undisclosed by Burd's partners, the vaccine makers, including Novartis, CSL, Baxter, and Glaxo-SmithKlein. Thus, the inoculations contraindications are missing from Safeway's pharmacists brains.

When on a recent visit to Safeway, Ms. Kane asked the pharmacist if he would take the shot. He replied, I am not going to lie, no, I won't take the vaccine. Five minutes later the man pleasantly provided the flu shot to a customer conned by the promotion to save 10% on her next grocery bill; so the impulse inoculation would cost her less than $20. This recession savvy promotion at check-out got her to take the shot.

Discounted injections are most profitable as they secure people's dependency on the store's pharmacy. Common vaccine and drug side effects last for years, and prescribed medicines generate greater toxicity causing additional diseases. Experts shudder to think vaccine ingredients include toxic oils, heavy metals, poisonous chemicals, anti-HIV spermicides, and (in the UK) a cancer virus believed liked to the origin of AIDS called SV40.

Incredibly, the live genetically-engineered H1N1flu viruses in Safeway's vaccines are expected to mutate rapidly with other circulating viruses including flu strains, common cancer viruses like Epstein Barr, and even HIV, potentially yielding new more deadly pandemics rivaling AIDS and the 1918 Spanish Flu.

As far as medical doctors are concerned, Safeway stores are considered competitors or travel medicine providers (TMPs), according to the Infectious Diseases Society of America (IDSA). You get what you pay for, one official told us wishing to remain anonymous. Safeway is hiring these untrained and unqualified TMPs to administer these risky vaccines.

One of Safeway's former pharmacists explained that their best druggists are fired whenever they raise reasonable objections to vaccinations. Thus, Safeway's tenured pharmacists tend to remain lame.

For all the above reasons, an immediate lasting boycott of Safeway is indicated.

THE GLOBE AND MAIL | SCIENCE

Patrick White

Study prompts provinces to rethink flu plan
Report suggests people who get vaccinated are more likely to catch H1N1

The Globe and Mail, 27 September 2009, 8:52PM EDT
https://web.archive.org/web/20091015073525/http://www.theglobeandmail.com/news/technology/science/study-prompts-provinces-to-rethink-flu-plan/article1303330/

A "perplexing" Canadian study linking H1N1 to seasonal flu shots is throwing national influenza plans into disarray and testing public faith in the government agencies responsible for protecting the nation's health.

Distributed for peer review last week, the study confounded infectious-disease experts in suggesting that people vaccinated against seasonal flu are twice as likely to catch swine flu.

The paper is under peer review, and lead researchers Danuta Skowronski of the British Columbia Centre for Disease Control and Gaston De Serres of Laval University must stay mum until it's published.
=> D. M. Skowronski, etc. https://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.1000258

Met with intense early skepticism both in Canada and abroad, the paper has since convinced several provincial health agencies to announce hasty suspensions of seasonal flu vaccinations, long-held fixtures of public-health planning.

"It has confused things very badly," said Dr. Ethan Rubinstein, head of adult infectious diseases at the University of Manitoba. "And it has certainly cost us credibility from the public because of conflicting recommendations. Until last week, there had always been much encouragement to get the seasonal flu vaccine."

On Sunday Quebec joined Alberta, Saskatchewan, Ontario and Nova Scotia in suspending seasonal flu shots for anyone under 65 years of age. Quebec's Health Ministry announced it would postpone vaccinations until January, clearing the autumn months for health professionals to focus on vaccinating against H1N1, which is expected to the more severe influenza strain this season.

"By the time the H1N1 wave is over, there will be ample time to vaccinate for seasonal flu," Dr. Rubinstein said.

B.C. is expected to announce a similar suspension during a press conference Monday morning.

Other provinces, including Manitoba, are still pondering a response to the research.

New Brunswick is a lone hold-out, announcing last week it would forge ahead with seasonal flu shots for all residents in October, as originally planned.

So far, the study's impact is confined to Canada. Researchers in the U.S., Britain and Australia have not reported the same phenomenon. Marie-Paule Kieny, the World Health Organization's director of vaccine research, said last week the Canadian findings were an international anomaly and could constitute a "study bias."

An international panel is currently scrutinizing the research data. "The review process has been expedited, so we're hoping for a response within days," said Roy Wadia, spokesman for the B.C. Centre for Disease Control.

Dr. Rubinstein, who has read the study, said it appears sound. "There are a large number of authors, all of them excellent and credible researchers," he said. "And the sample size is very large – 12 or 13 million people taken from the central reporting systems in three provinces. The research is solid."

The vaccine suspensions do not apply for people over 65. Seniors are considered more susceptible to severe seasonal flu symptoms. At the same time, they carry antibodies from a 1957 pandemic that seem to neutralize the current version of H1N1.

Even if the statistical link is proven, the medical link between seasonal flu shots and H1N1 remains mysterious. One hypothesis suggests seasonal flu vaccine preoccupies the cells that would otherwise produce antibodies against H1N1.

But, according to Dr. Rubinstein, the research shows that people who received the seasonal shot during the 2007-08 flu season remained vulnerable to swine flu well into 2009 – an interval that should provide most immune systems ample restoration time. "We don't understand the mechanism," Dr. Rubinstein said. "At the present time it is quite perplexing."

New York State NURSES ASSOCIATION

Rick Stearns

Stopping the forced "H1N1 vaccination"
Letter sent to NY State Nurses' Association District Presidents

A Letter, 28 September 2009
https://educate-yourself.org/cn/stearnsletternysna06oct09.shtml

To current and recent NYSNA District Presidents:

As the husband of a New York State RN, I recently learned of the state "requirement" for a seasonal flu shot, as well as the H1N1 vaccine, for NY health care workers. News reports indicate that the NYSNA and similar organizations were duly opposed to this but were overruled, effectively ignored, by the NY health board.

Well-informed individuals such as Dr. Gary Null are rallying to our cause. However, various polls and blogs reveal a frequent attitude among health care workers that might be summarized as follows: "They shouldn't be forcing anyone, it's unethical, but people should be encouraged to voluntarily consent to these shots."

The unwritten postscript is: "We may need the shots anyway, so I won't make too much noise about it."

This attitude reflects a completely misinformed assessment of vaccines and a serious ignorance of the purpose of Constitutional law.

The NYSNA web site outlines many cogent points against the state's egregious violation of human rights (www.nysna.org/advocacy/testimonies/mandated_shots.htm). However, the comments carry the underlying presumption that vaccines in general actually prevent disease. This claim has been in extreme dispute by physicians and scientists for more than a century, whom we rarely if ever see in popular (i.e. highly funded) media. More importantly, no mention is made of the known harmful, often deadly contents of most vaccines (e.g. thimerosal, squalene, live viruses) and especially this particular vaccine.

The historical point we should stick in the state's veins is this: Vaccines are far more likely to cause pandemics. Put another way: mass acceptance of the H1N1 vaccine, and quite possibly the seasonal flu shot (this year), will be the only way a real H1N1 pandemic can actually occur.

Even if there were a true pandemic of deadly, rapidly spreading disease killing millions worldwide (a virtual impossibility today without deliberate human interference), under no circumstance would such a toxic concoction as the "H1N1 vaccine" save us – it would be like pouring gasoline on a fire. Natural supplements are always the safest, most effective solution, certainly where influenza is concerned, and it is our fundamental right to choose them. Vitamin D3, among others, is a logical (and cheap) choice in this case.

As many researchers have concluded, disease eradication came primarily from modern living conditions and nutrition, not vaccines. No matter what statistics the multi-billion dollar health industry cites to support the effectiveness of vaccines, the evidence exposing their danger, not to mention their financiers' ulterior motives, is legion – especially recently. Vaccines are debilitating to the immune system and in many cases, fatally harmful. Religious and philosophical objections are legitimate enough, but the scientific and legal objections are paramount.

Legally, forced vaccination (and forced quarantine relocation) violates the First Amendment, Fourth Amendment, Fifth Amendment, Fourteenth Amendment, the Geneva Accords, and the Nuremberg code, at minimum. Calling it a "regulation" in the context of state health care makes it no less illegal than if Congress had passed it and called it "law." The primary purpose of human rights laws is to protect the individual against force and fraud on the part of the state. (It is not about "personal preference," Commissioner Daines.) When we couple this arbitrary violation of fundamental rights with federal liability protection for vaccine makers, and when we consider the pharmaceutical cartel dominance of funding for all major media, alarm bells should be going off in everyone's mind.

When someone on a major news network actually tells viewers, "Get your damn vaccine," alarm bells should be going off in everyone's mind.

Even if they intended to inject us with saline, they cannot be allowed to set the precedent of dictatorial "medicine" from an unaccountable global body, the WHO, financed by admitted eugenicists such as the Rockefellers and "advised" by pharmaceutical bosses.

I have included several web references at the closing of this letter. It is heavy information, and each individual must process it at his or her own pace. But all health care professionals deserve to know this information exists. Not everything on the web is true, but most truth is on the web. Vast numbers of honest online reporters have little to no financial motivation and often a great deal to lose by exposing scams like this one. For certain, nothing blasted in unison across the hyper-funded major media, particularly "declared emergencies," is scientifically reliable. The major news media is a corporate and government funded product, owned and agenda driven by powerful interests, singing from controlled song sheets, not to mention dumbed down to an elementary school level. There is no law requiring them to tell the truth – and they don't. You cannot find enough accurate information without wading through the Internet.

I will expand on a few highlights. I apologize if I am preaching to the choir, but I would rather err on that side. As mentioned, the general health care worker population could use some stronger informational weapons in its peaceful-protest arsenal.

"Swine flu" is a composite of swine flu, avian flu, and human flu strains from around the globe. The chance of this combination occurring naturally is so remote it defies consideration. In fact both the virus (Medimmune) and the alleged vaccine (Novartis) were patented prior to the "new virus" outbreak in April 2009 (see source under References). Yet this particular virus has failed to kill in large numbers, forcing the media to hype it to maintain the illusion of real danger. The laws of nature weaken viruses as they spread, Hollywood fantasies like "Outbreak" notwithstanding. Under modernized, sanitary conditions, as mentioned, only deliberate human action can kill millions via disease.

Never in recent history has there been a major "pandemic" except those caused by vaccines. Typhus vaccinations in conjunction with unsanitary conditions caused the 1918 "flu" pandemic. Smallpox vaccinations caused the 1920s resurgence of smallpox, complete with media lies driving the panic then as now. The AIDS explosion in Africa had vaccinations written all over it. The explosion in autism (a pandemic the media labels a "hoax") has been shown in laboratory experiments to be directly related to thimerosal in MMR vaccines. Gulf War Syndrome (another denied pandemic) has

been conclusively traced to squalene in anthrax vaccines. Lymerix (a response to the man-made Lyme Disease) led to a class-action lawsuit for its debilitating effects (I know one sufferer personally). Gardasil is now causing all sorts of terrible "side effects" in young girls while failing to protect against HPV.

Do vaccines really have the kind of track record that warrants the blanket presumptions of safety and effectiveness we see from so-called experts today? No they don't, and word is getting out despite the pathetic talking heads on TV. Little wonder, then, that vaccine makers suddenly need compliant government officials to force people to take their poisons.

This particular "H1N1 vaccine" **contains more squalene** than is found in those anthrax shots responsible for Gulf War Syndrome, as well as the thimerosal of MMR-autism fame. It boasts a laundry list of other toxins, not the least of which is the live engineered, patented virus itself. Even among vaccine supporters, does anyone seriously believe that such an apparently novel, mysterious virus can lead to hundreds of millions of "effective vaccine" doses within a few months (or years)? To make matters worse, the first version of "H1N1 vaccine" will reportedly be a nasal spray. This harkens back to the disaster of the oral polio vaccine and is a perfect formula for spreading the live virus contents all over schools, offices and hospitals – thus justifying the injectable, even more poisonous incarnation. If this goes forward, no one will be safe around anyone who has been vaccinated.

In 1976 we experienced Swine Flu Take One, replete with TV media propaganda advising the population to "Get a shot of protection. The swine flu shot." Many who took the shot suffered irreparable harm to their bodies (such as developing Guillain-Barre Syndrome) or died. The government became embroiled in million-dollar lawsuits, while this "swine flu" was never conclusively shown to exist beyond a single military base.

The current media hype is equally devoid of substance. Most "swine flu" deaths have turned out to be caused by some other complication, one or two paragraphs beneath the screaming headline. People have even died from other diseases as a direct result of misdiagnosis with this misnamed disease. Probably more convincing "swine flu" death reports will surface in the coming weeks to ratchet up the fear. There is a worldwide trend toward labeling any cold-like sickness "swine flu" without any testing. The worst wave to date will likely occur once people start taking the live virus nasal vaccine, but this too will be reported as "naturally occurring swine flu." The point here is that the dishonest and sloppy reporting to date, coupled with the arrogant dismissal of scientifically proven vaccine dangers, alternative natural therapies, and the manufactured nature of this virus, is clear evidence of an agenda.

In early 2009, Baxter Corporation was caught mixing live avian flu virus with regular seasonal flu shots, thanks to diligent testers in the Czech Republic. The subject ferrets dropped like flies, which strongly suggested this was a form of weaponized flu virus. Baxter admitted it, claimed it was a mistake and refused to allow an investigation. Such a lethal "mistake" is virtually impossible given the normal safety measures that separate such "research" from "seasonal flu" vaccine tests (see http://www.torontosun.com/news/canada/2009/02/27/8560781.html and many other sources). These tainted vaccines had already shipped to over a dozen countries. That such a company even remains in business shows how much alphabet-soup agencies like WHO are really out to protect us.

No, the FDA, CDC and WHO (and CNN) do not exist for our best interests, despite well-meaning individuals working at the lower levels of these organizations. At the points of actual power, they form revolving doors with pharmaceutical corporations and even worse powers-that-be who have no concern for ordinary people, to put it mildly. Populations are waking up to the unified tyranny and eugenics programs of governments worldwide. This awakening is a huge factor in why we now see such extraordinary coordination across different countries (France, Greece, China,

Canada, USA) rolling out this "mandatory vaccination" insanity. However, here in the USA they are doing it more by stealth and increment than by outright declaration. One suspects they are testing us and know full well they lack the physical means to enforce this unless a majority of the people acquiesce.

This is why I am raising hell about it. Health care workers are among the first lines of defense and possibly the last. It is essentially impossible to educate the millions of TV-mesmerized, terrorized Americans already brainwashed into believing a pandemic exists and vaccines are the only solution. But even the ignorant will intuitively take cues from doctors and nurses. In the post-9/11 smallpox scare, the federal government attempted to declare that inoculation mandatory as well, but after several health care workers sickened or died from it and an overwhelming majority refused, the media hype died and their magic word "mandatory" lost all its power. Of course there was never a threat in the first place. This time around is no different; the powers-that-be are simply more meticulous in their manipulation, more outrageous in their lies, and more extensive in their military preparations.

New York is one of the worst offenders so far in terms of actual policy passed. But again, the state has no way to physically force all health care workers to do this. We cannot let this stand under any circumstances. We must reject their poison vaccines and refuse their illegal fines. We must engage in civil disobedience, a statewide strike, lawsuits, and whatever practical measures we can devise to stop this murderous, bullying agenda in its tracks. Rallies in Albany by a small minority of nurses may help to wake more people up, if there is any press coverage, but these centralized approaches essentially consist of begging a criminal government to suddenly turn lawful. Mass awareness and civil disobedience at the individual level will be far more effective.

Feel free to distribute this letter and the below references to as many medical personnel as possible. Many will reflexively dismiss the information as "conspiracy theory" or worse, but this sadly programmed attitude is largely how we got into this mess in the first place. A lot of people are getting hungry for the truth in today's climate of perpetual deception masquerading as news. We should have 90% opposition to this deadly farce, not 30%. And a critical mass could form well below that percentage. I appreciate your prompt attention to this matter.

Sincerely,

Rick Stearns
Red Hook, NY

Hi Ken,

On 9/28/09 I sent the following letter to as many district presidents of the New York State Nurses' Association (NYSNA) as I could find emails for. Thus far I have received no response from NYSNA, but in 48 hours my wife told me a co-worker at her hospital had received a forwarded copy with at least 50 others on the send list. (Hotmail has now flagged my IP address for spam.) We are peacefully pushing the hospitals to back off, based on losing too many employees. If they do not back off, my wife will leave her job anyway. As further trial balloons pop up around the country, this letter may also serve as a template for others to modify for a particular locale or target audience.

Cheers,

Rick Stearns

Health Care Workers Protest Mandatory H1N1 Vaccination

CBS News, 29 September 2009, 11:28 AM
https://web.archive.org/web/20091002124613/http://www.cbsnews.com/blogs/2009/09/29/taking_liberties/entry5349581.shtml

Health care workers are planning to take to the streets Tuesday at a rally in front of the Albany, N.Y. state capitol to protest mandatory vaccination.

The rally is intended to call for "freedom of choice in vaccination and health care" and to protest mandatory vaccination for influenza and the H1N1 swine flu. "This vaccine has not been clinically tested to the same degree as the regular flu vaccine," Tara Accavallo, a registered nurse on Long Island, told Newsday. "If something happens to me, if I get seriously injured from this vaccine, who's going to help me?"

While physicians, nurses, and medical technicians may not be known for their willingness to march on state capitols, a recent New York Department of Health requirement has sparked an unusually intense response. The August 13 regulations say that all health care workers who "could potentially expose patients" must be vaccinated for influenza by November 30 unless it would be "detrimental" to the recipient's health. (Any reprieve would be temporary and last only until injection with the vaccine would "no longer be detrimental.")

This raises an obvious and important question: Under what circumstances can government officials order mandatory vaccination? And could the general public be ordered to roll up their sleeves for injections, even if there might be side effects beyond a sore arm or mild fever? The concern in New York also comes as skepticism of vaccination in general seems to be on the rise.

First, some stipulations. Let us stipulate that that routine vaccination has virtually wiped out, at least in developed countries, once-rampant diseases like mumps and whooping cough. The horrors of smallpox – variola major, which slays about a third of its victims, and the less deadly variola minor – have vanished, thanks to a successful worldwide vaccination campaign. Even where mandatory vaccination can cause complications, the overall side effects in a population of millions will almost certainly not be as harmful as the infectious disease itself.

On the other hand, let us stipulate that not all vaccines are created equal; some may be safer than others. Out of lack of knowledge or fear, officials may order mandatory vaccinations when the vaccine has not been proven completely safe. And we should remember that the history of our own government when it comes to vaccines is not without its low points (more on this below).

Perhaps the best overview of the legality of mandatory vaccination lies in a 2005 report prepared for the U.S. Congress by the Congressional Research Service. It notes that while the federal government does have the power to order quarantines, public health has historically been the states' responsibility. The CRS report adds: "Generally, federal regulations authorizing the apprehension, detention, examination, or conditional release of individuals are applicable only to individuals coming into a State or possession from a foreign country... Any federal mandatory vaccination program applicable to the general public would likely incorporate similar jurisdictional limitations."

In terms of state authority, there's an important 1905 U.S. Supreme Court case called *Jacobson vs. Massachusetts*, which was affirmed in 1922. It arose out of a challenge to the state's requirement to obtain a free smallpox vaccine or pay five dollars. The majority voted to upheld the law, saying:

> We are not prepared to hold that a minority, residing or remaining in any city or town where smallpox is prevalent, and enjoying the general protection afforded by an organized local government, may thus defy the will of its constituted authorities, acting in good faith for all, under the legislative sanction of the state. If such be the privilege of a minority, then a like privilege would belong to each individual of the community, and the spectacle would be presented of the welfare and safety of an entire population being subordinated to the notions of a single individual who chooses to remain a part of that population.

That seems pretty clear. So are the state laws regarding vaccinations for children attending school – every state requires vaccines such as measles, rubella, and polio, although medical and religious exemptions do exist. A 2007 Texas executive order suggests that young schoolgirls receive the Human Papillomavirus (HPV) vaccine, which appears to have recently killed a 14-year old girl in England, while providing parents with the right to opt out.

Back to New York for a moment. State Health Commissioner Richard Daines, who is probably feeling a bit of political pressure after deciding that the Empire State will go where no other state has, released a lengthy open letter last week that concludes: "We, as health care workers, owe it to our patients and to society in general to demonstrate our confidence in those scientific standards. Even more importantly, we should reconfirm our noble commitment to the tradition of putting patients' interests first by supporting the mandatory influenza vaccination requirement." He's also holding a media availability after Tuesday's protest.

While no state has gone as far as New York, many other institutions have grappled with the concept of mandatory vaccination. The University of Iowa required all staff to be vaccinated for H1N1, but then backed down in the face of a union lawsuit. The University of Alabama requires proof of meningitis vaccination, without any obvious exceptions. Protests are planned in London on October 3 against mandatory vaccination.

All members of the U.S. military will receive the H1N1 vaccine starting in October, according to an American Forces Press Service article. Massachusetts is encouraging its health care workers to be vaccinated against seasonal influenza by December 15, but isn't mandating it; its public health commissioner has even sent out a statement trying to "dispel rumors" about "forced vaccination."

An article last year in the Harvard Law Review suggests that vaccination should be viewed as two different types: inoculation against easily-transmitted airborne diseases, and inoculation against diseases where the person can more easily prevent infection, such as sexually transmitted diseases. There are stronger arguments for mandatory vaccination in the first category than the second, the article argues:

> "It makes sense to create this two-tiered system in which medically necessary vaccines are linked with narrower exemptions and practically necessary vaccines are instead linked with generous exemptions. So, vaccine laws could explicitly state that parents can exempt their children from hepatitis B and HPV vaccines with no questions asked, unlike vaccines for diseases listed elsewhere in the statute."

In general, critics of mandatory vaccination tend to center their objections around side effects, which the Centers for Disease Control and Prevention acknowledge exist, albeit in mild forms. Critics worry about the possibility of a link to autism and the use of a thimerosal, a substance containing mercury that is being phased out, as a preservative; others object on general we-should-decide-this-

for-ourselves principles. The Association of American Physicians and Surgeons, a more conservative counterpart to the American Medical Association which opposes mandatory vaccinations for schoolchildren, notes that the vaccine approval process in general has "been contaminated by flawed or incomplete clinical trials."

An article in the British Medical Journal from October 2008 (published as part of a debate) argues that: "Although the physical harms from influenza vaccine are generally minor, there are potential psychosocial harms. Mandatory immunisation infringes civil liberty and autonomy." And the free-market Heartland Institute in Chicago, Ill., argues that mandatory vaccination can violate the Hippocratic Oath: "There is no question of the great benefit of general vaccination for such scourges as poliomyelitis, diphtheria, smallpox, etc. But can we say the same for greatly self-limited rotavirus diarrhea in infants, chickenpox for children, or for the sexually transmitted hepatitis B for both?"

One example of governmental overreaction to infectious disease came in 1976, when an outbreak of swine flu struck Fort Dix Army base in New Jersey. After a 19-year-old private died, President Gerald Ford ordered a nationwide vaccination program that eventually reached 40 million people, or about 24 percent of the United States population at the time.

Without the vaccine, Health Secretary F. David Matthews solemnly predicted at the time: "We will see a return of the 1918 flu virus that is the most virulent form of the flu. In 1918 a half million Americans died. The projections are that this virus will kill one million Americans in 1976."

The vaccination program turned out to be a mistake. Reports soon surfaced about the vaccine causing a neuromuscular disorder called Guillain-Barré syndrome, and vaccinations were halted about two months after they began. One million Americans never died.

Open Letter to New York State over mandatory vaccination

CBS News, 30 September 2009, 1:18 PM
https://www.cbsnews.com/news/open-letter-to-new-york-state-over-mandatory-vaccination/

September 29, 2009

Commissioner Daines and People of New York State:

This letter is from healthcare workers. You see us every day. We are your neighbors. We are your friends. You say peace to us in church. Our children play soccer together. We minister to you. We minister to your family. We coach you through grueling labors as you struggle to have your children. We help you believe in your personal strength as you gain the confidence needed for parenting. We kneel on the hard floor next to you, working relentlessly to help your baby learn to breast feed. We work 12-hour shifts, and sometimes we never even stop for a bathroom break, because you need us.

We are there for you in surgery, listening to your anxieties patiently and offering soothing reassurances. We hold your hand when you are scared, offering a quiet assurance that you are not alone. We care for your mothers and fathers with a sense of respect and compassionate effort to help them maintain their dignity. We listen to you about their idiosyncrasies, and manage to individualize their plans of care. We set goals with you in rehabilitation, and work by your side to help you achieve these goals. We are right next door to you. We don't live on some commune eating alfalfa leaves with our "crazy ideas." We are everyday people -- you have seen us, you have trusted us, and you know we have been passionate about the care we have provided to you. We love our professions and the opportunity they give us to minister to you.

Now, we need your help. As a group of healthcare workers, we are being mandated by a new New York state law to receive the seasonal flu vaccine and H1N1 vaccines. If we do not receive these vaccines by November 30th, that inaction is to be considered our resignation. We must sign a consent for the vaccines prior to their administration. The manufacturers have been granted immunity by the government; they cannot be sued for untoward effects.

We do not want to receive these vaccines. Our educated studies of risks versus benefits conclude that the risks of the vaccine are greater than the possible benefits. You know us -- you know we live by, "First, do no harm." We have many times extended ourselves to you, but our research concludes these vaccinations are not a safe choice for us. For many of us, being forced to receive the vaccine would be being forced to compromise our religious principles. All health care workers with direct patient care are mandated to receive the vaccine, so the coercion is real -- we cannot just go find a job "somewhere else." And the job market of 2009 does not offer opportunity in a different arena where we could still feed our families.

We understand the fear that swine flu and influenza has generated. While our sources of information indicate that swine flu is not a pandemic, we know that the slanted research fed by the media offers results intended to frighten the public. We do not have the power to stop the fear that mass hype is able to generate. However, we can wear masks and continue to practice our aggressive hand washing during peak flu seasons if that is what assures you. We hear the hype you are fed. We do not want to bring you harm, but we should not be forced into harm's way ourselves.

The seasonal flu vaccine is a guess as to what epidemiologists think will present the coming year as flu. Many times, the guess is wrong. And each year the vaccine is loaded with toxins and preservatives injected into muscle tissue which is not meant to filter toxins. It has clear risks. We have healthy immune systems which God gave us to fight disease. The seasonal flu vaccine is new every year – so can you tell us how well it is tested?

In that respect, the H1N1 vaccine has been rushed out with minimal testing. Testing was to occur over a three-week period, and in the rush to be the fastest providers of the vaccine, manufacturers were funded for production before that brief period was even concluded. The results – ask the dead squirrels – did not matter. They will be using an adjuvant in the H1N1 vaccine that had been pulled off the market because of its association with Gulf War Syndrome but is now allowed to get this vaccine out to the public. In the 1970's, they released a vaccine for H1N1 that was pulled off the market because it resulted in a significantly high incidence of Guillain-Barre Syndrome. Healthcare workers will be the clinical test. We will be enrolled in a clinical trial without consenting to be research subjects.

This law should never have passed through a governing body in the United States of America. It violates the Bill of Rights. It declines our freedom to practice our religion and expects us to compromise our moral code by penalizing us with loss of employment. It mandates consent under duress, which makes the consent itself invalid. It obtains us as human research subjects in a clinical trial that we do not consent to. It denies us our right to refusal of a medication by putting us under duress. We are being put in a situation of coercion and assault. We fear loss of employment by exercising our freedom of speech and speaking out against this injustice. The United States is a different governing body than the democracy we learned about as children.

We are your brothers and sisters as citizens of New York State and we are beseeching your help. The government has created a law that should have no legal standing, but we will lose our jobs unless we yield to the law. We do not want these injections in our bodies and should have that freedom of choice. We should be allowed to practice our freedom of religion in which we place our trust in God, not medical establishments and political agendas.

Please do not let New York state proceed with this law. It will only become a precedent for further violations of our freedoms. We are everyday people and we do not have the monetary means to fight this individually, it is a huge battle. The New York State Nurses' Association had already spoken out against mandated vaccines when the law was just a bill, but their voice was not considered. We do not have time to wait for "someone else" to fight this battle, we need every individual's help to make a large public voice so the government will repeal this law or at the very least, gain an injunction to stop the mandating so there is time for the law to be reviewed by the courts and be found unconstitutional.

We have made it our profession to help and would like to continue to practice in New York state. We have been placed in a situation that is terrifying us. Commissioner Daines, you tell us we should not let us fear infringe patient safety. Please do not insult us. We take care of HIV patients during their post partum hemorrhages; we provide VRE (vancomycin-resistant enterococci) wound care and suction. We work 13 hours non-stop putting our patient desires above even our basic body needs. There is a reason 60 percent of educated health care workers historically decline the seasonal vaccine, and there is even more opposition to the H1NI.

It seems you'd like to use your position to threaten ours and play God with our lives. You are not our God, Commissioner Daines. We are perfectly willing to wear masks around our patients during the peak influenza season. We beg you to reconsider before New York state loses another group of dedicated health care workers. We will find our united voice and New York state will have a health care crisis on December 1 without us. Please come to reason.

Jennifer McLogan

N.-Y. Health Care workers Revolt over H1N1 Vaccine

WCBSTV, 30 September 2009, 6:09 am US/Eastern
https://web.archive.org/web/20091002191044/http://wcbstv.com/topstories/swine.flu.h1n1.2.1216352.html

Saying They Should Be Given A Choice, Employees Rally In Albany, Around State, Chant "No Forced Shots!" Protesters Hold Signs That Read: "The State Doesn't Own My Body."

Stony Brook, N.Y. (CBS) – They're upset over an ultimatum from the health department. Workers are being told to either get the swine flu vaccine or lose their jobs.

New York is the first state in the country to mandate flu vaccinations for its health care workers. The first doses of swine flu vaccine will be available beginning next week. Much of it is reserved for state health care workers, but there is growing opposition to required innoculations.

Health care workers in Hauppauge screamed "No forced shots!" as they rallied Tuesday against the state regulation requiring them to roll up their sleeves.

"I don't even tend to the sick. I am in the nutrition field. They are telling me I must get the shot because I work in a health clinic setting," said Paula Small, a Women, Infants and Children health care worker.

Small said she will refuse, worried the vaccine is untested and unproven, leaving her vulnerable. In 1976, there were some deaths associated with a swine flu vaccination.

Registered nurse Frank Mannino, 50, was also angry. He said the state regulation violates his personal freedom and civil rights. – "And now I will lose my job if I don't take the regular flu shot or the swine flu shot."

When asked if he's willing to lose his job, Mannino said, "Absolutely. I will not take it, will not be forced. This is still America."

The protest also shook Albany Tuesday. Hundreds of demonstrators demanded freedom of choice. After all, as health care professionals they argue they're already constantly washing their hands and aren't likely to transmit or contract the flu.

Around 500,000 health care workers are slated to receive the vaccine.

"It's certainly their prerogative to voice their opinion," said Dr. Susan Donelan of Stony Brook University Hospital. Donelan said most in the medical community see the benefits and safety of the shots and welcome them, and that hospitals must obey the law. – "Our hospital is committed to following the mandate to have our personnel vaccinated," she said.

The state said change was needed this year to save lives, typically only about 45 percent of health care workers take advantage of voluntary flu vaccines. More than 150 institutional outbreaks of seasonal and H1N1 flu are expected this year in hospitals, nursing homes and hospice centers.

New York and New Jersey will get their first doses of the swine flu vaccine next week. It will be the nasal mist, not a shot.

Influenza Part 4: The Facts on Tamiflu and Swine Flu Vaccine

Our Firm Foundation, September 2009, 24(9): 25-28
https://dn720001.ca.archive.org/0/items/2009-olson-influenza-part-1-4/2009_Olson_Influenza_Part%201-4.pdf

***Dr. Olson** comes from a long line of health professionals including MDs, naturopaths, and osteopaths. Having early wanted to help people, especially in the area of health, she was a missionary to Belize and Korea. A national speaker, an RN for years, a certified herbologist, and a naturopathic doctor, Dr. Olson is utilizing this experience and wealth of knowledge for the benefit of people all over the world*

...

Do your Homework and Make an Informed Decision

So, who is saying (and will be saying) that Tamiflu and the swine flu vaccination work? Why, the companies selling them, of course! Can we trust them? Well, in the past, drugs have been "proven" safe and effective, only later to show that they were not only ineffective, but also completely unsafe, with some being downright deadly. So do your homework and make an informed decision. Don't just take a drug "because the doctor says it's okay". The doctor said it was okay to take Vioxx, and you see how that turned out! The doctor usually only tells you whatever the drug representative from the drug manufacturer has told him. Think about it, take some time to research if you need to, and make your own informed decision as to what drugs you will take. ...

As far as the vaccine is concerned, I would suggest that you look at history and the facts and make that choice yourself. Keep in mind: vaccines are only useful against the specific viral strain that was available at the time of their manufacture. But influenza viruses mutate quickly, and as the WHO has already said, the real concern with H1N1 swine flu is that it will combine with seasonal flu (or heaven forbid, the Avian flu) in the fall, creating a new, deadly strain that will, of course, be immune to all available vaccines. If they are worried about the strains mixing in the fall, how would it even be possible to have a vaccine ready now?

Previous Flu Vaccines:

- 1918 Swine Flu – An H1N1 virus – Doctors recommended "vaccines" (who knows what was in them, yet they were still given) – They were completely ineffective. (5) The virus killed between 30-100 million people worldwide.

- 1976 Swine Flu – "In February 1976, an outbreak of swine flu struck Fort Dix Army base in New Jersey, killing a 19-year-old private and infecting hundreds of soldiers. Concerned that the U.S. was on the verge of a devastating epidemic, President Gerald Ford ordered a nationwide vaccination program at a cost of $135 million (some $500 million in today's money). Within weeks, reports surfaced of people developing Guillain-Barré syndrome, a paralyzing nerve disease that can be caused by the vaccine. By April, more than 30 people had died of the condition. Facing protests, federal officials abruptly canceled the program on Dec. 16. The epidemic failed to materialize." (6)

- July 2005 – People can now file a claim for side effects from flu shot: "Flu vaccination can cause serious problems, such as severe allergic reactions, stroke, brain damage, encephalopathy, and/ or coma. As of July 1, 2005, people who think that they have been injured by the flu shot can file a claim for compensation from the National Vaccine Injury Compensation Program (VICP)." (7)

Avian Flu February 2009 – In what was called a "serious error", drug manufacturer Baxter International Inc. sends out Avian Flu vaccines that are tainted with live Avian flu virus. (8)

The FDA does not Test Drugs

Remember, drug companies are cleverly disguised marketing machines. It is their job to sell, not heal. And if you think the FDA is watching out for you, think again. According to the FDA's own website, the "FDA does not develop, manufacture or test drugs. Drug manufacturers *submit reports* of a drug's studies so that the Center can *evaluate* its data." (9) So, the drug company gives the FDA the data that supports the drug (after all, they are trying to get it approved to sell), and the FDA just reviews it. If information is omitted, the FDA may pass a dangerous drug unknowingly. Don't let the commercials, news stories, or advertisements fool you.

Do your homework, and be informed, so if need be, you will be able to stand up and refuse to be drugged, even if everyone around you is giving in, convinced that they need it! Before you say, "But my doctor said…", let's look at what "doctors" have recommended in the past:

...

As you're deciding about what treatment you will take, keep in mind that "medicine" changes over the years and the drugs that doctors once confidently stood behind have ended up being disastrous and deadly. And, remember, not all doctors are recommending vaccines anyway.

There are many doctors who boldly oppose the use of vaccines, whether for the flu or other:

"Take the profit out of the manufacture and administration of serums and vaccines and they would soon be condemned even by those who are now using them» - George Starr White M.D. (21)

"The only safe vaccine is a vaccine that is never used." - James A. Shannon, M.D. (21)

Swine Flu 2009 Vaccine Timeline:

- April 27: Drug companies say it will take 6-8 months to develop an effective vaccine. (13)

- April 30: "There is no vaccine currently that exactly matches the swine flu. The seasonal flu vaccine is not effective against swine flu, said Richard Besser, acting head of the CDC." (14)

- May 6: The Obama administration is considering an unprecedented fall vaccination campaign that could entail giving Americans three flu shots" (15) Drug companies (who happen to stand to profit from the sales of vaccines) are pushing for this, even though:

1. This has never been done.
2. An effective vaccine has not even been produced.
3. Possible side effects of doing this are not even known at this point.

- June 12: Miraculously only one and a half months later:

"Swiss pharmaceuticals company Novartis AG said Friday it has successfully produced a first batch of swine flu vaccine weeks ahead of expectations… The announcement comes a day after the World Health Organization declared swine flu… a pandemic." (16) Wow! Is that perfect timing or what? Does this sound a bit fishy to you?

- June 13: "Specialty drug maker Baxter International Inc. (see Avian Flu bullet point above) says it's in "full scale" production of a swine flu vaccine that will be commercially available in July." (17)

- June 27: "According to officials, an unprecedented 600 million doses of swine flu vaccine may be given this fall even though officials have not yet developed a way to administer such a large

number of shots… Tracking the vaccination side effects will also prove to be a difficult task. If both the swine flu vaccination, and the seasonal flu shot are given at the same time, it will likely cause issues determining which side effects are from which vaccination. This issue previously arose in 1976, when officials vaccinated for swine flu. Over 500 of those receiving the vaccinations came down with Guillain-Barre Syndrome, a paralyzing autoimmune disorder. Researchers still do not know what caused the side effect." (18)

- Fall // Winter 2009 – What will you choose?

I know time has passed and we seem to be in a lull from the swine flu - especially in the media. This was to be expected. Don't let your guard down and forget about the deadly potential of this bug. According to Michael T. Osterholm, Director, Center for Infectious Disease Research and Policy at the University of Minnesota, "An influenza pandemic of even moderate impact will result in the biggest single human disaster ever - far greater than AIDS, 9/11, all wars in the 20th century, and the recent tsunami combined. It has the potential to redirect world history as the Black Death redirected European history in the 14th century." (19)

The Greatest Prescription is a Saving Relationship with Jesus

One last (but no less important) note: I realize I have outlined many things here you can do to be prepared for the flu if it hits in pandemic proportions this fall, however, if it ever gets so severe that people who are infected in the morning are dead by evening, there is one thing that is more important than anything else: you must have a personal relationship with our Savior, Jesus Christ, and share His love with others so they can be prepared as well. You and your family can have a peace that few others will possess. You can be assured that regardless of the outcome, you will all be together again one day with Him in heaven, where there will be no more sickness, sadness, or death. And this is something that you can know every day, regardless of what is going on in the government, the economy, or whether or not there is a pandemic, etc. While the swine flu is dangerous, none of us are promised tomorrow. At any time, our life on this earth may end, whether it is the swine flu or a car accident. Give your heart to Christ and you will have nothing to fear, now or ever.

Health Workers Resistant to H1N1 Vaccine Mandate

CBS2, 5 October 2009, 6:02 am US/Eastern
https://web.archive.org/web/20091015134046/http://wcbstv.com/health/h1n1.vaccine.mandate.2.1227444.html

New York (CBS) – Parents may have a choice when it comes to vaccinating their kids, but that's not the case for New York's health care workers.

It's a move that has some workers feeling sick.

Outside New York's Capitol, health care workers vowed to fight an unprecedented order from state health officials – a requirement for every health care worker to get seasonal and H1N1 flu shots, or face the possibility of getting fired.

Physical therapist Carole Blueweiss is weighing that risk.

"I'm healthy and I have a strong immune system, and I don't want to feel like someone is telling me what to put into my body to protect me," Blueweiss said.

But the state maintains that the objective is to reduce the possibility of infecting patients.

"Every flue season, in New York for example, we have about 160 outbreaks of flu inside health care institutions," Dr. Richard Daines, New York State Commissioner of Health, said.

In past years, when vaccinations were voluntary, only 40 percent of the state's 925,000 health care workers got vaccinated.

"That's kind of intolerable – that patients should come to a hospital and not know that the health care workers are vaccinated," Dr. Daines said.

But Blueweiss, who plans to give her son the seasonal vaccine, doesn't trust H1N1 for him or herself. In her 15 years as a physical therapist at a large New York hospital, she says she's never gotten a flu shot and never had the flu.

"We are health care workers, and we are not even given the credit or the respect to make the decision," Blueweiss said. "It's outrageous, and it feels criminal and anti-American."

While New York has the only state-wide mandate, a number of private and public hospitals are also requiring employees to take flu shots.

There is also a strong resistance to the vaccine from the general public. A new Harvard University poll shows that only four in 10 adults intend to take the vaccine themselves, and only six in 10 plan to give it to their children.

New York's mandate affects health care workers in hospitals, outpatient clinics and home care services.

Nursing Times

Nurse confidence in swine flu vaccine falling

Nursing Times, 6 October 2009
http://www.nursingtimes.net/whats-new-in-nursing/swine-flu/nurse-confidence-in-swine-flu-vaccine-falling/5006950.article

Nurses' confidence in the safety of swine flu vaccination has fallen over the last two months, Nursing Times' latest survey suggests.

With the first doses of vaccine expected to arrive at trusts in the next week or two, just under half of frontline nurses say they do not intend to have the jab, according to a snapshot survey of nearly 1,700 readers.

The results suggest fewer nurses are likely to get vaccinated now than in August, when Nursing Times asked readers the same questions about immunisation against swine flu.

In August, 31 per cent of respondents said they would not get vaccinated while 35 per cent said they would. However, in the latest online survey, carried out last week, the percentage of nurses saying they will not get vaccinated has increased to 47 per cent. Those saying they will has fallen to 23 per cent

The main reason nurses cited for not having the vaccine was concern over its safety - the percentage of nurses saying this is the main reason they do not intend to get immunised has increased from 60 per cent in August to 78 per cent in now.

A sizeable minority – 25 per cent – said they do not consider the risks to their health to be great enough. The comments suggest many nurses hold both views - believing that the condition is not serious enough to warrant trying a relatively new vaccine.

Both vaccines ordered by the Department of Health have now been licensed, having undergone trials. But many nurses responding to the survey raised concerns that the approval process had been rushed.

One respondent said: "I don't believe that it has been tested properly and there is not enough information regarding side effects. It could come back and haunt us in years to come."

"I am not confident that it has been sufficiently tested. I would rather take the risk of getting the flu," another said.

Other common reasons cited by nurses for remaining unvaccinated were that the infection was mild enough for them not to bother, or that they had previously experienced flu-like illness after receiving the seasonal flu vaccine.

One respondent said: "I have worked on a swine flu isolation ward and have not become ill. I feel good barrier nursing with the correct masks has allowed me to build up my own resistance."

Both the RCN and Unison have publically encouraged NHS staff to get vaccinated. Last month Unison head of nursing Gail Adam said: "We are strongly recommending that all health workers have the swine flu vaccination."

INTERNATIONAL BUSINESS TIMES

Grippeimpfung verdoppelt möglicherweise Risiko von H1N1-Infektion

IBT, 9 October 2009, 00:53 CET

https://web.archive.org/web/20091008115703/http://www.ibtimes.de/articles/20091004/grippeimpfung-verdoppelt-risiko-von-h1n1-schweinegrippe-infektion.htm

Vorab bekannt gewordene Ergebnisse einer kanadischen Grippe-Studie und die Reaktion einiger Provinzen Kanadas platzen in die Vorbereitung der zweifachen Grippe-Massenimpfung in Deutschland.

Wie das Nachrichtenmagazin FOCUS meldet, wollen Seuchenexperten der Pazifikprovinz British Columbia entdeckt haben, dass die Gabe des saisonalen Impfstoffs das Risiko verdoppelt, sich mit H1N1 ("Schweinegrippe") zu infizieren.

Laut kanadischen Zeitungsberichten wollen die meisten Provinzen deshalb den normalen Grippeschutz vorerst nur über 65-Jährigen zugänglich machen.

Der "unerwartete" Befund sei "nicht überprüfbar", solange die Studie nicht vorliege, sagte der Leiter des Marburger Universitätsinstituts für Virologie, Stephan Becker, zu FOCUS.

=>

Previously announced results of a Canadian flu study and the reaction of some Canadian provinces are interrupting the preparation of the double flu mass vaccination in Germany.

As the news magazine FOCUS reports, disease experts in the Pacific province of British Columbia claim to have discovered that administration of the seasonal vaccine doubles the risk of becoming infected with H1N1 ("swine flu").

According to Canadian newspaper reports, most provinces want to make normal flu protection only available to people over 65 for the time being.

NY Nurse Sues to Block Mandatory Flu Vaccines

CBS 2, 10 October 2009

https://web.archive.org/web/20091013211452/http://wcbstv.com/topstories/mandatory.h1n1.vaccine.2.1240506.html

Dutchess County RN Files Lawsuit To Block Rule Mandating That State Health Workers Get Seasonal, H1N1 Vaccines

A registered nurse has asked a judge to block New York state's requirement that all health care workers get vaccinated against the flu.

An attorney for Suzanne Field, a nurse in Dutchess County, said she filed the lawsuit to protect the rights of nearly 60,000 medical workers covered by an emergency rule put in place in the wake of this year's swine flu scare.

This fall, New York became the first state to require most doctors, nurses and health care aides to get a vaccine for both the seasonal flu and the new swine flu if they want to stay on the job.

Flu can be deadly if spread in health care facilities among people already weakened by illness, but the mandatory inoculations have upset some workers with worries about the safety of vaccines.

Physical therapist Carole Blueweiss is weighing that risk.

"I'm healthy and I have a strong immune system, and I don't want to feel like someone is telling me what to put into my body to protect me," Blueweiss said.

Field's request for a restraining order is now before a judge in Manhattan. A hearing is planned for Wednesday.

State Health Commissioner Richard Daines said the rule is both legal and necessary to protect the public. Courts, he noted, have already upheld similar rules that require health care workers to get vaccinated for the measles and rubella.

But Blueweiss, who plans to give her son the seasonal vaccine, doesn't trust H1N1 for him or herself. In her 15 years as a physical therapist at a large New York hospital, she says she's never gotten a flu shot and never had the flu.

"We are health care workers, and we are not even given the credit or the respect to make the decision," Blueweiss said. "It's outrageous, and it feels criminal and anti-American."

Presently, between 30 percent and 40 percent of health care workers voluntarily get a flu shot each year.

The New York State Nurses Association has encouraged its members to get vaccinated voluntarily, but has opposed the new rule, saying there should be exemptions for people who don't want vaccines for religious or philosophical reasons.

"We're against our civil liberties being stepped on," said Barbara Crane, president of the National Federation of Nurses.

There is also a strong resistance to the vaccine from the general public. A new Harvard University poll shows that only four in 10 adults intend to take the vaccine themselves, and only six in 10 plan to give it to their children.

Bloomberg

Health Workers Sue to Void FDA Approval of Swine Flu Vaccine

Bloomberg, 10 October 2009 at 5:05 AM GMT+8
https://www.bloomberg.com/news/articles/2009-10-09/health-workers-sue-to-void-fda-approval-of-swine-flu-vaccine
https://archives.rep-am.com/2009/10/12/health-workers-sue-to-void-fda-approval-of-swine-flu-vaccine/

A group of New York doctors and health-care workers who are to be among the first inoculated against swine flu asked a federal judge to void U.S. approval of the vaccine until more safety tests are done.

Rima Laibow, a physician, nurse Suzanne Field and four other New York residents filed the suit Friday in federal court in Washington. They claim a state law requires them to get the vaccine, putting their health at risk from an unproven treatment and their livelihoods at risk if they refuse.

"This is an emergency action in a matter of significant public importance," Leslie Fourton, an attorney for the health workers, said in the lawsuit. The Food and Drug Administration "has approved or licensed the vaccines without definitive prerequisite safety testing, in clear violation of federal law."

The workers asked Judge Reggie Walton to issue an immediate order barring approvals of A/H1N1 vaccines until all legally required testing is conducted and an order preventing New York from firing them if they refuse to take it.

Doctors and hospital workers in Marion County, Ind., and Le Bonheur Children's Medical Center in Memphis, Tenn., were among the first to receive AstraZeneca Plc's nasal spray vaccine this week.

Swine flu, or H1N1, is spreading widely in most U.S. states. The first vaccines will be aimed at health-care workers, children, pregnant women and people with chronic conditions that put them at risk for complications. While the U.S. has ordered doses to cover all Americans, only half of U.S. adults plan to get the vaccine, according to a Harvard University poll.

Swine flu is responsible for more than 600 U.S. deaths since the virus was identified in April, according to the Centers for Disease Control and Prevention in Atlanta.

ÄrzteZeitung

Schweinegrippe: Berliner Ärzte wollen nicht impfen

Ärzte Zeitung, 12 Oktobre 2009
https://www.aerztezeitung.de/Wirtschaft/Schweinegrippe-Berliner-Aerzte-wollen-nicht-impfen-372625.html

Berlin (ami). Trotz offizieller STIKO-Empfehlung wollen Kassenärzte in Berlin vorerst keine Impfungen gegen Schweinegrippe vornehmen. Sie führen inhaltliche, praktische und finanzielle Gründe ins Feld.

Die Vertreterversammlung der Kassenärztlichen Vereinigung Berlin hat dem KV-Vorstand per Beschluss verboten, eine Vereinbarung mit dem Senat zu treffen, solange nicht das Mindesthonorar für eine Einfachimpfung laut Impfvereinbarung von 7,10 Euro gewährleistet ist. Die Impfungen seien eigentlich Aufgabe des Öffentlichen Gesundheitsdienstes (ÖGD), so der Orthopäde Dr. Hans-Detlef Dewitz. Er verwies auf eine Statistik des Berliner Senats, wonach eine Impfung durch den ÖGD im Jahr 2005 durchschnittlich 21,79 Euro gekostet habe. "Das ist dreimal so teuer, wie das, was die KV angeboten hat", so Dewitz.

Der Hausarzt-Internist Dr. Detlef Bothe vertrat die Auffassung, dass selbst der einfache Impfkostensatz "ein wahres Geschenk an den Senat" sei, da ein hoher Beratungsbedarf zu erwarten sei. Nicht nur finanzielle Gründe waren für die Ablehnung entscheidend. Die Vertreter äußerten zahlreiche inhaltliche Bedenken gegen die Impfung. Bei einer Spontanumfrage gaben nur drei von knapp 30 Ärzten im Saal offen an, dass sie sich selbst gegen Schweinegrippe impfen lassen wollen. Viele äußerten Zweifel, ob sie ihren Patienten zur Impfung raten sollten. Sie verwiesen unter anderem auf die fehlende Zulassung des Impfstoffes in den USA, mangelnde epidemiologische Daten und die in den Medien diskutierte "Verquickung der Ständigen Impfkommission mit der Pharmaindustrie".

Bothe sprach von einer "vorschnell geplanten Massenimpfung" und erinnerte an die ärztliche Maxime "Zuallererst nicht schaden". Dagegen appellierte die Allgemeinmedizinerin und KV-Chefin Dr. Angelika Prehn an "die Verantwortung der Ärzte, Krankheiten zu vermeiden".

Zweifel äußerten die Berliner Ärzte auch an der Machbarkeit der Impfung in den Arztpraxen. Vor allem die Kinderärzte sehen sich vor einer Herausforderung. Sie müssten nicht nur zehn, sondern 20 Impfdosen an einem Tag verbrauchen. "In einer normalen Sprechstunde ist das nicht zu verimpfen", so der Pädiater Klemens Senger. Die Praxen müssten dazu reine Impfsprechstunden einrichten. Solange keine Vereinbarung mit dem Senat besteht, kann die Impfung nach Auffassung des KV-Vorstands Burkhard Bratzke nur gegen Kostenerstattung in den Arztpraxen vorgenommen werden. Die Impfvereinbarung der KV Berlin mit den Berliner Krankenkassen enthält jedoch eine Bestimmung, wonach eine STIKO-Empfehlung automatisch eine Leistungspflicht der Krankenkassen auslöst. Ob dieser Passus auch bei der Schweinegrippe greift, werden KV, Kassen und Senat diskutieren müssen.

Doctors in Berlin refuse to launch massive swine flu vaccination campaign

The Flu Case, 14 October 2009
https://web.archive.org/web/20091017033111/http://www.theflucase.com/index.php?option=com_content&view=article&id=1063:doctors-in-berlin-refuse-to-launch-massive-swine-flu-vaccination-campaign&catid=41:highlighted-news&Itemid=105&lang=en

Doctors in Berlin, Germany, have said they are not going to launch a massive "swine flu" vaccination campaign in spite of an "official recommendation" and instructions to do so from the government's central vaccine committee.

Only three of the doctor's attending a key meeting in Berlin on whether to start the swine flu jab programme in the capital said they would take the jab.

The doctors expressed concerns over the safety record of the "swine flu" jab with adjuvants, the lack of clinical data, especially on pregnant women and children", and also criticised the "rush" to mass vaccinate people as well as the poor renumeration.

In addition, they brought up claims that the country's government vaccine committee was in the pocket of the pharmaceutical industry.

Bild

Erster Ärztekammer-Chef warnt vor Schweinegrippe-Impfung
Nebenwirkungen sind mir zu gefährlich

Bild, 13 Oktobre 2009, 00:12
https://www.bild.de/regional/ruhrgebiet/keine-impfung-10075250.bild.html

Ein Ärzte-Chef ist gegen die Massen-Impfung!
Der Präsident der Ärztekammer Westfalen-Lippe, Theodor Windhorst, will sich nicht gegen die Schweinegrippe impfen lassen. Der in Deutschland zugelassene Impfstoff "Pandemrix" sei mit zu vielen Risiken behaftet.

"Ich werde mich lediglich gegen die klassische Wintergrippe impfen lassen und nicht zusätzlich gegen die neue Grippe", sagte Windhorst, der auch Vorstandsmitglied der Bundesärztekammer ist.

Panik wolle er nicht verbreiten, er sei nur gegen eine Massen-Impfung, einen "großen Feldversuch" mit Millionen von Menschen, sagte ein Sprecher der Ärztekammer BILD. Dafür sei über den Impfstoff noch zu wenig bekannt, mögliche Nebenwirkungen seien nicht abzuschätzen. Es sei besser, erst einer kleineren Anzahl von Menschen das Mittel zu geben.

Auch der Virologe Alexander Kekulé äußert sich kritisch zum Impfstoff.
Er warf den Ländern vor, den falschen Impfstoff bestellt zu haben. Der Wirkstoff für die Zivilbevölkerung enthält nach seinen Angaben ein sogenanntes Adjuvans - einen Wirkungsverstärker - mit erheblichen Nebenwirkungen. Dieses Mittel sei gegen die Schweinegrippe "völlig übertrieben", sagte Kekulé dem Sender MDR Info.

Die Impfung gegen die normale Grippe sei aber wichtig, sagte Windhorst.
Jedes Jahr würden an der saisonalen Influenza bis zu 11 000 Menschen in Deutschland sterben. Aufgrund der Neuen Grippe habe es bisher zwei Tote gegeben. Diese Patienten, eine 36 Jahre alte Frau aus Gelsenkirchen und ein 5 Jahre alter Junge aus München, hätten aber zusätzlich erhebliche Vorerkrankungen gehabt.

Insgesamt haben sich in Deutschland nach Angaben des Robert-Koch-Instituts bisher 22 400 Menschen mit dem Erreger infiziert.

Die weitaus meisten Fälle gibt es mit mehr als 6000 in Nordrhein-Westfalen.

Most popular German newspaper features top doctor's warning over "swine flu" jab

The Flu Case, 14 October 2009
https://web.archive.org/web/20091018123408/http://www.theflucase.com/index.php?option=com_content&view=article&id=1062%3Amost-popular-german-newspaper-features-top-doctors-warning-over-qswine-fluq-jab&catid=41%3Ahighlighted-news&Itemid=105&lang=en

One of Germany's most read mainstream newspapers, "Bild", yesterday reported a top doctor's warning about the "swine flu" jab as the revolt against the mass swine flu vaccination campaign accelerates.

On Monday, the German army announced it had changed its vaccination plans and was ordering a new "swine flu" jab, this one without mercury, the adjuvant, squalene, and a live virus, sparking fierce criticism from the German Health Ministry.

On Wednesday, Theodor Windhorst, the president of the doctor's chamber in Westfalen-Lippe, was featured by "Bild" newspaper, saying he would not take the swine flu jab.

He told "Bild", the swine flu jab had "side effects that were too dangerous for me."

Particularly risky, he said, was GlaxoSmithKline's Pandemrix jab, a vaccine classified as a bioweapon by EU and US regulators. He said he didn't want to spread "panic" but he was opposed to a "huge field experiment" with millions of people.

Windhorst is just the latest leading doctor in Germany to criticise the "swine flu" jab with virologist Alexander Kekule on Tuesday accusing the government of buying the "wrong vaccines."

Streit um Schweinegrippe-Impfung - Ärzte sauer auf Krankenkassen

MAINZ, 13 Oktobre 2009
https://web.archive.org/web/20091019142049/http://www.theflucase.com/index.php?option=com_content&view=article&id=1069%3Akey-doctors-in-rheinland-pfalz-germany-withdraw-from-mass-qswine-fluq-vaccination-campaign&catid=1%3Alatest-news&Itemid=64&lang=en

Die Kassenärztliche Vereinigung (KV) Rheinland-Pfalz wird sich nicht an der Organisation der Massenimpfung gegen die Schweinegrippe beteiligen. Dies erklärte am Dienstag KV-Vorsitzender Dr. Günter Gerhardt in Mainz.

Hintergrund ist, dass die AOK Rheinland-Pfalz sowie die IKK, die LKK und einzelne Betriebskrankenkassen im Gegensatz zu früheren Jahren die Impfung gegen die normale saisonale Grippe nur noch für Risikogruppen übernehmen wollen, obwohl laut Gerhardt Experten eine Durchimpfung gegen die Influenzaviren angesichts der Schweinegrippe für besonders wichtig halten.

Lediglich die Ersatzkassen und die Knappschaft wollen auch in diesem Herbst jedem, der den Grippeschutz will, diesen auch bezahlen. "Das ist schlechte Medizin", schimpfte Gerhardt über die Entscheidung der AOK und ihrer Mitstreiter. Je mehr Grippe-Infizierte es gebe, desto vorhersehbarer wäre auch die Ausbreitung der Schweinegrippe und die Wahrscheinlichkeit, dass die gegen das H1N1-Virus zur Verfügung stehenden Mittel verstärkt eingesetzt werden müssten, wodurch wiederum Resistenzen drohten. Während daher "internationale anerkannte Experten dringend eine umfassenden Grippeschutzimpfung" forderten, wie Gerhardt sagt, "rät" die Ständige Impfkommission Stiko nur dazu. Nur eine "Empfehlung" habe aber eine Kostenübernahme zur Folge.

AOK: "Kassenärztliche Vereinigung macht sich überflüssig"
Die AOK kritisierte die Entscheidung heftig und erklärte, die KV mache sich damit selbst überflüssig. Offensichtlich wolle die KV damit auch die AOK wegen ihrer Forderung nach einer Transparenzkommission im Zusammenhang mit der katastrophalen Honorarverteilung durch die Kassenärztliche Vereinigung im vierten Quartal 2009 abstrafen, mutmaßte AOK-Chef Walter Bockemühl und kündigte an, AOK-eigene Vertragsärzte, Kinderärzte und Arztnetze anzuschreiben, um dann die Schweinegrippe-Schutzimpfung selbst zu organisieren.

In den meisten Bundesländern war die Kostenübernahme zum Schutz gegen die saisonale Grippe sowieso schon restriktiver, so dass es keine Probleme wie in Rheinland-Pfalz gibt. "In Hessen wird seit Jahren nur nach der Stiko-Empfehlungen geimpft, das heißt nur Risikogrippen, das ist auch vertraglich zwischen Kassen und KV so festgelegt", sagte Silvia Herzinger, Pressesprecherin der KV Hessen.

A key doctor's association in Rheinland-Pfalz, Germany ...

=>

A key doctor's association in Rheinland-Pfalz, Germany, said on Tuesday it is not going to assist in organising the mass"swine flu" vaccination campaign due to start on October 26th.

The doctor's organisation is withdrawing from the "swine flu" vaccination campaign allegedly over a disagreement about payment for seasonal flu shots.

The decision by the doctors will be another blow to the German Health Ministry, determined to push through its mass vaccination campaign with the untested and toxic "swine flu" jab in record tempo.

Sofia Ström, Sebastian Chaaban

Fettdoktorn får sparken

Aftonbladet, 14 October 2009,
http://www.aftonbladet.se/nyheter/article5957251.ab

"Jag är fullständigt rättslös"

Fettdoktorn Annika Dahlqvist har nyligen varit i blåsvädret för flera kontroversiella uttalanden.

Och nu får hon sparken från jobbet som jourvikarierande läkare i Västernorrland.

Anledningen: hennes åsikter om vaccinering mot svininfluensan och mammografi.

Annika Dahlqvist blev under en föreläsning i Luleå i tisdags uppringd av en sköterska på en vårdcentral i Sundsvall.

Dahlqvist fick beskedet att primärvårdsdirektören Lennart Moberg beslutat att Dahlqvist inte längre ska anlitas som läkarvikare.

Hon får sparken för sina uttalanden om att en fettrik kost gör influensavaccination, cellprovtagning och mammografi onödiga.

– Det är ingen som talat med mig, jag känner mig fullständigt rättslös, säger Dahlqvist.

"Anmärkningsvärda synpunkter"

– Som jag förstår det är jag spärrad från alla arbetsplatser i primärvården i Landstinget Västernorrland. Det är väl ingen som vågar anställa mig på en vårdcentral nu.

Lennart Moberg, primärvårdsdirektör vid primärvården Västernorrland, säger att Dahqvist inte blivit uppsagd – eftersom hon inte har någon anställning.

– Men efter hennes anmärkningsvärda synpunkter och ifrågasättanden av medicinskt evidensbaserade arbetsmetoder, som cellprovstagning, vill vi inte att hon fortsätter som timvikarie.

Famous Swedish doctor fired
because of negative statements against the "swine flu" mass vaccination

https://web.archive.org/web/20091020041917/http://www.theflucase.com/index.php?option=com_content&view=article&id=1076%3Afamous-swedish-doctor-fired-because-of-negative-statements-against-the-qswine-fluq-mass-vaccination&catid=1%3Alatest-news&Itemid=64&lang=en

Aftonbladet reports that the in Sweden famous Dr Annika Dahlqvist has been fired from her position because she has made statements against the mass vaccination of the Swedish population. She received no warning. Many Swedes listen to what this doctor says since she uses a lot of common sense and logical thinking. She is a big promotor of healthy living and diets, which contain low levels of sugars, to help loose weight - something which is debated in Swedish media.

" - No one spoke with me about this, I feel completely without legal rights", she says.

"- As I understand it, they have blocked me from taking any position within the public health system in the region where I live."

Docs and cops decline H1N1 vaccine
Police officers, nurses and doctors are declining H1N1 vaccination

Politiken, 16 Oktobre 2009, kl. 09:02
https://web.archive.org/web/20091020112233/http://politiken.dk/newsinenglish/article810476.ece

A large number of those who have been chosen as primary recipients of the H1N1 vaccine are declining the injection, apparently because many Danes have the impression that swine flu is not as dangerous as first suggested.

Some 360,000 police officers, nurses, doctors and others deemed to be in key functions have been offered the vaccine but under a third have applied.

”After planning and and carrying out 12 seasons of mass vaccinations against influenza, I would think that at the moment only about 30 percent of those in key functions are prepared to take the vaccine,” says Danske Lægers Vaccinations Service (DLVS, Danish Doctors Vaccination Service) Chairman Karsten Østergaard.

The DLVS is Denmark’s largest vaccination agency, which is in constant contact wioth national and local authorities in connection with the vaccination of key personnel, and based on reporting from these authorities the service says only few want the vaccine.

A majority of police officers that Police Federation Head of Secretariat Hans Bundesen has been in contact with say they do not want the vaccine.

The Doctors’ Associaition and the Danish Nursing Council have advised their members to be vaccinated, but are unsure how many members will actually have the injection.

Østergaard says that reticence is the result of National Board of Health and Health Minister Jakob Axel Nielsen’s statements that the H1N1 virus is not as dangerous as first thought.

”The National Board of Health’s evaluation is that the population in Denmark need not generally be worried about infection (with H1N1),” the Board says prominently on its webpage.

The National Board of Health says that a total of some 1.1 million Danes will be offered the H1N1 vaccine.

Sanningen är att influensavaccinet innehåller farliga mängder kvicksilver

NewsMill, 18 Oktobre 2009
https://web.archive.org/web/20091021050148/http://www.newsmill.se/artikel/2009/10/18/sanningen-ar-att-influensavaccinet-innehaller-farliga-mangder-kvicksilver

"Eftersom vaccinet innehåller potentiellt farliga substanser i form av kvicksilver och skvalen tycker jag att det ska vara frivilligt att ta det, och att ingen propaganda ska föras om att vi ska vaccinera oss av solidaritet med andra" skriver **Annika Dahlqvist**.

Jag har blivit känd i Sverige för att jag förespråkar LCHF-kost, LowCarb-HighFat, för bättre hälsa för diabetiker och överviktiga, och många andra sjuka. Den kosten innebär mindre kolhydrater, vilka höjer blodsocker och insulin, vilket är skadligt - i stället mera naturligt fett - och mindre av livsmedelsindustrins alla kemikalier, inklusive margarinerna. Detta kostbudskap har spridit sig som en gräsbrand i Sverige, just för att det fungerar mirakulöst bra.

Jag har på senare år sporadiskt arbetat som vikarierande jourläkare på Primärvårdsjouren i Sundsvall, när vårdcentralerna inte har kunnat bemanna jourpassen med sina ordinarie läkare, på grund av läkarbrist.

Jag har under de senaste månaderna i min blogg uttalat mig negativt om massvaccination mot svininfluensa. Eftersom vaccinet innehåller potentiellt farliga substanser i form av Kvicksilver och Skvalen tycker jag att det ska vara frivilligt att ta det, och att ingen propaganda ska föras om att vi ska vaccinera oss av solidaritet med andra. Däremot tycker jag att alla som själva vill ta vaccinet ska göra det. Jag rekommenderar de så kallade riskgrupperna att vaccinera sig.

I slutet av augusti gjorde en journalist på Aftonbladet en telefonintervju med mig om vaccinationen. Jag redogjorde för min inställning till denna. Jag nämnde då i förbifarten att jag inte mammograferar mig eller gör cellprovtagning, eftersom jag bedömer att det är så viktigt att jag åker omkring i landet och informerar människor om hur de kan äta för att slippa bli sjuka av de aktuella kostråden från Livsmedelsverket, att jag inte ger mig tid att avsätta tid för att stanna hemma och mammografera mig.

Jag har skrivit i min blogg att jag dock rekommenderar andra att göra dessa undersökningar enligt programmet. Journalisten skrev om det i artikeln på ett sätt så att det kunde uppfattas som att jag avrådde från mammografi och cellprovtagning.

Jag fick häromdagen telefonbesked från en sköterska att jag har blivit avstängd som vikarierande jourläkare på primärvårdsjouren i Sundsvall. Primärvårdsdirektören Lennart Moberg hade tagit det beslutet, och uppgivit som orsak att jag har avrått från vaccination, mammografi och cellprovtagning. Det finns en utbredd kritik mot massvaccinationen både bland läkare och andra. Avrådande mot mammografi och cellprovtagning har jag aldrig uttalat.

Han har uppenbarligen tagit uppgifterna från Aftonbladet som underlag för sitt beslut, vilket jag anser vara ett undermåligt beslutsunderlag. Han har inte varit i kontakt med mig före beslutet, och inte heller personligen meddelat mig det efteråt.

Hans avstängning av mig innebär förstås i förlängningen svårigheter för mig att försörja mig på mitt yrke. Beslutet har skadat min heder, vilket kan innebära problem om jag ska söka arbete hos annan arbetsgivare.

Jag har mailat honom önskemål om uppgift om relevanta orsaker för att stänga av mig från arbete på jouren. Jag har aldrig avrått en patient från vaccination, mammografi eller cellprovtagning.
Jag har ännu inte fått något svar på mitt mail.

Dessutom uttalade sig Medicinalrådet Torsten Mossberg i Expressen. Jag skrev om det i min blogg: **- "Följer inte vetenskapen"**

- Det var troligen droppen för landstinget vilket jag har full förståelse för. Hennes uttalande följer inte vetenskapen och kan vara skadligt för stora patientgrupper, säger Torsten Mossberg, medicinalråd på Socialstyrelsen"

Är detta ett uttalande som är värdigt ett medicinalråd? På vilket sätt har jag plågat primärvården i Landstinget Västernorrland, så att de har anledning att tappa tålamodet med mig, så till den grad att de ställer mig utan försörjningsmöjlighet på hemorten?

Enligt min kunskap så måste man ha misskött sig grovt på arbetet för att det ska finnas skälig grund för avstängning. Åsikt om massvaccinering är inte rimligen förbjudet att ha. Vi är dessutom många som är negativa till massvaccineringen.

Till Aftonbladet hade jag sagt att jag inte såg någon anledning till att avsätta tid för min egen mammografi och cellprovtagning. Jag har aldrig avrått någon annan att göra dessa undersökningar.

Återstår frågan om diabeteskostråd. Stör det Torsten Mossberg att jag gör hundratals diabetiker i Sverige friska? Vilken vetenskap visar att LCHF är sämre för diabetiker än lågfett-högkolhydratkost?

Varför forskar inte etablissemanget på detta om de inte har bevis för att deras kostråd är bättre än LCHF?

THE FLU CASE

Fired Swedish doctor: "Corruption at the highest levels of WHO!"

[ref. to the article, published above]
The Flu Case, 19 October 2009
https://web.archive.org/web/20091024100838/http://www.theflucase.com/index.php?option=com_content&view=article&id=1151%3Afired-swedish-doctor-qcorruption-at-the-highest-levels-of-whoq&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The famous Swedish doctor, Annika Dahlqvist, was fired last week because of her statements about the Swedish mass vaccination campaign. She claimed that she would not take the vaccine and that there are better ways to protect oneself from an influenza virus. She has also expressed that she personally have little interest in mammography and cell tests. But is is clear that it was her stance against the mass vaccinations that made her lose her job.

In an article published by Newsmill, "The truth is that the flu vaccine contains dangerous amounts of mercury", she writes:

"Since the vaccine contains potentially dangerous substances in the form of mercury and squalene I think it should be voluntarily taken, and that no propaganda should be made that we all should vaccinate ourselves out of solidarity with others". "To have an opinion about the mass vaccination can not reasonably be forbidden. We are many that are negative towards the mass vaccination."

In an article in Expressen, one of the four large newspapers in Sweden, she states "It might well be that the damages [from the vaccine] are worse than the disease itself." "I suspect that the The Medical Products Agency (läkemedelsverket) are influenced by the vaccine manufacturers. There are enormous financial interests at play here."

She continues: "- I do not want to have that poison in my body." "To state that there is a pandemic when there is no pandemic is completely absurd. There might well be corruption at the highest levels of WHO (World Health Organization)".

Immun gegen die Impfung

Spiegel, 19 Oktober 2009.
https://www.spiegel.de/spiegel/a-655762.html

Kinderärzte rebellieren, Frauenärzte warnen: Die Impfkampagne gegen die Schweinegrippe gerät in Verruf. Sind die Deutschen Versuchskaninchen in einem gigantischen Pharmaexperiment?

Immunsystem

Auf der onkologischen Station von Chefarzt Wolf-Dieter Ludwig liegen vor allem Patienten mit Blutkrebs, bösartigen Lymphomen und anderen Tumoren. Viele haben eine Chemotherapie hinter sich, ihr Immunsystem ist ausgezehrt.

Grippe

"Diese Menschen gehören eigentlich zur Hochrisikogruppe, die würde man als Erste gegen eine pandemische Grippe impfen", sagt Ludwig, Chefarzt am Helios Klinikum in Berlin-Buch.

"Eigentlich", Ludwig spricht dieses Wort sehr langsam und nachdenklich aus. Immer wieder redet er in diesen Tagen mit seinen Patienten auch über die Schweinegrippe. "Die sind natürlich sehr besorgt, weil sie um ihre Infektionsanfälligkeit wissen", erzählt der 57-jährige Arzt. "Ich kläre sie auf über Nutzen und bekannte Risiken", sagt Ludwig, "aktiv empfehlen kann ich ihnen den Impfstoff aber derzeit nicht."

Ludwig ist nicht irgendwer im deutschen Gesundheitssystem. Als Vorsitzender der Arzneimittelkommission der deutschen Ärzteschaft ist er eine Autorität in der Bewertung von Medikamenten. Und dieses Mal fällt sein Urteil vernichtend aus: "Wir sind unglücklich über diese Impfkampagne." Sie werfe zahlreiche Probleme auf, und ihr Nutzen sei ungewiss, zürnt Ludwig: "Die Gesundheitsbehörden sind auf eine Kampagne der Pharmakonzerne hereingefallen, die mit einer vermeintlichen Bedrohung schlichtweg Geld verdienen wollten."

Während die Landesgesundheitsministerien dieser Tage die letzten Vorbereitungen für das Verteilen der Grippe-Vakzinen treffen, herrscht Verwirrung, Unsicherheit und Chaos. Angelegt ist sie als größte Impfmaßnahme in der Geschichte der Bundesrepublik. 50 Millionen Dosen des von GlaxoSmithKline (GSK) produzierten Impfstoffs Pandemrix werden von diesem Montag an von einem geheimen Ort in der Nähe der traditionsreichen Dresdner Serumwerke in Lastwagen geladen. Gut gekühlt rollen sie dann in die Bundesländer, von dort in Arztpraxen und Gesundheitsämter - und sollen schließlich in die Oberarme zunächst von Bediensteten des Gesundheitswesens sowie Risikopatienten gespritzt werden.

Die Impfstrategie der Behörden bricht binnen kurzem in sich zusammen

Doch unter Ärzten, Pharmaexperten und Politikern flammt Widerstand auf gegen die gewaltige Impfaktion, die den Staat und die Krankenkassen mindestens 600 Millionen Euro kostet.

Die Verwirrung begann, als die Ständige Impfkommission (Stiko) in der vorvergangenen Woche für Schwangere einen anderen Impfstoff empfahl. Einen, der keinen Wirkverstärker ("Adjuvans")

enthält. Dieser stachelt das Immunsystem besonders an. Deshalb kann er helfen, den Impfstoff zu strecken, so dass aus einer bis zu vier Impfdosen gemacht werden können.

Doch Vakzinen ohne Zusatzstoffe haben die Behörden nicht, und jetzt muss der zuständige Staatssekretär im Bundesgesundheitsministerium, Klaus Theo Schröder, als Bittsteller rund um die Welt telefonieren: "Es laufen derzeit Gespräche mit Herstellern sowie den Gesundheitsministerien in Frankreich und den USA mit dem Ziel, für Schwangere auch nichtadjuvantierten Impfstoff zu beschaffen", sagt Schröder. Ob er ihn bekommt, kann er noch nicht sagen. Denn die Lager der Hersteller sind leer. Die weltweite Produktion, allein bei GSK 440 Millionen Dosen, ist fast vollständig verkauft.

Binnen kurzem ist die ganze Impfstrategie der Behörden in sich zusammengebrochen. Denn immer mehr Ärzte raten nicht nur Schwangeren von der Impfung ab und begründen das einerseits mit dem unkalkulierbaren Risiko durch die Adjuvantien, andererseits aber auch mit dem eher geringen Nutzen der Impfung: Das Schweinegrippe-Virus nämlich hat sich keineswegs als jener große Killer entpuppt, der beim Ausbruch im Frühjahr in Mexiko angekündigt worden war.

Der Gedanke an eine Massenimpfung verblasst

Sogar die Stiko, sonst ein der Pharmaindustrie wohlgesinntes Gremium, lässt in ihrer Impfempfehlung Zweifel durchscheinen. Plötzlich verblasst der Gedanke an eine Massenimpfung: Bevor die gesunde Bevölkerung dazu aufgerufen wird, wolle man sich spätestens Mitte November noch einmal zusammensetzen, die Lage bewerten "und diskutieren, ob wir es dem Rest der Bevölkerung empfehlen", so Stiko-Mitglied Ulrich Heininger.

Offene Rebellion herrscht dagegen unter Allgemeinmedizinern und Kinderärzten. Der Präsident der Deutschen Gesellschaft für Allgemeinmedizin und Familienmedizin, Michael Kochen, empfiehlt den deutschen Hausärzten, nicht zu impfen. "Das Schadensrisiko überwiegt den Nutzen", sagt der Göttinger Professor.

Wolfram Hartmann, Präsident des Bundesverbands der Kinder- und Jugendärzte, wirft der Bundesregierung "wissenschaftliche Falschaussagen" vor. Wie bei Schwangeren so gelte auch für Kinder unter drei Jahren: "Der Impfstoff ist an ihnen noch überhaupt nicht getestet, deshalb ist das Risiko einfach zu groß, ihn jetzt bedenkenlos einzusetzen."

Dabei sei gerade diese Altersgruppe speziell gegen die Schweinegrippe zu schützen: Besonders Kinder mit chronischen Krankheiten, so weiß man aus Ländern mit hoher Schweinegrippe-Durchseuchung, leiden unter einem schweren Infektionsverlauf.

Dem Impfstoff ist ein Konservierungsstoff beigefügt

Hartmann kann einfach nicht verstehen, wie die Behörden einen Impfstoff kaufen konnten, der Wirkverstärker enthält. "Kinder haben ein Immunsystem, das zu Überreaktionen neigt, und genau die könnten durch Adjuvantien ausgelöst werden." Und zusätzlich sei dem Impfstoff auch noch ein Konservierungsstoff beigefügt, eine Quecksilberverbindung. "Das Zeug hat man in heutigen Impfstoffen für Kleinkinder bewusst herausgehalten", sagt Hartmann.

Entsprechend perplex reagierte die Öffentlichkeit, als vergangene Woche bekannt wurde, dass sich die Bundeswehr für nichtadjuvantierten Impfstoff der Firma Baxter entschieden hat. Das Absurde dabei: Der Baxter-Impfstoff ist zwar adjuvansfrei. Dafür ist er aber noch weniger erprobt als die Spritze von GSK.

Doch nicht nur im Verteidigungsministerium kämpft man mit eigenen Waffen gegen die Pandemie. Auch das Bundesinnenministerium hat für die Mitglieder der Bundesregierung, der Ministerien und nachgeordneter Behörden eine spezielle Lieferung bestellt. "Wir haben 200.000 Dosen des nichtadjuvantierten Impfstoffs Celvapan der Firma Baxter gekauft", gab Ministeriumssprecher Christoph Hübner gegenüber dem SPIEGEL zu: Nicht nur für die Kanzlerin ist also ein anderes Mittel vorgesehen

als für das gemeine Volk, sondern auch für die Mitarbeiter des Paul-Ehrlich-Instituts (PEI), die für die Zulassung von Impfstoffen zuständig sind.

Für Arzneimittelkommissionschef Ludwig ist das "ein Skandal", der den Menschen kaum zu vermitteln sei. Auch Angela Spelsberg von der Anti-Korruptionsinitiative Transparency International empört sich: "Die Sache stinkt zum Himmel." Ein parlamentarischer Untersuchungsausschuss müsse die Vergabe des Auftrags an den Impfstoffhersteller GSK überprüfen.

Angesichts dieser Debatten zeigen sich immer mehr Deutsche immun gegen die Impfung. Es zeichnet sich ab, dass die teure Aktion zum Flop werden dürfte. Auf den Fall jedenfalls, dass Impfstoff übrig bleibt, hat man sich bereits vorbereitet: Er soll als milde Gabe in Entwicklungsländern gespendet werden.

Eine willkommene Marktbelebung in finsterer Krisenzeit

Neben den Armen dieser Welt dürften sich aber vor allem die Pharmamultis freuen. Für sie ist die Schweinegrippe schon jetzt das, was für die Autoindustrie die Abwrackprämie war: eine willkommene Marktbelebung in finsterer Krisenzeit.

Die Arzneiunternehmen plagt zudem ein ganz grundsätzliches Leiden: Ihre Entwicklungs-Pipelines sind bedrohlich leer, neue Blockbuster kaum in Sicht - während zugleich viele der derzeitigen Kassenschlager in den nächsten Jahren ihren Patentschutz verlieren und somit billige Nachahmerpräparate auf den Markt drängen werden.

Bei Impfstoffen hingegen gibt es keine Nachahmerpräparate. Und so sind die Vakzinen für die Pharmaindustrie längst kein Nischengeschäft mehr, sondern ein Heilsbringer für bedrohte Bilanzen. Immer mehr große Konzerne wollen auf sie ihre Zukunft bauen.

Die Zeiten, in denen pro Spritze nicht mehr als ein paar müde Mark zu verdienen waren, sind ohnehin längst vorbei; die neuartige Impfung gegen Gebärmutterhalskrebs etwa kostet in Deutschland pro Dosis stolze 159 Euro.

Auch könnten Impfungen bei vielen großen Krankheiten der Welt - Aids, Alzheimer, Malaria etwa - helfen, den Ausbruch zu verhindern. Der Blockbuster-Status wäre garantiert - und ein gutes Image dazu, nicht unwichtig für die ständig unter Beschuss stehende Pharmabranche.

Wer im Impfgeschäft erfolgreich sein will, muss auf neue Techniken setzen

Analysten sagen der Impfstoffindustrie ein jährliches Wachstum von 18 Prozent voraus, im Vergleich zu 4,4 Prozent für die Pharmabranche insgesamt. Nachdem dieses Jahr bereits der Pharmagigant Pfizer den Impfspezialisten Wyeth aufgekauft hat, verkündeten vor wenigen Wochen gleich drei weitere Pharmariesen - Abbott Laboratories, Johnson & Johnson und Merck -, Anteile oder Rechte an Impfstoffproduzenten kaufen zu wollen.

Eines allerdings ist dabei allen klar: Wer im Impfgeschäft erfolgreich sein will, muss auf neue Techniken setzen. Und neben der Gentechnik sind dabei gerade die Wirkverstärker die Hoffnungsträger schlechthin, weil sie die Immunabwehr des Menschen zu Höchstleistungen anspornen. "Die Adjuvantien bieten Lösungen für die großen Probleme der Impfstoffforschung", sagt etwa der Mediziner Ruprecht Schmidt-Ott vom Fachbereich Impfstoffe bei GSK in München. Nicht nur in der umstrittenen Schweinegrippe-Spritze, auch im GSK-Impfstoff Cervarix gegen Gebärmutterhalskrebs sei ein verstärkender Zusatz enthalten. Ein entsprechender Tuberkulose-Impfstoff befinde sich in der klinischen Erprobung. "Und wir hoffen, dass wir in wenigen Jahren den ersten Malaria-Impfstoff der Welt, der ein weiteres Adjuvans enthält, auf den Markt bringen können."

Tatsächlich könnten die Wirkverstärker die Impfstoffentwickler genau dort voranbringen, wo sie bislang gescheitert sind: bei jenen Krankheiten, bei denen sich das Immunsystem nicht so leicht gegen den Übeltäter aufwiegeln lässt: Malaria, Aids, Alzheimer, Krebs, Herpes oder Magengeschwüre, wie sie das Bakterium Helicobacter pylori auslöst.

Kein Wunder, dass die neuen Substanzen geradezu bejubelt werden. "Der Traum wird wahr", schwärmte das sonst so nüchterne Fachblatt "Human Vaccines"; "Neue Horizonte" tun sich für "Trends in Immunology" auf. Der Durchbruch in eine neue Impfstoffära schien geschafft.

Die Gefahr überschießender Immunreaktionen wird zu groß eingeschätzt

Ausgerechnet die US-Arzneimittelzulassungsbehörde FDA jedoch zeigt sich bislang sehr skeptisch gegenüber den Wundersubstanzen. Kein einziger Impfstoff mit neuartigem Adjuvans ist dort bislang zugelassen. Zu groß schätzt die FDA die Gefahr überschießender Immunreaktionen ein.

Auch bei der GSK-Vakzine treten Nebenwirkungen häufiger auf als bei einem einfachen Pandemie-Impfstoff ohne Adjuvans, so zeigte eine Vergleichsstudie: Es gab mehr Rötungen, Schwellungen und Verhärtungen an der Einstichstelle, öfter Fieber, mehr Glieder- und Kopfschmerzen. Aus Tierstudien mit verschiedenen Adjuvantien sind auch schmerzhafte Gelenkentzündungen als Nebenwirkung bekannt. Trotz verlockender Möglichkeiten fiel für die FDA die Nutzen-Risiko-Bewertung deshalb bislang immer negativ aus.

Auch als es darum ging, einen Schweinegrippe-Impfstoff zu entwickeln, setzten die USA, wie einige Jahre zuvor bereits bei der Vogelgrippe, ganz bewusst auf Altbewährtes. Inzwischen sind vier Präparate in den USA zugelassen, keines davon enthält einen Wirkverstärker. Auch ein Lebendimpfstoff, der abgeschwächte Viren enthält und als Nasenspray verabreicht wird, ist ein herkömmliches Produkt. Für den Fall, dass der Impfstoff nicht reicht und verdünnt werden muss, kaufte die US-Regierung zwar Adjuvans ein; dieses wird jedoch erst einmal nur eingelagert.

Die Vorsicht der Amerikaner erklärt sich unter anderem auch mit den hohen Haftungssummen, die in den USA bei Impfschäden fällig sind. "Die Beweislast liegt dabei nicht auf der Seite der Betroffenen, so wie das bei uns der Fall ist", sagt Wolfgang Becker-Brüser vom pharmakritischen "arznei-telegramm".

So ließen sich in Europa die Verantwortlichen von Anfang an von den Versprechungen der Adjuvantien verzaubern, allen voran Johannes Löwer, in Kürze scheidender Chef des für Impfstoffe zuständigen Paul-Ehrlich-Instituts und oberster Vakzin-Berater der Regierung.

Erfindung des Musterzulassungsverfahrens

2005, in Erwartung einer Vogelgrippe-Pandemie, plädierte er dafür, zur Abwehr ganz auf Wirkverstärker zu setzen - und er kritisierte scharf den konservativen Ansatz der USA. Nur mit Hilfe eines Adjuvans könnten schnell genug ausreichend viele Dosen hergestellt werden. "Der H5N1-Impfstoff, der gerade in Amerika getestet wird, würde der deutschen Bevölkerung im Pandemie-Fall alles andere als helfen", erklärte er in der "Frankfurter Allgemeinen Sonntagszeitung" - und sieht sich nun von der Realität widerlegt: In den USA läuft die Schweinegrippe-Impfaktion mit klassischen Vakzinen bereits seit zwei Wochen.

Löwers Sonderweg sah anders aus: Im Auftrag der Regierung, so der PEI-Chef vor zwei Jahren, habe sein Institut nach Gesprächen mit Herstellern eine alternative Strategie entwickelt.

Das Massensterben bei einer Vogelgrippe-Pandemie vor Augen, wurde dazu ein Musterzulassungsverfahren erfunden: Die Hersteller dürfen ihre Impfstoffe demnach bereits vor Eintritt einer Pandemie genehmigen lassen. Im Ernstfall muss dann nur noch das Antigen ausgetauscht werden. Inzwischen sind in Europa drei Pandemie-Impfstoffe nach diesem Verfahren endgültig zugelassen worden. Zwei davon enthalten Adjuvantien, einer wächst, auch dies ein neuartiges Verfahren, auf Zellkulturen. Keiner setzt auf altbewährte Technik.

Im Fall eines Killers wie der Vogelgrippe hätten die neuartigen Substanzen durchaus Vorteile geboten, die die Risiken vermutlich bei weitem aufgewogen hätten. Auch bei Malaria, Tuberkulose, Aids, Krebs oder anderen Geißeln der Menschheit könnten Adjuvantien durchaus segensreich sein. Bei der zumindest derzeit meist mild verlaufenden Schweinegrippe jedoch wäre eine völlig neue

Nutzen-Risiko-Abwägung notwendig gewesen. "Doch die Behörden kamen aus den Musterzulassungsverfahren nicht mehr heraus", kritisiert Becker-Brüser.

Die Deutschen als Versuchskaninchen für den US-Markt

"Gerade in einer solchen Pandemie-Situation, in der zig Millionen Menschen geimpft werden, hätte man auf bewährte Mittel setzen müssen", kritisiert Frank Ulrich Montgomery, Vizechef der Bundesärztekammer. Löwer hingegen steht zu seiner alten Überzeugung: "Es war eine richtige Entscheidung, das Konzept der Musterzulassungen zu etablieren."

Für die Konzerne geht es bei der Schweinegrippe-Impfung auch darum, dass sie nun mit ihren neuartigen Techniken Erfahrungen im großen Stil sammeln können. Erst Anfang Oktober schrieben Novartis-Forscher im Fachblatt "Science": "Die H1N1-Pandemie ... stellt auch die Gelegenheit dar, unseren bisherigen Ansatz zur Behandlung von Influenza zu überdenken und wirkungsvollere Impfstoffe zu entwickeln."

GSK und Novartis werden die Erfahrungen, die sie während der Massenimpfungen in Europa sammeln, gut brauchen können, um weitere adjunvantierte Impfstoffe zu entwickeln. Vor allem aber könnten sie ihnen helfen, die FDA doch noch vom Nutzen der Zusatzstoffe zu überzeugen.

Den Preis dafür könnten am Ende die Europäer zahlen. "Die Deutschen", meint jedenfalls Pharmakritiker Becker-Brüser, "sind so etwas wie die Versuchskaninchen für den US-Markt."

THE FLU CASE

E. Beeth, O. Bernard, Q. Blonda, P. Coomans, R. Delaunoy, et al.

Belgian doctors, lawyers and citizens warn against receiving the so-called swine flu vaccine

The Flu Case, ASANAT, 20 October 2009
https://web.archive.org/web/20091023154802/http://www.asanat.org/

Nine reasons for you not to get vaccinated against the swine-flu virus A H1N1

1. The swine-flu virus is contagious yet should be no more a threat than normal seasonal influenza. At the end of winter 2009, the toll of victims in New Zealand or Chile is negligible. There was no vaccination.[a]

2. The reputable international pharmacological monitoring NGO Cochrane Collaboration, drawing on 40 years of research gives anti-flu vaccines a poor rating in terms of their effectiveness and of tolerance for them. It has found that (a) in the case of over-65s, their performance is particularly unimpressive (b) in healthy young adults, there is a lack of any proof of their effectiveness (c) in children, the available data does not permit verification of tolerance to different types of vaccines (d) in health professionals, there is no credible evidence that their administering vaccines mitigates the complications suffered by flu victims in their care. [b]

3. Recently, a Canadian survey drawing on 12 million observations would have come to the provisional conclusion that people vaccinated against flu during the course of the past two years stood double the chance of succumbing to the H1N1 virus. By the same token, were the virus to mutate, those vaccinated with the H1N1 vaccine could run an even greater risk of falling ill. This study awaits confirmattion. [c]

4. The new H1N1 vaccines are still in an experimental stage. They have not been subjected to proper, long-term clinical testing. Neither their effectiveness nor absence of risks have been established, particularly vis-à-vis sicknesses with a long gestation period.

5. The vaccines in 10-dose phials contain mercury (thiomersal) as a preservative. Thiomersal has been implicated in the onset of autism. The American Academy of Pediatrics (60,000 members) in 1999 demanded that it be removed from vaccines.[d] [e] [f]

6. The vaccine contains an additive, squalene which strongly compounds the immune response. Although naturally present in the body and can be ingested without problem, squalene if injected is suspected of triggering auto-immune diseases (eg. MS, Amyotrophic Lateral Sclerosis, Fibromyalgia) or various neurological and rheumatic disorders. [g] The FDA in the United States forbids its use in flue vaccines.[h]

7. It was the squalene present in the anti-anthrax vaccine that was suspected of causing Gulf War Syndrome in over 25% of the veterans (with a marked presence of antibodies to squalene). The concentration of squalene in H1N1 vaccine is substantially greater. Using squalene enables the dose of antigen to be reduced and larger quantities of vaccine to be produced. [i]

8. According to an EU ruling on 15/09/09, manufacturers and doctors administering this experimental vaccine may be exempted from all civil responsibility. In the event of side-effects linked to the vaccine, there will be no basis for legal action.

9. Finally, there is a whole range of other natural means, scientifically proven, of strengthening your immune system and of fending off or minimising complications linked to flu. For example, vitamins C, D and E, certain amino acids, minerals, polyphenol antioxidants, essential oils…The government is neglecting its duty to provide the population with correct information on this subject.

THE FLU CASE

E. Beeth, O. Bernard, Q. Blonda, P. Coomans, R. Delaunoy, et al.

Des médecins, des avocats et des citoyens belges mettent en garde contre le vaccin contre la grippe porcine

The Flu Case, ASANAT, 20 October 2009
https://web.archive.org/web/20091023154802/http://www.asanat.org/

Neuf raisons de ne pas vous faire vacciner contre la grippe A H1N1

1. La grippe A H1N1 est contagieuse mais resterait sans gravité par rapport à la grippe saisonnière. Au sortir de l'hiver, le bilan en victimes en Nouvelle Zélande et au Chili est très faible. Sans vaccination. [a]

2. Des organismes indépendants, comme la très respectée Cochrane Collaboration, font un bilan accablant de l'efficacité ou de la tolérance des vaccins anti-grippaux sur base de 40 années d'études: (a) chez les plus de 65 ans, leur effet est particulièrement modeste ; (b) chez les adultes jeunes en bonne santé, il manque des preuves de leur efficacité (c) chez les enfants, les données disponibles ne permettent de vérifier la tolérance des différents types de vaccins ; (d) chez les professionnels de santé, il n'existe pas de preuve crédible que leur vaccination modifie les complications grippales des personnes dont ils ont la charge.[b]

3. Une étude canadienne portant sur 12 millions d'observations aurait abouti à la conclusion provisoire que les gens ayant été vaccinés au cours des deux dernières années contre la grippe présentaient un risque deux fois plus élevé de tomber malade du virus H1N1. En cas de mutation du virus, il se pourrait donc que les personnes vaccinées avec le vaccin H1N1 courent un risque plus élevé de tomber malade. Cette étude attend confirmation. [c]

4. Les nouveaux vaccins H1N1 sont des produits expérimentaux. Ils n'ont pas fait l'objet d'essais cliniques approfondis à long terme. Ni leur efficacité ni leur absence de risques n'ont été prouvées, en particulier vis-à-vis de maladies à évolution lente.

5. Le vaccin en flacons de 10 doses contient du mercure (thiomersal) comme agent conservateur. Le thiomersal est suspecté d'être à l'origine de cas d'autisme. L'Association Américaine des Pédiatres (60.000 membres) a demandé en 1999 qu'il soit retiré des vaccins.[d] [e] [f]

6. Le vaccin contient un additif, le squalène, augmentant très fortement la réponse immunitaire. Bien qu'il soit naturellement présent dans l'organisme et qu'il puisse être ingéré sans problème, le squalène injecté est suspecté d'induire des maladies auto-immunes (ex. sclérose en plaque, sclérose latérale amyotrophique, fibromyalgie) ou différents troubles neurologiques et rhumatismaux. [g] Son usage pour les vaccins anti-grippaux reste interdit par la FDA aux Etats-Unis [h].

7. Le squalène dans le vaccin contre l'anthrax est suspecté responsable du Syndrome de la Guerre du Golfe chez plus de 25% des vétérans (avec une nette présence d'anticorps au squalène). La concentration de squalène dans le vaccin H1N1 est largement supérieure. L'utilisation de squalène permet de sous-doser l'antigène et de produire rapidement de plus grandes quantités de vaccins. [i]

8. Selon une régulation européenne du 15/09/09, les fabricants et les médecins qui administreront ce vaccin expérimental pourront être exemptés de toute responsabilité civile. En cas d'effets secondaires liés aux vaccins, vous n'aurez donc pas la possibilité de porter plainte.

9. Enfin, il existe de multiples autres moyens naturels, scientifiquement fondés, pour renforcer votre système immunitaire et prévenir ou limiter les infections et les complications liées à la grippe. Par exemple, les vitamines C, D et E, certains acides aminés, des minéraux, des polyphénols, des huiles essentielles… Le gouvernement néglige son devoir d'informer correctement la population à ce sujet.

Süddeutsche Zeitung

Interview:
Barbara Galaktionow – Angela Spelsberg

Ein unhaltbarer Zustand

Süddeutsche Zeitung, 20 Oktobre 2009, 10:39
https://www.sueddeutsche.de/wissen/schweinegrippe-impfung-ein-unhaltbarer-zustand-1.43320
https://web.archive.org/web/20100614031713/https://www.sueddeutsche.de/wissen/schweinegrippe-impfung-ein-unhaltbarer-zustand-1.43320

Wenn die Behörden mit der Pharmaindustrie: Korruptionsexpertin Spelsberg über die Fehler der Bundesregierung und den fraglichen Nutzen der Impfung.

Sueddeutsche.de: Wie glaubwürdig ist die Empfehlung der Ständigen Impfkommission (Stiko) für die Schweinegrippe-Impfung? Wurden hier Nutzen und Risiken adäquat gegeneinander abgewägt?

Angela Spelsberg: Ganz klar: nein. Das Problem ist die neue Impfstrategie von 2003/2004 der "Vaccine Working Party" der europäischen Zulassungsbehörde Emea. Die Zulassung eines neuen Impfstoffs ist nun innerhalb von drei Tagen möglich, weil sogenannte Mock-up-Impfstoffe (engl. für "Attrappe", Anm. d. Red.) hergestellt werden. Der Impfstoff gegen die Schweinegrippe basiert auf einem, der eigentlich für die Vogelgrippe H5N1 entwickelt und jetzt nur mit den Antigenen der Schweinegrippe H1N1 versehen wurde. Diese Modell-Impfstoffe sind wesentlich niedriger dosiert als die herkömmlichen. Kein Mensch weiß, ob und wie lange sie wirklich funktionieren. Hinzu kommt, dass die Wirkverstärker, die Adjuvantien, nicht ausreichend getestet wurden.

Sueddeutsche.de: Welche Verbindungen gibt es zwischen der Stiko und den Impfstoffherstellern?

Spelsberg: Zahlreiche. Die Mehrzahl der 16 Mitglieder hat Kontakte zu den wichtigsten Impfstoffherstellern. Es gibt Mitglieder, die in der Stiko sitzen und gleichzeitig Impfstoffe testen. Andere halten Vorträge für die Hersteller von Impfstoffen oder sind für das von Produzenten von Impfstoffen finanzierte "Forum Impfen" tätig. Und einige waren mal Mitglied der Stiko und sitzen jetzt in Pharmakonzernen.

Sueddeutsche.de: Auch um die Unabhängigkeit der europäischen Zulassungsbehörde Emea ist es laut Ihrer Organisation Transparency International schlecht bestellt...

Spelsberg: Die Vorgänge bei der Emea sind ein noch größeres Problem. Hier werden die Impfstoffe ja zugelassen. Transparency kritisiert schon seit Jahren, dass diese Behörde der Generaldirektion Wirtschaft der EU-Kommission unterstellt ist und nicht der Generaldirektion Gesundheit und Verbraucherschutz. Zudem wird die Emea zu fast zwei Dritteln von der Pharmaindustrie finanziert. Das ist ein unhaltbarer Zustand. Es zeigt sich, dass die Mechanismen der Kontrolle nicht mehr funktionieren.

Sueddeutsche.de: Hat Ihrer Ansicht nach auch die Bundesregierung Fehler gemacht?

Spelsberg: Das Problem ist vor allem, dass sie nicht auf das veränderte Bedrohungsszenario reagiert. Zu Beginn des Ausbruchs wurde die Gefährlichkeit des H1N1-Erregers überschätzt und es

gab wenig gesicherte Daten. Inzwischen ist der weltweite Verlauf der sogenannten "Schweinegrippe" im Vergleich zur üblichen saisonalen Grippe als mild zu beschreiben, nicht nur in Deutschland, sondern auch auf anderen Kontinenten. Die Todesrate bei Menschen, die sich mit dem Erreger angesteckt haben liegt weltweit bei etwa 0,2 Prozent. In Deutschland starben bislang zwei Menschen am Schweinegrippe-Erreger (noch viel weniger als die bei der angegeben Todesrate zu erwartenden potentiellen 46 Todesfälle) – beide waren gesundheitlich vorbelastet. Trotzdem laufen die Maßnahmen gegen eine Pandemie unvermindert weiter. Der Nutzen und das Risiko einer Impfung werden nicht erneut gegeneinander abgewogen. Es gibt in Deutschland keinen Plan, wie man eine Pandemiewarnung wieder zurückfährt.

Sueddeutsche.de: Gut, das Szenario mag nicht mehr so bedrohlich sein, aber der Impfstoff wurde nun mal bestellt und das Geld dafür ausgegeben. Wird die Impfung deshalb durchgezogen?

Spelsberg: Gesundheitsfragen können nicht nach marktwirtschaftlichen Kriterien behandelt werden. Bei einer Impfung muss der Nutzen größer sein als der mögliche Schaden. Und wenn der Schaden gering erscheint, muss halt auch der Nutzen sowie das mögliche Risiko neu bewertet werden.

Sueddeutsche.de: Müssen die Verantwortlichen mit Konsequenzen rechnen, falls es zu schweren Negativfolgen einer Schweinegrippe-Impfung kommt?

Spelsberg: Nein, und das ist ja Teil des Skandals. Die Impfstoffhersteller haben sich ausbedungen, dass sie für mögliche Nebenwirkungen nicht verantwortlich zu machen sind.

Sueddeutsche.de: Können Sie einen Tipp geben, an wessen Empfehlung man sich nun halten kann - die der Ärzte?

Spelsberg: Die Glaubwürdigkeit der eigentlich zuständigen Kommission, der Stiko, ist auf alle Fälle in Zweifel zu ziehen. Die Ärzteschaft ist, was die Schweinegrippe-Impfung angeht, komplett gespalten. Und das ist gut. Denn die Notwendigkeit der Impfung und ihre Begleitumstände müssen öffentlich ausdiskutiert werden. Die Stiko und das Robert-Koch-Institut müssen darlegen, warum sie an ihrer positiven Haltung gegenüber der Impfung festhalten. Und da reicht ein Hinweis auf eine mögliche Mutation des Virus' nicht. Schon bei der Vogelgrippe wurde mit diesem Was-ist-wenn-Szenario operiert. Das ist alles vollkommen überzogen.

Sueddeutsche.de: Was muss jetzt getan werden? Sie fordern unter anderem, ein parlamentarischer Untersuchungssausschuss müsse die Vergabe der Impfstoffherstellung an den Konzern GlaxoSmithKline (GSK) untersuchen...

Spelsberg: Nicht nur bezüglich der Vergabe an GSK. Außerordentlich fragwürdig ist doch auch die jetzt bekannt gewordene Bestellung eines anderen, nicht adjuvantierten Impfstoffes für die Bundeswehr und für Regierungsangehörige und Bundesbeamte. Dokumente und Sitzungsprotokolle, das muss alles auf den Tisch. Es kann nicht sein, dass so folgenreiche und kostenintensive Entscheidungen unter Ausschluss der Öffentlichkeit gefällt werden. Parlamentarische Kontrolle ist in solchen Gesundheitsfragen enorm wichtig - auch für die Zukunft.

[Angela Spelsberg ist Vorstandsmitglied bei Transparency International. Die Ärztin und Epidemiologin leitet das Tumorzentrum Aachen. Sie beschäftigt sich mit der Bedeutung von Einflussnahme und Korruption im Gesundheitswesen].

German doctor calls for parliamentary inquiry into "swine flu" jab scandal

The Flu Case, 21 October 2009
https://web.archive.org/web/20100704074634/http://www.theflucase.com/index.php?option=com_content&view=article&id=1261%3Agerman-doctor-calls-for-parliamentary-inquiry-into-qswine-fluq-jab-scandal&catid=1%3Alatest-news&Itemid=64&lang=en

A German doctor has called for a parliamentary inquiry into the decision by the German government to purchase GlaxoSmithKline's Pandemrix vaccine and the recommendation of the national vaccine advisory board and Robert Koch Institute in favour of the untested "swine flu" jabs.

Dr Angela Spelsberg, head of a tumour center in Aachen and a member of Transparency International, said in an interview in the mainstream newspaper Die Sueddeutsche Zeitung that key control mechanisms to protect the general public against dangerous vaccines have stopped functioning.

The exposure of people to dangerous vaccines by the government is "a situation that cannot go on," she said.

She noted that many of the people who sit on the national vaccine advisory board, STIKO, have financial links with the pharmaceutical industry; some are involved in clinical trials on vaccines; some are paid for holding talks on vaccines.

In addition, the European Medicines Agency, the EU drug regulator, derives two thirds of its money from pharma companies, and is subordinated to the business directorate and not the public health directorat of the European Commission.

Spelsberg said that the "swine flu" jabs were not adequately tested. The vaccines were based on so-called mock up vaccines which used much lower amounts of antigens than standard vaccines, and it was not clear how these vaccines functioned or for how long.

In addition, the jabs had adjuvants that were not tested.

She said it was a "scandal" that pharma companies had been given immunity.

She said parliamentary control was vital to stop these kind of scandals occuring in the future.

RP ONLINE

Berliner Ärzte verweigern Schweinegrippe-Impfung.

RP.OnLine, 21 Oktobre 2009, 20:06
https://web.archive.org/web/20091025165344/http://www.rp-online.de/public/article/panorama/deutschland/772947/Berliner-Aerzte-verweigern-Schweinegrippe-Impfung.html

Berlin (RPO). Die Schweinegrippe-Impfung in Berlin droht sich wegen eines Honorarstreits zwischen Ärzten und Senat zu verzögern. "Wir führen die Impfung nicht durch", sagte die Vorstandsvorsitzende der Kassenärztlichen Vereinigung Berlin, Angelika Prehn, in einem Interview.

Statt der üblichen Vergütung von 7,10 Euro für eine Einfachimpfung will der Berliner Senat den Ärzten die Schweinegrippe-Impfung laut Prehn nur mit 5,50 Euro vergüten. Für die Zweitimpfung soll es 4,50 Euro geben. Die Vertreterversammlung der Kassenärztlichen Vereinigung lehnte dies nun ab.

Die Berliner Ärzte bestehen nun auf einem höherem Honorar. "Allein die Beratung der Patienten wird viel Zeit in Anspruch nehmen, da die Menschen verunsichert sind. Das muss gerecht entlohnt werden", forderte Prehn in der Tageszeitung "B.Z.".

Impfmüdigkeit in Deutschland

In Deutschland herrscht angesichts der Schweinegrippe weiterhin eine große Impfmüdigkeit vor. Wie eine am Mittwoch veröffentlichte Umfrage der AOK Hessen unter 1650 Versicherten ergab, wollen nur 28,6 Prozent sich impfen lassen. Mehr als 60 Prozent schließen eine Impfung derzeit noch aus.

Nach Angaben der Krankenkasse stehen vor allem Menschen mit einem hohen Bildungsniveau der Impfung gegen die Schweinegrippe skeptisch gegenüber. So wollen sich nur 25,6 Prozent der Menschen mit Abitur sich immunisieren lassen, aber 55 Prozent der Menschen ohne Schulabschluss. Betrachtet man die unterschiedlichen Altergruppen, so nimmt die Zahl der Impfskeptiker mit dem Alter zu. So ist nach AOK-Angaben in der Altersgruppe der Menschen bis 30 Jahre die Impfbereitschaft mit 36,4 Prozent am höchsten.

Impfaktion startet nicht überall am Montag

Die Massenimpfaktion gegen die Schweinegrippe beginnt nicht in allen Bundesländern bereits am kommenden Montag. In Niedersachsen werde die Aktion erst Mitte bis Ende kommender Woche anfangen, teilte das Landesgesundheitsministerium am Mittwoch in Hannover mit. Trotzdem liege man voll im Plan. Die Politik rief unterdessen die Bevölkerung zur Teilnahme an der Impfung auf. Viele Menschen wollen sich nach wie vor nicht gegen die Schweinegrippe impfen lassen.

In Niedersachsen soll der Impfstoff Pandemrix Mitte der Woche in 400 ausgewählten Apotheken ankommen. Danach können sich chronisch Kranke, medizinisches Personal, Feuerwehrleute und Polizisten impfen lassen. Der Grund für die Verzögerung liegt im Impfstoffwerk in Dresden, wo nicht so viel Impfstoff produziert werden kann wie ursprünglich gedacht, wie der Sprecher des Thüringer Gesundheitsministeriums, Thomas Schulz, sagte. Der Freistaat hat derzeit den Vorsitz in der Gesundheitsministerkonferenz.

Der Sprecher betonte aber: "Das Schlüsselpersonal wird überall versorgt." Dazu gehören Arzte, Krankenschwestern, Polizei und Feuerwehr. Weil bei dieser Gruppe die Impfbereitschaft auch eher verhalten ist, kommen wahrscheinlich auch viele chronisch Kranke an die Spritze. Die normale Bevölkerung wird sich voraussichtlich ab Mitte bis Ende November impfen lassen.

Der nordrhein-westfälische Gesundheitsminister Karl-Josef Laumann appellierte unterdessen an die Bürger, sich den Impfstoff trotz vieler gegenteiliger Stimmen verabreichen zu lassen. Man dürfe sich von den Diskussionen der vergangenen Tage nicht verunsichern lassen, sagte der CDU-Politiker in Düsseldorf.

Selten Nebenwirkungen

"Ich bin davon überzeugt, dass eine rechtzeitige Impfung der beste Schutz gegen die sich unverändert ausbreitende neue Grippe ist", erklärte dagegen Gesundheitsminister Laumann. Der Impfstoff Pandemrix sei auf Wirksamkeit und Unbedenklichkeit geprüft worden. Grundsätzlich könne zwar niemand ausschließen, dass bei einer breiten Anwendung eines neuen Arzneimittels bislang unbeobachtete Nebenwirkungen auftreten. Dies sei erfahrungsgemäß aber sehr selten.

Am Wochenende wurde bekannt, dass der Bund einen anderen Impfstoff bestellt hat. Die Bevölkerung soll das Medikament Pandemrix mit Verstärkern (Adjuvanzien) gespritzt bekommen. Spitzenbeamte, Minister und Soldaten sollen dagegen das Mittel Celvapan erhalten, das ohne Wirkverstärker auskommt und von einigen Experten daher als weniger risikoreich betrachtet wird. Andere Wissenschaftler halten dagegen Celvapan für nicht ausreichend getestet.

H1N1 vaccine parent alert:
Dr. Mercola and NVIC's BL Fisher expose disinformation and dangers

Examiner, 21 October 2009, 12:44 PM
https://web.archive.org/web/20100430234007/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2009m10d21-H1N1-vaccine-parent-alert-Dr-Mercola-and-NVICs-BL-Fisher-expose-disinformation-and-dangers

Today, Dr. Mercola released his new interview (below) with Barbara Loe Fisher in an H1N1 vaccine alert in which America's two most popular and trusted health experts expose disinformation about the new flu, the vaccine and the work of the National Vaccine Information Center (NVIC).

Both Fisher and Mercola are noted internationally as intellectually honest health experts of integrity, empowering the public.

The interview was prompted after the recent *60 Minutes* TV program about the H1N1 'swine flu.'

According to Fisher, the H1N1 'swine flu' has now been proven to be less virulent than regular flu. In the Southern Hemisphere, it has caused no more serious cases than regular flu, unlike what TV and newspapers are repeatedly portraying.

To vaccinate or not: exercise free will

In the new interview about today's so-called "pandemic," the two leaders in the field of prevention, Fisher and Mercola address numerous points concerning parents about their decision to vaccinate or not.

The bottom line of this decision, as health workers are taught, is one of informed consent, **a** *basic human right of exercising free will.*

"Don't let anyone tell you what to do," says Fisher.

To have courage to best protect self and children, Fisher recommends that parents empower themselves with information and speak only to trusted health workers.

"You have the right, the responsibility and the ability to look at this issue, become informed, and make wise health care choices for you and your children," says Fisher.

Dr. Mercola comments that *60 Minutes,* his favorite TV show, disappointingly provided an infomercial on the H1H1 swine flu vaccine that he further discusses in his H1N1 swine flu alert.

TV is a major tool in the government's multi-million dollar covert marketing campaign to repeatedly scare people to become vaccinated, similar but more sophisticated than the 1976 TV ad campaign convincing Americans to vaccinate for the flu.

The 1976 flu vaccine caused more deaths and disabilities than the flu.

Between the new ad campaign and doctors intimidating patients to be vaccinated as numerous parents have written or spoken to the author indicating is regularly happening, parents are coerced to vaccinate their children.

The legal definition of coerce is, "*The intimidation of a victim to compel the individual to do some act against his or her will by the use of psychological pressure, physical force, or threats..*"

Coercion violate the basic human right of practicing free will.

Paradigm shift

"What we're seeing is a paradigm shift is occurring towards a more natural approach to achieving good health," states Fisher who recognizes that those holding onto the old, pharmaceutical model of "health" are doing everything within their power to halt or reverse the shift.

The numbers of people stating they will take the swine flu vaccine is dropping.

This is "showing that more people are using analytical approaches," says Fisher. The government using the, "You do what I say and don't ask any questions, those days are gone," she says.

But this isn't happening easily. Fisher calls the treatment of people working to provide accurate information to the public "persecution."

Dr Mercola extends a hearty thanks to Fisher for her role in public education about the truth and reality about the vaccine issue.

Mercola also commends other people involved in the struggle of exposing the truth about vaccines. He reminds the public that "we are winning" because people who had never thought too much about vaccines are thinking, seeing and realizing this flu is a mild viral infection, not causing tremendous mortality and asking why the government is not expsoing the truth or being held accountable for this.

To see Dr. Mercola's full report associated with the video below of the unique and important interview of Fisher, visit mercola.com.

Fisher wrote the first American book questioning vaccines, *Shot in the Dark.* For over twenty-five years, Fisher, the Co-founding Director of NVIC, has consistently provided accurate information about vaccines and right to choose, in direct opposition to individuals with vested interest in the pharmaceutical military industrial complex.

Süddeutsche Zeitung

Schweinegrippe-Impfung:
"Das Virus ist unter uns"

Süddeutche Zeitung, 22 Oktobre 2009, 12:33
https://www.sueddeutsche.de/wissen/schweinegrippe-impfung-das-virus-ist-unter-uns-1.31257

Trotz meist milder Krankheitsverläufe und ungeklärter Impfrisiken ruft das Gesundheitsministerium zur Impfung gegen die Schweinegrippe auf. Denn die Zahl der Infektionen in Deutschland steigt.

Ungeachtet der Debatte um verschiedene Impfstoffe, milde Krankheitsverläufe und ungeklärten Impfrisiken appelliert das Bundesgesundheitsministerium an die Bürger, sich möglichst zahlreich gegen die Schweinegrippe impfen zu lassen.

Der wirksamste Schutz gegen die neue Grippe sei die Impfung, sagte der Staatssekretär im Gesundheitsministerium, Klaus Theo Schröder, in Berlin. Das Ministerium wünsche sich eine "hohe Impfbeteiligung" und halte diese auch für "dringend geboten". Die Impfungen sollen am kommenden Montag beginnen.

Bisher verlaufe die Grippe zum Glück mild, sagte Schröder. Es sei aber im Herbst und Winter mit einer stärkeren und intensiveren Ausbreitung zu rechnen. Nach Angaben des Robert-Koch-Instituts (RKI) gab es bislang 25.000 Schweinegrippe-Fälle in Deutschland, darunter zwei Todesfälle.

Die Ansteckungszahlen steigen laut RKI-Präsident Jörg Hacker derzeit wieder an. Hacker verwies zudem darauf, dass mehr als 90 Prozent der Menschen das Virus in Deutschland und nicht wie noch im Sommer im Ausland bekommen hätten. "Das Virus ist unter uns. Es verbreitet sich in Deutschland", sagte Hacker.

Bei Untersuchungen des Erbmaterials des Virus' seien bislang keine Mutationen gefunden worden, die zeigten, dass sich der Erreger in Richtung einer Resistenz entwickle. Entwarnung geben wollte Hacker dennoch nicht: Das seien immer nur Momentaufnahmen.

Auch die Entstehung von Mischviren könne für die Zukunft nicht ausgeschlossen werden, sagte der Institutschef. Diese entwickelten sich allerdings meist nicht in Menschen, sondern in Tieren.

International stellt sich nach den Worten Hackers die Situation ähnlich dar wie in Deutschland. In vielen europäischen Ländern und in den USA gebe es eine steigende Anzahl von Schweinegrippefällen.

Nur auf der Südhalbkugel würden die Zahlen derzeit sinken. Dies erklärte Hacker damit, dass der Beginn der Schweinegrippe hier zunächst mit dem Beginn der saisonalen Influenza zusammengefallen sei. Sowohl in den USA als auch auf der Südhalbkugel gebe es eine lebhafte Nachfrage nach dem Impfstoff.

Ärger um Impfung in Berlin

Andrea Laslop sagte für die europäische Zulassungsbehörde Emea, dass die Behörde nach der Prüfung der drei verfügbaren Impfstoffe - Pandemrix, Celvapan und Focetria - zu dem Schluss gekommen sei, "dass der erwartete Nutzen einer Impfung das mögliche Risiko übersteigt".

In Berlin könnte sich derweil wegen eines Streits zwischen Ärzten und Gesundheitsbehörden die Schweinegrippe-Impfung verzögern. Die Ärzte sind einerseits unzufrieden mit dem niedrigen Honorar für die Impfung, wie die Zeitung B.Z. meldete. Nach einem Bericht der Berliner Zeitung sorgen sie

sich zudem über einen Haftungsausschluss des Impfstoffherstellers bei gesundheitlichen Schäden durch das Serum.

"Die Herstellerfirma GlaxoSmithKline ist vertraglich von der Haftung für ihr Produkt freigestellt", zitiert das Blatt aus einem Bericht der Kassenärztlichen Vereinigung (KAV) Berlin. Bei etwaigen Schäden müsste also nicht die Pharmafirma, sondern der Staat oder gar der Arzt dafür aufkommen, warnt die Ärztevertretung.

Das Bundesgesundheitsministerium habe zwar erklärt, ein solcher Haftungsausschluss sei gängig. Die KAV bestreite dies aber. Nötig sei zudem eine gewissenhafte Beratung der Patienten. Denn die Impfung sei nicht so erprobt und unbedenklich wie die gebräuchlichen Standard-Impfungen, zitiert das Blatt weiter.

THE FLU CASE

Berlin doctors worried they could have to pay compensation for "swine flu" jab damage

The Flu Case, 23 October 2009

https://web.archive.org/web/20091027213141/http://theflucase.com/index.php?option=com_content&view=article&id=1321%3Aberlin-doctors-worried-they-could-have-to-pay-compensation-for-qswine-fluq-jab-damage&catid=1%3Alatest-news&Itemid=64&lang=en

Doctors in Berlin are concerned that they will be forced to pay compensation to patients who suffer death or damage from the "swine flu" shot because pharmacuetical companies have been given immunity under existing contracts.

Doctors say that the "swine flu" jab is not as well tested and safe as the "flu jab" and that the clause giving pharma companies immunity is new.

The German government is pushing doctors to give as many patients the "swine flu" jab as possible.

Annika Dahlqvist

Mera om influensan

Doktor Dalquists Blogg, 22 oktobre 2009, kl 08:54
https://web.archive.org/web/20091025105225/http://blogg.passagen.se/dahlqvistannika/entry/mera_om_influensan

Som ni förstår så får jag många mail om influensan och vaccinationen. En del av dem innehåller uppgifter om hur det nya svininfluensaviruset och vaccinet kom till.

Detta virus består av genmaterial från säsongsinfluensa-, svininfluensa- och fågelinfluensavirus.

Virus kan inte i naturen blanda sig på detta sätt. Virus kan mutera, men de har ingen sexuell förökning som kan blanda genmaterial. Detta innebär att det nya viruset är tillverkat i laboratorium, sannolikt av läkemedelsföretag. Sedan planterar de viruset på strategiska ställen i världen så att det utbryter epidemier. Sedan kan fabrikanterna förmå sina kontakter i WHO att utfärda pandemiförklaring. De aningslösa politikerna i världens länder drar på med massvaccination av befolkningen. Vaccinfabrikanterna tjänar många miljarder pengar på alltihop, med ganska låga insatser.

Media älskar influensan och massvaccinationen. Jag läser idag i en krönika av Rolf Elmér i Sydsvenskan. Han skriver: "Följden av ett misslyckat vaccinationsprogram i Sverige skulle i värsta fall kunna vara en långsiktigt försämrad folkhälsa och återkomsten av forna tiders farsoter."

På vilket sätt skulle en lägre vaccinationsgrad långsiktigt försämra folkhälsan?

Och tror han uppriktigt att man med omfattande massvaccination kan utrota ett virus så att det inte kommer tillbaka? Det är sanslöst naivt tycker jag.

Fired Swedish doctor suspects the WHO

The Flu Case, 24 October 2009
https://web.archive.org/web/20091028005410/http://www.theflucase.com/index.php?option=com_content&view=article&id=1352:fired-swedish-doctor-suspects-the-who&catid=41:highlighted-news&Itemid=105&lang=en

"As you can imagine, I get many emails about influenza and vaccination. Some of them contain information about how the new swine flu virus and the vaccine was created. This virus consists of genetic material from seasonal flu, swine flu and avian flu viruses. Viruses can not mix in this way in nature. Viruses can mutate, but they have no sexual reproduction that can mix genetic material. This means that the new virus was made in a laboratory, probably by pharmaceutical companies. The virus is then planted in strategic places around the world to cause an epidemic outbreak. After that, manufacturers persuade contacts in the WHO to issue a pandemic declaration. The unsuspecting politicians in countries around the world start mass-vaccinations of the population. And vaccine manufacturers makes billions off the whole thing, with relatively little input.

Media loves influenza and mass-vaccination. I read today in a chronicle by Rolf Elmer in Sydsvenskan. He writes: "The consequence of an unsuccessful vaccination program in Sweden would at worst be a long-term deterioration of public health and the resurgence of epidemics of the past."

How would a lower vaccination rate cause long-term deterioration of public health? And does he seriously believe that extensive mass-vaccination can eradicate a virus so that it will not come back? It is unbelievably naive, I think.

BILD.de-Moderatorin Hadnet Tesfai (30) noch immer müde

BILD, 23 Oktober 2009, 22:02 Uhr
https://www.bild.de/news/2009/hadnet-tesfai-tag-2-nach-impfung-10204664.bild.html

Deutschland droht eine Schweinegrippe-Welle ungeahnten Ausmaßes – doch nur ein Bruchteil der Bürger scheint die Gefahr ernst zu nehmen. Viele fürchten sich mehr vor eventuellen Nebenwirkungen der Impfung, als vor dem Killer-Virus selbst!

BILD wollte es genau wissen – und hat den Impfstoff für die "gemeine" Bevölkerung schon mal vorab getestet.

Ergebnis: Leichte Schmerzen an der Einstichstelle, Müdigkeit, leichter Schüttelfrost. Gravierende Folgen? Bislang Fehlanzeige!

BILD.de-Moderatorin Hadnet Tesfai (30) führt darüber hinaus exklusiv einen Video-Blog über die Folgewirkungen.

Auch sie fühlt vor allem Müdigkeit, die Muskelschmerzen haben stark nachgelassen. Dafür erwartet unsere Kollegin morgen ein echter Härtetest ...

THE FLU CASE

Bild journalist reports tiredness and pain after "swine flu" jab test

The Flu Case, 25 October 2009
https://web.archive.org/web/20091028004001/http://www.theflucase.com/index.php?option=com_content&view=article&id=1362:bild-journalist-reports-tiredness-and-pain-after-qswine-fluq-jab-test&catid=1:latest-news&Itemid=64&lang=en

A reporter from Germany's Bild newspaper who took the "swine flu" jab as a guinea pig has said she still "feels tired above all, but the muscle pain is much less in the meantime."

30-year-old Hadnet Tesfai tested the "swine flu" vaccine planned for use on "lowly commoners", as Bild puts it, referring to the fact that high government officials are getting a different jab without mercury and adjuvants.

The results: light pain at the injectin site, tiredness, light shaking and trembling, reports Bild.

DAGENS Medicin

Simon Rothelius

Skeptiska läkare förbjuds att prata om massvaccinering

Dagens Medicin, 23 Oktobre 2009
https://web.archive.org/web/20091026094751/http://www.dagensmedicin.se/nyheter/2009/10/23/lakare-forbjuds-uttala-sig/index.xml

Chefer inom primärvården i Norrbotten tillåts inte att uttala sig negativt om massvaccineringen mot svininfluensan.

För drygt två veckor sedan skrev Meta Wiborgh, chef för Bergnäsets vårdcentral i Luleå, och Björn Olsson, distriktsläkare vid Örnäsets vårdcentral i Luleå och krönikör i Dagens Medicin, under en debattartikel i Svenska Dagbladet. Där riktade de kritik mot att hela Sveriges befolkning ska erbjudas vaccin mot den nya influensan, A(H1N1).

Utspelet retade upp primärvårdsledningen i Norrbotten, som menade att läkarna kan göra patienterna osäkra om de uttalar sig negativt om de nationella rekommendationerna.

– Hur skulle det se ut om de 32 cheferna för vårdcentralerna går ut och säger sin mening, säger Bo Westerlund, divisionschef för primärvården i Norrbottens läns landsting, till tidningen Dagens Samhälle.

Efter flera veckors öppen konflikt i de lokala medierna har parterna nu nått en överenskommelse. Meta Wiborgh och Björn Olsson tillåts svara sanningsenligt på frågan om de tänker vaccinera sig själva. Däremot får de inte uttrycka någon kritik mot själva vaccinationskampanjen om en patient frågar.

– Jag hänvisar till den officiella information som finns och säger att det är ett ställningstagande du måste göra själv, säger Meta Wiborgh till Dagens Samhälle.

Simon Rothelius

Sceptical Swedish doctors forbidden to talk about the mass vaccinations

The Flu Case, 23 October 2009
https://web.archive.org/web/20091027012325/http://www.theflucase.com/index.php?option=com_content&view=article&id=1347:sceptical-swedish-doctors-forbidden-to-talk-about-the-mass-vaccinations&catid=1:latest-news&Itemid=64&lang=en

Managers in primary care in Norrbotten are not allowed to say anything negative about the mass vaccinations against swine flu.

Two weeks ago, Meta Wiborgh, head of Bergnäset health center in Luleå, and Björn Olsson, district medical officer at Örnäset health center in Luleå and a columnist for Dagens Medicin, signed a debate article in Svenska Dagbladet. In the article, the two doctors voiced their criticism about vaccinating the whole Swedish population against the new influenza, A(H1N1).

The move angered the primary care management in Norrbotten, who said that doctors can make patients uncertain if they speak negatively about the national recommendations.

- How would it look like if the 32 heads of health centers go out and voice their opinions, says Bo Westerlund, division manager for primary care in Norrbotten County Council, to the newspaper Dagens Samhälle.

After several weeks of open conflict in the local media, the parties have now reached an agreement. Meta Wiborgh and Björn Olsson are allowed to answer truthfully when asked if they intend to vaccinate themselves. By contrast, they are not allowed to express any criticism of the vaccination campaign if a patient asks.

- I refer to the official information available, and say it is a position you have make yourself, Meta Wiborgh tells Dagens Samhälle.

Possible hidden hazards of mass vaccination against new influenza A/H1N1:
have the cardiovascular risks been adequately weighed?

Med Microbiol Immunol, 23 October 2009, 198: 205-209
https://doi.org/10.1007/s00430-009-0130-9

Abstract

Programs for vaccination against the new influenza A/H1N1 targeting many hundred million citizens in Europe and the USA are to be launched in the fall of this year.

The USA is planning to employ a non-adjuvanted vaccine, whereas European nations are opting for inclusion of MF59, the adjuvant contained in an alternative seasonal flu vaccine, or the related adjuvant AS03 that is contained in a recently developed H5N1 vaccine.

We draw attention to unappreciated hazards of using adjuvanted vaccine in Europe. Evidence from animal experiments in conjunction with clinical epidemiological data indicates that, quite irrespective of cause, stimulation of the immune system may accelerate atherogenesis.

Application of adjuvanted flu vaccines to individuals at risk may therefore aggravate the course of underlying atherosclerotic vessel disease with all the clinical consequences. The same may hold true for other widespread diseases that are propelled by deregulated immune mechanisms.

Safety trials conducted to date have not specifically taken these possible side effects into account, and unexpected serious adverse effects thus may follow in the wake of a general vaccination program.

A prudent consequence would be to establish careful survey systems alongside with mass application of new adjuvanted vaccines, or to hold mass vaccination in reserve for use only in situations of true need, such as would arise with the emergence of a more virulent new H1N1 virus strain, or to use non-adjuvanted vaccines in individuals who are potentially at risk for adverse side effects.

Background

The current flu pandemic that originated in Mexico in April 2009 has triggered a global reaction of unprecedented dimension in science and society [1, 2]. Fortunately, the H1N1 virus has not yet transformed itself into the dreaded killer, although well over 300.000 infections have been documented [3]. The probability that such a transformation will ever take place is thus obviously small, but a single event could have dire consequences. With high priority, vaccination programs were accordingly conceived and are already on the verge of implementation [4, 5]. Vaccination is also expected to reduce the death toll and costs for hospitalization incurred by H1N1. Somewhat oddly, the same arguments have not been made to implement a similar vaccination program against seasonal flu, which would appear reasonable. Instead, at least 1.000.000.000 Euros are planned to be spent to vaccinate one-third of the German population against H1N1, and troubled discussions are ongoing behind the scenes as to how this is to be financed.

...

Mass H1N1 vaccination: to do or not to do

The authors do not question the necessity of developing effective vaccine strategies against H1N1. There is no intent to criticize, and less still to blame any of the decision-makers for the course the program has taken thus far. Quite to the contrary, it is recognized that the preparations undertaken to face the H1N1 as well as the H5N1 threat set impressive standards for the future [19–21]. Of ultimate importance now is wise timing of the next move.

Foremost, the question to be answered is whether the hazards of conducting mass vaccinations at the present stage might outweigh the expected benefits. One argument in favor of mass vaccination derives from observational studies reporting reductions in all-cause mortality in older persons who had been vaccinated against seasonal flu vs. non-vaccinated individuals [22–28]. At present, however, H1N1-related mortality is very low in Europe, and whether it will rise to the extent observed with seasonal flu in winter simply cannot be predicted.

To quote EMEA (European Medicines Agency): "Public confidence in vaccination programs may only be maintained if it is considered that competent authorities will access the safety of vaccines in a timely and adequate manner and take appropriate action. This includes investigation of rare and unexpected adverse events, increases in the occurrence of known adverse reactions and careful analysis of theoretical concerns”. Now, should any of the thoughts expressed here contain just a grain of truth, this cannot but be uncovered by the sheer numeric power of the program. If, in retrospect, vaccination should turn out to have been unnecessary because a virulent H1N1-virus never emerged, consequences for the responsible parties can be foreseen, and public faith in preventive medicine will be shaken to the roots.

Must these risks be taken? The production of sufficient H1N1 vaccines is guaranteed, and the world is now armed to conquer the hypervirulent virus, should it ever emerge. Surveillance programs have been installed to ensure that the new foe is quickly tracked down, and action could then be immediately taken.

So why play out a trump prematurely? Man has already won the first round in the race against this adversary. Why not hold mass vaccination in reserve? Or, if the vaccination program is implemented, would it not be prudent to use non-adjuvanted vaccine in individuals at risk? We have focused on cardiovascular disorders but the arguments would extend to other diseases that harbor immuno-pathological components. Finally, if the decision is still made to uniformly employ adjuvanted vaccines, careful survey systems should be implemented to clearly establish that the concerns expressed here, in particular the potential of adjuvanted vaccines to precipitate cardiovascular events, are nothing more than theory.

THE FLU CASE

German doctors refuse to be bullied by authorities into giving "swine flu" jab

The Flu Case, 24 October 2009 11:52
https://web.archive.org/web/20091027012335/http://www.theflucase.com/index.php?option=com_content&view=article&id=1354:german-dcotors-refuse-to-be-bullied-by-authorities-into-giving-qswine-fluq-jab&catid=1:latest-news&Itemid=64&lang=en

Fredrich Hoffmann, the head of Germany's national vaccine commission, has told doctors that they should give the untested "swine flu" jab to their patients no matter what their opinion about it might be, but German doctors are refusing to bow down and be bullied.

The German national vaccine commission is made up of members with financial and other ties to pharmaceutical companies, and so it does not come as a surprise that Hoffmann is putting pressure on German doctors to give patients the lethal "swine flu" jab even though those same doctors will be liable to pay compensation for any damage and death caused by the jabs because the pharma companies have been given immunity.

However, doctors in Germany are refusing to be bullied by the authorities in league with big pharma into roll ingout a "swine flu" jab campaign that will make billions for vaccine companies.

Dr Jürgen Seefeldt, a specialist in internal medicine from Paderborn, sent an open letter to the Dr Susanne Stöcker, an official from the German drug regulator, the Paul Ehrlich Institute, pointing out the reason why her statement in the media that the "swine flu" jab was not risky was an "infamous lie".

Seefeldt systematically lists the dangers of squalene and mercury citing relevant scientific literature. He also notes that these toxic ingredients are not necessary for making a vaccine.

"You should desist in future in the interest of the rest of the population from making false statements of this kind and to put your efforts and energy into making swine flu vaccines withotu squalene and mercury," he writes.

This is his letter in German:
Dr. med. Jürgen Seefeldt
Winfriedstr.7
Facharzt für Innere Medizin
33098 Paderborn

Sehr geehrte Frau Dr. Stöcker,

Sie wurden im Westfalen-Blatt Nr. 230 vom 03.10.09 mit den Worten zitiert, "die Schutzimpfung gegen die Neue Grippe ist unbedenklich..."
Ich möchte Sie dringend ersuchen, diese infame Lüge zu unterlassen! Sie sind in dieser Aussage durch von mir unten genannte Medline-gelistete Aufsatz-Literatur inhaltlich damit einer Falschaussage überführt.
Alle deutschen Schweinegrippe-Impfstoffe, einschl.
Pandemrix enthalten: See: =>

https://web.archive.org/web/20100413015612/http://www.svd.se/nyheter/inrikes/vardpersonal-tveksam-till-vaccin_3712585.svd

Bland vårdpersonal finns invändningar mot att vaccinera sig mot den nya influensan, visar SvD:s rundringning. Det är bland annat risken för biverkningar som oroar. Men hittills är biverkningsrapporterna som Läkemedelsverket fått in enligt förväntan.

På Universitetssjukhuset MAS i Malmö är man besviken på att antalet anställda som vill vaccinera sig inte är högre. Av sjukhusets cirka 5 000 anställda som arbetar med patienter är det hittills 60 procent som vaccinerat sig.

– Vi hade hoppats på fler. Vi har märkt att en del är skeptiska, säger Sven Haidl, infektionsläkare till SvD.se.

Bland invändningarna märks att influensan inte verkar så farlig samt rädsla för att biverkningar.

Även på Sahlgrenska universitetssjukhuset i Göteborg har man märkt tveksamheter bland en del av personalen.

– Många har frågor och undrar om det verkligen är nödvändigt att vaccinera sig, säger chefläkare Mats Tullberg till SvD.se.

Sjukhusets policy är att personalen ska vaccineras för att skydda både sig själva och patienterna, men beslutet är upp till var och en.

– Jag tycker att vi har fått en olycklig debatt där argumenten emot och biverkningar fått stort utrymme. I själva verket är biverkningarna mycket lindrigare än influensan, säger chefläkare Mats Tullberg till SvD.se.

Han oroar sig för hur de anställda ska få vaccinet om de inte tar det under de två veckor som man genomför vaccineringen.

– Det finns ju risk att folk vill vaccinera sig senare i höst när influensan slår till ordentligt. Då är det inte lika enkelt, säger han till SvD.se.

På Södersjukhuset i Stockholm har man ännu inte fått vaccin men planerar att påbörja vaccineringen av personalen i nästa vecka. På Karolinska universitetssjukhus börjar man att vaccinera personalen idag.

– Att döma av de frågor vi fått hittills och de doser vaccin vi beställt är det en stor del av personalen som kommer att vaccinera sig, säger Ann-Britt Bolin, chefläkare till SvD.se.

Annika Linde, statsepidemiolog på Smittskyddsinstitutet har förståelse för invändningarna mot vaccinet, men menar att riskerna en influensa kan innebära är farligare än de biverkningar som hittills rapporterats.

– Vaccinet är i princip kroppsnaturligt. Kvicksilvret var nödvändigt men det handlar om mycket små mängder, säger Annika Linde som tycker att en del av skriverierna kring biverkningar är olycklig.

– Det är många som har uttalat sig utan sakkunskap. Det är naturligtvis bra att den här sortens saker debatteras men en del av rapporteringen är ganska förödande för möjligheten att vaccinera befolkningen, säger Annika Linde till SvD.se.

På Läkemedelsverket som har i uppdrag att sammanställa biverkningarna av vaccinet har man hittills fått in fler än 350 rapporter om biverkningar – majoriteten är milda influensasymtom som muskelvärk, huvudvärk och trötthet.

– Tidigare studier visade att biverkningar som de här är vanligare i det nya vaccinet, så det var inte oväntat, säger Gunilla Sjölin-Forsberg, enhetschef på Läkemedelsverkets biverkningsenhet till SvD.se.

Bland rapporterna som lämnats in av både privatpersoner och sjukvården finns 5 dödsfall. Ingen av dessa har dock kunnat kopplas till vaccinet.

– Samtliga har varit multisjuka med kroniska sjukdomar.

Läkemedelsverket har även fått in rapporter om allergiska reaktioner på vaccinet.

Majoriteten av de inrapporterade fallen där biverkningar uppstått tillhör riskgrupperna.

– Riskgrupperna har ju prioriterats så det är inte så konstigt att de fall vi får in nu är de med sjukdomshistoria, säger Gunilla Sjölin-Forsberg.

DEUTSCHER BERUFSVERBAND KLINISCHER UMWELTMEDIZINER E. V.

Schweinegrippe-Impfstoff für Patienten mit chronischen Multisystemerkrankungen ungeeignet

DBU, 26 Oktober 2009

https://web.archive.org/web/20091116134339/http://www.dbu-online.de/index.php?id=203&tx_ttnews[tt_news]=100&tx_ttnews[backPid]=13&cHash=44f00c0446

Pandemrix® stellt wegen fehlender Sicherheitsnachweise ein erhebliches Gesundheits-risiko bei Massenimpfungen dar. Wegen der Haftungsfrei-stellung des Herstellers durch die Bundesregierung liegt das Risiko von Nebenwirkungen und/oder bleibenden Schäden durch den Impfstoff letztlich beim Patienten.

Der Deutsche Berufsverband der Umweltmediziner dbu hat trotz der in den Medien von Seiten der Regierung, des Paul-Ehrlich-Instituts wie des Herstel-lers geäußerten Unbedenklichkeitsbeteuerungen ernsthafte Bedenken gegen den von der Bundesregierung als einzigem für die breite Massenimpfung gegen die "neue Grippe" zur Verfügung gestellten Pandemieimpfstoffes "Pandemrix®" der Fa. GlaxoSmithKline (gsk).

Der dbu diskutiert an dieser Stelle weder den medizinischen Nutzen von Impfmaßnahmen im Allgemeinen noch die Notwendigkeit solcher Maßnahmen im bisher eher milden Verlauf der Schweinegrippepandemie.

Unsere Kritik richtet sich allein gegen die Pandemievaccine Pandemrix®.

- Es bestehen erhebliche Zweifel an der Wirksamkeit des Impfstoffes: in der Zulassungsphase wurde ein Impfstoff mit einem um 40% höheren Anteil an Virusantigen (5,25 µg) als die jetzt ausgelieferte Vaccine (3,75 µg) getestet. Es besteht noch kein eindeutiger Konsens ob die Impfung einmalig oder zweimalig pro Saison erfolgen soll!!!
- Es bestehen erhebliche Zweifel an der Unbedenklichkeit des adjuvantierten Wirkverstärkers, da dieser erstmals verwendet wird. Der Impfstoff enthält 27,4 mg AS03, eine Emulsion aus Polysorbat, Squalen und Tocopherol. Ausreichende Studien dazu fehlen, da in der Erprobungsphase als Surrogatkriterium lediglich der Aufbau von Antikörpertitern bestimmt wurde und nicht etwaige Nebenwirkungen.
- Hersteller wie amtliche Stellen verschweigen, dass Squalen im Gegensatz zur oralen Aufnahme (Squalen ist u.a. als Naturstoff z.B. in Olivenöl enthalten) bei subkutaner oder intramuskulärer Anwendung ein proinflammatorisches immunaktivierendes Immunogen ist.
- Autoimmunkrankheiten können damit provoziert, bereits bestehende aktiviert werden. Squalen wird mit der Entstehung eines Guillan-Barré-Syndroms (GBS) in Zusammenhang gebracht und gilt heute als der Auslöser des Golf-Krieg-Syndroms (GWS). In Tierversuchen hat Squalen das Krankheitsbild einer rheumatoiden Arthritis ausgelöst.
- Squalen aus Nahrungsquellen wird im Organismus v.a. in Membranen eingebaut. Eine impfbedingte Bildung von Squalenantikörpern löst an den Membranen chronische Entzündungen aus, die Erkrankungen wie GWS, aber auch degenerative Nervenerkrankungen wie MS, ALS, CIDP und GBS erklären.
- Die Auslieferung des Impfstoffes in Mehrfachdosenampullen ist obsolet. In Einzeldosenampullen wären Quecksilber haltige Konservierungsstoffe wie das in enthaltene Thiomersal überflüssig. Auch Quecksilber löstÒPandemrix erwiesenermaßen Autoimmunkrankheiten aus.

• Da der Impfstoff weder an Kleinkindern noch an Schwangeren erprobt wurde (Einspruch der Ethikkommission), stellt die Forderung, gerade diese besonders gefährdete Bevölkerungsgruppe in der ersten Impfphase bevorzugt zu impfen, einen unzulässigen Feldversuch dar.

• Für Umweltpatienten und Immunsupprimierte (z.B. AIDS) stellt der Impfstoff ein höheres Risiko als die Schweinegrippe selbst dar.

• Der Hersteller GlaxoSmithKline (gsk) ist laut Vertrag mit der BRD weitgehend von der Haftung freigestellt. Im Falle eines Impfschadens wird der betroffene Impfling statt gegen gsk gegen die Regierung und somit gegen den deutschen Staat klagen müssen, ein im Regelfall aussichtsloses Unterfangen.

• Um nicht selbst in die Haftungsfalle zu geraten, muss der die Impfung durchführende Arzt den Patienten über alle Risiken der Impfung und des Impfstoffes sorgfältig aufklären. Es empfiehlt sich, diese Aufklärung im Beisein einer Helferin durchzuführen und mit einer Unterschrift vom Impfling bestätigen zu lassen. Die Aufklärung sollte auch die haftungsrechtlichen Besonderheiten umfassen. Auch der Hinweis darauf, dass andere, risikoärmere Impfstoffe in Europa existieren, diese aber wegen einer Fehlentscheidung der Bundesregierung für die deutsche Bevölkerung zur Zeit nicht zur Verfügung stehen, sollte in diesem Aufklärungsgespräch nicht fehlen.

Wegen den vorgenannten Gründen gibt der Vorstand des Deutschen Berufsverbandes der Umweltmediziner folgende Empfehlung heraus:

Aus allgemeinmedizinischen und umweltmedizinischen Überlegungen heraus rät der dbu dringend von der Durchführung einer Impfung mit Pandemrix® ab!

Dr.med. Hans-Peter Donate
Für den Vorstand des dbu
ViSdPG

THE FLU CASE

German doctors association issued warning about swine flu jab last week

The Flu Case, 17 November 2009 10:52
https://web.archive.org/web/20100102032500/http://theflucase.com/index.php?option=com_content&view=article&id=1836%3Agerman-doctors-association-issued-warning-about-swine-flu-jab-last-week&catid=1%3Alatest-news&Itemid=64&lang=en

The German Professional Assocation of Environmental Doctors, (Deutschen Berufsverbands der Umweltmediziner) issued a press release on November 9th warning of the "significant health risks" of using GlaxoSmithKline's Pandemrix for mass vaccinations in view of the lack of data on its safety, especially for pregnant women and children.

The press release predicted the kind of deaths that are now being reported in Germany as a result of people taking the Pandemrix jab. The BILD newspaper today admitted that at least seven people have died after taking the shot in Germany so far.

The DBU notes out that GSK and pharma companies have been given immunity for any deaths or damage that their vaccines cause by the government leaving patients to bear all the risks.

In addtion, the DBU states that the adjuvant squalene – illegal in the US and UK – causes a proinflammatory response, activates the immune system and is immunogenic when taken as a subcutaneous or intramuscular injection and can provoke autoimmune diseases such as those found among US and UK soldiers who took squalene as part of the anthrax vaccine.

Studies on squalene, carried out mainly by pharma companies and WHO, did not assess side effects and so do not give the full picture.

The German government and the Paul Ehrlich Institute have systematically ignored the huge body of scientific evidence indicating the swine flu jab is dangerous and so exposed people to an unacceptable risk.

WEB OF EVIDENCE

Leonard Horowitz and Sherri Kane

Obama's H1N1 Swine Flu National Emergency Evidences Vaccine "Market-Building" for Mass Murder

Web Evidence, 28 October 2009
https://clareswinney.wordpress.com/2009/10/28/obamas-h1n1-swine-flu-national-emergency-evidences-vaccine-market-building-for-mass-murder/

Los Angeles-President Obama's declared H1N1 emergency cannot be reconciled by either vaccine shortages or flu cases; only by medical "market-building," vaccination intoxications, and mass murder for population reduction says common sense and mounting evidence.

Over the weekend, initial reports from Reuters News Service and Fox News stated that the President's declaration was intended to prepare the country in case of "a rapid increase in illness that may overburden health care resources." The media quoted an unidentified administration official saying, "It's important to note that this is a proactive measure - not a response to a new development." This action was "similar to disaster declarations issued before hurricanes hit coastal areas," Reuters reported.

Why would the Obama administration anticipate an H1N1 "hurricane" to hit when Purdue researchers concluded last week the epidemic was expected to peak this week? In fact, too soon for vaccines to be helpful. Thus, most people getting vaccinated now risk side effects for NOTHING – no benefit what-so-ever!

Furthermore, CBS News determined last week the CDC's reported H1N1 cases had been overblown up to 97 percent. Only about 1,000 people have died of H1N1 since April's Mexican outbreak. That is merely 1/18th, or less than 6%, of expected deaths from a normal seasonal flu during the same time period.

It is highly suspicious that David A. Paterson, New York State's Governor, suddenly suspended "mandatory" H1N1 shots for health professionals citing vaccine shortages, not litigation exposures, as cause for the policy change.

Neglecting notice that more than 60 percent of nurses in New York State refused to take the H1N1 vaccines according to polls, and unions had filed lawsuits against New York and Washington State to gain injunctions against mandated injections, Paterson's yellow press blamed "limited vaccine supplies" as reason to inject pregnant women and children exclusively. Only two weeks earlier, New York State officials posted their first priority, "as established by the CDC," to vaccinate health care workers and emergency medical services personnel.

Oddly, all this talk about sudden vaccine shortages being the cause of a federal emergency grossly contradicts what many health officials were saying merely three weeks ago. United Press International (UPI) reported, for instance, Dr. Judy Monroe, Indiana's state health commissioner, said that an ample supply of the vaccine would be available for everyone by mid-October. Now, suddenly, there is an alleged shortage that compels mixed messages and general confusion.

"Shortage Marketing" Disease and Death

"This is called "shortage marketing," Dr. Leonard Horowitz explains. "It is an increasing trend in the industrial world to get consumers to purchase products that are unappealing, over-inventoried, or scarce."

For weeks preceding Obama's declaration of national emergency polls showed the vast majority of Americans, including health care workers, rejecting the seasonal and H1N1 flu vaccines. So with stockpiles high, despite allegations of manufacturing delays, the government's promotions and policy changes simply reflect "shortage marketing."

But this is a "superficial concern" according to Dr. Horowitz, who references neurobehavioral and neurocognitive disorders demonstrated in vaccine recipients who were normal before getting vaccinated. He credits the brilliant work of Andrew Moulden, MD, PhD, photographically detailing tremendous physical damage occurring following vaccinations. These previously unknown and unseen subtle changes in nerve function and physical appearance is now demonstrated in pictures by Dr. Moulden that are irrefutable in courts and the scientific world.

Dr. Horowitz, a Harvard-trained expert in behavioral science, media persuasion and public health education, has spent 20 years documenting drug industrialists' and health officials' criminal actions.

"The only way to reconcile President Obama's declaration of emergency, given the increasing risks of vaccine injuries, post-peak diminishing risks of H1N1, and the anticipated public health nightmare caused by live viruses "shedding" from those vaccinated to unvaccinated persons, is to follow the flow of money," Dr. Horowitz says. "In the process of shedding vaccination H1N1, the highly unstable shed virus is expected to pick up more lethal genes from other circulating viruses, including possibly H5N1 that kills nearly 60 percent of those infected."

Dr. Horowitz notes that authorities have been mum on the triple recombinant H1N1 produced in labs for use in the "active" vaccine. Experts know this is highly unstable, because it is a man-made laboratory creation that did not evolve naturally over the millennia. This unstable mutant more readily recombines with other circulating viruses when it is shed for up to 3 weeks, thus exposing non-vaccinated people who are infected with other viruses.

This is the best explanation for Obama's anticipated "hurricane," explains Dr. Horowitz, who criticizes the mainstream media for completely neglecting this greatest risk while falsely reporting vaccine "shortages." Something else is obviously happening behind the scenes that only seasoned investigators can discern, he says.

He diagnoses the alleged vaccine shortage as a profitable ploy used by those "who have outrageously obvious connections to the Population Council, the preeminent organization directing global depopulation, as encouraged by Obama's science czar, John Holdren.

Dr. Holdren is the co-author of the 1977 book, Ecoscience, which calls for massive global depopulation using sterilizing vaccinations.

Dr. Horowitz points to the fact that Nonoxynol-9, a spermicidal drug causing spontaneous abortions in pregnant women, and birth defects in infants, is one of the many new "adjuvants" banned in the United States, but used by the American-based Baxter Company in their H1N1 flu vaccines stockpiled by European nations.

Outrageous Conflicting Interests

Dr. Horowitz also suggests discerning conflicting interests between vaccine makers and the news sources that break the federal government's announcements, in this case Reuters and FOX news.

Reuters is directed by Thomas H. Glocer, a Merck & Co. director making money from H1N1 vaccine sales through Merck's subsidiary, CSL, Inc. Merck also sells Pneumovax, a vaccine suggested for use at the time influenza vaccines are given, yet contraindicated in people with active influenza infections.*

A "live" H1N1 vaccine infects those vaccinated with "active" viruses. Thus, Merck's suggested Pneumovax usage is contraindicated according to their own package insert!

If that's not bad enough, CSL, Inc. did its H1N1 vaccine safety testing on pregnant women, infants, and children at facilities financed by Rupert Murdoch and his family--the Royal Victoria Women's Hospital directed by Elisabeth Murdoch, and the Murdoch Children's Research Institute overseen by Rupert's daughter-in-law Susan Murdoch. So much for FOX News's impartiality.

The Wall Street Journal that announced "New York Ends Flu Shot Mandate for Health Care Workers" on October 23rd, is disqualified by way of its links to Merck also. . . . WSJ CEO Councilman, David Brennan, directs the AstraZeneca's Flumist manufacturer, Medimmune, Inc. AstraZeneca drafted Brennan from Merck & Company, and appointed him CEO in 2006.

This pattern of gross conflicting interests, and coordinated multi-media genocidal counterintelligence, expands with reading Thomas Glocer's article wherein Reuters plugs "an experimental new drug called peramivir, made by Biocryst Pharmaceuticals Inc."**

Peramivir is produced by Jon P. Stonehouse's BioCryst Pharmaceuticals, Inc. President and Chief Executive Officer, Stonehouse recently served as Senior Vice President of Corporate Development at (surprise, surprise) Merck. At Merck, Stonehouse was responsible for "leading strategic developments . . . [that] significantly changed the company," according to BioCryst's website.

The Partnership for New York City and Council for Depopulation

It is obvious that our H1N1 "intelligence" is being gathered and broadcast from the highest levels of the medical-media's mafia. As previously reported in Dr. Horowitz's "AFFIDAVIT," submitted to the FBI earlier this month, and filed last week in a lawsuit against federal officials in Washington State, David Rockefeller, Rupert Murdoch, Thomas Glocer, and other media moguls are partnered in the world's most powerful drug ring and biotechnology consortium. Its members include the government of New York State as well as the US Federal Government. Proof of these facts are available for inspection online at The Partnership for New York City (PFNYC). The site provides its members list and related pharmaceutical industry activities.

The Founder of PFNYC, David Rockefeller, wields tremendous influence over many of the foundations and institutions that direct the US Federal Government's policies and practices. American "health care reform" is currently directed, on behalf of the Democratic party, by Sen. Jay Rockefeller.

The Rockefeller Brothers Fund granted millions of dollars to the Population Council of the City of New York during its formative years. Rockefeller family members founded this Population Council, according to The Rockefeller Archive Center. The organization currently advances globally as the world's premier depopulation advocacy group. The US Federal Government and private institutions fund the Population Council at this time.

Summary and Conclusion

"Biopreparedness" for the 2009 H1N1 Swine Flu is all about mind manipulation and vaccination for population reduction.

In the past week, the swine flu situation went from near ending to causing a "National Emergency." People, aware of the dangers of H1N1 vaccinations, opted out and gained precedent-setting federal court prohibitions on mandatory vaccinations. CBS declared the numbers of H1N1 cases fraudulently overstated by the CDC, and additional lawsuits were filed exposing State and Federal officials for genocidal malfeasance.

Rather than admitting disgrace, government spin doctors integrated vaccine "shortage marketing" as a distraction for public consumption. New York State Health Commissioner, Richard F. Daines,

who said only a week ago that health workers must be vaccinated for the seasonal flu and the H1N1 virus, or risk discipline, said that scarce vaccines would be given exclusively to pregnant women and children.

Ironically, US Health and Human Services Secretary, Kathleen Sebelius, pledged 10 percent of vaccines would be donated to other countries.

All of this preceded Barack Obama's declaration of "National Emergency," thus, exercising Executive power to implement The Model State Emergency Health Powers Act affecting most of the 50 States.

Obviously, none of this makes much sense unless you examine the fundamental and overriding intoxication and depopulation agendas, and what the media moguls know that few commoners learn: the H1N1 vaccines contain "live" viruses that are highly unstable. As laboratory "reverse engineered" genetically spliced germs, they are expected to recombine with more deadly viruses, possibly H5N1, by January, 2010. These new strains, circulating the globe, are projected to kill nearly 3 billion people. This Lex Lutheresque evil is obviously orchestrated by David Rockefeller's family and friends that control vaccine manufacturing, "health care reform," mass media persuasion, and global depopulation industries.

Like it or not, you are advised to prepare for the worst.

*Thus, "live" H1N1 vaccinated viruses causing influenza-like symptoms in people simultaneously injected with Pneumovax is arguably medical malpractice.

**This article came out the same day as the Wall Street Journal article, synchronous with Obama's emergency declaration, on Friday, Oct. 23rd. Then the U.S. Food and Drug Administration (FDA) issued an emergency use authorization for peramivir encouraging intravenous used in patients who cannot take pills, Tamiflu, or Relenza.

Grippe A/H1N1: la campagne de vaccination vire au pugilat

Le Soir, 29 Octobre 2009, 13:43
https://web.archive.org/web/20201124150256/https://www.lesoir.be/art/grippe-a-h1n1-la-campagne-de-vaccination-vire-au_t-20091029-00QM0E.html

Exclusif: L'Association belge des syndicats médicaux réclame la démission du commissaire interministériel Influenza, le virologue Marc Van Ranst. A la veille de l'ouverture, vendredi, du procès en référés qui oppose le collectif Initiative citoyenne à l'Etat belge. Jeudi matin, Marc Van Ranst a indiqué que le vaccin contre la grippe A/H1N1 choisi par la Belgique ne présente pas de danger pour les femmes enceintes. Par Ricardo Gutiérrez

Le Dr Roland Lemye, président de l'Absym, en est à se demander si le coordinateur fédéral de la campagne de vaccination (KUL) n'est pas «en train de masquer ses erreurs et sa gestion chaotique (…) en en répercutant la faute sur les médecins, qui reçoivent ordres et contre-ordres, fausses explications, quand ce n'est pas carrément des mensonges».

Le patron du principal syndicat de médecins n'hésite plus à réclamer à la ministre fédérale de la Santé, Laurette Onkelinx (PS), la démission du virologue, estimant que son comportement « fait douter de ses capacités à gérer l'événement et enlève toute confiance que le corps médical pouvait avoir en lui».

Comme pour charger le réquisitoire, un sondage publié, mercredi, par Le Journal du Médecin avance que plus de 75 % des généralistes et des spécialistes interrogés estiment que «la manière dont le Commissariat Influenza communique avec le corps médical sème la confusion». Plus de six médecins sur dix pensent même que le Commissariat « provoque la panique au sein de la population».

Après le personnel des hôpitaux, où l'accueil du vaccin reste mitigé, la seconde phase de la campagne volontaire de vaccination visera, dès le samedi 7 novembre, les «groupes prioritaires»: enseignants, personnel des crèches et maisons de repos, parents d'enfants de moins de six mois, femmes enceintes, certains malades chroniques (les diabétiques, ceux qui souffrent d'affections respiratoires, de pathologies cardiaques, d'insuffisance rénale, hépatique…).

Femmes enceintes: le bon vaccin ?

«Le problème, concernant les femmes enceintes, réagit un généraliste, c'est que le gouvernement a commandé, pour 100 millions d'euros, 12,6 millions de doses d'un seul type de vaccin, le Pandemrix, produit par GSK. Le Centre belge d'information pharmacothérapeutique (CBIP) relève qu'il entraîne "nettement plus d'effets indésirables mineurs que les vaccins classiques contre la grippe", essentiellement attribués à l'adjuvant qu'il contient, une substance qui dope la réaction immunitaire du patient vacciné.»

Problème? Alors que la Belgique ne dispose que d'un vaccin avec adjuvant, nombre d'Etats – les Etats-Unis, la France, l'Espagne, l'Allemagne… – recommandent aux femmes enceintes de lui préférer un vaccin sans adjuvant. Le Canada vient même de commander au laboratoire CSL, en Australie, 200.000 doses de vaccin sans adjuvant, spécialement destiné aux femmes enceintes.

Alors que le Commissariat Influenza continue à recommander le Pandemrix (avec adjuvant) aux femmes enceintes, pour la première fois, ce mercredi, une autorité sanitaire belge, le CBIP, a publié un avis nettement moins enthousiaste, invitant les médecins belges à «tenir compte» de la réticence française à traiter avec un vaccin « adjuvanté » certains groupes à risque, dont les femmes enceintes … Le CBIP cite le Haut Conseil français de la santé, qui déconseille clairement (sauf situation d'urgence) le recours au vaccin avec adjuvant.

«Pourquoi les femmes enceintes belges ne pourraient-elles pas se voir offrir le même vaccin sans adjuvant qui leur correspond le mieux ?, s'interroge Philippe Vanlangendonck, l'un des avocats du collectif Initiative citoyenne. Cette différence de traitement m'interpelle sur le plan juridique et éthique. S'agit-il de renforcer le Royaume comme "paradis bioéthique", sachant que la Belgique est le deuxième pays producteur de vaccins au monde?»

Pour Bertrand Bellier, spécialiste des pathologies immunitaires à la Pitié-Salpêtrière, cité par la presse française, «une chose est certaine : même si l'utilité de ces nouveaux adjuvants n'était finalement pas démontrée dans cette pandémie, elle aura constitué une bonne occasion pour les industriels».

THE FLU CASE

Belgian doctors call for sack of government virologist in row over swine flu adjuvant advice

The Flu Case, 29 October 2009, 14:37

https://web.archive.org/web/20100205022257/http://theflucase.com/index.php?option=com_content&view=article&id=1446%3Abelgian-doctors-call-for-sack-of-government-virologist-in-row-over-swine-flu-adjuvant-advice&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Belgian association of doctors has called for the government's interministerial commissioner for the flu, the virologist Marc Van Ranst, to be fired after he said on Thursday that the Pandemrix swine flu jab with the adjuvant squalene was safe for pregnant women, reports Belgian's Le Soir newspaper.

There are no clinical data on the swine flu vaccine with adjuvants on pregnant women. A trial on pregnant women has just started and involves a swine flu jab without adjuvants. Also, the trial will be finished until the end of next year long after the jabs are to be given.

German doctors have said pregnant women should not get a jab with adjuvants.

The row in Belgian comes after a group of citizens took legal action in a bid to force the government to inform people of the risks associated with the "swine flu" jab as part of free and informed consent.

A poll published Wednesday in Le Journal du Médecin shows that 75% of Belgian doctors think that the "manner in which the flu commissariat communicates with the medical body generates confusion."

More than six out of ten doctors thought that the Commissariat "was provoking pain in the heart of the population."

WELT ONLINE

Elke Bodderas

"Ich impfe mich nicht mit Pandemrix"

Die Welt, 3 November 2009, 04:00 Uhr
https://web.archive.org/web/20091106082612/http://www.welt.de/die-welt/wissen/article5065296/Ich-impfe-mich-nicht-mit-Pandemrix.html

Der Epidemie-Experte Michael Kochen über das Schweinegrippe-Serum, Fehler der Bundesregierung und die WHO.

Die Angst vor der Schweinegrippe geht um. Michael Kochen, Leiter der Allgemeinmedizin in der Uniklinik Göttingen und Chef der Deutschen Gesellschaft für Allgemein- und Familienmedizin hat einen Impfstoff-kritischen Ratgeber verfasst, den Ärzte in den Praxen auslegen können. Mit dem Professor sprach Elke Bodderas

Die Welt: Die Ukraine meldet 190 000 Schweinegrippe-Opfer, die WHO nur mehrere 1000 bestätigte Fälle. Was ist da los?

Michael Kochen: Keine Frage, dass mit der Zahl der Erkrankten auch die proportionale Zahl der Komplikationen ansteigen wird. Morgen werden vielleicht noch weitere 50 Länder um Hilfe rufen, das ändert aber nichts daran, dass wir es hier mit einem milden Erreger zu tun haben - insbesondere wenn wir ihn mit dem saisonalen Influenzavirus vergleichen, mit dem wir es seit Jahren zu tun haben.

Die Welt: In Deutschland ist jetzt eine ansonsten gesunde Frau gestorben ...

Kochen: Es ist eine mediale Schlacht, die hier ausgetragen wird. Dieses Virus ist bei Weitem nicht so gefährlich, wie es in manchen panikartigen Verlautbarungen dargestellt wird. Alle Verantwortlichen, die sich rationale Grundsätze auferlegt haben, werden schwach, weil die Presse schreibt, jetzt schon wieder zwei Tote. Bei der normalen Grippe sterben jedes Jahr zwischen 5000 und 11 000 Menschen, Natürlich sind das hauptsächlich ältere Menschen, es sterben daran aber auch Kinder, die völlig gesund und nicht chronisch krank sind. Das vergisst man immer wieder. Ich habe wenig Zweifel, dass wir bis Ende März vielleicht 50, vielleicht auch 120 Tote in Deutschland haben werden. Leider konfrontieren nur wenige diese Statistik mit den Zahlen, die die saisonale Grippe an Toten produziert.

Die Welt: Eltern beunruhigt: Bei der neuen Grippe sind hauptsächlich Jüngere betroffen und Kinder ...

Kochen: ... aber für kleine Kinder wird der adjuvantierte Impfstoff nicht empfohlen, für Schwangere erst recht nicht. Die Ständige Impfkommission sagt, schwangere Frauen sollen mit nicht adjuvantierten Impfstoffen geimpft werden. Wo aber sind die denn bitte schön? Erst nach massiver öffentlicher Kritik beginnt die Bundesregierung bei der Europäischen Arzneimittelbehörde die nicht adjuvantierten Impfstoff zuzulassen, die es ja etwa von Sanofi-Pasteur längst gibt.

Die Welt: Es gibt noch einen ohne Verstärker, und zwar Celvapan ...

Kochen: ... der übrigens von allen drei Impfstoffen der am schlechtesten erprobte ist und eine schlechtere Immunreaktion aufweist.

Die Welt: Was empfehlen Sie?

Kochen: Wenn man schon einmal akzeptiert, dass Europa - einmal abgesehen von Celvapan - nur zwei Impfstoffe mit Verstärkern zur Verfügung hat, dann würde ich statt für Pandemrix für Focetria von Novartis plädieren. Er ist zwar auch mit Wirkverstärkern versetzt, aber über 40 Millionen Mal erprobt worden. Zudem kommt er in Einzelspritzen und enthält nur Spuren des quecksilberhaltigen Konservierungsstoffes Thiomersal. Pandemrix hingegen kommt in Flaschen mit zehn Dosen, die sie innerhalb von 24 Stunden verimpfen müssen. Wenn der Arzt die nicht zusammenbekommt, muss er den Rest verwerfen. Aber versuchen Sie doch einmal, diese andere Vakzine in Deutschland zu bekommen. Selbst über internationale Apotheken ist sie nicht erhältlich, weil in allen europäischen Ländern diese Impfstoffe über die Regierungsschiene bestellt wurden. Sie müssen sich statt dessen schon nach Holland oder Italien begeben und versuchen, über persönliche Kontakte eine Dosis "abzustauben".

Die Welt: Wie reagieren die Hausärzte auf die Situation?

Kochen: Niemand ist glücklich. Die Hausärzte sind mit verschiedenen Verlautbarungen konfrontiert, aber wissen oft nicht, was sie ihren Patienten sagen sollen. Bis jetzt wollen sich nur wenige Menschen impfen lassen. Das wird sich natürlich ändern, wenn die Zeitungen jeden Tag die Meldung über einen Toten bringen. Viele Hausärzte impfen nicht, auch unsere Praxis bietet die Schweinegrippe-Impfung nicht an. Wenn sich bei uns jemand impfen lassen möchte, verweisen wir an Praxen, die die Spritze anbieten. Übrigens impft das örtliche Gesundheitsamt hier auch nicht. Eine Liste von Ärzten, die impft, war bis vor wenigen Tagen nicht verfügbar.

Die Welt: Das Robert-Koch-Institut rechnet mit einer gefährlichen zweiten Welle, die auf Deutschland zukommen wird.

Kochen: Die Erkrankungszahlen werden sicher ansteigen. Allerdings gibt es in keinem Land der Erde die vielfach heraufbeschworenen Anzeichen einer Mutation hin zu einer größeren Gefährlichkeit. Wir können seit Monaten in die Länder der südlichen Hemisphäre schauen. Dort hat sich nichts dergleichen abgespielt. Ich bin ein Impfbefürworter, ich bin ein richtiger Impffan. Aber ich impfe mich nicht mit Pandemrix, ebenso wenig wie unsere Praxismitarbeiter und meine Familie.

Die Welt: Sollte die Pandemie also zurückgestuft werden?

Kochen: Die Pandemie ist jetzt einmal ausgerufen und die nationalen Gesundheitsbehörden haben damit auch nicht besonders viel Spielraum. Wenn ich der WHO etwas raten dürfte, dann wäre das mehr Unabhängigkeit. Gerade in solchen Beamtenapparaten, wie die WHO einer ist, würde ich viel stärker darauf achten, dass meine Beratergremien unabhängig sind.

Dr. Russell Blaylock

"Swine Flu – One of the Most Massive Cover-ups in American History"

Russell Blaylock md, 3 Novemner 2009
https://web.archive.org/web/20091106110545/http://www.kauaitruth.com/

What experience and history teach is this – that people and governments never have learned anything from history or acted on principles deduced from it." G.W.F. Hegel

I have been following the evolving "pandemic" of H1N1 influenza beginning with the original discovery of the infection in Mexico in March of this year. In the course of this study I have tried to utilize as my sources high-quality, peer-reviewed journals, data from the CDC and accepted textbooks of virology.

As with all such studies one has to integrate and correlate previous experiences with epidemics and pandemics. As you will see, a great deal of my material comes from official sources, such as the Center for Disease Control and Prevention, the National Institutes of Health, the National Institutes of Allergy and Infectious Diseases and the *New England Journal of Medicine*. Thus my distracters cannot claim that I am using material that is not within the mainstream.

Pregnant Women NOT at Special Risk from Swine Flu

In the beginning, even before it was declared a level 6 pandemic by the World Health Organization (WHO), a group of "scientists" were sounding the alarm that this might indeed be the terrifying, deadly pandemic they had been expecting for over half a century.

Naturally, the vaccine manufacturers were doing all they could to fuel this fear and they were quietly making deals with WHO to be among the companies selected to manufacture the "pandemic" vaccine for the world. Being anointed by WHO would guarantee tens of billions in profits.

As the infection began to spread into the United States and then the rest of the world, its peculiar nature became obvious. Those born before 1950 seem to have a high degree of resistance to the infection and the disease seems slightly more pathogenic (disease causing) among those aged 25 to 49. Early on the official sources declared that pregnant women were at a special risk as compared to the seasonal flu.[1] As we shall see later, this was a grand lie.

Initial Studies Show H1N1 NOT Dangerous or Highly Contagious

Once the pandemic had been declared, virologists tested the potency of this virus using a conventional method, that is, infecting ferrets with the virus.[2] What they found was that the H1N1 virus was no more pathogenic than the ordinary seasonal flu, even though it did penetrate slightly deeper into the lungs. It in no way matched the pathogenecity of the 1917-1918 H1N1 virus. It also did not infect other tissues, and especially important, it did not infect the brain.

Next, they wanted to test the ability of the virus to spread among the population. The results of their tests were conflicting, but the best evidence indicated that the virus did not spread to others very well. In fact, an unpublished study by the CDC found that when one member of a family contracted the H1N1 virus, other members of the family were infected only 10% of the time - a very low communicability.

This was later confirmed in a study of the experience of New York State, in which only 6.9% of the population contracted the virus, far below the 50% predicted by the President's Council of Advisors on Science and Technology.[3] It is instructive to note that during the 1917-18 Swine flu epidemic the world infection rate was only 20%.[4]

They also predicted that 1.8 million people would need hospitalization and 300,000 would end up in the intensive care units (ICU). Further, they predicted that hospitals would be overwhelmed and that ICU units would not have enough beds to care for the sick and dying. Incredibly, they predicted that 90,000 people would die.

Much Fear Mongering

Not satisfied, they up the ante on fear mongering by peddling the idea that pregnant women were especially in danger as were small children. We were told daily that young, healthy people were dying, not just those with underlying medical conditions, such as heart disease, diabetes, cancer and other immune suppressive diseases. The Minister of Fear (the CDC) was working overtime peddling doom and gloom, knowing that frightened people do not make rational decisions – nothing sells vaccines like panic.

These same dire predictions were extended to Australia and New Zealand, which began to show an increase in their reported cases of H1N1 and associated hospitalizations as they entered their fall and winter. Recently, two major articles were released in the *New England Journal of Medicine*, which analyzed the American hospitalization experience[5] and the Australian/New Zealand ICU experience[6]. I will analyze these very interesting studies.

There is a dramatic disconnect between what the science is discovering about this flu virus and what is being broadcast over the media outlets. As you will see, this is a very mild flu virus infection for 99.9% of the population.

Australian and New Zealand Experience Prove U.S. is Wrong

As I stated, the countries in the southern hemisphere have already gone through their fall and winter, that is the seasons of peak flu infections. Epidemiologists and virologists have been surprised at how mild this flu pandemic has been in the Southern Hemisphere, with relatively few deaths and few hospitalizations in most areas.

The study reported in the *New England Journal of Medicine* on October 8, 2009, called the AZIC study, analyzed all ICU admissions in New Zealand and Australia, looking at a number of factors.[6] Here is what they found.

ICU Hospitalizations

Out of a population of 25 million people, 722 were admitted to the intensive care unit (ICU) with a confirmed diagnosis of H1N1 influenza. Overall, 856 people were admitted with a flu virus, but 11.3% were a type A flu that was not subtyped and 4.3% were seasonal flu.

They also analyzed the number of people admitted with viral pneumonia and found the following:

Number of People Admitted to the Hospital each Year with Viral Pneumonia[5]

57 people in 2005
33 people in 2006
69 people in 2007
69 people in 2008
37 people in 2009

So we see that in 2009 they had 32 fewer people admitted with actual viral pneumonia. The CDC and other public health agents of fear like to imply that mass numbers of people are dying from "flu", that is, actual influenza viral pneumonia, when in fact, most are dying from other complications secondary to underlying health problems -- either diagnosed or undiagnosed.

They also found that the average person's risk of ending up in the ICU was **one in 35,714** or about three thousandths of one percent (0.00285%), an incredibly low risk. When they looked at actual admission to the ICU, they found that it was people aged 25 to 49 who made up the largest number admitted. Infants from birth to age 1 year had the higher admission per population, and had a high mortality rate.

Majority of Children Respond POORLY to Flu Vaccine

It is interesting to note that babies this age respond poorly to either the seasonal flu vaccine or the H1N1 vaccine. One of the largest studies ever done, found that children below the age of 2 years received no protection at all from the seasonal flu vaccine.[7]

The recently completed study on the effectiveness of the new H1N1 vaccine reported by the National Institute of Allergy and Infectious Disease found that **75%** of small children below age 35 months received no protection from the H1N1 vaccine and that **65%** of children between the ages of 3 years and 9 years received no protection from the vaccine.[8]

Flu Vaccine DOUBLES Risk of Getting H1N1

It is also important to view this in the face of the new unpublished Canadian study of 12 million people that found getting the seasonal flu vaccine, as recommended by the CDC and NIH, doubles one's risk of developing the H1N1 infection. It would also make the infection much more serious. So much for expert advice from the government.

Obese at Six Times Higher Risk from H1N1 Complications

As stated, most authorities agree that the H1N1 variant virus is quite mild as far as flu viruses go. The vast majority of people (99.99%) are having very brief and mild illnesses from this virus.

Keep in mind that when I am discussing numbers and risk, this does not intend to understate the devastation experienced by the people who are experiencing serious illness or even death.

Any death is a tragedy.

What we are discussing here is - is the risk from this virus significant enough to justify draconian measures by the government and medical community? Should we implement mass vaccinations with a vaccine that is essentially an experimental vaccine, poorly tested and of questionable benefit?

The study also looked at the health risk of the people admitted to the ICU, but unfortunately did not look at the underlying health problems of those who died. We get a hint, since the American study did note that it was those over age 65 who were most likely to die, and that **100%** of these individual had underlying health problems before they were infected.

One of the real surprises from this study, and the American study, was that one of the more powerful risk factors for being admitted to the ICU and of dying was obesity. Obese people are admitted 6x more often than those of normal weight. As we shall see, obesity played a significant role in the risk to children and pregnant women as well, something that has never been discussed by the media, the CDC or the public health officials.

This study found that **32.7%** of those admitted to the ICU had asthma or other chronic pulmonary disease, far higher than the general population. The Australian and New Zealand study also had a large number of aboriginal patients and those from the Torres Strait. It is known that nutrient deficiencies are common in both populations, which means an impaired immune system.

Obesity is associated with a high incidence of insulin resistance and metabolic syndrome, both of which would increase one's risk of having a serious infection, even to viruses that are mildly pathogenic. (mild viruses).

H1N1 Vaccine is NOT Made the Same as Regular Flu Vaccine!!

I am really upset at the insistence by the CDC, medical doctors and the media that all pregnant women should be vaccinated by this experimental vaccine. The media repeats the manufacturers' mantra that this vaccine is produced exactly like the seasonal flu, when in fact it is not. Yes, they use chicken eggs, but the rest has been fast tracked and many shortcuts on safety procedures have been allowed.

There are 250,000 pregnant women in Australia and New Zealand combined. Only 66 pregnant women were admitted to the ICU, an incidence of 1 pregnant woman per 3,800 pregnant women or a risk of **.03%.**[6] Put another way, a pregnant woman in these two countries can feel comfortable to know that there is a **99.97%** chance that she will not get sick enough to end up in the ICU.

Pregnant Women NOT at Increased Risk, Obese Women Are!!

So, why did even 66 pregnant women end up in the ICU? As we shall see in the American study[5], a significant number of these pregnant women were either obese or morbidly obese and most had underlying medical problems. The Australian/New Zealand study[6] found that one of the major risk factors for pregnant women was indeed being obese and that obesity was associated with a high risk of underlying medical disorders.

They also found that death from H1N1 infection correlated best with increasing age, contrary to what the media says. They concluded the study with the following statement:

"The proportion of patients who died in the hospital in our study is no higher than that previously reported among patients with seasonal influenza A who were admitted to the ICU." [6]

In fact, they report that of those infected with the H1N1 variant virus who were sick enough to be admitted to the ICU, **84.5 %** went home and **14.3%** died and that of those admitted with seasonal flu **72.9%** were discharged and **16.2%** died. That is, **more died from the seasonal flu**.

Recent NEJM Study of the American Experience

In the same Oct, 8[th] issue of the *New England Journal of Medicine* they reported on the American experience with the H1N1 variant virus.[5] The study looked at data from 24 states with widespread influenza infection from April through June 2009. Remember, unlike most flu epidemics in the United States, this epidemic began early and by the end of September it was beginning to peak, with late October being the date it may begin to decline.

The study examined 13,217 cases of infection involving 1082 people who were hospitalized. Here is what they found:

Underlying Medical Conditions

Of the total hospitalized patients:

60% of children had underlying medical conditions
83% of adults had underlying medical conditions

They also found that **32%** of patients had at least 2 medical conditions that would put them at risk. We are constantly told that it is the young adult aged 25 to 49 who is at the greatest risk. Note that **83%** of these people had underlying medical conditions. This means that in truth only **292** "healthy" people out of **1082** in 24 states were sick enough to enter the hospital **-** that is 292 healthy people out of tens of millions of people, not much of a risk if you do not have an underlying chronic medical problem.

Underlying Medical Conditions Risk Factor for H1N1 Deaths

When they looked at people over age 65 years of age, that is, the folks who are most likely to die in the hospital, **100%** had underlying medical conditions -- all of them. So, there was not one healthy person over age 65 who has died out of 24 states combined.

What about the children, a special target of the fear mongering media and government agencies? This study found that **60%** had underlying medical conditions and that **30%** were either obese or morbidly obese.

A previous CDC study states that **2/3** of children who died had neurological disorders or respiratory diseases such as asthma.[3] If we take the **60%** figure, that means out of the 84 children reported to have died by October 24[th], 2009, only **34 children** considered healthy in a nation of 301 million people really died, not 84. It is also instructive to note that according to CDC figures, the seasonal flu last year killed **116** children.[9]

Remember, that is, 34 so-called healthy children out of a nation of **40 million children**. In 2003 it was reported by the CDC that **90 children** died from seasonal flu complications. Ironically, as shown by Neil Z. Miller in his excellent book -- ***Vaccine Safety Manuel*** -- once the flu vaccine was given to small children the death rate from flu increased **7-fold**.[10] Not surprising, since the mercury in the vaccine suppresses immunity.

Pediatric Flu Deaths by Year Made WORSE by Flu Vaccine

1999 – 29 deaths
2000 – 19 deaths
2001 – 13 deaths
2002 – 12 deaths
2003 – 90 deaths (Year of mass vaccinations of children under age 5 years)
2006 – 78 deaths
2007 – 88 deaths
2008 – 116 deaths (40.9% vaccinated at age 6 months to 23 months)[11]

Parents should also keep in mind that this study, as well as the Australian/New Zealand Study found that childhood obesity played a major role in a child's risk of being admitted to the ICU or dying. This is another dramatic demonstration as to the danger of obesity in children and that all parents should avoid MSG (all food-based excitotoxin additives), excess sugar and excess high glycemic carbohydrates in their children's diets. This goes for pregnant moms as well.

Every Parent Needs to Know Other Vaccines INCREASE Risk of H1N1

One major factor being left out of all discussion of these vaccines, especially those for small children and babies, is the effect of other vaccinations on presently circulating viral infections such as the H1N1 variant virus. It is known that several of the vaccines are powerfully immune suppressing. For example, the measles, mumps and rubella virus are all immune suppressing, as seen with the MMR vaccine, a live virus vaccine.[12, 13]

This means that when a child receives the MMR vaccine, for about two to five weeks afterwards their immune system is suppressed, making them highly susceptible to catching viruses and bacterial infections circulating through the population. Very few mothers are ever told this, even though it is well accepted in the medical literature.

In fact, it is known that the Hib vaccine for haemophilus influenzae is an immune suppressing vaccine and that vaccinated children are at a higher risk of developing haemophilus influenzae meningitis for at least one week after receiving the vaccine.[10,14] These small children receive both of these vaccines.

According to the vaccine schedule recommended by the CDC and used by most states, a child will receive their MMR vaccine and Hib vaccine at one year of age and both are immune suppressing.

At age 2 to 4 months, they will receive a Hib vaccine. Therefore at age 2 to 4 months, and again at age one year, they are at an extreme risk of serious infectious complications caused by vaccine-induced immune suppression. The New Zealand/Australian study found that the highest death in the young was from birth to age 12 months, the very time they were getting these immune-suppressing vaccines.[6]

The so-called healthy children and babies that have ended up in the hospital and have died may in fact be the victims of immune suppression caused by their routine childhood vaccines. We may never know because the medical elite will never record such data or conduct the necessary studies. Recall also that the seasonal flu vaccine, which is recommended for all babies 6 months to 35 months, is also immune suppressing because of the mercury-containing thimerosal in the vaccine.[15]

If parents allow their children to be vaccinated according to the CDC recommendations, that is 2 seasonal flu vaccines and 2 swine flu vaccines as well as a pneumococcal vaccine, that will increase the number of vaccines a child will have by age 6 years to **41**. This amounts to an enormous amount of aluminum and mercury as well as intense brain inflammation triggered by vaccine-induced microglial activation.[16]

Risk of Serious Illness from the H1N1 Mutant Virus

Their survey of 24 states found that a total of **67** patients out of tens of millions of people ended up in the ICU. That is, only **6%** of the people admitted to the hospital were so sick as to need intensive treatments. Of these 67 patients, 19 died (25%) and of these 67% had obvious underlying long-term medical illnesses. This means that only **6 patients** out of tens of millions of people in 24 states that were considered "healthy" before their infection, had died. Is this justification for a mass vaccination campaign?

Of the 1082 hospitalized patients, **93%** were eventually discharged recovered and only **7%** died, a very low death rate. Their analysis of these cases concluded that those who died fell in three categories:

They were older patients
Antiviral medications were started 48 hours after the onset of the illness
There was no correlation to having had seasonal vaccines

The last item is especially interesting because they assume that having had seasonal flu vaccine would have offered some protection – it offered none.

What they did find was that none who died had been given antiviral medications (Tamiflu or Relenza) within 48 hours of getting sick. Those given the antiviral medications within the golden 48-hour period rarely died. Relenza is far safer than Tamiflu. This was the only factor found to correlate with survival of severely ill ICU patients.

What about the Danger to Pregnant Women? The American Experience

Our media is inundating the public with scare stories of the danger this virus poses to pregnant women. Most of us visualize the pregnant woman as being healthy, young and without underlying medical diseases. The study is quite revealing, but omits some very important factors.

We are told that pregnant women are **6x** more likely to end up in the hospital than the general population. This figure is derived from the fact that it was estimated that pregnant women had a **7%** greater chance of requiring hospital admission than did the general public at **1%** (Even this is a far higher number than their own studies indicate – actually it is a very small fraction of 1%).

Dr. Michael Bronze, a professor of internal medicine at the University of Oklahoma Health Sciences Center, writing for emedicine medscape.com (WebMD), states that the risk of a pregnant women being hospitalized with the H1N1 infection is 0.32 per 100,000 pregnant women (which is 1 in 300,000 pregnant women).[17] One can safely say, based on the Australian/New Zealand experience (at the peak of their flu season) and the American data somewhere in the middle of their flu season, that pregnant women have about a **99.97%** chance they will not become so sick as to require hospital care at any level.

The death rate of pregnant women who were admitted to the ICU was **7.7%,** a fairly low figure for infectious ICU patients. Remember, most patients admitted to the hospital are admitted for hydration and are not that ill in terms of the infection itself.

Smoking and Obesity Increase Risk of H1N!

Now, most of us assume that these pregnant women are perfectly healthy as mentioned above, but the data shows something quite different. They found that greater than **30%** of the pregnant women were either obese or morbidly obese, as did the Australian/New Zealand study. Of these, **60%** had underlying medical conditions that put them at greater risk of overwhelming infections – both viral and bacterial.

It is unfortunate that they did not enter any information on smoking, either by the mother or by anyone living in the household. It is known that smoking greatly increases ones risk of severe complications from any flu virus.[18,19] This is for several reasons. One, smokers eat a much poorer diet than non-smokers.

Second, smoking destroys the cilia in the bronchial passageways that are essential for clearing mucus and debris – thus increasing the risk of developing pneumonia.[20] Finally, nicotine is a very powerful immune suppressant.[21] The combined effect of all three is enough to land anyone in the

ICU during even a mild flu season. Likewise, chronic smokers have low magnesium levels, which increase their risk of developing bronchiospasm that is resistant to normal drug treatments.[22-24]

They also failed to record possible illegal drug use, how many were living at poverty levels and how many were on prescription drugs known to suppress immunity or deplete nutrients essential for immune function. And, one must keep in mind, at this age, (age range of 15 to 39 years) many would have had numerous childhood vaccines and booster vaccines.

This was also not considered for obvious reasons. So, some critical information we all need to evaluate this "pandemic" is being excluded or purposely kept from us.

Bacterial Pneumonia and Swine Flu

The American study found that of the people admitted to the hospital, **40%** were found to have X-ray evidence of pneumonia. Of these, **66%** had pre-existing medical conditions, such as asthma, chronic obstructive pulmonary disease (COPD), immunosuppression for transplants or cancer or neurologic disorder.

We are not told how many were smokers or lived with smokers, again, something that puts people at great risk of having severe reactions to any infection. Smokers have much higher bacterial pneumonia rates every year. The CDC estimates that smokers have a **200%** increased risk of flu virus complications as compared to nonsmokers.

The CDC released in the September 29 issue of the MMWR an analysis of the lung tissue from 77 fatal cases of H1N1 infection.[25] Of these, **29%** had a secondary bacterial infection – pneumonia. This is an important study because the media and the CDC are telling adults they need to get a pneumococcal vaccine and that parents need to have their children vaccinated with the pneumococcal vaccine as well.

This adult study found that **only half** of the pneumonias were due to Streptococcus pneumoniae, the organism used in the vaccine. Half of the cases were due to other strains of streptococcus, staphilococcus or H. Influenza. Some **18%** of the people had multiple organism cultured from their lungs.

It is important to note that they found that **all of these autopsied patients** had previous, serious medical problems prior to becoming infected with H1N1 variant and that not all bacteria were examined, meaning that even those with Strep pneumoniae could have had multiple infections, for which the vaccines would have offered no protection.

Parents should also know that the vast majority of pneumonias found in these infected children were not due to Strep pneumoniae, but rather **Staph aureus**. Again, the pneumococcal vaccine would have offered these children no protection.

Pregnant Women Given Vaccine Have Babies with More Health Problems

It has always been a principle of medicine that one should not vaccinate pregnant women, except in extreme cases, because the risk to the baby is too high. Recently, we have seen two examples of violation of this policy. When the HPV vaccine **Gardasil** was first released the CDC and the manufacturer (Merck Pharmaceutical Company) recommended that it be given to pregnant women.

Shortly after beginning this dangerous practice it was ordered halted because a number of women were losing their babies and babies were **being born with major malformations**.[26]

It is known that stimulating a woman's immune system during midterm and later term pregnancy significantly increases the risk that her baby will develop autism during childhood and schizophrenia sometime during the teenage years and afterward.[27]

Compelling scientific evidence also shows an increased risk of seizures in the baby and later as an adult.[28] In fact, a number of neurodevelopmental and behavioral problems can occur in babies born to women immunologically stimulated during pregnancy.[29-32]

It is true that serious flu infections or E. coli infections during pregnancy are a major risk for all these complications, but a woman's risk of becoming infected, as we have seen, is a very small fraction of 1 %, yet they are calling for **all pregnant women** to be vaccinated with at least three vaccines, two of which contain mercury. There is also evidence to show that a large number of these women will gain no protection from the vaccine.

Dr. Bronze, quoted above, notes that animal studies have shown that vaccines harm unborn babies and that **no safety studies have been done in humans**. A recent study done by Dr. Laura Hewitson, a professor of obstetrics at the University of Pittsburg Medical Center, found that a single vaccine used in human babies, when used in newborn monkeys, caused significant abnormalities in brainstem development.[33] This mass vaccination program for H1N1 variant virus will be the largest experiment on pregnant women in history and could end as a monumental disaster.

How Many Cases are Really Swine Flu?

CBS, to their credit, conducted a three-month long investigation that indicates that we have all been hoodwinked by the governmental "protection" agency called euphemistically, the Center for Disease Control and Prevention.[34]

What they tried to learn from the CDC was just what percentage of the "flu cases" were in fact H1N1. The CDC did all they could to protect this information and only after filing a Freedom of Information request and waiting 2 months did they finally release the data. Now we know why they wanted it protected and why they stopped testing for the H1N1 virus in late July.

The data revealed that in fact very few cases reported as swine flu were in fact H1N1 variant virus. CBS examined the data in all 50 states. What they found, for example, was that in Georgia only **2%** of reported cases were H1N1 (97% negative for H1N1); in Alaska only **1%** of reported cases were H1N1 (93% negative for flu and 5% seasonal flu) and in California only **2%** of reported cases were H1N1 with 12% being other flu viruses and 86% negative for flu.

A recent release from the CDC found that their survey reported that of 12,943 specimens tested from around the country, only **26.3%** of cases tested positive for H1N1 variant virus, but that 99.8% of the specimens tested positive for some type of other flu virus, most of which were regular seasonal flu.

The CDC has now changed all data reporting on the flu effects. They did this by stopping viral typing and subtyping and rolled back all previous numbers based on prior data. The new system for collecting data now started on **August 30th, 2009**.

The only reason I can imagine they did this is that the prior data was clearly demonstrating that the H1N1 variant virus was causing a very mild illness in most people (99.99%) with fewer hospitalizations, fewer cases of pneumonia and fewer deaths for all ages and groups than the prior seasonal flu in past years. This was true for the United States and the Southern Hemisphere, which has gone though the worst of its flu season.

Now that they are no longer typing the virus, they can attribute all cases of pneumonia, hospitalizations and deaths to H1N1, even though the majority of cases appear to be from a long list of other causes. In fact, they can classify many cases of primary pneumonia as caused by H1N1.

Actually LESS Flu Deaths this Year

One must always keep in mind that the CDC has told us that **36,000** people die every year from influenza and influenza-related complications. Thus far, we have seen (accepting their data) about **900 deaths** and **21,829** cases of pneumonia.

This is far below the 36,000 figure. In fact, perhaps we should be breathing a sigh of relief that **35,000 fewer people** have died this year from flu-related disorders. This would go down on record as the fewest flu-related deaths in recorded history.

In fact, worldwide, according to CDC and WHO data, far fewer people have died form H1N1 than any seasonal flu in the past. This graph from the CDC showing the "Pneumonia and Influenza Mortality for 122 US Cities" also show that, so far, this year's flu mortality is far below that of 2008.

In fact, worldwide, according to CDC and WHO data, far fewer people have died form H1N1 than any seasonal flu in the past. So, one must ask, why is the government and their handmaidens, the media, fueling this panic mentality? Why are we once again talking about mandatory vaccination for every man woman and child in the nation?

And I can assure you that soon we will hear an announcement that the adjuvant MF-59 or ASO3 (squalene) will be needed to save lives.

Now, if the CBS data forced from the files of the CDC is correct, why are so many people dying from this flu? The answer is that no greater number are dying now, for any age group, sex or state of pregnancy than have died in any previous flu outbreak.

By statistical slight of hand they have created this pandemic and continue to do so. One cannot foretell the future, but based on the data now available from the United States, Canada, Europe and the Southern hemisphere, there is no justification for the fear mongering by the media and government agencies.

It is accepted that the cognitive portions of the human brain work less well under two conditions – **fear and anger**. Those who have survived deadly situations or who make their living surviving such situations tell us that controlling our fear is the most important thing in survival. More people have died from making poor decisions while overwhelmed by fear than have died as a result of the situation itself.

I am reminded of the poor elderly person who died several years back waiting in a very long line for a flu vaccine in the sweltering heat. It seems she passed out and struck her head on the hard asphalt.

She was standing in that line for hours because the CDC announced that that year's flu was going to be especially deadly for the elderly and there was a shortage of vaccine. As it turned out, that year they picked the wrong virus to make the vaccine -- so it was not only a dangerous vaccine, it would have given her no protection. But then, the vaccine manufactures got their blood money.

What Do They Not Know About This Vaccine?

Insurance companies in Australia would not insure doctors who gave the vaccine because it was a fast tracked vaccine and therefore experimental. They felt that the danger of complications was far too high to risk insuring the doctors. Unlike doctors in America, they did not have a special law that Congress would pass to insulate them from liability should severe complications arise from the vaccine.

It is also of special interest to note that tens of millions of babies were vaccinated with the Hepatitis B vaccine (providing no protection to the babies) only to learn later that it is linked to a **310% increased risk** of developing multiple sclerosis.[36]

One has to ask **- What else do they not know about this vaccine?**

Well, it turns out a lot.

Years after it was added to the recommended vaccine schedule, it was linked to a terrifying disorder called **macrophagic myofascitis**, which in children is associated with a severe dementia-like illness.

Then we have the case of the **Gardasil** vaccine. Millions of young girls were vaccinated and within several months pregnant women were losing their babies, babies were being born deformed, several of these very young girls died and a growing number have had serious reactions to the vaccine.

Once again we have to ask **- What else do they not know about this vaccine?**

Vaccine Safety Testing Only Done for ONE Week

Now we are being told that this new fast tracked, poorly tested vaccine is very safe and effective. The results of the testing on this vaccine were reported in the *New England Journal of Medicine*.[39] It is instructive to learn that the tests for safety and to assess complications lasted only **7 days** after the vaccine, an incredibly short period of follow-up. **Gullian Barre paralysis** can occur even months after a vaccine as can seizures, behavioral problems and neurodevelopmental disorders in children.

It is interesting to note that the authors of the safety study for our swine flu vaccine were **all employees of the maker of the vaccine CSL Biotherapeutics** and eight held equity interest in the company.[39] This admission is part of the disclosure policy of the *New England Journal of Medicine*.

It is always important to keep in mind when you hear about this vaccine being safe and produced just like the seasonal flu vaccine **-- What else do they not know about this vaccine that they will discover months, years or even decades later.** Once injected with the vaccine and you develop a complication there will be little that can be done to treat the life-long degenerative disorder it produces. You will just be a sad story on 60 minutes.

About Dr. Russell Blaylock:

Dr. Blaylock is a board certified neurosurgeon, author and lecturer. For the past 25 years he has practiced neurosurgery in addition to having a nutritional practice. He recently retired from both practices to devote full time to nutritional studies and research.

Dr. Blaylock has written and illustrated three books. The first book was on the subject of excitotoxins, Excitotoxins: The Taste That Kills,and how they are related to diseases of the nervous system.

His second book, Health and Nutrition Secrets That Can Save Your Life, covers the common basis of all diseases, nutritional protection against diseases of aging, protection against heavy metal toxicity, the fluoride debate, pesticide and herbicide toxicity, excitotoxin update, the vaccine controversy, protection against heart attacks and strokes.

His third book, Natural Strategies for Cancer Patients, was released in April, 2003 and discusses the ways to defeat cancer, enhance the effectiveness of conventional treatments and prevent complications associated with these treatments.

In addition, he has written and illustrated three chapters in medical textbooks, written a booklet on nutritional protection against biological terrorism and written and illustrated a booklet on multiple sclerosis. He has written over 30 scientific papers in peer-reviewed journals on a number of subjects.

Since the publication of his first book he has been a guest on numerous national and international syndicated radio programs.

References [+] Speaking to CBS' "60 Minutes," CDC Director Dr. Frieden said he has confidence that the vaccine will be safe and effective: "We're confident it will be effective we have every reason to believe that it will be safe."

However, the CDC recommendation for those who had "probable" or "presumed" H1N1 flu to go ahead and get vaccinated anyway means the relatively small proportion of those who actually did have H1N1 flu will be getting the vaccine unnecessarily. This exposes them to rare but significant side effects, such as paralysis from Guillain-Barre syndrome.

It also uses up vaccine, which is said to be in short supply. The CDC was hoping to have shipped 40 million doses by the end of October, but only about 30 million doses will be available this month.

An interview with Dr Marc Vercoutère on the the 1976 swine flu vaccination campaign, WHO's pandemic statistics, the risk of H1N1 and H5N1 viruses combining and mutating, the ingredients of the vaccines, adjuvants, the pharmaceutical lobby groups, obligatory vaccination and legal action.

THE FLU CASE

Doctors protest Israel's decision to give toxic Focetria and Pandemrix jabs to people

The Flu Case, 5 November 2009, 10:55
https://web.archive.org/web/20100102013041/http://theflucase.com/index.php?option=com_content&view=article&id=1611%3Adoctors-protest-israels-decision-to-give-toxic-focetria-and-pandemrix-jabs-to-people&catid=1%3Alatest-news&Itemid=64&lang=en

Protests are growing over the decision by the Israeli Ministry of Health to give people in Israel the toxic and untested swine flu jabs Focetria and Pandemrix produced by Novartis and GlaxoSmithKline.

At least five people in Sweden have died shortly after receiving the intested Pandemrix swine flu jab, classified as a bioweapon by EU and US regulators.

The German army rejected the "swine flu" jab vaccine with mercury and squalene as too toxic for its soldiers .

The Polish Health Minister has said she will not allow the untested jab to be given to people without more evidence of safety.

Dr Daisy J Stern outlined her concerns in a letter to Professor Dan Engelhard.

The letter (below) comes as the Swiss-based Association Around Israel has produced a leaflet about the dangers of the swine flu jab. - (http://www.rund-um-israel.ch/)

Professor Dan Engelhard
Head, Department of Pediatrics, Infectious Diseases
Hadassah University Hospital, Ein-Kerem
POB 12000, Jerusalem 91120, Israel
Fax: 02-6434579
Tel: 02-6778960, 050-7874040

Jerusalem, Nov. 4th, 2009

Dear Professor Engelhard,

A few days ago I spoke to you on the phone, and expressed my serious concerns to you regarding the decision of the Ministry of Health in Israel to administer Focetria and PandemRix, the two adjuvanted H1N1 vaccines respectively from Novartis and GSK, to the unsuspecting population of Israel.

I reminded you of the squalene and polysorbate 80 contained in these vaccines, and about the dangers of auto-immune reactions, neurotoxicity, and infertility that these vaccines present. You responded to me that you were well aware of the dangers involved, but that you and your panel of physicians , specialists in their respective fields, had decided that benefits outweigh the risks, based on worldwide mortality statistics due to the H1N1 virus.

Professor Engelhard, please let me remind you of the following facts (I have included one or two references for each topic, but there are many, many more, some peer- reviewed, some not. Time is of the essence and unfortunately I do not have time to include them all at present).

Main points:

1.The statistics presented by the CDC and other monitoring bodies are severely distorted: the proven number of deaths due to the actual H1N1 virus is much smaller than previously reported: most cases were of patients who died of underlying, concomitant conditions, yet were labeled as H1N1 related deaths. Furthermore, a ;arge number of so-called H1N1 cases were never actually proven to be such, cases counted even including phone calls made to doctors by patients worried they might have the H1N1 virus. S. Attkisson. Swine Flu Cases Overestimated? – CBS News, 21 October 2009

https://web.archive.org/web/20091022182003/http://www.cbsnews.com/stories/2009/10/21/cbsnews_investigates/main5404829.shtml

2. H1N1 is a mild influenza virus, much milder even than regular, yearly seasonal influenza. The number of deaths is relatively small, compared to yearly influenza mortality rates.

http://articles.mercola.com/sites/articles/archive/2009/11/03/What-We-Have-Learned-About-the-Great-Swine-Flu-Pandemic.aspx

3. The Southern Hemisphere winter season passed without any major catastrophe. The flu season already peaked in the USA.

http://articles.mercola.com/sites/articles/archive/2009/11/03/What-We-Have-Learned-About-the-Great-Swine-Flu-Pandemic.aspx

4. There IS vaccine available that does not contain either adjuvant or thimerosal. That vaccine is being used on 250,000 German soldiers.

German Soldiers to Receive Different Swine Flu Vaccine Than German People. – Prison Planet, 13 October 2009.

https://web.archive.org/web/20091016235302/http://www.fightbackh1n1.com/2009/10/german-soldiers-to-receive-different.html

5. Squalene is highly neurotoxic and causes severe auto-immune reactions., even deaths.

Gary Matsumoto. Squalene adjuvant toxicity in animals. – Without Consent, 2009

https://web.archive.org/web/20091229153436/http://www.without-consent.com/media/SqualeneReferences-AnimalToxicology.pdf

6. The concentration of squalene in both Focetria and PandemRix is between half a million to a million times higher than the squalene contained in the anthrax vaccine administered to US soldiers in 1991, which was seriously implicated in the Gulf War Syndrome, and from which hundreds of thousands of soldiers suffered terribly, and many thousands died.

Jacobucci G. Million TIMES more Squalene in H1N1 Vax than caused GWI. – 26 August 2009

https://web.archive.org/web/20101222124044/http://uncensored.co.nz/2009/08/26/million-times-more-squalene-in-h1n1%20-vax-than-caused-gwi/

Ongoing administration of unlisted vaccines in the US military caused severe reactions and even deaths in thousands of people. The IDF also recently participated in illegal anthrax vaccine experiments on 716 unsuspecting Israeli soldiers ; administration of toxic substances by the US and Israeli government is nothing new.

Squalene: compound Summary – http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=638072
Target 5: Secret Shots - http://www.youtube.com/watch?v=Q7M_TZpQiIY

7. The unnecessary H1N1 vaccination campaign of 1976 caused many cases of Guillain-Barre, some of them permanent. Just as today, people were not informed of the potential dangers involved in taking these highly toxic substances…

Swine Flu Vaccine Dangers. - http://www.personalgrowthcourses.net/video/swine_flu_vaccine_2

8. Pandemrix has barely been tested on children at all, and has been banned from use in Switzerland below the age of 18, because of lack of clinical data. http://www.physorg.com/news176099207.html

Annex I: Summary of product characteristics:

https://web.archive.org/web/20091002210338/http://www.emea.europa.eu/humandocs/PDFs/EPAR/pandemrix/emea-combined-h832en.pdf

Switzerland on Friday restricted the use of British drugs group GlaxoSmithKline's swine flu vaccine Pandemrix, excluding pregnant women, minors and people over the age of 60.

https://medicalxpress.com/news/2009-10-switzerland-restricts-glaxosmithkline-swine-flu.html#google_vignette

9. The only studies done with Focetria, containing the Marketable Product, were on a total of 132 people. Focetria: Summary information. – EMEA, 29 September 2009.
https://web.archive.org/web/20091001140020/http://www.emea.europa.eu/influenza/vaccines/focetria/focetria.html

10. The combination of squalene and polysorbate 80 in a buffered solution has been shown to be an excellent anti-fertility combination, in anti-fertility research performed by scientists for the WHO, who were assigned the job of developing anti-fertility vaccines to reduce world population. Giving these vaccines to our young population is tantamount to sterilizing them.
[Fertility Impairing Vaccine And Methods of Use' This application claims the benefit of U. S. Provisional Application No. 60/070,375, filed January 2,1998, U. S. Provisional Application No. 60/071,406, filed January 15,1998].
=> https://patentimages.storage.googleapis.com/a3/4a/72/105b4327d326dc/WO1999034825A1.pdf

11. Giving these vaccines to our population is equivalent to using them as guinea pigs for the rest of Europe, the world, and specially for pharmaceutical companies, as they have not yet been properly tested in children or adults in other countries.
See reference , article #8.

12. Because of the recombinant nature of the H1N1 antigen used in the manufacture of these vaccines, there is significant risk that the vaccine itself will lead to a much more serious pandemic, by reassorting itself with other viruses in the community.
Horowitz L, Kane S. Obama's H1N1 Swine Flu National Emergency Evidences Vaccine "Market-Building" for Mass Murder. – Web Evidence, 28 October 2009.
http://clareswinney.wordpress.com/2009/10/28/obamas-h1n1-swine-flu-national-emergency-evidences-vaccine-market-building-for-mass-murder/

I understand that, in accordance with W.H.O. directives, and with Prime Minister Benjamin Netanyahu's agreement, the goal of the Ministry of Health is to inject the whole population of Israel with these deadly vaccines by December 31st.

I urge you to cancel the decision to use PandemRix in our children ages 3-10, and desist as well from using Focetria in the rest of our population. The orders of the Ministry of Health significantly and unnecessarily endanger our whole population; the current risk of H1N1 pandemic clearly does not warrant such a step at this time. And even if there was a real need for a vaccine, using an adjuvanted vaccine that contains thimerosal is totally unwarranted and contraindicated.

Yours sincerely,
Daisy, J. Stern, MD
Family and Preventive Medicine.
USA and Israel.

Die Gefährlichkeit der H1N1-Schutzimpfung (Schweinegrippe)

Liebe Freunde und Bekannte

Die sogenannte Schweinegrippe ist immer noch aktuell. Mit der Gefährlichkeit dieser Krankheit wird aber sehr übertrieben. So ist es nun auch in vielen Ländern so, dass Massenimpfungen durchgeführt werden mit verschiedenen Substanzen. Es ist daher wichtig, sich mit dieser Impfung genauer auseinander zusetzen. Die Medien lassen Fachleute zu Wort kommen, welche die Nebenwirkungen bagatellisieren und sogar Falschinformationen liefern. Gerade in der Diskussion um die Zusatzstoffe werden Aussagen gemacht, die irreführend sind. Man spricht davon, dass schon immer Zusatzstoffe in den Impfungen waren. Allerdings unterschlägt man dabei die Tatsache, dass in der jetzigen Impfung neuartige und schwach erforschte Mittel verwendet werden. Lest daher diese Informationen gut durch.

Als erstes ein Bericht zum offiziellen Beipackzettel des Impfstoffes der Firma Novartis:
http://luegengrippe.blogspot.com/2009/09/beipackzettel-des-h1n1-impfstoff-warnt.html – has been deleted

etc.

Bradley VanWaus, SEIU Staff
Vicki Siefers, SEIU Witness
Matt Glasson, SEIU Witness
Becky Leven, SEIU Witness

DECISION AND AWARD

For the reasons cited above, the Undersigned concludes that the grievance is sustained. The University of Iowa Hospitals and Clinics as Employer has violated the Collective Bargaining Agreement at Article XIX - Section 2 and Section 4 with the creation of the Universal Influenza Vaccination Policy HR-03.29 which makes influenza vaccinations mandatory and institutes an

unpaid leave for non-compliance. UIHC is hereby ordered to continue the practice of providing influenza vaccinations at no cost to the employee on a voluntary basis. UIHC is additionally ordered to cease and desist from requiring employees in the bargaining unit to receive influenza (seasonal and/or H1N1) vaccinations or face related consequences of unpaid leave.

In arriving at this decision, I have considered all evidence, arguments and authorities submitted by the parties even if not specifically discussed in my decision. Respectfully submitted, 58% of the doctors and 90% of the medical staff at the Red Cross in Athens declared that they do not intend to be vaccinated, at a time when specialists are appealing to citizens to be vaccinated.

The president of the National Committee for the Influenza Pandemic, Eleni Giamarellou, in order to get across the message that there is no reason for anxiety about the possible side-effects of the vaccine against the new H1N1 flu, declared that she will be among the first to be vaccinated. The members of the National Committee nevertheless note that the vaccination is not compulsory.

The research carried out by the Red Cross indicates that not only the general public but also the country's medical personnel have NOT been persuaded by official statements in relation to the dangers from side-effects of the new vaccine. Similar studies carried out on the general population indicate that six out of ten people are thinking of staying away from the programme of mass vaccination.

The President of the National Committee for the Influenza Pandemic also emphasised the need to have immediately available the 150 beds in the Intensive Care Units, which are remaining unutilized. In the event of the scenario becoming a reality that 20% of the population will fall ill from the H1N1 virus, an additional 170 to 470 beds will be needed at Intensive Care Units. In the context of the attempt to find a solution there has been mention even of the possibility of requisitioning Intensive Care beds in private clinics.

41 cases of side effects

Since the beginning of October 1.4 million Swedes have been vaccinated, of whom 41 have come down with undesirable side-effects, including allergies. But none of the cases that have been detected have been serious and non-reversible, said Mrs Giamarellou immediately following yesterday's meeting of the Committee.

The president of the National Committee mentioned the necessity for pregnant women in the second or third month of pregnancy to be vaccinated, as they face greater risk than the rest of the population of suffering serious symptoms. She nevertheless pointed out that people allergic to eggs should not be vaccinated, something that does not apply for the regular flu vaccine. This is because Greece has been provided with vaccines that have been cultivated in eggs, not in cells.

Swiss doctor talks about his concerns over "swine flu" jab in video

The Flu Case, 6 November 2009, 16:28
https://web.archive.org/web/20100102043114/http://theflucase.com/index.php?option=com_content&view=article&id=1665%3Aswiss-doctor-talks-about-his-concerns-over-qswine-fluq-jab-in-video&catid=1%3Alatest-news&Itemid=64&lang=en

A Swiss doctor is being applauded for his courage for risking his licence, the wrath of the pharmaceutical industry and Swiss Health Ministry and for talking about the dangers of the swine flu jab.

In a video posted on a blog, he says:
"I don't trust the vaccine because it is totally untested or bought after only being tested in a very short time.... Bought by people who are perhaps not especially informed...Have bought a vaccine with completely new, unknown risks that I would not give to myelf or to people for whom I am responsible..."

Many Italian physicians reject swine flu vaccine

Press.TV, 7 November 2009, 16:32:26 GMT
https://web.archive.org/web/20091108121437/http://www.presstv.ir/detail.aspx?id=110686&sectionid=3510212

Italian family physicians refuse to prescribe the A/H1N1 vaccine for their patients, claiming that the risks of the vaccine outweigh its benefits.

Latest figures revealed that swine flu has infected more than 540,000 individuals, claiming the lives of 30 in Italy.

The country has ordered some 48 million doses of the A/H1N1 vaccine, enough to immunize 24 million of its population, and plans to start a mass vaccination program in the coming weeks.

Italian media outlets have, however, claimed that many of these vaccines would be useless as the majority of Italians including the Deputy Health Minister Ferruccio Fazio and the Mayor of Rome Gianni Alemanno have decided against vaccination.

According to a recent survey conducted, six out of every ten Italian family physicians do not prescribe the A/H1N1 vaccine for their patients particularly those with heart diseases.

A member of the European Association for Quality in General Medicine(EQUIP), Gianluigi Passerini told *L'espresso* that he would not advise vaccination for his patients, adding, "This virus is not aggressive and there is no reason to force individuals to get immunized against the virus."

Mario Nejrotti, the director of *torinomedica.com*, similarly, stressed that healthcare workers should only be urged to get vaccinated based on the severity and spread of the virus.

He added that a similar vaccine manufactured in the US in 1976 had contributed to a considerable number of cases with a severe neurological disease known as Guillain-Barré syndrome.

LE MATIN.ch

Grippe A: une majorité d'infirmières refuse de se faire vacciner

Le Matin.ch, 7 Novembre 2009, 23:47
https://web.archive.org/web/20100102035534/http://theflucase.com/index.php?option=com_content&view=article&id=1699%3Amajority-of-swiss-nurses-do-not-want-the-jab&catid=1%3Alatest-news&Itemid=64&lang=en

«Se vacciner contre la grippe A pour se protéger et protéger les autres». Martelée ces derniers jours par l'OFSP (Office fédéral de la santé publique), cette phrase s'adresse en priorité au personnel soignant.

Seulement voilà. Dans la même proportion que le reste de la population, une partie des professionnels de la santé n'est pas du tout disposée à suivre les recommandations officielles. Alors qu'une majorité des médecins devrait s'y plier, les infirmiers et infirmières semblent particulièrement réfractaires au vaccin. Selon les chiffres récoltés cette semaine par Le Matin Dimanche, moins de la moitié acceptera de se faire vacciner. Un constat qui fait bondir Hans Binz, président de l'Association des médecins cantonaux de Suisse: «Il est irresponsable de la part du personnel soignant de ne pas se faire vacciner contre la grippe A.»

A l'ALSMAD (Association lausannoise pour la santé et le maintien à domicile), seuls 20% des 750 collaborateurs se sont inscrits pour la vaccination contre la grippe A, alors que le formulaire leur a été envoyé il y a plus d'un mois. «Nous recommandons vivement à notre personnel, qui est en contact avec une population fragile, de se faire vacciner. Mais nous n'avons pas les moyens de l'exiger», regrette une collaboratrice de la direction.

«Nous n'avons aucun recul»

Dans les hôpitaux, l'heure est au branle-bas de combat pour vacciner les employés. Mais dans tous les établissements contactés en Suisse romande, le fossé est grand entre les intentions de la direction et celles du personnel. Le bras de fer qui s'engagera ces prochains jours promet d'être corsé. «Dans mon équipe, seuls deux employés sur sept vont se faire vacciner», explique cette infirmière de Vevey (VD), sur la base d'un colloque qui s'est tenu vendredi dans son service. «Autour de moi, les soignants sont très réfractaires au vaccin», confirme une employée de l'Hôpital cantonal de Fribourg.

Une tendance qui s'observe chaque année avec les vaccinations contre la grippe saisonnière. Au CHUV comme dans de nombreux autres hôpitaux, seul 25% à 30% de l'ensemble du personnel se fait vacciner. «Nous estimons que ce sera de même pour la grippe A», ajoute Lucien Portenier, de l'Association suisse des infirmières et infirmiers (ASI). L'organisme, qui prône l'autonomie de ses collaborateurs, ne leur demande pas de suivre les recomman dations de l'OFSP.

Une attitude qui tranche avec celle de la FMH (Fédération des médecins suisses), qui a participé au plan de vaccination national. «Nous nous sommes concertés, et je peux affirmer que 100% des pédiatres de Neuchâtel seront vaccinés», témoigne par exemple Michel Giordano, médecin au Locle (NE).

Cette différence de point de vue entre médecins (homéopathes exceptés) et infirmières n'étonne pas Eric Masserey, médecin cantonal adjoint dans le canton de Vaud: «Est-ce parce que les médecins sont mieux renseignés ou parce qu'ils sont plus responsables? Je me pose sérieusement la question.»

Mais pourquoi do nc cette rebuffade du monde infirmier? Parmi les arguments avancés (lire ci-dessous), celui de la sécurité du vaccin est récurrent. «Nous n'avons aucun recul et ne connaissons pas les effets secondaires de ce produit», résume cette infirmière genevoise. Un argument que balaie Eric Masserey: «Ce débat est largement stérile. La production de ce vaccin ne présente aucune surprise par rapport à celui contre la grippe saisonnière, fabriqué chaque année».

Destinée en priorité au personnel soignant et aux personnes à risque, la campagne de vaccination a débuté hier en Suisse, dans le canton de Soleure. Elle devrait commencer dès mardi en Romandie.»

A Genève, les soignants doivent choisir entre le vaccin et le masque

Même si la protection des patients passe avant tout le reste, personne ne peut obliger un soignant ou une soignante à se vacciner pour ne pas risquer de transmettre la grippe A. Afin de répondre à ce dilemme entre responsabilité professionnelle et liberté individuelle, les Hôpitaux universitaires genevois (HUG) ont mis en place un système sans équivoque: «La vaccination est fortement conseillée, explique Chantal Bonfillon, médecin d'entreprise. Le personnel soignant qui ne souhaite pas se faire vacciner aura l'obligation de porter un masque dans les zones de soin durant toute la durée de l'épidémie. Comme pour la grippe saisonnière, le personnel vacciné portera un badge annonçant clairement qu'il est immunisé.»

Un badge et un masque montrant clairement la couleur: n'est-ce pas stigmatisant pour ceux qui ont fait le choix de ne pas se vacciner? «Non, car il n'est pas immoral pour un soignant de ne pas se vacciner, répond Samia Hurst, médecin et bioéthicienne à Genève. Ce qui est immoral, c'est de ne pas protéger ses patients. Des études ont montré que vacciner le personnel soignant contre la grippe saisonnière améliore la survie des patients. Le masque vise le même but, mais sans intrusion sur le corps. Il signale la même chose que le badge: que le porteur prend sa responsabilité au sérieux.»

THE FLU CASE

Majority of Swiss nurses do not want the jab

The Flu Case, 8 November 2009, 14:46

https://web.archive.org/web/20100102035534/http://theflucase.com/index.php?option=com_content&view=article&id=1699%3Amajority-of-swiss-nurses-do-not-want-the-jab&catid=1%3Alatest-news&Itemid=64&lang=en

A majority of nurses in Switzerland do not intend to get the swine flu jab, according to a recent poll reports Le Matin.

In some regions, as few as 20 % intend to take the vaccine citing safety concerns.
In Geneva, hospital health care workers can choose between the vaccine and a mask.

H1N1 injection (and spray) rejection
Some doctors are just saying no to the swine flu vaccine

The Washington Post, 8 November 2009
https://www.washingtonpost.com/wp-dyn/content/article/2009/11/07/AR2009110703116.html?wprss=rss_health
https://www.washingtonpost.com/wp-dyn/content/article/2009/11/07/AR2009110703116_2.html?wprss=rss_health&sid=ST2009110800126

The biggest frustration facing many doctors is the dearth of swine flu vaccine for their patients. But not Paula Soghomonian's pediatrician at Pediatric Village in the District. She is not recommending the shots - or the nasal spray.

"The senior doctor there doesn't believe in it and doesn't want it for her patients," Soghomonian said. "I think the feeling was it's just too new."

Soghomonian's doctor is one of a small cadre of outliers who remain skeptical about the government's unprecedented immunization campaign, citing doubts about the risks presented by the H1N1 virus or the safety of the vaccine, despite the fact that no worrisome reactions have been reported.

"My feeling is that this is all being over-hyped," said Laurence J. Murphy, a pediatrician in Burke who also will not inoculate his patients. "Most people who get this virus do beautifully. I believe the vaccine hasn't been tested enough. I just think the benefit of it at this point is not outweighed by the possible risk."

Such contrarian voices, through the megaphone of cable news or in the quiet of exam rooms, have forced federal health officials to play defense as well as offense in their campaign to encourage immunization.

Public health leaders are at a loss to explain the skeptical minority, except to say that it mirrors the chronically low percentage of health-care workers who get the seasonal flu vaccine every year. Officials worry that these doubters could have a disproportionate influence in an already frustrating and confusing situation, and stress that the studies conducted so far and the intensive monitoring underway indicate that the vaccine is as safe as any flu vaccine.

"I am very disappointed, deeply puzzled and very disturbed by this," said William Schaffner, president-elect of the National Foundation for Infectious Diseases. "The people for whom these doctors are not recommending this vaccine are clearly high-priority patients who could have very adverse outcomes if they get infected with the virus."

'Not enough data'

Although no one has surveyed doctors' views on the vaccine, polls show that people look to their physicians when deciding whether to get the shots or nasal spray. A nationally representative survey

of 1,042 adults in September found that 68 percent said they trusted the advice of their doctor or their child's pediatrician on this issue, far more than those who said they trusted top federal health officials and medical groups.

"People rely very heavily on their physician's judgments about whether or not they should take a vaccine," said Robert J. Blendon, a professor of health policy at the Harvard School of Public Health who conducted the survey. "They are at the top of the charts."

As a result, the naysayers have left patients torn between a doctor's long-respected advice, their own judgment and official recommendations.

"It's like total confusion for me to try to figure out what to do," Soghomonian said as she lined up with her 3-year-old daughter, Ally, on a recent morning at a District flu clinic.

"It's really been very frustrating and very scary," said Soghomonian, who eventually left after deciding to give her daughter only the seasonal flu vaccine. "I just want someone to tell me what to do, you know?"

Cheryl F. Edmonds, founder of the practice where Soghomonian takes her children, declined to be interviewed. But a member of her staff, who spoke on the condition of anonymity, characterized her concerns this way: "Her thing is there's just not enough data."

Murphy, the Burke pediatrician, said he has no reason to think the vaccine is unsafe – he, like many of the skeptics, said he generally supports vaccinations. But he wonders whether it was tested enough.

"They just didn't have the time to do that properly. They mean well and they are not doing anything to mislead people in any direct way. The reality is no one knows. I'm not pretending to know. I don't think they should pretend to know," he said.

'Jumping on the bandwagon'

Murphy is not alone. A smattering of obstetricians, family practice doctors, internists and other physicians nationwide who harbor doubts about safety of the vaccine or the danger the flu poses raise questions on blogs and during interviews, and counsel their patients not to get the immunization.

"What bothers me is pretty much every doctor in the country is jumping on the bandwagon and saying, 'This vaccine is completely safe' – even for the pregnant woman and the unborn baby," said Bob Sears, of Orange County, Calif. "But they can't give you a single study that backs up that statement."

Officials repeatedly have stressed that while no vaccine is completely safe, there is no reason to believe the swine flu immunization would pose any unusual risks, and so far no problems have emerged.

"I can understand the hesitancy and reluctance to take a vaccine that appears to be new and different. All we can do is provide the facts," said Thomas R. Frieden, director of the federal Centers for Disease Control and Prevention. "The facts are that this is the same manufacturing process, the same manufacturers, the same factories, the same safeguards as the seasonal flu vaccine that has been used for more than 100 million doses each year for many years and which has an excellent safety record."

But Meryl Nass, an internist in Bar Harbor, Maine, still has doubts, especially given that most people who become infected get only mildly ill.

"In this situation, when there's very little data, I don't think people – and children in particular – should be asked to bear the burden of being experimental subjects," said Nass, who has been blogging about her doubts. Nass also questions the assertion that the vaccine is safe for women in all stages of pregnancy.

"The CDC is telling women in all trimesters to go out and get vaccine. To my mind, this is reckless," said Nass, who is advising her patients to consider receiving the vaccine only in their second or third trimesters.

'Behind the curve'

Some doctors hear echoes of politics in the reactions to their concerns.

"You come out and offer some caution about the safety of the vaccine, and it becomes very political: Are you with us or are you against us?" said Kent Holtorf, whose Southern California practice specializes in treating chronic conditions. "It's almost like Republicans and Democrats, and no one wants to toe the middle ground, because it could help the other side."

Giuseppe Lancellotti, a pediatrician from Ephrata, Pa., argues that the vaccine has arrived too late to make a difference anyway.

"We're just way behind the curve," he said.

Government officials counter that it remains far from clear whether the second wave of infections currently sweeping the country has peaked. Even if it has, people will continue to become infected for months and another wave could hit later.

"The risk of not getting the vaccine is much greater than the risk from getting it," said Anthony S. Fauci, who is leading the government's ongoing testing of the vaccine at the National Institutes of Health.

Soghomonian was finally forced to make a snap decision when her husband took her 5-year-old son to get a seasonal flu shot and discovered the swine flu vaccine was available, too.

"I called him and said, 'Just do both,' " she said. He did, but Soghomonian was still uneasy. "There was a moment of panic, like: What did I do?"

Nevertheless, Soghomonian was among the first few dozen people to line up last week at Wilson High School in the District to finally get her daughter vaccinated.

"It's your pediatrician. Your children have been there since Day One. You feel like they know and you should listen to their advice. And here I'm going against it," she said.

"Ultimately, you have to make your own decision."

Influenza A? Un 'virus mediatico'.
I pediatri: "Allarme ingiustificato"

ADN Kronos, 8 Novembre 2009
https://web.archive.org/web/20091111002217/http://www.adnkronos.com/IGN/News/Cronaca/Influenza-A-Un-virus-mediatico-I-pediatri-Allarme-ingiustificato_3969239872.html

Roma - (Adnkronos) - Il presidente della commissione Vaccini della Sip: "Esposizione esagerata sui mass-media, la stagionale causa più morti". E avverte: "L'emergenza è l'assalto agli ospedali". A Napoli deceduta una bimba di 8 mesi. Le vittime (MAPPA). L'acquasantiera anti-virus diventa un business. E nel presepe spuntano le statuine con la mascherina. Gelmini: "Non farò il vaccino"

Roma, 8 nov. (Adnkronos) - "Questo è un virus mediatico. Non discuto il fatto che ci si trovi di fronte a una pandemia e che questa provochi vittime ma l'esposizione sui mass-media è ingiustificata. Basti pensare che l'influenza stagionale causa un numero di morti dieci volte superiore. E anche tra i bambini la normale influenza causa ogni anno decine di decessi che però non fanno notizia". Così Alberto Ugazio, presidente della commissione Vaccini della Società Italiana Pediatria ai microfoni di Cnrmedia.

"Anche le ipotesi di una mutazione del virus - rileva - sono scontate e creano solo allarmismo. I pericoli qui sono altri: cominciamo a vedere medici che negli ospedali non riescono ad assistere malati gravi perché i servizi essenziali sono assaliti da presunti malati. Ai genitori ripeto: se il vostro bambino ha la febbre, tenetelo a casa".

Da parte sua il vice ministro per la Salute Ferruccio Fazio , intervenendo in diretta telefonica a 'Domenica In-L'Arena' su Raiuno, sottolinea: "Mi rendo conto che le morti dei giovani colpiscono emotivamente. Non è più un'influenza ma una pandemia. Questa semmai è più leggera di quanto può essere l'influenza stagionale che lo scorso anno ha causato 8 mila morti".

Fazio ha spiegato che "parte dell'allarmismo è dovuto all'allarme che c'è stato in passato per altre pandemie, come l'aviaria e la Sars. Ci spaventano perché non le conosciamo e perché sono comunque molto contagiose". Il vice ministro alla Salute ha poi confermato di aver già raccolto l'appello lanciato in studio dal presidente dell'Ordine dei medici di Roma Mario Falconi, affinché le Regioni potenzino l'assistenza sanitaria.

"Se continua questo allarmismo - ha spiegato Falconi - succederà che si paralizzerà l'attività dei medici di base, che già non ce la fanno più". Fazio ha poi chiesto ai medici di vaccinare "i malati cronici perché sono gli unici che rischiano veramente".

Gelmini: "Farò il test antidroga ma non il vaccino per il virus A"

ADN Kronos, 8 Novembre 2009

https://web.archive.org/web/20091111003702/http://www.adnkronos.com/IGN/News/Politica/Gelmini-Faro-il-test-antidroga-ma-non-il-vaccino-per-la-nuova-influenza-A_3968736276.html

Roma - (Adnkronos/Ign) - Il ministro dell'Istruzione: "Credo che chi ha impegni pubblici debba avere il massimo della trasparenza". E sulla nuova influenza ribadisce: "La chiusura delle scuole creerebbe soltanto problemi enormi". Test antidroga, senatori e deputati non si tirano indietro. Di Pietro: "Controlli per tutti i parlamentari". **'Le Iene'** su droga e Parlamento (VIDEO). Arabia Saudita, il ministro della Salute si vaccina contro l'influenza A in diretta tv

Roma, 8 nov. (Adnkronos/Ign) - Dice sì al test antidroga ma non farà il vaccino contro l'influenza A. Parola del ministro per l'Istruzione, Mariastella Gelmini, che così si è espressa nel corso della registrazione de 'L'intervista' di Maria Latella, in onda oggi alle 11.35 su SkyTg 24.

"Non ho ancora pensato se fare o meno il test antidroga ma possiamo dire che lo farò" ha annunciato la Gelmini. "Credo sia un'iniziativa che ha il suo valore. Credo che chi ha impegni pubblici debba avere il massimo della trasparenza", è l'opinione del ministro.

Quanto all'influenza A, "la chiusura delle scuole creerebbe soltanto enormi problemi di gestione dei bambini da parte delle famiglie senza creare benefici. In collaborazione con il ministero della Sanità - dice - stiamo monitorando quanto accade all'interno delle scuole italiane. Il calendario delle vacanze di Natale non cambierà. Per ora non ci sono le condizioni di allarme per un cambiamento rispetto alla rotta che abbiamo intrapreso e che ci sta dando risultati puntuali".

"Non ho fatto il vaccino contro l'influenza A perché ritengo di essere una persona sana", ha poi aggiunto. "Non ho malattie croniche. Questa è un'influenza da non sottovalutare, ma credo - ha concluso - che non dobbiamo nemmeno esasperare i toni e creare inutilmente allarmismi".

Nurses Allowed Temporary Restraining Order in Required Vaccination Case

DOTmed News, 10 November 2009
http://www.dotmed.com/news/story/10708

A temporary restraining order has been granted in favor of union-represented employees working for Nevada health care facilities who were required to either have seasonal and H1N1 flu vaccines or wear a surgical mask for their shifts. The federal litigation involves defendants Southern Hills Medical Center, LLC and Sunrise Hospital and Medical Center, LLC of Clark County, NV. The facilities' policies would also require employees to wear markings on their badges to indicate their vaccination status. The defendants enacted the policy without first bargaining with plaintiff Service Employees International Union, Local 1107 (Union). The Union represents registered nurses and other employees of the facilities.

According to the complaint filed by the Union, Sunrise and Southern Hills had announced to their employees in August that employees who could infect a patient or be infected would be required to receive both a seasonal flu vaccination and a H1N1 vaccination. Those who declined the vaccinations would be required to wear a surgical mask for the entirety of their shift. The Union then filed grievances with Sunrise and Southern Hills for a final and binding arbitration decision on whether the facilities may unilaterally implement the immunization policy without first bargaining with the Union.

The Union applied for a temporary restraining order to prevent the defendant facilities from continuing the required immunization and masking policy in order to preserve the arbitration. The U.S. District Court, District of Nevada Judge Robert C. Jones has found that the parties in the case are bound to arbitrate the grievances, and that the plaintiff will suffer irreparable harm without injunctive relief. With the legal equities in the Union's favor, the Judge found that granting the injunction preventing the facilities from directly or indirectly taking any action to further implement the seasonal immunization and masking is in the public interest.

The Judge said without the injunction, the grievance-arbitration process would be frustrated, and the Union's members would be forced to receive an unwanted vaccine, expose their decisions regarding the decisions to the public, or be subject to termination. Once those policies were instituted, an arbitrator would then have great difficulty remedying them. The Judge pointed out that the facilities have already used a voluntary immunization process and had already delayed implementation of the new policy. Continuing the voluntary status quo would not hurt the defendants, as 80 to 90 percent of the employees have already voluntarily been vaccinated.

Leading doctor tells Greek TV swine flu jab not tested

The Flu Case, 18 November 2009 15:13
https://web.archive.org/web/20100102004444/http://theflucase.com/index.php?option=com_content&view=article&id=1854%3Aleading-doctor-tells-greek-tv-swine-flu-jab-not-tested-&catid=1%3Alatest-news&Itemid=64&lang=en

Athanasios Karabelis, director, Metaxas Hospital, Athens: "No to the vaccine for the new flu" [http://anopetra-eleos.blogspot.com/2009/11/blog-post_4629.html]

10th November 2009: On the news bulletin of the ALTER channel in Greece, the director of the pathology clinic of the Metaxas hospital Athanasios Karabelis **(**pathologist-oncologist) was categorical:

"Mortality from swine flu is 0.1-0.2%. New Zealand and Poland are not carrying out comprehensive vaccinations of citizens, restricting the relevant action to high-risk groups. The vaccine is not sufficiently tested and includes adjuvants suspected of triggering serious side-effects. The first reliable clinical study is expected in December 2010."

On Friday 6th November the syndicalist organization of doctors ARSI held a public meeting on the subject of the new flu at the Law School of the University of Athens.

The truth about the new swine flu H1N1 and the vaccine.
In the coming days vaccination will begin for "school students, health workers and vulnerable groups" against the new H1N1 swine flu, and the population as a whole is urged to be vaccinated against both the new flu and the seasonal flu, on a voluntary basis, without the written consent which was originally mandatory.

But there are many who doubt both the safety of, and the necessity for, these vaccines, and a large proportion of people internationally, including doctors, are declaring that they will not be vaccinated against the new flu.

This doubt is indeed justified, because the truth about this new H1N1 swine flu and the relevant vaccination has been systematically concealed, internationally, by everyone concerned who has something to gain from the conspiracy of silence, that is to say the pharmaceutical companies (the sickness industry), the mass media (the fear industry), the medical hierarchy and the fellow-travellers (opportunity for a career and side benefits), and the politicians - salesmen of protection.

THE FLU CASE

Marc Girard

Vaccination antigrippale : réquisition des professionnels de santé

The Flu Case, 10 Novembre 2009.
https://web.archive.org/web/20100102041130/http://theflucase.com/index.php?option=com_content&view=article&id=1726%3Amarc-girard-advises-french-health-workers-to-practise-non-cooperation&catid=1%3Alatest-news&Itemid=64&lang=en

Plusieurs internautes ont sollicité mon conseil après avoir reçu un ordre de réquisition.

Sous réserve d'une analyse juridique actuellement en cours, quelques remarques de bon sens peuvent aider nos collègues à gérer la situation.

Avant toute chose, il convient de remarquer qu'en pareille espèce, la résistance a d'autant plus de chances d'être efficace qu'elle sera collective. Sanction de son improvisation : le gouvernement n'a cessé de reculer (on vient encore de le voir avec l'abandon d'un projet de vaccination obligatoire dans la gendarmerie), et il ne prendra pas le risque d'affronter publiquement une opposition organisée et, surtout, motivée.

Le second point, c'est qu'en aucun cas, semblable réquisition ne peut s'accompagner d'une vaccination obligatoire: actuellement en France, il n'y a aucune obligation vaccinale contre la grippe "porcine". Il s'agit donc de refuser tout net toute pression en ce sens.

D'un point de vue pratique, toute réquisition doit être confirmée par écrit. Ce prérequis ouvre déjà un vaste champ d'action car, compte tenu de la désorganisation actuelle de la Poste:
- une lettre peut toujours n'être pas arrivée à destination (récemment, un de mes correspondants, habitant à 500 km de chez moi, a vu un de mes courriers lui parvenir - après un délai certain - après passage par le Laos...) ;
- un professionnel de santé surchargé peut toujours renoncer à faire une heure de queue au bureau de poste du coin pour aller retirer un recommandé.

Ainsi, s'autoriser du désordre actuel de la Poste pour ne pas se soumettre à un ordre de réquisition sera doublement moral, car il s'agira:
- de résister au comportement honteux d'un gouvernement s'appliquant à soumettre le peuple français aux desiderata des lobbies pharmaceutiques ;
- de renvoyer le gouvernement à ses contradictions : à l'échelle d'un pays, c'est difficile de prétendre organiser quoi que ce soit dans l'urgence quand on s'est appliqué à en désorganiser systématiquement les services postaux...

La maladie, d'autre part, réalise une condition de force majeure permettant de ne pas se soumettre à la réquisition:
- par les temps qui courent, nul ne peut contester à quiconque le droit à une bonne gastro-entérite virale ou à une intoxication alimentaire;
- il suffira d'appliquer les critères hautement discriminatifs qui ont permis aux autorités sanitaires d'accréditer l'existence d'une pandémie (fièvre à 38°C, un peu de toux) pour

s'autodiagnostiquer une grippe porcine et justifier les mesures d'isolement qui en découlent (Madame Bachelot ne pouvant, alors, que se féliciter de voir les contrevenants contribuer à crédibiliser le mythe d'une pandémie en constante croissance - auquel est s'est tellement consacrée...)

Avant mercredi 11/11/09 au soir, une analyse juridique viendra compléter les remarques qui précèdent. Dans l'entre temps, il est recommandé aux internautes de faire circuler au maximum le présent article.

THE FLU CASE

Marc Girard advises French health workers to practise non cooperation

The Flu Case, 10 Novembre 2009
https://web.archive.org/web/20100102041130/http://theflucase.com/index.php?option=com_content&view=article&id=1726%3Amarc-girard-advises-french-health-workers-to-practise-non-cooperation&catid=1%3Alatest-news&Itemid=64&lang=en

Dr Marc Girard has advised health professionals in France who have received letters from the government ordering them to participate in the mass "swine flu" vaccination campaign to practise non cooperation.

He notes the importance of collective resistance and says that the French government has rolled back its vaccination plans whenever the protests have been strong enough; he also suggests that plans to make the swine flu jab compulsory for the French Gendarmerie/Police and their families could soon be abandoned by the government.

He says health workers who have got a notice ordering them to turn up for service in a "vaccine center" could say that they are sick.

For example, a high fever of 38 degrees could be detected and health professional could perform a self diagnosis and attribute their illness to the "swine flu", a pandemic virus that justifies isolation.

"[The French Health Minister] Madame Bachelot can only be overjoyed to see events contributing to the credibility ot the myth that there is a pandemic that is constantly growing - to which she is so devoted...", Girard writes.

JIM.fr JOURNAL INTERNATIONAL DE MEDECINE

Vaccination des professionnels de santé: ça ne se bouscule quand même pas!

Journal International de Médecine, 10 Novembre 2009
https://web.archive.org/web/20100102054409/http://theflucase.com/index.php?option=com_content&view=article&id=1740%3Aonly-10-of-french-doctors-and-nurses-take-the-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

… ne semble pas avoir l'optimisme arithmétique (...):

«On a parlé de désaffection des professionnels de santé pour la vaccination, de début poussif, certains ont même parlé d'échec, un de ces experts (…) a même parlé de bide. Qu'en est-il vraiment? Je vous laisse juge : ils seront ce soir plus de 80 000 praticiens hospitaliers, médecins et infirmiers de ville à être vaccinés. Je dis bien 80 000». Ces chiffres méritent-ils cependant tant d'être répétés? Au regard des 800 000 professionnels de santé principalement visés par la campagne et du million de soignants que compte la France, il semble que moins de 10 % des personnes visées aient pour l'heure répondu à l'appel.

34 praticiens libéraux immunisés pour un bassin de population de 300 000 personnes!

C'est d'ailleurs ce dont témoigne également des chiffres rendus publics la semaine dernière. Ainsi, mercredi 4 novembre, l'Assistance publique des hôpitaux de Paris recensait 7 000 vaccinations, soit moins de 10 % de ses effectifs. Le lendemain, dans un communiqué commun, MG France, la Coordination médicale hospitalière et le Syndicat national de médecins, chirurgiens, spécialistes biologistes et pharmacien des hôpitaux publics (SNAM-HP) indiquaient que seuls 7 % des professionnels de santé hospitaliers auraient choisi de se faire vacciner. Par ailleurs, des données officielles du ministère de la santé confirmaient que selon les établissements, la couverture vaccinale variait entre 2 et 10 %.

Sur le terrain, les informations délivrées par les praticiens responsables de la vaccination confirment ce que Roselyne Bachelot refuse de devoir appeler une «désaffection». Ainsi, le chef du service «microbiologie et hygiène» d'un établissement francilien, contacté par le JIM, indique qu'au sein de son hôpital comptant 1900 personnes, seules 91 avaient choisi de se faire immuniser vendredi 6 novembre, ce qui correspond à 4 % du personnel. Concernant les praticiens libéraux, le spécialiste soulignait qu'au vu des demandes de rendez-vous enregistrées et des personnes s'étant déjà présentées à l'hôpital, une trentaine serait vaccinée « avant l'ouverture des centres dédiés». Ces résultats concernent un établissement situé dans un bassin de population comptant 300 000 personnes… qui bénéficieront donc le 12 novembre de 34 praticiens libéraux immunisés !

Roselyne Bachelot vaccinée le 12 novembre!

A l'heure des questions des journalistes, ce matin, l'équipe de Roselyne Bachelot se montrait un peu moins triomphaliste. Ainsi, le directeur général de la Santé, Didier Houssin, confirmait qu'il s'agissait d'un «faible pourcentage», qu'il évaluait «autour de 10 %». Cependant, il soulignait qu'il était sans doute «un peu tôt pour juger de la couverture vaccinale». Dans la lignée de son directeur général de la Santé, le ministre tempéra également son enthousiasme en remarquant que si les chiffres

étaient «encourageants», ils n'étaient pas «satisfaisants». Elle tint cependant à rappeler que de nettes différences prévalaient en fonction des hôpitaux, non seulement en raison d'organisations logistiques diverses, mais aussi en fonction «de l'histoire de l'épidémie». «Je pense par exemple à cet hôpital où deux nourrissons et deux femmes enceintes ont été hospitalisés» souffrant de formes sévères de la grippe A (H1N1), et où «les demandes de vaccination ont été beaucoup plus importantes» observe-t-elle.

Quelques minutes plus tôt lors de son exposé, le ministre avait évoqué le «décès dramatique d'une patiente au CH de Nice la semaine dernière très vraisemblablement contaminée au sein même de l'hôpital [qui] doit rappeler chaque professionnel, chaque personne au contact des plus fragiles d'entre nous au sens des responsabilités». Et pour témoigner qu'elle n'hésite pas elle-même à prendre ses responsabilités, Roselyne Bachelot a annoncé qu'elle se ferait vacciner le jeudi 12 novembre. Elle confirmera ainsi qu'elle fait toute confiance aux premiers rapports de pharmacovigilance qui ne font apparaître aucun trouble majeur associé à la vaccination contre la grippe A (H1N1). Ainsi, pour 50 000 personnes immunisées, une trentaine d'effets indésirables «d'intensité bénigne à modérée» ont été rapportés.

THE FLU CASE

Only 10% of French doctors and nurses take the swine flu jab

The Flu Case, 11 Novembre 2009

https://web.archive.org/web/20100102054409/http://theflucase.com/index.php?option=com_content&view=article&id=1740%3Aonly-10-of-french-doctors-and-nurses-take-the-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

As few as 2% of the health care workers in some hospitals in France have taken the swine flu jab according to the French Health Ministry in spite of intense media hype about the swine flu pandemic and government pressure for a 100 % of health workers to take the shot.

A total of 80,000 out of 800,000 doctors and nurses and health care workers took the jab in France in the first phase of the country's mass swine flu vaccination campaign, reports Journal International de Medecine.

The head of microbiology and hygene department reported that only 91 out of its 1,900 staff had taken the swine flu jab by November 6th, which amounts to about 4 %.

Medical Doctor retracts H1N1 vaccine advice after reading insert

Raiva Escondida // Prisonplnet.com, 14 Novembro 2009
https://raivaescondida.wordpress.com/tag/swine-flu/
https://www.youtube.com/watch?v=r051fXtfng8

The following video highlights a retraction made by a medical doctor, **Dr. Roby Mitchell**, after he initially advised a group of nurses to take the H1N1 Swine Flu vaccine.

Once he had read the actual package insert which comes with the vaccine and realized that the vaccine makers themselves admit it is untested and may cause a myriad of disorders to include paralysis, neurological damage, possible sterilization and may cause fetal harm in pregnant women (one of the high priority groups targeted to get the vaccine), he retracted his advice so that they would have informed consent.

His reading of the insert also revealed that an adjuvant called MF 59, which is similar to the squalene molecule found in our normal nerve tissue, is indeed in the H1N1 vaccine after we've been told that adjuvants had been removed.

We need more doctors like this one in our country who use their common sense and not talking points from the media and pharmaceutical industry when giving advice to their patients and colleagues. My sincere compliments go out to Dr. Mitchell.

ΤΟΞΟΤΗΣ

Καταπληκτική στάση νοσηλευτών και γιατρών με αποχή στο "πρόγραμμα εμβολιασμού"

ViclyToxotis, 17 Νοεμβρίου 2009

https://web.archive.org/web/20101016121107/http://vickytoxotis.blogspot.com/2009/11/blog-post_9252.html

Σύμφωνα με διάφορα δημοσιεύματα τύπου, οι γιατροί και νοσηλευτές της χώρας μας ακολουθούν τη γραμμή που τήρησαν ήδη συνάδελφοι τους στην Ευρώπη και τις ΗΠΑ, απέχοντας από το πρόγραμμα εμβολιασμού για τη "νέα γρίπη". Η πλειοψηφία των γιατρών και του νοσηλευτικού προσωπικού των νοσοκομείων δεν προσήλθε για να εμβολιαστεί, δίνοντας το παράδειγμα στους υπόλοιπους πολίτες.

Βέβαια τα "ευχάριστα" για εμάς νέα, είναι αρνητικά για τις "αρμόδιες υπηρεσίες" που επί μήνες τρομοκρατούν τους πολίτες για να τους πείσουν με κάθε μέσο να εμβολιαστούν... κλασικό παράδειγμα η κ. Γιαμαρέλου που συνεχίζει να σνομπάρει τη στάση των γιατρών, μιλώντας για "έλλειψη επιστημονικής βάσης" για την επιφυλακτική στάση που τηρείται... με το μη-επιστημονικό επιχείρημα της "πως εμβολιάστηκαν -τάχα- εκατομμύρια άνθρωποι στον κόσμο και άρα δεν υπάρχει λόγος ανησυχίας"... Αμελεί φυσικά -εσκεμμένα- να αναφερθεί σε επιστημονικές έρευνες που αποδυκνίουν το γεγονός πως πολλές από τις άσχημες συνέπειες των εμβολίων εμφανίζονται μήνες ή και χρόνια μετά τον εμβολιασμό... Αλήθεια για τίνος το καλό κόπτεται η κυρία? της υγείας των πολιτών ή της τσέπης των φαρμακοβιομηχανιών και των σκοπιμοτήτων του ΠΟΥ?...

Γιατί δεν μπορούν πλέον να αρνηθούν πως δίχως την εναλλακτική ενημέρωση... ίσως και να είχαν πετύχει τα σκοτεινά σχέδια τους...

Ενδεικτικά διαβάζουμε στο in.gr:
Κατώτερη των προσδοκιών η ανταπόκριση στο πρόγραμμα εμβολιασμού κατά της νέας γρίπης

Όσον αφορά στο πρόγραμμα εμβολιασμού που ξεκίνησε τη Δευτέρα από το προσωπικό των νοσοκομείων, τα στοιχεία είναι μάλλον απογοητευτικά, αφού η πλειονότητα των ιατρών και των νοσηλευτών επέλεξαν να μην εμβολιαστούν.

Είναι αυτό που έλεγα παραπάνω: το δικό μας καλό μοιάζει "απογοητευτικό" για κάποιους άλλους ...

- Στο εμβολιαστικό κέντρο του Ερυθρού Σταυρού χορηγήθηκαν μόλις 79 εμβόλια -και από αυτά τα 20 έλαβαν χρόνια πάσχοντες που ανήκουν στην ομάδα υψηλού κινδύνου.
- Στο Γενικό Κρατικό εμβολιάστηκαν περίπου 50-55 γιατροί και νοσηλευτές και έξι πολίτες,
- ενώ στον Ευαγγελισμό -το μεγαλύτερο νοσοκομείο της Αττικής με περίπου 3.000 εργαζόμενους- εμβολιάστηκαν μόνο 60 γιατροί και νοσηλευτές.

Ανάλογη είναι η εικόνα και για τα νοσοκομεία της Θεσσαλονίκης.

- Στο νοσοκομείο ΑΧΕΠΑ προσήλθαν μόλις 40 εργαζόμενοι σε σύνολο άνω των 1.000, ενώ
- στο νοσοκομείο «Παπαγεωργίου» μόλις 10 από τους συνολικά 1.200 εργαζομένους.

Σημαντικός κρίνεται ο αντίκτυπος που είχαν δηλώσεις του προέδρου της Επιτροπής για την Πανδημία της Γρίπης του νοσοκομείου «Αγιος Παύλος» κ. Στρατή Πλωμαρίτη, ο οποίος παραιτήθηκε από τη θέση του εκφράζοντας σοβαρές επιφυλάξεις ως προς την αναγκαιότητα του εμβολίου.

Είναι χαρακτηριστικό πως στο νοσοκομείο «Αγ.Παύλος» δεν εμβολιάστηκε κανείς από τους συνολικά 750 εργαζομένους.

Μπράβο στον κύριο Πλωμαρίτη, που με την έντιμη στάση του σώζει τουλάχιστον 750 ανθρώπους από τον βέβαιο κίνδυνο των τοξικών εμβολίων! Μπράβο και σε όλους τους άλλους έντιμους λειτουργούς στο χώρο της υγείας που με το παράδειγμα τους δείχνουν στους πολίτες την ορθή στάση στο συγκεκριμένο ζήτημα. Μακάρι να είχαμε περισσότερους γιατρούς που να τιμούν τον όρκο τους... Λέμε εμείς βέβαια, γιατί οι "αρμόδιοι" του τρομο-εμβολιαστικού προγράμματος συνεχίζουν να εφησυχάζουν για την "δήθεν ασφάλεια" του τοξικού σκευάσματος και "ελπίζουν", όπως διαβάζουμε παρακάτω, να κάμψουν την εύστοχη άρνηση γιατρών και πολιτών να εμβολιαστούν.:

Οι υπεύθυνοι του προγράμματος εμβολιασμού ελπίζουν πως τις προσεχείς ημέρες η ανταπόκριση των ιατρών και των νοσηλευτών θα είναι μεγαλύτερη.

Η πρόεδρος της Επιτροπής Πανδημίας Γρίπης Ελένη Γιαμαρέλλου δήλωσε, από την πλευρά της, πως δεν υπάρχει επιστημονική βάση στις επιφυλάξεις που εκφράζονται.

«Οι Έλληνες είμαστε συγκριτικά με άλλους Ευρωπαίους σε ευνοϊκότερη θέση, δεδομένου πως ήδη έχουν εμβολιαστεί στο κόσμο εκατομμύρια άνθρωποι και άρα γνωρίζουμε πλέον πως δεν συντρέχει λόγος ανησυχίας» ανέφερε.

Τα "εύκολα" συμπεράσματα της κ. Γιαμαρέλλου, φανερώνουν την πλήρη συγκάλυψη της αλήθειας που τόσοι άλλοι γιατροί επισημαίνουν... (όπως στην αμέσως προηγούμενη ανάρτηση) και δεν χρειάζεται να πουμε πως δεν αξίζει να τα πιστεύουμε, αφού "καθήκον" των "αρμόδιων φορέων πανδημίας" είναι όχι η υγεία μας, αλλά η τυφλή προώθηση των εντολών που λαμβάνουν από τους "προϊσταμένους τους"...

THE FLU CASE

Greek Doctors stay away from vaccination programme

The Flu Case, 17 November 2009
https://web.archive.org/web/20100102024152/http://theflucase.com/index.php?option=com_content&view=article&id=1848%3Agreek-doctors-and-nurses-shun-swine-flu-jab&catid=41%3Ahighlighted-news&Itemid=105&lang=en

According to various news items appearing in the Greek media, the doctors and nurses of Greece are following the line already marked out by their colleagues in Europe and the USA, staying away from the vaccination programme for the "new flu". Most doctors and other medical staff at the hospitals have not gone to be vaccinated, setting the example for other citizens.

Of course, this news which is so pleasing to us is displeasing to the "authorities", who for months now have been trying to frighten citizens, pressuring them in every possible way to be vaccinated. The classic example is Mrs. Giamarellou, who is continuing to a deplore the stance of the doctors, speaking of a "lack of scientific foundation" for the doctors' present stance of reluctance, employing the unscientific argument that "millions of people in the world have been vaccinated, so that there are no grounds for anxiety." She neglects of course, apparently deliberately, to mention the scientific studies that indicate the fact that many of the unpleasant consequences of vaccines appear months and years after the vaccination. … Truly, whose benefit does this lady have in mind? Is she interested in people's health or the pockets of pharmaceutical companies and the agendas of the WHO?

Because it is undeniable that if it weren't for alternative information services, she may well have succeeded in her dark plans.

Response less than expected to the vaccination programme against the new flu.

As far as the vaccination programme is concerned, which started on Monday with hospital staff, the data appear disappointing, as most doctors and nurses chose not to be vaccinated.

(As indicated, what is good for us is "disappointing" for some others.)

- At the Red Cross vaccination centre only 79 vaccinations were administered – and of these 20 went to people belonging to the high-risk group.
- At the General State around 50-55 doctors and nurses were vaccinated and six members of the public.
- At the Evangelismos – the largest hospital in Attica, with around 3,000 employees, only 60 doctors and nurses were vaccinated.

The picture was similar in the hospitals of Thessaloniki.
- At the AHEPA hospital only 40 of the staff, of a total of 1,000, turned up to be vaccinated.
- At the Papageorgiou hospital 10 out of 1,200 turned up.

It is judged that the statements of the President of the Committee for the Influenza Pandemic at the St. Paul hospital, Stratos Plomaritis, had a significant effect. Dr. Plomaritis resigned from his position, expressing reservations as to the necessity for the vaccination.

It is characteristic that at the St. Paul hospital nobody was vaccinated, of a total staff of 750.

Congratulations to Dr. Plomaritis and to all the principled medical specialists who are respecting the vows they have taken.

But the "officials" of the "vaccinate in fear" programme are continuing to issue reassurances and to hope that the resistance of doctors and of the public will bend.

The President of the Committee for the Influenza Pandemic Eleni Giamarellou stated that there is no scientific foundation for the reservations being expressed.

"We Greeks are in a relatively favourable position compared to other Europeans, given that millions of people in the world have already been vaccinated, so that we know there are no grounds for anxiety."

Greek Doctors and Nurses shun Swine Flu jab

The Flu Case, 17 November 2009 13:55
https://web.archive.org/web/20100102024152/http://theflucase.com/index.php?option=com_content&view=article&id=1848%3Agreek-doctors-and-nurses-shun-swine-flu-jab&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Allgemeine Zeitung

Armin Burkart

Arzt lehnt Impfungen ab

Allgemeine Zeitung, 20 November 2009
https://web.archive.org/web/20091123072808/http://www.allgemeine-zeitung.de/region/alzey/alzey/7897806.htm

Schweinegrippe Vorsitzender des Gesundheitsnetzes nennt Wirkstoffverstärker als Grund.

Framersheim. Der Vorsitzende des Gesundheitsnetzes Alzey und Framersheimer Hausarzt, Dr. Friedel Rohr, lehnt Impfungen gegen die "Schweinegrippe" ab. "Ich impfe meine Patienten auf Wunsch gegen die saisonale Grippe und empfehle diese Impfung auch, biete aber keine Impfungen gegen H1N1 (Schweinegrippe) an", sagte Rohr.

Der Framersheimer Arzt begründet seine Ablehnung in erster Linie mit dem in dem "Schweine-geripppe-Impfstoff" enthaltenen Verstärker. Hier habe die alte Bundesregierung von Anfang an falsch informiert, "da ist massiv gelogen worden", protestiert Dr. Rohr. So sei die Behauptung unwahr, der Impfverstärker sei notwendig, weil die Pharmaindustrie sonst nicht ausreichend Zeit gehabt hätte, genügend Impfstoff zu produzieren. "Auf der ganzen Welt steht ausreichend Impfstoff ohne Verstärker zur Verfügung", behauptet Dr. Rohr. "Das Bundesgesundheitsministerium hat die Öffentlichkeit getäuscht. Für die Mitglieder des Bundestages wurde verstärkerfreier Impfstoff gefordert, während für die Bevölkerung der risikoreichere Impfstoff mit Verstärker bei der Pharmaindustrie bestellt wurde." Im Alzeyer Raum lehnten eine ganze Reihe von Ärzten ebenfalls die Impfung ab: "Nur fünf oder sechs Kollegen haben sich entschlossen zu impfen."

Dr. Rohr sieht inzwischen seine Skepsis bestätigt. In der Schweiz sei die Impfung für Kinder unter fünf Jahre und ältere Menschen verboten worden, in Deutschland werde inzwischen empfohlen, Schwangere nicht zu impfen. "Außerdem ist bekannt, dass bei 30 Prozent der Menschen die sich impfen lassen, Probleme auftreten", weiß Dr. Rohr. Er behandele seit drei Wochen in seiner Praxis eine Patientin, die nach der Impfung gegen "Schweinegerippe" an starken Nebenerscheinungen leide. "Diesen Risiken setze ich meine Patienten nicht aus, zumal die an `Schweinegrippe` erkrankten Personen, wenn sie direkt zum Arzt gehen, gut behandelt werden können."

Dr. Ralf Schneider, Alzey, bietet Impfungen gegen "Schweinegrippe" an und hat inzwischen etwa 150 Patienten geimpft. "Nur zwei waren danach bisher für einige Tage arbeitsunfähig", so Schneider. Täglich habe er jedoch auch sechs bis zehn Verdachtsfälle von Schweinegrippe in seiner Praxis. Ich selbst habe mich impfen lassen und hatte danach für zwei Tage leichtes Fieber", berichtet Schneider von seinen Erfahrungen.

"Bisher wissen wir, die Schweinegrippe verläuft meistens harmlos. Wir wissen auch, die Impfungen mit dem Impfverstärker haben mehr Nebenwirkungen als wir das aus bisherigen Immunisierungen kennen. Wir wissen aber nicht, was in den nächsten Monaten an Erkrankungen noch alles auf uns zukommt", so der Arzt. "Ich kläre prinzipiell meine Patienten über Nutzen und Risiken auf und dränge niemanden sich impfen zu lassen. Das muss jeder für sich selbst entscheiden", meint Dr. Schneider.

THE FLU CASE

German doctor accuses health ministry of "massive lies" concerning adjuvant squalene

The Flu Case, 20 November 2009, 15:37

https://web.archive.org/web/20100102054827/http://theflucase.com/index.php?option=com_content&view=article&id=1990%3Agerman-doctor-accuses-health-ministry-of-qmassive-liesq-concerning-adjuvant-squalene&catid=1%3Alatest-news&Itemid=64&lang=en

The head of the Health Net of Alzey und Framersheimer, GP Dr Friedel Rohr, has accused the German Health Ministry of deceiving the general public about the risks associated with the swine flu jab.

In a report in the local newspaper, Allgemine Zeitung, Alzey, Rohr said that there had been "massive lies" on the part of the German government concerning the jab and the adjuvant squalene.

He said it was not true to say that the adjuvant was needed by the pharmaceutical industry because there was too little vaccine to go round.

"There is sufficient vaccine without adjuvants in the whole world," he said.

Rohr also said that about 30 per cent of the people who took the swine flu jab developed problems.

He said he had been treating one woman for three weeks for serious side effects after taking the jab.

"I am not exposing my patients to this risk, especially as patients who become sick with the swine flu can be treated easily if they go directly to their doctor."

He said only five or six of his fellow doctors had decided to give the swine flu jab.

Der Impfwille hält sich in Grenzen

Thurgauer Zeitung, 20 Novembre 2009
https://web.archive.org/web/20091121151039/http://www.thurgauerzeitung.ch/thurgau/kanton/Der-Impfwille-haelt-sich-in-Grenzen/story/29896546

Die Schweinegrippe-Bilanz an den Spitälern: Zwei stationäre Patienten in Münsterlingen, acht Verdachtsfälle in Frauenfeld. Das Gesundheitspersonal gibt sich weiterhin impfkritisch.

Frauenfeld/Münsterlingen - Die Zahl der Grippefälle steigt in der Schweiz an. Im Spital Münsterlingen waren bisher zwei Patienten mit Schweinegrippe in Pflege, ein 40-jähriger Mann und vor Kurzem eine schwangere Frau. «Wir haben beide isoliert», sagt Infektiologe Martin Krause. Das Personal wurde mit Schürze und Mundschutz geschützt und hielt sich an eine «peinliche Handhygiene». Die Behandlung sei ohne Probleme verlaufen, beide konnten das Spital in der Zwischenzeit wieder verlassen. Im Spital Frauenfeld bestand in den letzten zehn Tagen bei acht Patienten der Verdacht auf Schweinegrippe.

220 Mitarbeiter geimpft

Die Spitäler appellieren an ihr Personal, sich impfen zu lassen, um eine Ausbreitung zu verhindern und die Ansteckung von Patienten zu vermeiden. Die Impf-Bereitschaft hält sich bis jetzt in Grenzen, ist aber grösser als bei der saisonalen Grippe-Impfung. Das belegen die aktuellen Zahlen. Seit zehn Tagen kann sich das Gesundheitspersonal im Thurgau gegen die Schweinegrippe impfen lassen. 220 Ärzte und Pflegepersonen des Spitals Frauenfeld haben dies bisher getan. Das sind 27 Prozent der Mitarbeiter, die mit Patienten in Kontakt stehen.

Es könnten noch mehr werden, da die Impfaktion noch nicht abgeschlossen ist. Personalarzt Philippe Rochat spricht schon jetzt von einer «erfreulichen Zahl». Denn bei der Impfung gegen die saisonale Grippe liegt der Prozentsatz um einiges tiefer – bei 18 Prozent. Im Kantonsspital Münsterlingen liessen aber auch gegen die Schweinegrippe nur 10 bis 15 Prozent der Mitarbeiter mit Patientenkontakt im Spital impfen. Für Kantonsarzt Max Dössegger ist dies zu wenig. Bei anderen Krankheiten sei eine Durchimpfrate von 85 Prozent erforderlich, um die weitere Ausbreitung zu stoppen. Er appelliert an die Berufsethik: «Mit der Impfung schützen die Pflegenden jene Menschen, die sie betreuen müssen.» Besonders in der Neugeborenen- und der Kinderabteilung sowie in der Frauenklinik sei es wichtig, dass das Personal geimpft sei.

«Frage der Verantwortung»

Während sich Ärzte eher impfen lassen, gilt insbesondere das Pflegepersonal als impfskeptisch. Katharina Linsi, Präsidentin der Ostschweizer Sektion des Berufsverbandes der Pflegefachfrauen und -männer (SBK), bestätigt diesen Eindruck. Sie hat sich unter Berufskolleginnen umgehört. Diese äusserten Bedenken, ob der Impfstoff genügend ausgetestet sei; dazu kommen Zweifel an der Wirksamkeit der Impfung und die Angst vor möglichen Nebenwirkungen.

Viele argumentieren auch, dass die Grippe für einen gesunden Menschen ja nicht so tragisch sei. «Die persönlichen Aspekte werden höher gewichtet als die professionellen», sagt Linsi, die selbst

geimpft ist. Für sie ist es eine Frage der Verantwortung: «Das Pflegepersonal hat täglich Kontakt zu vielen Menschen, die körperlich geschwächt sind. Je mehr sich impfen lassen, desto weniger verbreitet sich die Grippe.» Auch in Alters- und Pflegeheimen steht das Pflegepersonal der Schweinegrippe-Impfung kritisch gegenüber. Das sagt Dominique Nobel, Präsident von Curaviva Thurgau. Er rechnet mit einer tiefen Impfquote.

Die Impfung ist freiwillig. Dazu gezwungen werden kann niemand. Sollte sich die Pandemie-Lage verschärfen, sieht Kantonsarzt Dössegger Folgendes vor: «Man könnte das Personal anweisen, Masken zu tragen.» Eine andere Möglichkeit, die er in Betracht zieht, hat Genf gewählt. Dort tragen Pflegende einen Anstecker mit der Aufschrift: «Ich bin zu Ihrem Schutz geimpft.»

THE FLU CASE

Swiss doctors and nurses shun swine flu jab in spite of pressure

The Flu Case, 21 November 2009, 13:37
https://web.archive.org/web/20100102031700/http://theflucase.com/index.php?option=com_content&view=article&id=2010%3Aswiss-doctors-and-nurses-shun-swine-flu-jab-in-spite-of-pressure&catid=1%3Alatest-news&Itemid=64&lang=en

Doctors and nurses in Switzerland have been told that they will not be forced to take the swine flu jab if the "pandemic" escalates but will be given the option of wearing a face mask or possibly a stick with the statement: "I have been vaccinated for your protection."

Uptake of the swine flu jab among Swiss doctors and nurses remains low in spite of huge pressure.

Swine Flu Vaccine: Physicians' Rejection of the Injection

Mercola.com, 26 November 2009
http://articles.mercola.com/sites/articles/archive/2009/11/26/Swine-Flu-Vaccine-Physicians-Rejection-of-the-Injection.aspx
https://web.archive.org/web/20100102042539/http://theflucase.com/index.php?option=com_content&view=article&id=2092%3Aswine-flu-vaccine-physicians-rejection-of-the-injection-by-dr-mercola&catid=1%3Alatest-news&Itemid=64&lang=en

One senior physician at Pediatric Village is refusing to recommend H1N1 shots or nasal spray to any of her patients. She is one of a small cadre of outliers who remain skeptical about the government's unprecedented immunization campaign, citing doubts about the risks presented by the H1N1 virus or the safety of the vaccine.

"My feeling is that this is all being over-hyped," said Laurence J. Murphy, a pediatrician in Burke who also will not inoculate his patients. "Most people who get this virus do beautifully. I believe the vaccine hasn't been tested enough. I just think the benefit of it at this point is not outweighed by the possible risk."

Murphy said he has no reason to think the vaccine is unsafe – he, like many of the skeptics, said he generally supports vaccinations. But he wonders whether it was tested enough.

"They just didn't have the time to do that properly. They mean well and they are not doing anything to mislead people in any direct way. The reality is no one knows. I'm not pretending to know. I don't think they should pretend to know," he said.

"What bothers me is pretty much every doctor in the country is jumping on the bandwagon and saying, 'This vaccine is completely safe' – even for the pregnant woman and the unborn baby," said Bob Sears, of Orange County, Calif. "But they can't give you a single study that backs up that statement."

Scientists working to understand the genetic makeup of the H1N1 virus that causes the disease have linked it to a virus behind a 1998 swine flu outbreak at an industrial hog farm in Sampson County, North Carolina's leading hog producer. A virus related to the current outbreak was first identified a decade ago at a farm in the eastern North Carolina County.

The 1998 North Carolina outbreak began with pregnant sows developing high fevers. A state microbiologist who tested nasal samples taken from the animals was surprised to encounter a virus he didn't recognize – and his alarm grew when he found that some of the sick animals had been immunized for ordinary swine flu.

The H1N1 virus behind the current flu outbreak contains genetic material from birds, humans and pigs, though it's called "swine flu" because it's a type of virus that typically infects hogs.

If nothing else, the latest swine flu outbreak should spur governments to begin building a safer, more sustainable agricultural structure. And they must reach across national lines to do so, since neither agribusiness nor viruses are held back by borders.

THE FLU CASE

Susie Stone

**Doctors are speaking out about the dangers of H1N1 vaccine ...
have you heard the news?**

The Flu Case, 2 December 2009, 2:54 PM

https://web.archive.org/web/20100102020608/http://theflucase.com/index.php?option=com_content&view=article&id=2170%3Adoctors-are-speaking-out-about-the-dangers-of-h1n1-vaccinehave-you-heard-the-news-&catid=1%3Alatest-news&Itemid=64&lang=en

The media doesn't cover it and the CDC isn't telling; but numerous medical professionals have warned health authorities and continue to warn the public about the dangers and ineffectiveness of the vaccine.

Pediatrician, Laurence J. Murphy, will not inoculate his patients with the H1N1 vaccine, saying,"My feeling is that this is all being over-hyped, most people who get this virus do beautifully. I believe the vaccine hasn't been tested enough. I just think the benefit of it at this point is not outweighed by the possible risk." (The Washington Post)

More and more Americans are researching on their own and more and more doctors are presenting the dangers of H1N1 vaccine. Why? Because our health officials are NOT being truthful or providing the facts to the public. Health officials cannot, in all honesty and integrity, announce that the vaccine is "safe and effective," when research and the manufacturer's inserts state otherwise.

If our health officials are as professional and prudent as we would like to think, wouldn't it be advantageous to make sure everyone is fully informed of ALL THE RISKS...You are the one taking all those risks!

The flu shot is no guarantee against getting the flu

Dr. Anthony Morris, a distinguished virologist and former Chief Vaccine Office at the U.S. Federal Drug Administration (FDA), states that "There is no evidence that any influenza vaccine thus far developed is effective in preventing or mitigating any attack of influenza" and that "The producers of these vaccines know they are worthless, but they go on selling them anyway." (reported by Richard Gale and Dr. Gary Null)

Dr. Palevsky, M.D., F.A.A.P. explains, "More studies are coming out to show that the proper studies haven't been done; antibodies are not the final way in which your body is protected, there is a difference between how children process material through air and food versus through injection, there are particles in vaccines that do accumulate in your body and cause impairments in your immune system, there are particles in the vaccines that get into your brain, and there are foreign DNA particles that get into your body."

"Remember, as tragic as any death is, the greater tragedy is using the few deaths that have occurred – which were in most cases not directly caused by the H1N1 virus – as fuel to get rid of useless vaccines that may do more harm than good," Dr. Mercola.

Stay informed, eat well, live well.

Hospital workers lose jobs over flu shot

ABC 6 Action News, 4 December 2009.
https://web.archive.org/web/20091213053046/http://abclocal.go.com/wpvi/story?section=news/health&id=7153869

Philadelphia – December 4, 2009 (WPVI) – This year, the Children's Hospital of Philadelphia made it mandatory for employees to get the seasonal flu shot. There were some exemptions made for medical or religious reasons, but some employees were denied that exemption and because they wouldn't get the shot they lost their jobs.

"We're very concerned because this is our livelihood, this is our main source of income, my husband and I, we have a mortgage; we have 5 children," terminated employee Tyrika Cowlay said.

Tyrika and her husband are among nine CHOP employees who as of today lost their jobs due to refusing to be vaccinated against the seasonal flu.

They refused the vaccine based on religious beliefs. They are not the only ones.

"I'm just standing up for what I believe in and it's hard, it really is," terminated employee Khadijah Muhammad said.

Officials at CHOP say some religious exemption requests were accepted, others were not.

Rodney Bond, a CHOP employee of more than 30 years who is now terminated, says this is not fair.

"How do you pick and choose what religion is credible?" Bond said.

Dr. Susan Coffin, an infectious disease doctor at CHOP, says the decisions were made on a case-by-case basis and looked at whether employees have had other vaccinations in the past. The employees we spoke with say they either don't recall getting other shots or have chosen not to recently due to new religious beliefs.

The terminated workers offered to wear masks, but Dr. Coffin says masks aren't enough.

"We just can't rely on a somewhat flimsy mask to provide all the protection our patients need when we have another option," Dr. Coffin said.

She also says the decision to let workers go was not an easy, but again was done to protect patients.

"It's not right for our patients to come to our hospital, have us look them in the eye and say we are doing everything possible to keep you healthy and safe here knowing we have people who walk through the hallways when they are making a choice not to get vaccinated," Dr. Coffin said.

This shot in quesion was the seasonal flu vaccine, not the H1N1. The hospital did not make that vaccine mandatory due to the low supply of doses.

Le Parisien

Les futurs infirmiers contre les réquisitions

Le Parisien, 5 Décembre 2009, 07h00
https://www.leparisien.fr/paris-75/paris-75007/les-futurs-infirmiers-contre-les-requisitions-05-12-2009-733625.php

VII e . «Etudiants réquisitionnés, on n'est pas des boulets», «la vaccination tue la formation».

Blouse blanche et masque chirurgical sur le visage, plusieurs centaines d'étudiants infirmiers, venus de toute l'Ile-de-France, ont manifesté hier devant le ministère de la Santé, dans le VII e.

Objectif: dénoncer les conditions dans lesquelles ils sont réquisitionnés pour participer à la campagne de vaccination contre la grippe A/H1N1.

«Des cours et des stages sont supprimés, alors que nous passons les examens dans quelques mois», détaille Edouard, 24 ans, élève de troisième année à la Pitié-Salêpetrière (XIII e).

Une délégation a été reçue par le cabinet de Roselyne Bachelot dans l'après-midi.

«On nous a promis que la participation se ferait uniquement sur la base du volontariat. Mais nous restons vigilants», estimait un délégué syndical à l'issue de l'entretien.

L'envers du décors des camps de vaccination - Au secours!

News of Tomorrow, 5 Décembre 2009
https://web.archive.org/web/20091222045008/http://newsoftomorrow.org/spip.php?page=imprimir_articulo&id_article=6962

Le mot d'ordre est de vacciner a tous prix, quelque soit les risques!

Aujourd'hui se tenait une manifestation d'étudiants infirmiers devant le ministère de la santé pour dénoncer la situation dont ils sont les victimes et l'organisation scandaleuse des centres de vaccinations.

Je me suis rendu à cette manifestation... Et j'ai appris des choses! Environ un millier d'étudiants et "professeurs" sont venus, une délégation a été reçue par le ministère, mais rien, comme d'habitude dans les médias (si, 5 secondes sur TF1 qui ne disent rien sur le problème de fond).

Donc voilà la situation: depuis le 12 novembre, les centres de vaccination ont ouverts. La vaccination est faite par des étudiants infirmiers de troisième année, au départ volontaires. Puis il a fallut faire plus, et les réquisitions ont commencées.

- Des réquisitions illégales: un simple mail, des listes collectives, un coup de téléphone de la DDRAS. Rien d'écrit alors que la loi exige un courrier nominatif, signé par le préfet, afin de clarifier les horaires, les modalités de l'action, etc (on parle de santé quand même!

- Des menaces envers les étudiants et leur diplôme: Pendant plusieurs semaines, les infirmiers réquisitionnés se sont rendus aux centres, et aujourd'hui ils ont l'impression de s'être fait avoir. Vous ne venez pas vaccinez? Alors vous serez recalé pour le diplôme d'État! Mais surtout, tous doivent cesser leur stage indispensable pour leurs études, ils ne peuvent plus suivre les cours, ou sinon réussir à terminer un mémoire ou préparer des examens après des heures de réquisitions... d'autant plus que les professeurs/encadrants sont aussi réquisitionnés. Et du coup, les premières année et deuxième années se retrouvent... sans professeur! Du coup la carotte est la suivante: vous venez vaccinez et vous aurez votre diplôme sans problème (il ne vaudra rien). Avec à la clé, la menace d'envoyer les gendarmes à domicile si l'on optempère pas!

- Les details: Normalement, il était prévu deux séances de vacations par semaine, et non vaccinez presque sept jours sur sept, de 8 heures à 22 heures! D'autant plus que les étudiants ne sont pas rémunérés, ils doivent prendre à leur charge les transports, et ils sont souvent envoyés à des dizaines de kilomètres de là où ils habitent.

- La situation dans les centres: De nombreux étudiants sont venus témoignés. Ils dénoncent, et ce n'est pas des cas isolés:
- le fait qu'il n'y ait pas de gant pour vacciner! ouch:
- le manque d'organisation généralisé
- le flou autour de la vaccination des jeunes enfants, pas de consignes claires, dose de 0,25 ou 0,50 ça change d'un jour à l'autre
- les aiguilles ne sont pas adéquates

- un enfant de 8 ans fait un malaise, rien pour y faire face, dans tout un gymnase un seul brancard, une seule fiole d'adrénaline...
- les horaires sont épuisants, leur travail non rémunéré, pas de possibilité de se restaurer ou de boire sur place
- au moindre accident ils seront les premiers à être accusés, non assuré (pas de papier officiel)
- vacciner à tous prix, même les enfants avec des vaccins adjuvantés!
- il n'y a aucun contrôle d'identité à l'entrée, vous ou moi pourrions nous présenter comme médecin ou comme infirmier, pas de problème!
- les chefs de centre de vaccination sont méprisants vis à vis des infirmières
- plusieurs cas de séquestration (si, si!): les vestiaires avec les affaires des infirmières étaient fermés a clé par les chefs de centre pour qu'elles ne puissent pas partir!

Il y a donc un ras le bol général, puisque aujourd'hui il y a eu confirmation grâce à la délégation envoyée, que les réquisitions devaient se faire en bonne et du forme, et plus à l'encontre de la loi! Pendant plusieurs semaines, ils se sont fait avoir mais maintenant le mot d'ordre est le suivant: ne plus répondre au coup de fil de la DRASS, ne rien signer, ne plus se rendre au réquisitions qui sont illégales.

THE FLU CASE

French student nurses protest Squalor and Terror in Army-run vaccine camps

The Flu Case, 9 December 2009, 13:31
http://newsoftomorrow.org/spip.php?page=imprimir_articulo&id_article=6962
https://web.archive.org/web/20100102043441/http://theflucase.com/index.php?option=com_content&view=article&id=2205%3Afrench-student-nurses-protest-squalor-andterror-in-army-run-vaccine-camps&catid=41%3Ahighlighted-news&Itemid=105&lang=en

About a thousand student nurses and teachers staged a demonstration outside the Ministry of Health in Paris, France, on Saturday against a government order compelling them to work in the country's 1,100 swine flu vaccine centers as reports of disorganization, squalor and intimidation emerge.

The student nurses say they are being forced to work in inhuman conditions having to put in 14-hour days without proper breaks under a decree that compels them to work in the centers for no pay. Students who refuse report being escorted to the centers by the police.

Though student nurses are not allowed to give injections because they are not fully qualified, they are being made to work such long hours that they are unable to attend their regular classes.

They have to work seven days a week including Sunday from 8 am until 10 pm with barely a break in between in what appears to be part of a well-known tactic to keep people so stressed that they have no time to organize a protest.

They have to pay for the costs of travelling often long distances to the vaccine centers out of their own pocket and are obliged to stay there until 10:30 pm.

The heads of the nursing school are reported to be putting intense pressure on the students to do their "duty" and give people jabs with the untested swine flu vaccine in the centers, the students say. Teachers are also being requisitioned, leaving the first and second years without instructors.

The students have been promised they will get their certificates without doing their exams as long as they work in the swine flu jab centers.

Students from the third year on were first asked to work in the vaccine centres on a voluntary basis but this changed in November, and now student nurses are being summoned to forced work by a phone call. The law on requisitions requires the summons to be delivered by a letter. However, the authority, DRASS phones students out of the blue with immediate demands.

Students working in the centers report chaos, the administration of arbitrary doses of swine flu vaccines as well as the absence of proper provisions to treat people who suffer a reaction to the jab.

A child of 8 who became sick after getting the jab could not immediately be helped because there were no adequate facilities with limited availability of even flowing water, one witness report.

The student nurses also say the doses they are ordered to give can vary from day to day for no apparent reason. People can wonder in and out of the vaccination zone with minimal security checks.

Babies are being given jabs with untested adjuvants. Nurses who resist are ordered to give the jab by their center's management.

The nurses report they are not allowed to rest or take a break; if there is a problem, they are the first to be accused.

Papers are also taken from them and put under lock and key.

The swine flu vaccine centers appear to be run by the army or branches of the police or fire services under the direction of the prefect of each department.

At least 100 to 150 army medical corps vaccination teams are reported to be already at work in the vaccine centers underling the military character of the vaccine campaign.

Family doctors have been systematically excluded from participating in the swine flu campaign on the orders of the government.

Very few nurses and doctors volunteered to work in the centers leading to the government requisitioning medical personnel to give the jab as well as units from the controversial army medical corps, which produces Tamiflu for Roche.

Only doctors can refuse the requisition order if they pay a fine of 3750 euros.

The mainstream media in France is not reporting the concerns of the nurses and doctors. TF1 showed only a clip of a few seconds of the nurses protest on Saturday outside the ministry of health when a delegation met government officials.

However, even the sanitized mainstream media clips of the vaccine centers portray as the vaccination campaign that resembles a military operation in an occupied country rather than a medical programme.

One video shows people standing in the freezing cold for up to four hours in the cold outside a center.

https://www.youtube.com/watch?v=TQkSs0Sus7Q

What appear to be security or army personnel open chained gates and wave people on with hand signals.

Inside the centers, people stand in overcrowded corridors.

Most of the sports hall is taken up with an administration area comprising metal barriers, a group of tables with numerous white tents that serve as the injection cubicles.

New arrivals are crowded together in the remaining portion having to wait in lines to register.

Another video shows the same long queues and overcrowding in a center in Lyon run by Lieutenant Colonel Claude Guillard, a high-ranking commander in the Rhone department firefighting services.

http://www.youtube.com/watch?v=bo-GV2A6do4

Nurses are seen wearing plastic overcoats and gloves. People are being shown injected with the swine flu vaccine sitting on a chair in front of desks covered with papers. There appear to be minimum hygiene provisions.

Many of the centres have security locks on the orders of the government, sparking fears that at some point the government is planning to make the vaccination compulsory.

The pictures of long lines of freezing people waiting for hours in the cold with their children are reminiscent of war zones.

The nurses are now protesting the illegal requisition orders made by phone and the illegal requirement to give toxic substances to their fellow human beings.

In a campaign of non compliance, they are refusing to go and refusing to sign any papers.

Criminal charges should be brought against DRASS, the management of nursing schools and vaccine centers, the government and the pharmaceutical companies for using illegal means to force student nurses to carry out illegal orders that potentially result in harm to other people.

THE FLU CASE

Are Doctors using their Ingenuity to avoid giving the soft Kill Jab?

The Flu Case, 18 December 2009, 12:03
https://web.archive.org/web/20100220010807/http://www.theflucase.com/index.php?option=com_content&view=article&id=2328%3Aare-doctors-using-their-ingenuity-to-circumvent-giving-the-soft-kill-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Reports are coming in that doctors are using various methods to ensure that they do not give patients the toxic and untested swine flu jab in spite of orders from authorities.

This is a report from Europe:

"A friend of mine knows an [elderly] lady, who was addressed by the authorities to get vaccinated as she belongs to a risk group.

So, at the appointed time a woman-doctor (paid by the state) came to her home, prepared all the necessary stuff with syringe etc and held a ball of cotton-wool in her hand, which she positioned beside the spot where the injection should take place. The doctor only stang slightly and shortly into the skin - the lady did not feel any liquid entering her arm - and she supposes that the doctor had the whole lot of vaccine flow into the ball of cotton-wool outside .... a genius way for doctors, to do their duty without harming people .... in case there is no chip in the tip of the needle," emails a person.

Doctors advise not to vaccinate against influenza A (H1N1)

Ennahar, 31 December 2009 12:05:00

https://web.archive.org/web/20100105194601/http://www.ennaharonline.com/en/news/2754.html

Algiers. – The department of epidemiology and preventive medicine at the University Hospital of Beni Messous has not experienced rush to vaccinate against influenza A (H1N1). Apart from doctors and staff working in the health sector, few people appeared to be vaccinated.

It was eleven o'clock when we headed to the epidemiological and preventive medicine services where we had found only service employees whose opinions were divided between those for and those against. Those who have been vaccinated believe that the vaccine was effective to protect against the flu that kills.

Professor Soukhal Abdelkrim, head of epidemiology department was the first to be vaccinated. He declared that the vaccine is a need to guard against the epidemic spreading in recent times and that resulted in casualties. The influenza A (H1N1), according to the professor, attacks the immune system and lung cells in 24 hours because of its ability to multiply.

Poor regions are more vulnerable due to lack of conditions of life, including health. *Nutrition plays a very important role* as according to him and these regions are therefore more exposed to the dangers of the virus of swine influenza. The influenza A (H1N1), according to our interlocutor, can live up to 5 minutes in the palm of the hand, 12 hours on clothing and 48 hours on iron, which helps its quick spread. He added that the only way is to get vaccinated to stop the spread of this virus.

Mohamed, a nurse, decided not to get vaccinated, because he believes the department thinks about something else rather than take charge of their claims relating to health employees status and the issue of wages. Mohammed tells us that he and his family will be a prey to the virus because of malnutrition. He adds that their "rights are violated and the department has not deigned to take into consideration their social situation while it is concerned about the swine flu. "Hunger will kill us before the virus," he says.

In France they say it is not efficient

Soumia is also a nurse, she refused to be vaccinated regardless of conditions. She said she had followed the hype surrounding the vaccine campaign in France whose conclusion was that the evil was greater than the benefit of the vaccine. Prevention, she said, remains the best way to guard against swine flu.

Hamida, housewife: "My doctor recommended me not to be vaccinate"

Ali, a doctor in the service of Epidemiology: "I will immediately get vaccinated; I will not wait until I catch the disease to cure.

Expert Explains the Flu Vaccine Deception and the Swine Flu Hoax

Tandhälso-förbundet, 5 January 2010
https://www.tf.nu/artiklar/expert-explains-the-flu-vaccine-deception-and-the-swine-flu-hoax/

Dr. Shiv Chopra was a drug company insider, and also worked for what is now Health Canada -- the Canadian equivalent of the FDA. He is uniquely qualified to explain why no flu vaccine has ever worked, and that swine flu and avian flu are nothing more than hoaxes.

Expert Explains the Flu Vaccine Deception and the Swine Flu Hoax

Dr. Mercola's Comments:

I met Dr. Chopra while we were both attending the National Vaccine Information Center's "4th International Conference on Vaccines" in Washington D.C. He was clearly one of the top leading experts there, giving an enormously compelling and effective presentation that got rounds of standing ovations.

Dr. Chopra is an insider; he was hired by the drug companies and worked with vaccine development in Europe. He has also worked for the Canadian government, in the equivalent of the FDA. He was a senior scientific advisor for what is now Health Canada for 20 years, working primarily in vaccines and antibiotics.

So with respect to vaccines, the understanding of them and the history and the regulatory authorities that are involved with them, there are really very few people in the entire world who are more qualified than Dr. Chopra to comment on the issues, specifically swine flu.

And that is why I am so excited to share this interview with all of you.

Swine Flu: True Claims or Mere Hoax?

Is swine flu really a devastating pandemic that may wipe out large numbers of people? Are you doing yourself disservice by not getting the vaccine? According to Dr. Chopra, no and no way.

He states:

"No flu vaccine has ever worked. Swine flu, we don't even know there is such a thing. It's a misnomer. Avian [bird] flu, these are all made-up things. The whole thing is a hoax. It has been for the last 10 years. First they started with the avian flu, and then swine flu."

For those of you who don't remember, the bird flu epidemic – predicted to kill some 2 million Americans – turned out to be a whole lot of hot air, and not much else. This is why I wrote the book The Great Bird Flu Hoax.

Dr. Chopra was really one of the earliest advocates to warn that the bird flu was a hoax, and he explains that nobody really knows to this day what all of the major influenza epidemics of the past really were – including the 1918 flu epidemic.

"How come they never talked about this influenza in India? We never heard of it. I never heard of it. Remember, this swine flu at that time was originally called Spanish flu, and the Spanish called it French flu because the two countries were on the opposite sides of the war. And then eventually they settled on swine flu. Again, nobody knew if that was really swine flu because we didn't know how to isolate a virus at that time," Dr. Chopra says.

"There were no tissue cultures and the viruses didn't grow outside living cells. We know a lot of people died; exactly what they died of, it could be swine flu, the virus, or pneumonia. We didn't have any antibiotics at that time. So complications may have killed them. It's even possible as some people say it was: with influenza you get fairly high fever, with some flu you get higher fever.

The aspirin at the time was a thing to reduce your body temperature. People say too much aspirin – there were no controls, we didn't know how aspirin really worked and what damage it did. Some people may have died from internal bleeding, by taking too much aspirin and trying to bring the temperature down," he continues.

How Did Vaccines Come to be Trusted?

You may remember the 1976 swine flu epidemic, which also never materialized. Dr. Chopra shares the inside story on how it materialized and why so many people jumped on the vaccine bandwagon:

"All of a sudden, a rumor came out: an American marine had died of influenza and it was swine influenza. Nobody compared it to the actual swine influenza … Nobody also revealed that that soldier on that day had run 12 miles. With a fever going, this can happen: he died. This became a reality for America. They said, "There's going to be a major epidemic, a pandemic. It's going to kill millions of people around the world. At least we're going to take care of America"."

So Merck was contracted to produce a swine flu vaccine for every single American. The American population at that time was 250 million, so 250 million doses were taken care of at that time for the United States.

We were next door in Canada. I was working on these issues, too, and we had a high-powered meeting. What are we going to do? We approached Merck and Merck said, "We don't have enough vaccine. We only have for the Americans. We don't have for you." So Canada ran around to bu y the vaccine at that time.

We had a company in Toronto: Canadian company Canada Laboratories, who used to make insulin and so on. They said, "We can't make it but we can get it for you from Glaxo." So a contract we proposed for 21 million doses because Canada's population at that time was 21 million. Now it's 33.

So we prepared a contract. I was sitting there in this meeting and said, "You know, people, let's really consider: is it necessary?

I said that in 1968, I used to live in England. When that epidemic occurred at that time in England, they were saying they don't have enough vaccine; it will only be given to senior executives and important people. Because I worked in a pharmaceutical company as a senior executive, I was offered the vaccine.

But I didn't take it. So I left and I said in this meeting in '76 in Canada that I didn't take the vaccine. The funny thing is, I was sick only once. People who took the vaccine were sick twice: their first from the vaccine, then from the flu because it didn't protect them."

This whole business of vaccines, for a long time, used to be under the National Institutes of Health, Dr. Chopra explained.

"So the government was responsible for doing good to the entire public. Public health was under that area. If the government was doing it, there was no question ever raised that they will do any wrong thing. They're making vaccines. All over the world, it was the same system. So they were not brought under the regular drug evaluation system," he says.

"This is the way the politics of vaccines work," he continues. "What I'm saying categorically is that vaccines have never been tested. Vaccines other than smallpox have never been tested for safety or efficacy, as they should have been."

Real Scare from the H1N1 'Pandemic'

You may recall over the summer when the World Health Organization raised the swine flu threat level from a 5 to a 6, which meant this is a full-blown pandemic. As Dr. Chopra explains, this decision, along with the news that the virus was "mutating," may have been completely unfounded.

"Who is the Directorate General of the WHO to say that "I'm raising it to pandemic level #6 ?" Based on what? At the same time, from the same sources, we're receiving information that we think sooner or later, the virus is going to mutate. We don't know when but it is going to. How did they know that? How do they come to that conclusion?

Then we hear the new virus H1N1 has components: the bird flu, H5N1, or the other way around. When you use these kinds of numbers and technical words, it frightens people because they don't understand what H or N stands for. They take people's words for it and the media picks it up and then starts to say, "This is very different. This is entirely different. This has components of the 1918 flu and the bird flu. It also has the swine flu."

And you go around in Mexico and you get H1N1 in the swine right now. So you make six, eight or ten different drugs, different vaccines as many as the companies, and then you say, "Some will be live and they'll be given in the nose, some will be killed, some will have adjuvants like squalene oils… And some people are being given nasal vaccine, so that means a live virus. If you're putting a drop in the nose like you put the drop of polio in the mouth, then those are the portals of entry that obviously mean this is a live virus. If it's a live virus, then you actually maybe creating a pandemic with whatever you manufactured in the laboratory. If it's a live virus then that's what could happen," he states.

One of the Most Massive Cover-Ups in American History?

Swine flu is quickly becoming exposed for the massive hoax it really is. For more insider information, be sure to listen to my interview with retired neurosurgeon and researcher Dr. Russell Blaylock and stay tuned to the newsletter for the latest news and updates.

Oberster Arzneimittelprüfer muss gehen

Spigel, 21 Januar 2010, 20:43
https://www.spiegel.de/wissenschaft/medizin/iqwig-chef-sawicki-oberster-arzneimittelpruefer-muss-gehen-a-673239.html

Der Krimi um IQWiG-Chef Peter Sawicki ist zu Ende: Nach Informationen von SPIEGEL online soll der Chef des obersten Arzneimittelprüfinstituts seinen Posten räumen. Es ist ein Sieg der Klientelpolitik und der Pharmaindustrie über den Mann, der ihr lange Zeit ein Dorn im Auge war.

Der Vorstand der Stiftung für Qualität und Wirtschaftlichkeit im Gesundheitswesen beriet sich vergangenen Mittwoch fast fünf Stunden lang. Am Ende stand fest, was alle erwartet und viele befürchtet hatten: Peter Sawicki, der Leiter des von der Stiftung getragenen Instituts für Qualität und Wirtschaftlichkeit im Gesundheitswesen

(IQWiG), muss gehen. Sein Vertrag läuft noch bis Ende August, danach wird er abgelöst. Zwar wurde die endgültige Entscheidung auf Freitag vertagt, da vorher noch der Stiftungsrat angehört werden muss. Das, verlautete aus Kreisen des Vorstands, sei jedoch eine reine Formalie. Sawickis Abgang sei besiegelt.

Sawicki und das 2004 gegründete IQWiG sind der Pharmaindustrie schon lange ein Dorn im Auge. Das Institut soll die Vor- und Nachteile medizinischer Leistungen, vor allem aber die Wirksamkeit von Arzneimitteln bewerten. Fällt eine solche Bewertung negativ aus, werden die Kosten für das Mittel oft nicht mehr von den gesetzlichen Kassen übernommen - schon eine einzige IQWiG-Entscheidung kann so für den Hersteller Verluste in mehrstelliger Millionenhöhe bedeuten.

Der Hauptgrund für Sawickis Rauswurf ist jedoch offiziell eine "Dienstwagenaffäre": Sawicki schloss 2006 und 2009 Leasing-Verträge für zwei Dienstwagen ab, einen Audi Q7 und einen Audi Q5. Dies sei ein Verstoß gegen seinen Dienstvertrag gewesen, urteilte die mit der Prüfung des Vorgangs beauftragte BDO Deutsche Warentreuhand AG Wirtschaftsprüfungsgesellschaft. Sawicki hätte zumindest zuvor den Vorstand informieren müssen.

Häme wegen "Dienstwagenaffäre" und Nepotismus-Vorwürfen

"Pharmaprüfer am Pranger" schrieb die "Frankfurter Rundschau" daraufhin. "Dienstwagenaffäre belastet Arzneimittelprüfer" die "Frankfurter Allgemeine Zeitung". Hämisch nannte sie Sawicki "Wiederholungstäter" und schrieb, dies mache "seinen Verbleib an der Spitze eines Instituts unmöglich, das als integrer Gegenspieler zur Pharmaindustrie fungieren soll."

Tatsächlich jedoch bleibt bei näherer Betrachtung von der Dienstwagenaffäre wenig übrig: Ein von Sawicki in Auftrag gegebenes Rechtsgutachten kommt zu dem Schluss, er habe keinesfalls gegen seinen Dienstvertrag verstoßen. Schließlich sei ihm ein Dienstwagen bei den Vertragsverhandlungen zugesichert worden, auch wenn sein Dienstvertrag diese getroffene Vereinbarung nur unzureichend und widersprüchlich wiedergebe. Alle Teilnehmer der Verhandlungen haben dies im BDO-Bericht einmütig bestätigt. Zudem standen Sawickis Dienstwagen stets ordnungsgemäß im Haushaltsplan des IQWiG, der vom Vorstand erstellt und vom Stiftungsrat genehmigt wird. Dass Sawicki einen Dienstwagen geleast hatte, war den Vorstandsmitgliedern also bekannt.

1121,40 Euro, die Sawicki zudem irrtümlicherweise vor allem für private Parkquittungen und Mautgebühren erstattet worden waren, da er seinen Dienstwagen auch privat nutzen durfte, hat er

inzwischen weitgehend zurück gezahlt. Ebenso die Beträge von 10 Euro und 15,20 Euro; hierüber hatte er Quittungen für Rasenmäherbenzin eingereicht.

Auch von einem anderen Vorwurf blieb nicht viel übrig: 2007 hieß es, Sawicki habe IQWiG-Aufträge an eine Einrichtung vergeben, an der seine Ehefrau beteiligt war. Externe Wirtschaftsprüfer wurden beauftragt, die Angelegenheit zu untersuchen. Sie kamen zu dem Ergebnis, dass es zwar formale Fehler bei der Auftragsvergabe gegeben habe, sprachen Sawicki jedoch von persönlicher Vorteilsnahme oder Begünstigung frei. Der IQWiG-Vorstand ermahnte Sawicki daraufhin, sprach ihm aber weiterhin das Vertrauen aus. 2008 gab es noch einmal Ärger: Ein IQWiG-Experte hatte zugleich die Pharmaindustrie beraten.

"Das riecht nach einer rein politischen Entscheidung"

Tatsächlich steckt viel mehr hinter Sawickis Rauswurf als Dienstwagen und Benzinquittungen. "Das riecht nach einer rein politischen Entscheidung", sagt Norbert Schmacke, Gesundheitswissenschaftler von der Universität Bremen.

Finanziert wird das IQWiG aus der gesetzlichen Krankenversicherung. Über die Leitung des Instituts entscheidet laut Satzung einstimmig der Vorstand des IQWiG. Gestern saßen deshalb zwei Vertreter des GKV-Spitzenverbandes, der Vorstandsvorsitzende der Kassenärztlichen Bundesvereinigung, Georg Baum, Chef der Deutschen Krankenhausgesellschaft (DKG) und Stefan Kapferer (FDP), Staatssekretär im Bundesgesundheitsministerium, zusammen.

Schon im Koalitionsvertrag hatten Union und FDP vereinbart, die Arbeit des Instituts zu prüfen und "damit die Akzeptanz von Entscheidungen für Patienten, Leistungserbringer und Hersteller" zu verbessern. Ende November wurde dann bekannt, dass Regierungskreise sowie die von FDP-Mitglied Baum geführte DKG offenbar die Ablösung Sawickis betrieben. In einem Papier ("Kernforderungen an eine schwarz-gelbe Gesundheitspolitik") hatten sich die führenden Gesundheitspolitiker der Unionsfraktion dafür ausgesprochen, Sawicki nach Ablauf seines Vertrags durch einen industriefreundlicheren Kandidaten zu ersetzen. Auch die DKG hatte ihr Veto gegen eine Vertragsverlängerung angekündigt. Zuvor hatten sich auch die Wirtschaftsminister der Länder darauf verständigt, die IQWiG-Methodik sei nicht länger "volkswirtschaftlich hinnehmbar". Bei der Bewertung von Arzneimitteln müssten auch Kriterien wie die "Wettbewerbsfähigkeit, insbesondere der heimischen pharmazeutischen Unternehmen", einfließen. Dem hatte auch der damalige Wirtschaftsminister Niedersachsens und heutige Gesundheitsminister Philipp Rösler zugestimmt.

Pharmaindustrie auf den Barrikaden

Sawicki jedoch interessieren Kriterien wie Wettbewerbsfähigkeit oder volkswirtschaftlicher Schaden nicht. Vorwürfe, er gefährde mit seinen negativen Bewertungen Arbeitsplätze, lassen ihn kalt. Er und sein Institut arbeiten alleine nach den Prinzipien der "evidenzbasierten Medizin", die die Wirksamkeit eines Medikaments ausschließlich auf der Basis wissenschaftlicher Studien beurteilt. Eine Therapie, so ein Grundsatz der evidenzbasierten Medizin, ist immer erst einmal ein Schaden, den man einem Patienten zufügt – außer es ist mit qualitativ guten Studien nachgewiesen, dass die Behandlung dem Patienten tatsächlich nützt, und dass sie besser wirkt als eine bewährte Alternative.

Schon als er noch Chefarzt der Inneren Abteilung des St. Franziskus-Hospitals in Köln-Ehrenfeld war, behandelte Sawicki seine Patienten nach diesen ehernen Prinzipien. Als IQWiG-Chef führte er im Großen fort, was er vorher schon jahrelang im Kleinen praktiziert hatte.

Oft trieb das IQWiG mit seinen Entscheidungen die Pharmaindustrie auf die Barrikaden. Etwa mit seinem Urteil zu den kurzwirksamen Insulinanaloga, die von der Pharmaindustrie mit perfektem Marketing in den Markt gedrückt wurden. Sie seien nicht besser als herkömmliches Humaninsulin, entschied das Institut. Auch die langwirksamen Insulinanaloga, die einen den Diabetes vergessen lassen sollten, bewertete das IQWiG negativ: Möglicherweise seien sie sogar krebserregend, ergab die Studie. Memantin, hunderttausendfach an Alzheimerpatienten verordnet und oft deren letzte Hoffnung? Kein Beleg für einen Nutzen bei Alzheimer-Demenz, entschied das IQWiG unter schärfstem Protest von Pharmaindustrie und Patientenvertretern. Mitunter enttäuschte das IQWiG aber auch die Krankenkassen, weil es Behandlungen für gut befand, die diese gerne nicht mehr bezahlen wollten.

Sogar international eckte Sawicki dabei mit seiner Unbeugsamkeit bei der Pharmaindustrie an. Im März vergangenen Jahres beschwerte sich der US-Verband der Forschenden Arzneimittelhersteller bei der Obama-Regierung über Sawicki - allerdings ohne auf Gehör zu stoßen. "Er gibt nie auf. Er hat ein starkes Rückgrat", sagt Gerd Antes, Direktor des Deutschen Cochrane Zentrums in Freiburg über Sawicki. So habe er es geschafft, in fünf Jahren ein Institut mit sehr gutem internationalem Ansehen aufzubauen. Auch Schmacke meint: "Es ist ganz klar: Sawicki kann man nicht kaufen."

Schaden für den Ruf des Instituts befürchtet

Ob das IQWiG auch mit einem neuen, möglicherweise pharmafreundlicheren Leiter seine Unabhängigkeit wird wahren können, ist fraglich. Laut Satzung kommt dem Institutsleiter viel Macht zu. "Die Institutsleitung verantwortet die Aufgabendurchführung des Instituts", heißt es dort klar in Paragraph sieben, Absatz fünf. Wolf-Dieter Ludwig, Vorsitzender der Arzneimittelkommission der deutschen Ärzteschaft, ist besorgt: "Natürlich sehe ich die Gefahr, dass das Institut ohne Sawicki nicht mehr so unabhängig ist. Wenn man die Stärkung des Pharmastandortes Deutschland zur Aufgabe des Instituts machen würde, wäre das unvereinbar mit seiner ursprünglichen Aufgabe."

Auch international könnte dann der Ruf des Instituts Schaden erleiden. Sawicki, heißt es in einer Petition, die von 600 Ärzten unterschrieben wurde, habe als Person maßgeblich dafür gesorgt, dass das IQWiG internationale Anerkennung gewonnen habe und in seiner Reputation mittlerweile seiner britischen Vorbild-Institution NICE in keiner Weise mehr nachstehe. Sawickis Ablösung an der Spitze des IQWiG füge der internationalen Vernetzung des Institutes wie auch der deutschen medizinischen Wissenschaft insgesamt schweren Schaden zu. "Sawickis Ablösung" so der Initiator der Petition, der Bremer Allgemeinmediziner Günther Egidi, "wäre der Anfang vom Ende des IQWiG."

Inzwischen hat sogar das renommierte Fachblatt "Science" über den Fall Sawicki berichtet. Die Überschrift: Unter feindlichem Beschuss der Pharmaindustrie.

Honest German drug regulator removed from position in spite of doctors' protests

The Flu Case, 25 January 2010 15:28

https://web.archive.org/web/20100220012920/http://www.theflucase.com/index.php?option=com_content&view=article&id=2629%3Ahonest-german-drug-regulator-removed-from-position-in-spite-of-doctors-protests&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Peter Sawicki, the head of the German government drug regulator IQWiG who insisted on adequate safety and financial data before approving drugs, will not have his contract renewed when it runs out in August 2010, reports Der Spiegel.

Sawicki enjoyed strong support from doctors for his science- and evidence-based approach to approving drugs: 600 doctors in Germany signed a letter asking for him to be kept in his position.

However, Sawicki has come *under fierce criticism from the pharmaceutical companies* for his stance. The ruling government coalition of CDU/CSU and FDP has pushed for his removal.

Sawicki's contract was ostensibly not renewed because of irregularities with concerning his company car, but Der Spiegel reports that Sawicki has complied with all the conditions of the IQWiG company car contract, and suggests he is suffering being discredited and punished as a result of his refusal to approve potentially dangerous drugs.

The decision to remove Sawicki will raise fears that the profits of pharmaceutical companies are being put before the health of the general public, and that the politicans see big pharma as their "clients" to be pleased.

Under Fire from Pharma, Institute may lose its Director

Science, 22 January 2010: 327(5964): 402 – 403
DOI: 10.1126/science.327.5964.402-b
https://www.science.org/content/article/under-fire-pharma-german-institute-may-lose-its-director-updated

A long-running feud between pharmaceutical companies and the German institute that evaluates the effectiveness of medical treatments could cost the institute director his job. Although the post is supposed to be apolitical, members of Germany's new coalition government have called for Peter Sawicki, founding director of the Institute for Quality and Efficiency in Health Care (known by its German acronym IQWiG, pronounced ICK-vig), to be replaced with someone who is friendlier to the pharmaceutical industry. The institute's board of directors is expected to decide on 20 January whether Sawicki, a clinical researcher and diabetes expert, will be replaced when his contract runs out later this year.

Sawicki's supporters say the move would endanger the institute's reputation for impartial and rigorous science, and earlier this month a petition signed by 600 doctors and clinical researchers called on the health minister and the board to keep Sawicki on. Gerd Antes, director of the German Cochrane Centre in Freiburg, a not-for-profit organization that analyzes health care effects, says that replacing Sawicki would significantly undermine IQWiG and its work. Antes views the anti-Sawicki push as "part of the political game to soften and to weaken rigorous procedures for new drugs and medical devices in Germany."

IQWiG, based in Cologne, was started in 2004 as part of a reform of the German health care system. With a function similar to that of the U.K.'s National Institute for Health and Clinical Excellence (NICE), IQWiG's reports inform the panel that decides which treatments are covered by Germany's publicly funded insurance plans. Sawicki has tussled with drug companies over access to their unpublished studies and over reports from the institute, such as the one that found "no evidence" that a new product was superior to older synthetic human insulin. Industry groups, especially the German organization of research-based pharmaceutical companies, the VFA, have been highly critical of IQWiG, saying, for example, that IQWiG is too selective in deciding which studies to include in its evaluations.

Big pharma's attacks have even come from outside Germany. In March 2009, the Pharmaceutical Research and Manufacturers of America petitioned the Obama Administration to put Germany on a trade and intellectual property "priority watch list" chiefly because of IQWiG's influence on the German drug market. The petition complained that the institute has "inadequately taken into account the value of innovative pharmaceuticals," among other complaints. The Obama Administration declined to put Germany on its watch list.

Sawicki acknowledges that it is difficult for new drugs or techniques to make the grade. "We have introduced a method based on patient-relevant outcomes: morbidity, mortality, and quality of life," he says, while avoiding what he calls "invalid surrogates," such as cholesterol levels or bone density.

"You can lower cholesterol and increase mortality. You can lower blood pressure and increase heart failure," he says. Second, he says, "we are looking for progress" rather than just effectiveness, which means that an innovation is not compared with a placebo but with the current standard of care. "We are trying to answer the question: 'Is it better?' " Sawicki says he has some sympathy for the drugmakers: "It is very difficult to produce something better than what we already had."

Industry complaints about the institute have found some support among German politicians. In the October agreement forming Germany's new governing coalition, the parties stated their intention to examine IQWiG's methods, with the goal of "increasing the acceptance of the institute's findings among patients, caregivers, and producers." In late November, German media reported that a white paper circulated among top health policymakers called for Sawicki to be replaced and for the institute to be made more industry-friendly. Sawicki is also facing an ethics inquiry, which he says he requested after a new finance director found irregularities in expense accounts. News of the inquiry, which reportedly involves several hundred euros in travel expenses (*see update below*), leaked when the white paper was circulated.

The institute's work is bound to be controversial, says Antes. Similar research in the United States has also drawn criticism. Although Sawicki's term hasn't been flawless, Antes says, he has been instrumental in getting the institute up and running. "He never gives in. He has a very strong spine. In 5 years, they have established an institute with a very good international reputation."

UPDATE

Details of the ethics inquiry surrounding Sawicki's expenses have been leaked in the run-up to Wednesday's decision. Investigators found that Sawicki booked business-class tickets for domestic flights and improperly claimed more than €1100 worth of private costs, most of which he has since paid back. According to *Handelsblatt* (in German), which obtained a copy of the confidential report, Sawicki also leased an Audi Q7 in 2006 and an Audi Q5 in 2009 as official cars, although he had agreed to use his private car for business and receive compensation. *Handelsblatt* reports that the investigators found, however, that Sawicki had tacit approval for the leasing arrangement, in part to compensate for a pay cut that Sawicki experienced when he took the director job.

ACADÉMIE NATIONALE DE MÉDECINE

Pierre Bégué

Nouveau communiqué sur la grippe A (H1N1)v

MOTS-CLÉS : grippe, pandemie, vaccination, sante publique

Academie Nationale de Medicine, 9 février 2010
https://www.academie-medecine.fr/nouveau-communique-sur-la-grippe-a-h1n1v/

*Au nom de la Commission VII (Maladies infectieuses et médecine tropicale) et de la Sous-commission des Vaccinations**

En complément de son communiqué du 13 octobre 2009, l'Académie nationale de médecine fait les remarques suivantes Ã propos du déroulement de la campagne de vaccination contre la grippe A(H1N1)v, dont les bases sanitaires étaient justifiées :

· La communication médiatique intense et les propos alarmistes ont fait naître rapidement des doutes dans le public sur la réalité des dangers alors difficilement évaluables. Un tel excès risque d'émousser l'adhésion de la population en cas d'une nouvelle alerte de santé publique.

· La stratégie vaccinale imposée par le Ministère de la santé avec recours aux «centres de vaccination» s'est heurtée Ã des difficultés logistiques et psychologiques dans la population française, où la vaccination est assurée depuis longtemps Ã 90% par la médecine libérale (médecins généralistes et pédiatres). L'association d'emblée de ces praticiens de proximité au plan de vaccination aurait sensiblement amélioré l'adhésion de la population.

· Le choix entre une vaccination de masse et une vaccination ciblée pour les personnes Ã risques n'a pas fait l'objet d'un débat préalable. L'acquisition des vaccins aurait du se faire par étapes en fonction de l'évolution de la pandémie au sein de la population générale. La décision d'une vaccination de masse aurait dû être expliquée et justifiée.

· L'évolution actuelle de la pandémie est rassurante, mais un ou plusieurs rebonds ne peuvent être exclus, légitimant la poursuite de la vaccination.

· A la fin de cette première campagne, l'efficacité, les effets secondaires et le coût de la vaccination (H1N1)v devront être évalués avec précision.

L'Académie nationale de médecine considère que dans de telles circonstances une meilleure concertation entre les autorités sanitaires, les comités d'experts, l'industrie pharmaceutique, les sociétés savantes et les praticiens (généralistes et pédiatres) est indispensable et elle souhaiterait être associée Ã l'évaluation de cette vaccination

THE FLU CASE

French Academy for Medicine fiercely criticises mass swine flu vaccination campaign

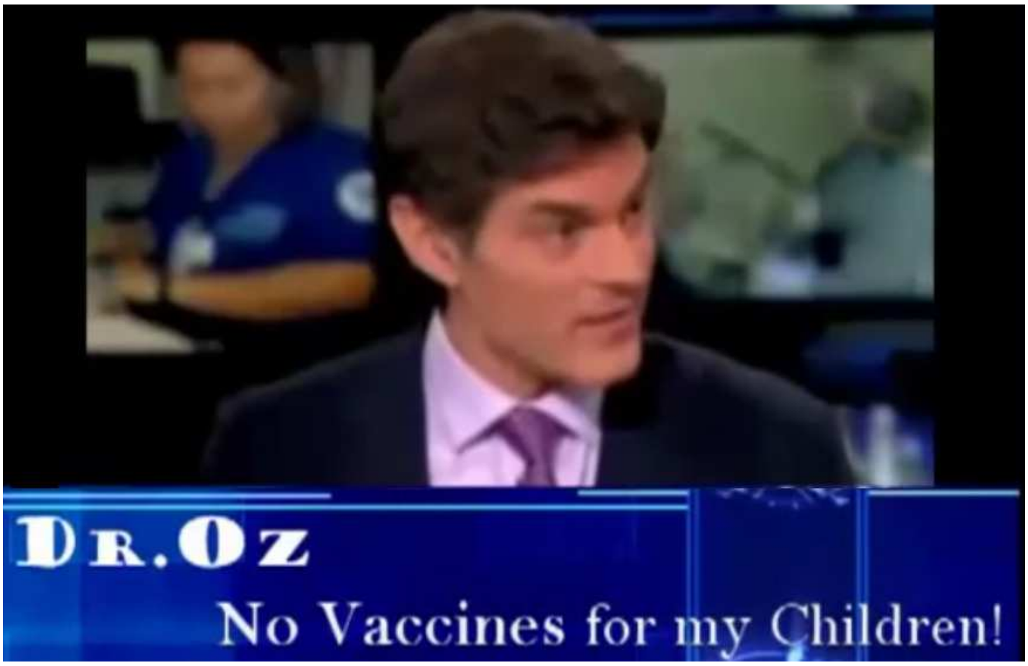
The Flu Case, 1 March 2010, 16:10
https://web.archive.org/web/20100525024504/http://www.theflucase.com/index.php?option=com_content&view=article&id=2874%3Afrench-academy-for-medicine-fiercely-criticises-mass-swine-flu-vaccination-campaign&catid=1%3Alatest-news&Itemid=64&lang=en

The French government has come in for criticism over its handling of the mass swine flu vaccination campaign from the country’s prestigious National Academy for Medicine.

The Academy said the mass swine flu vaccination campaign was ill conceived, fraught with logistical problems and also counter productive in as far as it had led to more scepticism in the population about mass vaccination campaigns.

In a press release issued in the name of the Commission for Infectious Diseases and the Sub Committee on Vaccinations, the Academy accused the media and government of alarmism over the mild swine flu.

Furthermore, the Academy said that the decision to set up vaccination centers to administer the jab created logistical and pyschological problems. This was because people in France are used in nine cases out of ten to getting their vaccinations from GPs.



The Academy also raised concerns about the decision to mass vaccinate the entire population instead of just people who were at an especial risk, saying such a campaign needed a better justification and explanation.

Finally, the Academy called for a proper review of the effectiveness and the secondary effects of the vaccination as well as the cost of the vaccination campaign.

Evening Standard

Vaccine for swine flu may be unsafe warns WHO

Evening Standard, 27 July 2009
https://www.standard.co.uk/hp/front/vaccine-for-swine-flu-may-be-unsafe-warns-who-6766000.html

Plans to fast-track the swine flu vaccine in Britain came under fire from World Health Organisation chiefs today.

The Department of Health plans to make the vaccine available at least two months earlier than in America.

More than 132 million doses have been ordered with the first batch due to arrive next month.

However, Dr Keiji Fukuda, the WHO's flu chief, today warned about the potential dangers of the untested vaccine: "There are certain areas where you simply do not try to make any economies. One of the things which cannot be compromised is the safety of vaccines."

The European Medicines Agency, the drug regulatory body for the EU, is accelerating the approval process for the vaccine, allowing firms to bypass large-scale human trials and instead test a vaccine based on bird flu.

Countries including Britain, Greece, France and Sweden plan to start using it as soon as it is cleared.

The Department of Health said it was "extremely irresponsible" to suggest Britain would use an unsafe vaccine. A spokesman said: "Over 40,000 doses of the vaccine which the swine flu vaccines are based on have been given without any safety concerns."

The plan comes amid growing public concern over the outbreak.

A cruise ship packed with 160 British tourists and hit by swine flu was briefly "impounded" by Italian authorities.The Ruby Princess, carrying 3,393 passengers and 1,196 crew, docked in Venice and was surrounded by coastguards yesterday. After a medical examination passengers, except seven confirmed cases of H1N1, were allowed off the boat.

THE TIMES

Health Officials Warn of H1N1 Vaccine's Link to Deadly Nerve Disease

The Times, London, 16 August 2009

https://web.archive.org/web/20090904022432/http://www.foxnews.com/story/0,2933,539880,00.html

https://web.archive.org/web/20091108090613/http://www.timesonline.co.uk/tol/news/uk/health/Swine_flu/article6797993.ece

Hartford, Conn. – British health officials have warned doctors of possible similarities between the new H1N1 vaccine and a shot linked to 25 deaths in the U.S. in the 1970s.

The British government's Health Protection Agency (HPA), said in a letter to neurologists that they needed to look out for increases in cases of a brain disorder that might follow the launch of the immunization program.

The letter has been sent because of concerns sparked by studying of the swine flu vaccination campaign in the U.S.

In 1976, Washington rushed in a mass immunization program against a similar swine flu outbreak that was confined to a single military base.

Several hundred cases of a rare, lethal, paralyzing neurological disease called Guillain-Barré syndrome (GBS) were reported afterwards, and although no clear link was ever found to the vaccine, the incident made many mistrustful of immunizations.

Although the swine flu virus vaccine now close to completion is different from the one used in 1976, the HPA said the earlier incident nevertheless highlighted a possible area of concern.

"The vaccines used to combat an expected swine influenza pandemic in 1976 were shown to be associated with GBS and were withdrawn from use," Professor Elizabeth Miller, head of the HPA's immunisation department, wrote in the letter sent last month to neurologists.

"GBS has been identified as a condition needing enhanced surveillance when the swine flu vaccines are rolled out."

The Department of Health said: "Appropriate trials to assess safety and immune responses have been carried out on vaccines very similar to the swine flu vaccine. The vaccines have been shown to have a good safety profile."

The World Health Organisation has also said recently that the public should be "reassured" about the safety of the new vaccine. It acknowledged that "genuine adverse events directly caused by the vaccine may also occur, but cannot be predicted in advance".

The NHS will monitor any possible risks from the vaccine, including a possible connection with GBS.

GlaxoSmithKline is developing the vaccine in Germany for an immunisation programme due to start in October.

Some 9.4m people in England will receive the vaccine if they fall into priority groups, alongside 2.1m frontline health and social care workers. In Scotland 1.4m people in either at-risk groups or working in health and social care will get the jab.

Priority will be given to those aged six months to 65 years in high-risk groups – including those with asthma, diabetes, heart disease, renal disease or with a compromised immune system.

Fight Back H1N1

US Judge Rules Against Compulsory Vaccinations New Jersey, USA

Fight Back H1N1, 30 September 2009
https://web.archive.org/web/20101106013750/http://www.fightbackh1n1.com/2009/09/us-judge-rules-against-compulsory.html

US Judge Rules Against Compulsory Vaccinations New Jersey, USA

New Jersey: Last month when we launched our website we posted this case in our Filed Case section of our website. And now New Jersey US Court issues an injunction to stop it and to hold the the government and drug companies responsible for reactions.

A Preliminary Injunction to stop mandatory vaccinations has been issued in the United States District Court of New Jersey.

This comes after a federal lawsuit opposing forced vaccines was filed in that court by Tim Vawter, pro se attorney, on July 31st with the federal government as defendant.

When the judge signs the Preliminary Injunction, it will stop the federal government from forcing anyone in any state to take flu vaccine against their will. It will also prevent a state or local government from forcibly vaccinating anyone, and forbid any person who is not vaccinated from being denied any services or constitutional rights.

Vawter's filings included a Complaint, and several pages of evidentiary Exhibits. Vawter's legal papers have been written not only for filing in federal court, but additionally so they can be looked at by activists around the world for ideas on filing lawsuits in their own countries to help stop forced vaccinations.

Vawter believes that as the truth of the dangers of flu vaccines continues to become known, banning the forced use of them will eventually succeed on a worldwide basis. He cautions people to avoid fear and keep themselves focused on the task of blocking forced vaccination. Preliminary Injunction will immediately halt mandatory vaccinations in the U.S.

The Court, having heard the Motion for Preliminary Injunction and read the papers in its support, states in the Preliminary Injunction that it appears the federal government has engaged in some amount of negligence with regards to failure to properly investigate the safety of the flu vaccines scheduled for use in late 2009-2010, and the evidence submitted does warrant a more thorough investigation into the safety of the flu vaccines.

The Court ordered that the government shall be forbidden from forcing any person to be required to take any influenza vaccination against that person's free will and free choice.

The government will not allow any state or local government, or any party, to force any person to be required to take any influenza vaccination against that person's free will and free choice.

U.S. government sued for gross negligence and violation of the Constitution

In his Cause of Action, Vawter charged that the federal government has engaged in gross negligence by funding and promoting flu vaccines that are proven to be dangerous and manufactured with little oversight. The vaccines scheduled for use in late 2009 and 2010 contain heavy metals including thimerosal mercury, which have been proven to cause autism in children with lowered immune systems, and other dangerous and toxic ingredients.

The federal government has stated it will force these flu vaccines onto the American public against their will, under a document signed by Health and Human Services Secretary Kathleen Sebelius.

He further charged that the vaccine makers stand to earn billions of dollars selling vaccines, and are already spending tens of millions advertising a "Phase 6 Pandemic" that the evidence shows does not really exist.

The federal government has not required the World Health Organization (WHO) to show evidence of such a pandemic. There has been no collection of facts, sworn testimony, witnesses being questioned, hearings being held, or lie detector tests being given when preposterous statements have been made. The WHO declared a massive "Phase 6 Influenza Pandemic", even though only a few hundred people worldwide had so far died of this swine flu virus, and when far more people die each year of regular flu.

Vawter noted there is a preponderance of evidence to show that the federal government so poorly trained its employees that they eagerly agreed with the unsubstantiated claims of the WHO in the face of evidence to the contrary.

Forced vaccination would violate the Fourth Amendment of the Constitution by allowing the government to enter homes and force people to be vaccinated, or to forcibly remove people to another location for vaccination. It would also violate Fifth Amendment Constitutional rights by depriving people of liberty without due process of law.

Vawter charged that the federal government has engaged in gross negligence by failing to properly investigate factual evidence submitted by esteemed medical professions over many years which proves flu vaccines have caused serious damage to people.

The CDC has stated that thimerosal mercury is being used in the new flu vaccines being prepared.

The government has failed to investigate profiteering.. Billions of dollars in vaccine sales can cause organizations to falsify threats so as to cause unwarranted public hysteria leading to forced vaccinations.

The government is guilty of gross negligence because its employees failed to properly investigate the release of a case of live swine flu virus. One of the main companies the government deals with, Baxter Vaccines, was apparently involved in the transporting of live bird flu virus that was released on a public train earlier this year.

A lab technician with the Swiss National Center for Influenza in Geneva had traveled to Zurich to collect eight ampoules, five of which were filled with the H1N1 swine flu virus. However, failure of the dry ice in their container allowed pressure to build up, and the ampoules exploded as the train was pulling into a station.

The highly reputable UK newspaper "the Telegraph" reported on July 2nd that flu vaccines tested on homeless people caused twenty-one of them to die.

Vawter charged there is a preponderance of evidence to show that government will not provide people being vaccinated with a list of the vaccine ingredients and possible negative side effects before they are vaccinated. Most of the public will not know this flu vaccine contains thimerosal mercury.

Vawter submitted an Order to force the government to publish vaccine ingredients and side effects, and to give this information to everyone who takes a flu vaccine, and do so at least 3 days prior to their vaccination. A denial of this order would violate Plaintiff's rights to demand the government obey the First Amendment of the U.S. Constitution by requiring it to engage in freedom of speech. The First Amendment not only allows a citizen to have freedom of speech himself, but it allows a citizen to demand his government engage in freedom of speech when it is promoting the use of such as these vaccinations to the public.

The government proclamation stating a person cannot sue for any damages he receives from the flu vaccine, completely bypasses the congress and the court system in violation of the Seventh Amendment of the Constitution which grants the right to sue to recover for damages.

Urgent Lawsuit filed against FDA to halt Swine Flu vaccines; claims FDA violated federal law

Natural News, 9 October 2009
https://web.archive.org/web/20091012022240/http://www.naturalnews.com/027205_vaccines_swine_flu_the_FDA.html

Health freedom attorney Jim Turner is filing a lawsuit in Washington D.C. mid-day Friday in an urgent effort to halt the distribution of the swine flu vaccine in America. On behalf of plaintiffs Dr. Gary Null and other licensed health care workers of New York State, the lawsuit charges that the FDA violated the law in its hasty approval of four swine flu vaccines by failing to scientifically determine neither the safety nor efficacy of the vaccines.

"The suit will seek an injunction against the FDA from approving the vaccine," attorney Jim Turner told NaturalNews on Thursday evening's Natural News Talk Hour show. "And the core of the argument is that they have not done the proper safety and efficacy tests on the vaccine to allow it to be release at this time."

The suit seeks to not only nullify the FDA's unlawful "approval" of the four H1N1 influenza vaccines, but to also ask the court to issue an injunction that would halt any mandatory vaccination requirements.

"The FDA is required by law to establish that a vaccine is safe and effective before it can be given to the public," said Turner. "We are arguing that they did not establish that the vaccine was effective, and did not establish that it was safe. They are trying to get it on the market by a waiver."

Vaccine / adjuvant combination has never been properly tested

The vaccine / adjuvant combination being referred to as the "swine flu vaccine" has apparently never been safety tested or approved by the FDA. In fact, in many cases the vaccine is being sent to clinics, pharmacies and other health establishments separately from the adjuvant chemical, leaving it up to each local vaccine retailer to properly mix the vaccine with the adjuvant, according to information provided by Turner. With hundreds of millions of Americans potentially being targeted with this vaccine, the potential for improper mixing, improper dosages, and human error is alarming.

If the charges described in the lawsuit are true, it means the FDA has blatantly abandoned medical science and violated its own regulations in approving not only these four vaccines, but the potentially deadly adjuvant chemicals as well. To date, the FDA has produced absolutely no scientific evidence documenting safety tests for any of these swine flu vaccines. There are no published studies, no records of any clinical trials, and no publicly-available paper trail demonstrating that any safety testing was done whatsoever. There is no researcher who has publicly put their name on the record declaring the vaccines to be safe, and no FDA official has ever stated that scientifically-valid safety testing has ever been conducted on the vaccine / adjuvant combinations now being distributed across America.

Normally, when a pharmaceutical achieves "FDA approved" status, there is a considerable paper trail of scientific scrutiny, peer review, clinical trials and other supporting evidence. To our knowledge, no such documents exist for the swine flu vaccines. The FDA's approval of these vaccines appears to be based entirely on a whim.

"What has been tested?" asked attorney Jim turner. "Where has it been tested? Who reviewed the test? Who looked at the test and said yes they proved safety and efficacy? There is no record that we can find that shows these things have been done."

By approving the four vaccines in the absence of such safety testing, the FDA itself stands in direct violation of federal law. "There is a law that they're supposed to follow and they are not following it," Turner added.

Billions of dollars are at stake

Why, then, did the FDA apparently violate the law and push these vaccines into full public distribution without securing the safety testing required by law? Turner suspects a profit motive may be involved: "They're charging $24.95 to get a vaccine. Multiplied by 100 million people, that's a lot of money. If you do the whole society, you're talking about several billion dollars.

THE FLU CASE

Belgian lawyers take legal action against mass "swine flu" vaccinations

The Flu Case, 15 October 2009, 12:29
https://web.archive.org/web/20100817032235/http://www.theflucase.com/index.php?option=com_content&view=article&id=1086:belgian-lawyers-take-legal-action-to-stop-mass-qswine-fluq-vaccinations&catid=41:highlighted-news&Itemid=105&lang=en

Five Belgian citizens went to court on Wednesday evening to stop the mass "swine flu" vaccinations.

Three lawyers representing the citizen's group deposited court filings in Brussels to stop the government from implementing a mass vacccination campaign, arguing that the "swine flu" jabs are untested, pose risks, and that the government, by mandating them without giving adequate information, is in breach of its duty to protect the fundamental right of its citizens to health and life.

The legal steps are being taken as the Belgium parliament meets today, Thursday, to decide whether to give the government sweeping "emergency" powers to fight the "swine flu" pandemic.

Belgian MPs are under increasing pressure to drop a provision that would allow forced vaccinations, and the President of the Chamber of Health Muriel Gerkens has said that this clause will be omitted in new draft legislation.

Lawyers Georges-Henri Beauthier, Philippe Vanlangendonck and Inès Wouters have said additional legal action is envisaged as the protests over the mass "swine flu" vaccination campaign grows.

"Citizens who are going to be given this vaccine are being turned into guinea pigs," said Ines Wouters.

"It is strictly forbidden to undertake clinical vaccine trials on pregnant women, for ethical reasons that are evident, but authorities are planning to administer from next week onwards the H1N1 vaccines to pregnant womenâ€¦.How can that be explained?" said Philippe Vanlangendonck.

A copy of the court filings in French can be found below as well as an email from the lawyers who made the civil filings:

Bonjour,

En pièce jointe, vous trouverez le texte exact de la citation.

Il s'agit d'une action en référé, plus précisément d'une demande de suspension avec astreintes Ã la clé.

Ce que nous souhaitons faire suspendre c'est cette campagne vaccinale de masse telle qu'elle est prévue jusqu'ici c'est Ã dire basée sur des informations biaisées sur le rapport bénéfices/risques du vaccin. Nous espérons que chaque personne aura droit Ã une information équitable, qui tienne compte de l'abondante littérature scientifique en la matière, Ã temps c'est Ã dire AVANT toute vaccination. Ainsi, chacun a le droit de savoir que, même vacciné contre le H1N1, on peut ne pas être réellement protéger contre ce virus et qu'on peut subir des effets secondaires Ã court, moyen ou long terme pouvant être bien plus graves que la grippe A elle même. De la sorte et seulement de la sorte, le droit du patient, le droit Ã l'information et Ã son consentement de même que le droit fondamental Ã l'intégrité physique pourront trouver une application concrète, dans les faits.

Dans ces conditions, nous espérons de même qu'il n'y aura plus cette pression/stigmatisation sociale intolérable contribuant Ã faire croire qu'il faut Ã tout prix se faire vacciner "pour protéger les autres" et ainsi sous-entendre que les non vaccinés, médecins ou non, manqueraient d'altruisme envers les personnes affailies-on en a tous!- de notre entourage!

Nous insistons, suite Ã ce que nous avons entendu dans les médias jusqu'Ã présent pour vous faire comprendre que, même si un amendement empêchant toute obligation vaccinale est voté, il n'empêche que nous continuons d'exiger une information loyale et claire sur les risques et qui soit accessible Ã tous CAR, des informations incomplètes et unilatérales peuvent faire croire aux gens qu'ils n'ont pas d'autre choix que de se faire vacciner!

City Room The New York Times

Sewell Chan, Anemona Hartocollis

Judge Halts Mandatory Flu Vaccines for Health Care Workers

City Room // New York Times, 16 October 2009, 12:58 p.m.
https://web.archive.org/web/20091019111518/http://cityroom.blogs.nytimes.com/2009/10/16/judge-halts-mandatory-flu-vaccines-for-health-care-workers/

A judge on Friday morning halted enforcement of a New York State directive requiring that all health care workers be vaccinated for the seasonal flu and swine flu.
https://web.archive.org/web/20090928023749/http://www.health.state.ny.us/press/releases/2009/2009-09-24_health_care_worker_vaccine_daines_oped.htm

The temporary restraining order by the judge, Thomas J. McNamara, an acting justice of the State Supreme Court in Albany, comes amid a growing debate about the flu vaccine.
https://web.archive.org/web/20121021064435/http:/www.nytimes.com/2009/10/16/health/16vaccine.html

On Friday afternoon, the State Department of Health vowed to fight the restraining order, saying that the authorities "have clear legal authority" to require vaccinations, and noted that state courts had upheld mandatory vaccinations of health care workers against rubella and tuberculosis. Justice McNamara scheduled a hearing for Oct. 30 on the three cases before him, involving the flu vaccine.

The state health commissioner, Dr. Richard F. Daines, through the State Hospital Review and Planning Council, issued a regulation on Aug. 13 ordering health care workers to be vaccinated by Nov. 30 or face fines.

Dr. Daines later explained the reasoning behind the vaccine, saying in a statement on Sept. 24:
https://web.archive.org/web/20090928023749/http://www.health.state.ny.us/press/releases/2009/2009-09-24_health_care_worker_vaccine_daines_oped.htm

Questions about safety and claims of personal preference are understandable. Given the outstanding efficacy and safety record of approved influenza vaccines, our overriding concern then, as health care workers, should be the interests of our patients, not our own sensibilities about mandates. On this, the facts are very clear: the welfare of patients is, without any doubt, best served by the very high rates of staff immunity that can only be achieved with mandatory influenza vaccination – not the 40-50 percent rates of staff immunization historically achieved with even the most vigorous of voluntary programs. Under voluntary standards, institutional outbreaks occur every flu season. Medical literature convincingly demonstrates that high levels of staff immunity confer protection on those patients who cannot be or have not been effectively vaccinated themselves, while also allowing the institution to remain more fully staffed.

Terence L. Kindlon, a lawyer for three nurses who sued the state, asserting that the order violated their civil rights, said the judge's ruling was a victory. New York was the only state in the country to mandate vaccinations for health care workers, he said.

The nurses – *Lorna Patterson*, *Kathryn Dupuis* and *Stephanie Goertz* – work in the emergency room at Albany Medical Center, a regional trauma unit. – "These are not libertarians, they are not lefties, they are not right-wing lunatics," Mr. Kindlon said of his clients in a phone interview on Friday. "They are health care professionals, and they think the vaccination is not going to be good for them. They have no confidence that either the seasonal flu vaccine or H1N1 vaccine is going to do any good for them."

Justice McNamara consolidated the nurses' suit with two other lawsuits, brought by the New York State Public Employees Federation and the New York State United Teachers Union, which also challenged the regulation.

Mr. Kindlon said of his clients: "They basically were being administratively ambushed. This regulation came out of the Health Department during the dog days of August. People weren't aware of it until September. Then they were suddenly advised that the drop-dead rate for receiving the vaccination from the state was Nov. 30."

The hospital imposed its own deadline – mid-October – for vaccinations for its employees, Mr. Kindlon said.

The state is all but certain to fight the lawsuits and seek enforcement of the mandate. At a legislative hearing on Tuesday, Dr. Guthrie Birkhead, a state deputy health commissioner, defended the mandate, saying, "Health care settings are no different than any other setting where vaccination is the most effective method of preventing influenza."

https://web.archive.org/web/20091020043025/http://www.health.state.ny.us/commissioner/testimony/2009-10-13_mandatory_vaccine_testimony.htm

In a statement on Friday afternoon, the State Department of Health noted that Justice McNamara's order was only temporary. Officials said in a statement:

In two weeks the Department is scheduled to be in court, where we will vigorously defend this lawsuit on its merits. We are confident that the regulation will be upheld. The Commissioner of Health and the State Hospital Review and Planning Council have clear legal authority to promulgate the mandatory regulation. As one court said in a 1990 ruling rejecting a challenge to regulations requiring mandatory rubella vaccinations and annual tuberculosis testing for health care workers: "Hospitals . . . exist for the benefit of their patients. They exist to cure the sick. The Legislature of this State has charged the Commissioner of Health with the responsibility of making hospitals safe places to get well. These regulations are tailored to accomplish that end."

The issue of mandatory vaccinations has divided health care workers and even experts.

The Public Employees Federation, which has about 5,000 members covered by the regulations, said it encouraged its members to be vaccinated against the flu but opposed making the vaccine a condition of employment.

The New York State Nurses Association has taken a similar position. The association "supports immunization as an effective way to reduce the risk of contracting the flu, but upholds the right of registered professional nurses to choose whether or not they wish to be vaccinated," officials said in a statement, adding, "The association believes effective patient protection is achieved through an aggressive voluntary vaccination program, coupled with a comprehensive infection prevention plan that includes education, proper hygiene practices, and the appropriate use of personal protective equipment."

Patricia Finn, a lawyer for Suzanne Field, a nurse from Poughkeepsie, N.Y., who has filed a lawsuit in State Supreme Court in Manhattan challenging the mandatory vaccinations, said on Friday that her case would proceed despite the Albany restraining order, but added about the temporary restraining order:

We're absolutely thrilled about it. I'm very pleased that the whole process has been slowed down. That's what we're so concerned about, the process of vaccinating. It's not like getting your teeth cleaned; it's pretty serious. It shouldn't be taken lightly. So we were happy about this.

Judge halts Flu vaccine mandate for health workers

02 HDTV, WCBSTV, CBS, 16 October 2009, 3:13 pm US/Eastern
https://web.archive.org/web/20091230110136/http://wcbstv.com/breakingnewsalerts/mandatory.h1n1.vaccine.2.1252672.html

New York Health Care Employees Won't Be Forced To Get H1N1 Vaccine...For Now

Health care workers in New York will no longer be forced to get the H1N1 swine flu vaccine, CBS 2 has learned.

A state Supreme Court judge issued a restraining order Friday against the state from enforcing the controversial mandatory vaccination.

The order came as the Public Employees Federation sued to reverse a policy requiring vaccination against the seasonal and swine flu viruses, arguing that state Health Commissioner Richard Daines overstepped his authority.

Three parties – the Public Employees Federaion, New York State United Teachers, and an attorney representing four Albany nurses – challenged the order and for now the vaccination for nurses, doctors, aides, and non-medical staff members who might be in a patient's room will remain voluntary.

The health department had said the workers must be vaccinated by November 30 or face possible disciplinary action, including dismissal. PEF said it encourages members to get flu vaccinations, but opposes the emergency regulation requiring the vaccine as a condition of employment.

A judge granted a temporary restraining order Friday morning, PEF spokeswoman Debbie Miles said. A court hearing is scheduled for October 30.

New York was the first state in the country to initially mandate flu vaccinations for its health care workers, but many health care workers quickly protested against the ruling. In Hauppauge, workers outside a local clinic screamed "No forced shots!" when the mandate came down at the end of September.

"I don't even tend to the sick. I am in the nutrition field. They are telling me I must get the shot because I work in a health clinic setting," said Paula Small, a Women, Infants and Children health care worker.

Small said she would refuse to be vaccinate, worried the vaccine is untested and unproven, leaving her vulnerable. In 1976, there were some deaths associated with a swine flu vaccination.

Registered nurse Frank Mannino, 50, was also angry. He said the state regulation violates his personal freedom and civil rights.

"And now I will lose my job if I don't take the regular flu shot or the swine flu shot."

When asked if he's willing to lose his job, Mannino said, "Absolutely. I will not take it, will not be forced. This is still America."

The protest also shook Albany. Hundreds of demonstrators demanded freedom of choice. After all, as health care professionals, they argue they're already constantly washing their hands and aren't likely to transmit or contract the flu.

Around 500,000 health care workers would have been slated to receive the vaccine

"It's certainly their prerogative to voice their opinion," said Dr. Susan Donelan of Stony Brook University Hospital.

Donelan said most in the medical community see the benefits and safety of the shots and welcome them, and that hospitals must obey the law.

"Our hospital is committed to following the mandate to have our personnel vaccinated," she said.

The state said change was needed this year to save lives. Typically only about 45 percent of health care workers take advantage of voluntary flu vaccines.

More than 150 institutional outbreaks of seasonal and H1N1 flu are expected this year in hospitals, nursing homes and hospice centers.

There is also a strong resistance to the vaccine from the general public. A new Harvard University poll shows that only four in 10 adults intend to take the vaccine themselves, and only six in 10 plan to give it to their children.

Farrakhan suspicious of H1N1 vaccine

UPI, 19 October 2009, 11:56 PM

https://www.upi.com/Top_News/US/2009/10/19/Farrakhan-suspicious-of-H1N1-vaccine/63931256011008/

Memphis, Oct. 19 (UPI) – Nation of Islam leader Minister Louis Farrakhan told an audience in Memphis he believes the H1N1 flu vaccine was developed to kill people, a witness said.

Farrakhan, 76, spoke for nearly three hours Sunday at a gathering to observe the religious group's Holy Day of Atonement, which also marked the 14th anniversary of the Million Man March in Washington, the (Memphis) Commercial Appeal reported, citing a source who attended the speech.

"The Earth can't take 6.5 billion people. We just can't feed that many. So what are you going to do? Kill as many as you can. We have to develop a science that kills them and makes it look as though they died from some disease," Farrakhan said, adding that many wise people won't take the vaccine.

"The black community has become toxic and must cleanse and restore peace from within," Farrakhan said.

Farrakhan told listeners not to become complacent as a result of Barack Obama's election as the United States' first black president, the newspaper said.

"You have to understand that he was voted in to take on the affairs of a nation, not yours and mine. He is the American president, not the black president," he said.

Nation of Islam leader tells Memphis audience swine flu shot is a soft kill weapon

Prison Planet, 20 October 2009

https://web.archive.org/web/20091024040022/http://www.theflucase.com/index.php?option=com_content&view=article&id=1243:farrakhan-says-qswine-fluq-jab-depopulation-tool-as-developping-nations-set-to-get-millions-of-qfreeq-jabs&catid=1:latest-news&Itemid=64&lang=en

Farrakhan says "swine flu" jab depopulation tool as developping nations set to get millions of "free" jabs.

Nation of Islam leader Minister Louis Farrakhan told an audience in Memphis on Sunday that they should refuse to take the H1N1 vaccine because it is a soft kill weapon designed to reduce global population.

Farrakhan has never shied from controversy and has previously spoken out on 9/11 being an inside job and how the international central bankers control the U.S. government. – "The Earth can't take 6.5 billion people. We just can't feed that many. So what are you going to do? Kill as many as you can. We have to develop a science that kills them and makes it look as though they died from some disease," Farrakhan said, adding that many wise people won't take the vaccine," reports United Press International. – "The black community has become toxic and must cleanse and restore peace from within," Farrakhan added.

As we have documented previously, the use of vaccines to sterilize minority populations and induce abortions is on the record.

In the following video clip, after an introduction by Alex Jones, women of the Akha tribe who live predominately in Thailand, describe how they miscarried shortly after taking vaccines when they were eight months pregnant. The videos below highlight the efforts of supporters of the Akha tribe to get answers from the University of Oregon and the United Nations, who provided funding for the vaccination and sterilization programs.

Further evidence of the link between vaccinations, birth control, cancer and other diseases can be researched here. Continuing on the theme of population reduction, Farrakhan claimed that prostate cancer was a tool of such a conspiracy, because it is abnormally prevalent amongst black men. He attacked pharmaceutical companies for making vast profits from disease. – "After you take a pill to fix this, you have to take a pill to fix that," he said. 'Who's getting rich off of us getting sick?'"

Farrakhan also warned black people not to be pacified by the false belief that President Obama represented them. – "You have to understand that he was voted in to take on the affairs of a nation, not yours and mine. He is the American president, not the black president," he said.

So long as Farrakhan continues to cause division along racial lines, he can easily be dismissed and sidelined as a crank by the establishment. However, if he ever has a change of heart and becomes a true uniter of all colors and creeds against the new world order then that's the point at which he'll meet the same consequence as Martin Luther King.

Many of Farrakhan's controversial views are certainly not shared by the vast majority of the freedom/patriot movement, but it cannot be denied that he has rhetorically stood up to the powers that be on many occasions, as the clip below illustrates.

THE FLU CASE

E. Beeth, O. Bernard, Q. Blonda, P. Coomans, R. Delaunoy, et al.

Des médecins, des avocats et des citoyens belges mettent en garde contre le vaccin contre la grippe porcine

The Flu Case, ASANAT, 20 October 2009
https://web.archive.org/web/20091023154802/http://www.asanat.org/

Neuf raisons de ne pas vous faire vacciner contre la grippe A H1N1

1. La grippe A H1N1 est contagieuse mais resterait sans gravité par rapport à la grippe saisonnière. Au sortir de l'hiver, le bilan en victimes en Nouvelle Zélande et au Chili est très faible. Sans vaccination. [a]

2. Des organismes indépendants, comme la très respectée Cochrane Collaboration, font un bilan accablant de l'efficacité ou de la tolérance des vaccins anti-grippaux sur base de 40 années d'études: (a) chez les plus de 65 ans, leur effet est particulièrement modeste ; (b) chez les adultes jeunes en bonne santé, il manque des preuves de leur efficacité (c) chez les enfants, les données disponibles ne permettent de vérifier la tolérance des différents types de vaccins ; (d) chez les professionnels de santé, il n'existe pas de preuve crédible que leur vaccination modifie les complications grippales des personnes dont ils ont la charge.[b]

3. Une étude canadienne portant sur 12 millions d'observations aurait abouti à la conclusion provisoire que les gens ayant été vaccinés au cours des deux dernières années contre la grippe présentaient un risque deux fois plus élevé de tomber malade du virus H1N1. En cas de mutation du virus, il se pourrait donc que les personnes vaccinées avec le vaccin H1N1 courent un risque plus élevé de tomber malade. Cette étude attend confirmation. [c]

4. Les nouveaux vaccins H1N1 sont des produits expérimentaux. Ils n'ont pas fait l'objet d'essais cliniques approfondis à long terme. Ni leur efficacité ni leur absence de risques n'ont été prouvées, en particulier vis-à-vis de maladies à évolution lente.

5. Le vaccin en flacons de 10 doses contient du mercure (thiomersal) comme agent conservateur. Le thiomersal est suspecté d'être à l'origine de cas d'autisme. L'Association Américaine des Pédiatres (60.000 membres) a demandé en 1999 qu'il soit retiré des vaccins.[d] [e] [f]

6. Le vaccin contient un additif, le squalène, augmentant très fortement la réponse immunitaire. Bien qu'il soit naturellement présent dans l'organisme et qu'il puisse être ingéré sans problème, le squalène injecté est suspecté d'induire des maladies auto-immunes (ex. sclérose en plaque, sclérose latérale amyotrophique, fibromyalgie) ou différents troubles neurologiques et rhumatismaux. [g] Son usage pour les vaccins anti-grippaux reste interdit par la FDA aux Etats-Unis [h].

7. Le squalène dans le vaccin contre l'anthrax est suspecté responsable du Syndrome de la Guerre du Golfe chez plus de 25% des vétérans (avec une nette présence d'anticorps au squalène). La concentration de squalène dans le vaccin H1N1 est largement supérieure. L'utilisation de squalène permet de sous-doser l'antigène et de produire rapidement de plus grandes quantités de vaccins. [i]

8. Selon une régulation européenne du 15/09/09, les fabricants et les médecins qui administreront ce vaccin expérimental pourront être exemptés de toute responsabilité civile. En cas d'effets secondaires liés aux vaccins, vous n'aurez donc pas la possibilité de porter plainte.

9. Enfin, il existe de multiples autres moyens naturels, scientifiquement fondés, pour renforcer votre système immunitaire et prévenir ou limiter les infections et les complications liées à la grippe. Par exemple, les vitamines C, D et E, certains acides aminés, des minéraux, des polyphénols, des huiles essentielles… Le gouvernement néglige son devoir d'informer correctement la population à ce sujet.

THE FLU CASE

E. Beeth, O. Bernard, Q. Blonda, P. Coomans, R. Delaunoy, et al.

Belgian doctors, lawyers and citizens warn against receiving the so-called swine flu vaccine

The Flu Case, ASANAT, 20 October 2009
https://web.archive.org/web/20091023154802/http://www.asanat.org/

Nine reasons for you not to get vaccinated against the swine-flu virus A H1N1

1. The swine-flu virus is contagious yet should be no more a threat than normal seasonal influenza. At the end of winter 2009, the toll of victims in New Zealand or Chile is negligible. There was no vaccination.[a]

2. The reputable international pharmacological monitoring NGO Cochrane Collaboration, drawing on 40 years of research gives anti-flu vaccines a poor rating in terms of their effectiveness and of tolerance for them. It has found that (a) in the case of over-65s, their performance is particularly unimpressive (b) in healthy young adults, there is a lack of any proof of their effectiveness (c) in children, the available data does not permit verification of tolerance to different types of vaccines (d) in health professionals, there is no credible evidence that their administering vaccines mitigates the complications suffered by flu victims in their care. [b]

3. Recently, a Canadian survey drawing on 12 million observations would have come to the provisional conclusion that people vaccinated against flu during the course of the past two years stood double the chance of succumbing to the H1N1 virus. By the same token, were the virus to mutate, those vaccinated with the H1N1 vaccine could run an even greater risk of falling ill. This study awaits confirmattion. [c]

4. The new H1N1 vaccines are still in an experimental stage. They have not been subjected to proper, long-term clinical testing. Neither their effectiveness nor absence of risks have been established, particularly vis-à-vis sicknesses with a long gestation period.

5. The vaccines in 10-dose phials contain mercury (thiomersal) as a preservative. Thiomersal has been implicated in the onset of autism. The American Academy of Pediatrics (60,000 members) in 1999 demanded that it be removed from vaccines.[d] [e] [f]

6. The vaccine contains an additive, squalene which strongly compounds the immune response. Although naturally present in the body and can be ingested without problem, squalene if injected is suspected of triggering auto-immune diseases (eg. MS, Amyotrophic Lateral Sclerosis, Fibromyalgia) or various neurological and rheumatic disorders. [g] The FDA in the United States forbids its use in flue vaccines.[h]

7. It was the squalene present in the anti-anthrax vaccine that was suspected of causing Gulf War Syndrome in over 25% of the veterans (with a marked presence of antibodies to squalene). The concentration of squalene in H1N1 vaccine is substantially greater. Using squalene enables the dose of antigen to be reduced and larger quantities of vaccine to be produced. [i]

8. According to an EU ruling on 15/09/09, manufacturers and doctors administering this experimental vaccine may be exempted from all civil responsibility. In the event of side-effects linked to the vaccine, there will be no basis for legal action.

9. Finally, there is a whole range of other natural means, scientifically proven, of strengthening your immune system and of fending off or minimising complications linked to flu. For example, vitamins C, D and E, certain amino acids, minerals, polyphenol antioxidants, essential oils…The government is neglecting its duty to provide the population with correct information on this subject.

Subject: Campbell vs. the US: Comprehensive Federal Lawsuit Against Forced Vaccinations Filed 10/23/09-3:30 PM PDT

Although this federal case was ostensibly filed by one person against one government, that one person has filed it on behalf of all of the peoples of the world so that they might hold their own governments accountable for the crimes that these governments have perpetrated in their names against other peoples, as well as against themselves.

Although it could have been filed on a narrower legal premise that might have made it easier to win in court, it was filed so that the larger context of the secret and sinister forces that have long controlled the governments of this world being finally exposed and thereby extirpated from this planet. It was filed in such a way so as not only to be heard in a court of law, but also to be heard in the court of public opinion, to help to win the hearts and minds of the people to a greater truth; to help win on earth the cosmic war now being waged for truth, rather than in this war to win but one more isolated battle.

To those who shall say that this one person acted without good faith, due diligence or sufficient discernment, let the judgement of eternity be the final arbiter.

Le vaccin contre le H1N1 pris en grippe

France Info, 23 octobre 2009
https://web.archive.org/web/20091025092035/http://www.france-info.com/sciences-sante-2009-10-23-le-vaccin-contre-le-h1n1-pris-en-grippe-359973-29-30.html

Neuf Isérois viennent de déposer une plainte contre X à Grenoble.

Ils dénonçent la campagne de vaccination contre la grippe H1N1 comme "une véritable tentative d'empoisonnement" de la population.

Une première en France, alors que le vaccin inquiète partout dans le monde.

Cette première plainte avec constitution de partie civile contre le vaccin de la grippe H1N1 est également déposée pour "tentative d'administration de substances de nature à entraîner la mort".

Les plaignants sont neuf habitants de la vallée du Grésivaudan.

Ils se sont rencontrés dans des réunions publiques consacrées notamment aux risques supposés du vaccin contre la grippe H1N1. "*Le but est d'arrêter ce que nous considérons comme un empoisonnement*", a souligné l'avocat des plaignants Maître Joseph.

Selon l'avocat, d'autres plaintes similaires seront déposées prochainement en Isère, ainsi qu'à Paris, Pau et Nantes.

Pour les autorités de santé, les vaccins H1N1 arrivant sur le marché sont des produits nouveaux pouvant provoquer des effets secondaires inattendus, qui devront faire l'objet d'une surveillance, mais elles estiment que les avantages d'une vaccination l'emportent sur les risques éventuels.

French inundate government with lawsuits over "act of poisoning"

The Flu Case, 23 October 2009
https://web.archive.org/web/20091027012315/http://www.theflucase.com/index.php?option=com_content&view=article&id=1345:french-inundate-government-with-lawsuits-over-qact-of-poisoningq&catid=1:latest-news&Itemid=64&lang=en

A raft of lawsuits is about to be filed in France concerning the government's mass "swine flu" vaccination campaign, with one civil case already deposited at a court in Grenoble, alleging a "real attempt to poison" the population is underway.

Similar charges are to be filed in other parts of France, including in Paris, Pau and Nantes, according to lawyer Jean Pierre Joseph.

"The goal is to stop what we consider to be an act of poisoning," said Joseph.

Medical Xpress

Switzerland restricts use of GlaxoSmithKline swine flu vaccine

MedicalXpress, 30 October 2009
https://medicalxpress.com/news/2009-10-switzerland-restricts-glaxosmithkline-swine-flu.html

Switzerland on Friday restricted the use of British drugs group GlaxoSmithKline's swine flu vaccine Pandemrix, excluding pregnant women, minors and people over the age of 60.

The regulatory authority Swissmedic said it had received data on the vaccine for adults, but not for pregnant women and very little data for children.

"For this reason, Swissmedic has not yet authorised the administration of Pandemrix to pregnant women, children under the age of 18 and adults over 60," the regulator said in a statement.

Pandemrix was one of two vaccines approved by European Medicines Agency (EMEA) in September for usage against the A(H1N1) virus, and GSK said in early October that it had orders for 440 million doses of the vaccine.

While the Swiss regulator did not give the green light for the usage of Pandemrix by vulnerable groups, it said Focetria, a vaccine produced by Swiss pharmaceutical giant Novartis, was safe to be used by both children and adults.

In this instance, Swissmedic said it "based its decision largely on the EMEA authorisation".

"In accordance with this, Focetria is recommended for use in adults and children over six months old," it said.

As for usage by pregnant women, Swissmedic left it to doctors to weigh up the advantages and disadvantages of the vaccination.

The regulator added that it was still examining a second Novartis vaccine, Celtura.

Citing anonymous sources, Swiss daily Tages Anzeiger had reported on Saturday that Celtura had problems gaining regulatory approval here due to possible bacterial contamination.

The vaccine is produced by a technique using cell cultures from dog kidneys, allowing more rapid production than by the more classical method using chicken eggs, according to the company.

However, Tages Anzeiger said Swissmedic had found bacterial contamination in test batches of Celtura.

A spokesman at Swissmedic told AFP then that the agency could "neither confirm nor deny" the report, while Novartis had denied that it was facing problems gaining approval for the vaccine.

Countries in the northern hemisphere are in the midst of rolling out vaccinations programmes, in preparation for the coming winter.

The WHO has recommended that health workers be given the vaccines in priority, followed by vulnerable groups such as pregnant women and young children.

Nearly 5,000 people have died from swine flu infections since the A(H1N1) virus was uncovered in April, according to data issued by the World Health Organisation last week.

ФОКУС

Польша не будет покупать вакцину от A/H1N1, пока не доказана ее безопасность

Фокус, 3 ноября 2009, 12:20
https://focus.ua/ukraine/76560

Польские власти не планируют закупать вакцину от так называемого свиного гриппа (A/H1N1), пока не будут завершены исследования ее неопасности для человеческого организма.

Об этом заявила министр здравоохранения Ева Копач после заседания эпидемиологического комитета вчера вечером.

"Не будем проводить прививку людям плацебо, будем базироваться не на сплетнях, а на результатах клинических исследований", - отметила министр.

Копач подчеркнула, что польское правительство сейчас ведет переговоры о возможной покупке вакцин с тремя фирмами, отметив, что ни одна из них не завершила необходимые клинические исследования.

Кроме этого, до сих пор неизвестно, хватит ли для защиты от вируса одноразовой прививки или ее надо будет проводить дважды.

Копач сказала, что польские власти выступают за то, чтобы прививка от A/H1N1 была введена в свободное обращение, что сделало бы возможной ее покупку непосредственно гражданами, а не только правительствами стран, как есть сегодня.

Как передает УНИАН, министр заверила, что в случае подтверждения неопасности прививки польское правительство успеет купить ее к пику возможной эпидемии, которая может иметь место с января по март 2010 года.

Копач отметила, что немецкое правительство закупило 50 миллионов доз, из которых из-за низкой заинтересованности прививками использовано только 10 млн. Министр также заверила, что польские власти имеют необходимое оборудование и лекарства для того, чтобы не допустить эпидемии в Польше.

Она отказалась озвучить данные о запасах лекарств, которые имеет в своем распоряжении правительство, заметив только, что на лекарственных складах (из которых лекарства попадают в аптеки) есть 150 тысяч доз "Тамифлю" и 38 тысяч "Релензе".

Копач подчеркнула, что лекарство "Тамифлю" умышленно не были переданы в аптечное обращение в Польше, поскольку его использование при более легких заболеваниях гриппа привело бы к тому, что в случае сложной формы лекарства уже не подействуют.

Ранее сообщалось, что польское Министерство здравоохранения считает намного опаснее A/H1N1 вирус обычного сезонного гриппа, призывая поляков проводить прививку собственно от него.

В 38-миллионной Польше в последнее время не зафиксировано роста заболеваний вирусными инфекциями, из-за которых в западных областях Украины заболели свыше 250 тысяч человек, из которых 71 умер.

Norway fends off WHO officials in pandemic power struggle

The Flu Case, 4 November 2009, 11:55

https://web.archive.org/web/20091107021141/http://www.theflucase.com/index.php?option=com_content&view=article&id=1589:norway-fends-off-who-officials-in-pandemic-power-struggle&catid=41:highlighted-news&Itemid=105&lang=en

A row has broken out between WHO and Norway after Norway allegedly rejected an offer by the UN global health organisation to send their "experts" to Norway to deal with the swine flu pandemic.

According to a report in the Norwegian newspaper Dagbladet, WHO wanted to send "experts" to Norway after reports that more people had died from the "swine flu" there than in other countries.

The Assistant Director-General of WHO contacted the Norwegian health director Bjørn Inge Larsen and apparently suggested sending his officials to the country.

However, the Norwegian government declined the offer.

"They offered their assistance. There was talk of sending someone from the WHO here to assist us, " Norwegian Health Minister Anne-Grete Strøm-Erichsen said.

The news that WHO had offered to send experts to Norway emerged after a letter sent by Strøm-Erichsen to GlaxoSmithKline company concerning the destruction of 170,000 doses of Pandemrix was published.

"Influenza pandemic is now spreading rapidly throughout the country and close to inhabited areas have now been hardest hit. Compared with other European countries, we have a higher death rate, to the extent that the WHO has expressed concern and have contacted our health authorities to provide assistance, "said the letter.

Under the International Health Regulations 2005 and pandemic plans, WHO officials are allowed to assume sweeping powers over a country's health and security infrastructure under the pretext of a pandemic emergency.

The "offer" to send officials by WHO, and the rejection of that offer by Norway could be part of a power struggle for control of Norway.

Soon after the news emerged that WHO had contacted the Norwegian government about sending its officials to the country, the Norwegian government backtracked and denied it had rejected an offer by WHO to send experts.

"The case is wrong. It is we who first made contact with pandemic coordinator at WHO, Keiji Fukuda. We have not turned down anything from the WHO…," health director Bjørn Inge Larsen told Dagbladet.

"You refer to a phone call where the WHO's pandemic chief Keiji Fukuda contacted me to show his attention and say that they were aware of the high death toll in Norway as a result of swine flu. I already did that then we will review the Norwegian death to look for common denominators we have not discovered before, and that if the high numbers in Norway continues, it will be appropriate for us to contact the WHO, "says Larsen.

The call from WHO appears to have come on Monday or Tuesday of last week, indicating that WHO has been moving fast behind the scenes to embed its officials into national government structures.

"We may request assistance from WHO experts to survey and review the data. It will be clear about a couple of weeks, "said Larsen.

Polish Vice Health Minister Adam Fronczak
in Parlliament on swine flu (AH1N1) vaccine deaths and issues

Polish Parlliament, 5 November 2009
https://www.youtube.com/watch?v=nXqEWl07olk&list=PL579700CA87CC3B5D&index=10

Polish Vice Health Minister on swine flu vaccine (AH1N1). Here's a script of what he says:

It was said here that WHO and Eurpean Comminssion recommends the AH1N1 vaccines. Yes, it is true. But the responsibility lies with Health Ministry of every country in terms of health security of given country. And now we have a situation where in one country that bought a very large amount of vaccines... *2 people dies of AH1N1 and 4 people died in few hours after vaccine injection, allegedly of post-vaccinational complications*.

Isn't that a signal for Health Minister, doesn't it trigger an alert?

Great Britain widely allows vaccines that contain adjuvants containing mercury, for all social groups: so called risk groups and for the whole society.

But other countries with their pandemic comitees say: 'Stop to this vaccines. We do not allow neither the children up to 18 years of age nor pregnant women to be vaccinated with this jab!' This is only 1000-2000km away! It is the same European community, same philosophy but so different points of view!

Polish Health Minister [Eva Kopacz], a family doctor, tells Parliament she will not allow use of untested swine flu jabs: reveals secret contracts violate the law

The Flu Case, 5 November 2009, 11:59
https://web.archive.org/web/20100106085046/http://www.theflucase.com/index.php?option=com_content&view=article&id=1618%3Aupdate-polish-health-minister-a-family-doctor-tells-parliament-she-will-not-allow-use-of-untested-swine-flu-jabs-reveals-secret-contracts-violate-the-law&catid=41%3Ahighlig

The Polish Health Minister Eva Kopacz today told Parliament during a heated debate on the swine flu vaccination that she, as a qualified family doctor with more than 20 year of experience, will not authorise the use of untested vaccines on millions of people in Poland when there is inadequate information about the safety of the jabs.

She said the secret contract that the Polish government was supposed to sign with pharmaceutical companies had more than 20 clauses which are against the law.

Kopacz noted that governments in Western Europe had signed secret agreements with pharmaceutical companies, but suggested that the prosperity of the people of Poland was more important to her than the profits of Big Pharma.

She noted that there are three vaccines proposed for Poland with different types of adjuvants and was concerned that these vaccines were all being treated as if they were the same.

In addition, she observed that only 13 % of the people in Germany want to take the swine flu jab even though 5 times more people in Germany take the regular flu shot than in Poland, and asked why the Germans are so unwilling to take the jab.

She said there was secrecy surrounding the contents of the vaccines. There is no information about the amount of adjuvants in the vaccinesm, she added.

Furthermore, the family doctor and Health Minister said there is absolutely no information about the side effects of the swine flu jab. The pharmaceutical companies did not want to take responsibilty for the jab.

Also, she said that trials for the swine flu jab were being conducted on a relatively small number of healthy people and that these were not adequate for her to recommend the jab.

Moreover, Kopacz said that the regular flu was much more common and dangerous than the swine flu - and yet no pandemic had been declared over the seasonal flu.

Why is there such a panic about the swine flu virus? She asked.

Kopacz said that the Polish people can tell the difference between objective facts and the truth and lies.

She noted that all 193 people who allegedly had the swine flu in Poland had survived.

Finally, she called on the people of Poland to show their support for her as she comes under growing pressure from the pushers of the "swine flu" jab to give the people the dangerous and untested jab.

Polish Prime Minister:
Donald Tusk, pressured by EC on swine flu (AH1N1) vaccines

European Commission, 6 November 2009.

Polish Prime Minister: Donald Tusk's press conference on 06.11.2009. He's sceptical regarding swine flu vaccines despite pushing announcement made by European Commission.

Citizens demanding Vaccination choice
carry Republican Chris Christie to New Jersey Governorship

Press Release, 6 November 2009
https://www.pr.com/press-release/190737

Middletown, NJ – (PR.com) – In an unprecedented and historic move, Chris Christie put pen to paper last week and made an official campaign promise to citizens of New Jersey in support of vaccination choice. He further cemented his position on live radio with Don Imus, by becoming the first gubernatorial candidate to utter the words vaccines, autism and parental choice in the same sentence. Vaccine choice supporters showed up in record numbers tonight to cast their vote for Christie.

"Tonight, vaccine choice advocates in New Jersey are proud to announce that vaccination choice is officially a voting block," says Life Health Choices Founder, Louise Kuo Habakus, who met with campaign leaders last December and kept the lines of communication open. "This election is a wake-up call to politicians nationwide. Vaccine choice belongs in the parents' house, not the Statehouse or the White House."

After receipt of the official Christie campaign promise on Friday, vaccination choice and autism advocates mobilized in force on the internet. They alerted tens of thousands of supporters, who in turn took to Facebook, Twitter, and their own support group networks to reach hundreds of thousands more. News of Christie's now famous statement spread like wildfire through the state and across the country:

"I stand by them now, and will stand with them as their governor in their fight for greater parental involvement in vaccination decisions that affect their children… Ending waste in government in order to improve care and services for these unique children and adults, as well as giving parents the choice they deserve in their children's health care decisions, will be top priorities."

"Anger towards Governor Corzine has been building," says Habakus. It is well known that New Jersey, Autism Capital of the World, is also Ground Zero for mandated shots for school. Many parents and grandparents blame environmental causes, including the state's ultra-aggressive vaccine schedule. The "Freedom of Choice" rally in Trenton last fall garnered national media attention and catapulted this issue into the mainstream dialogue. On the heels of Corzine's 2008 decision to add four additional vaccine mandates to the state's already crowded schedule, thousands of parents have lined up to attend vaccination choice seminars and protests across the state.

In August, Christie and running mate, Monmouth County Sheriff Kim Guadagno, met with parents and received an unvarnished assessment of New Jersey's position on this issue from Habakus: "Fifty percent of Americans in 18 U.S. states including the highly populous, corridor states of California and Texas have vaccination choice. We deserve it here, in the state that leads the nation in autism incidence and the number of mandated shots for school attendance."

"We look forward to Governor-elect Christie's leadership and working with the new administration," says Habakus.

H1N1 is a 'dud' pandemic, Ontario health official says

CBC News, 12 November 2009, 7:33 PM ET
https://web.archive.org/web/20091115080157/http://www.cbc.ca/health/story/2009/11/12/h1n1-vaccine-costs.html?ref=rss

The huge investments governments made into swine flu pandemic planning might not have been justified, an Ontario health official says.

The huge investments governments made in swine flu pandemic planning might not have been justified, an Ontario health official said Thursday.

"It's really not causing ? and is not going to cause and nowhere has caused ? significant levels of illness or death," said Dr. Richard Schabas, Ontario's former chief medical officer of health.

"But governments moved ahead regardless. They ramped up their response, spent a huge amount of money on vaccines and other things. I'm not sure the $1.5 billion includes the cost of new ventilators, the cost of Tamiflu stockpiles ? the huge investment that's been put into planning for what has ultimately turned out to be, from a pandemic perspective, a dud."

Schabas is now the chief medical officer of health for Hastings and Prince Edward counties in eastern Ontario.

On Thursday, The Globe and Mail reported that Canada has so far spent $1.5 billion on the H1N1 vaccination campaign, twice as much as health officials had predicted. The H1N1 vaccine targets the strain of H1N1 influenza A virus causing the current swine flu pandemic.

Originally, it was estimated a single dose of the vaccine would cost $16. That cost has now risen to $30. The increasing cost is attributed in part to an unexpected surge in demand late last month.

By the time the immunization campaign is complete, the cost could exceed $2 billion.

In another development, an EKOS poll conducted exclusively for CBC News suggests more than half of Canadians surveyed believe concerns over the risk of H1N1 are exaggerated.

Of those polled, 53 per cent said the level of concern about swine flu is exaggerated, considering the real risks involved with the virus. Thirty-seven per cent said the concern was consistent with the level of risk, and 10 per cent said the level of risk was understated.

The survey of 3,502 people was conducted by telephone between Nov. 4 and Nov. 10, 2009, and has an error margin of plus or minus 1.7 percentage points, 19 times out of 20. Both landline and cellphone users were included.

THE FLU CASE

Vietnam requests WHO clarification on H1N1 vaccine safety

Thanh Nien News // The Flu Case, 5 December 2009

https://web.archive.org/web/20100214152335/http://www.theflucase.com/index.php?option=com_content&view=article&id=2191%3Avietnam-requests-who-clarification-on-h1n1-vaccine-safety-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Vietnam has asked the World Health Organization to clarify the safety of H1N1 vaccines to be provided to the country after higher

In an urgent communication to WHO, Vietnam has demanded that all information about the Arepanrix H1N1 vaccines produced by the British-owned GlaxoSmithKline, including its dosage and the number of allergic reactions to it in other countries, be clearly stated, the health ministry's Drug Administration said on Wednesday.

The country is expected to receive 1.2 million does of vaccines produced by GlaxoSmithKline from the WHO this month.

Nguyen Huy Nga, head of the health ministry's Preventive Health and Environmental Department, said they planned to vaccinate 800,000-900,000 women who are more than three months pregnant and 280,000 health workers between this month and next February.

According to the Drug Administration, Canada last month withdrew 170,000 doses of the Arepanrix vaccines after six negative reactions were reported. One or two allergic reactions are expected in a batch of that size.

Also on Wednesday the Ministry of Health reported that two more people – a 17-year-old girl and a 33-year-old man in the Mekong Delta of An Giang – have died of swine flu.

Swine flu has so far killed 46 people nationwide.

THE FLU CASE

Lawyers will Represent Bachelot at Court Hearing to stop Swine Flu Vacinations in France

The Flu Case, 21 December 2009, 14:01

https://web.archive.org/web/20100304215726/http://www.theflucase.com/index.php?option=com_content&view=article&id=2364%3Alawyers-will-represent-bachelot-at-court-hearing-to-stop-swine-flu-vacinations-in-france&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A lawyer will represent the French Health Minister Roselyne Bachelot at a court hearing scheduled for January 4th in Paris on whether the mass swine flu vaccination programme should be suspended.

Bachelot received a summons after legal action was taken by a group led by Dr Marc Vercoutère and Christian Cotten, who argue the vaccine is untested and toxic and poses a danger to the people of France.

The judgement could be given on the same day as the hearing, but most probably it will come a few days later, Christian Cotten said.

He said he expected the hearing to be mostly symbolic in as far as the political and financial interests pushing the swine flu vaccination campaign remain powerful and are advancing the campaign in spite of polls showing that 76 % of the French now have no intention of taking the jab.

The citizen's group hopes to use the occasion to publicise the inadequate basis for the current mass swine flu vaccination campaign by compelling Bachelot and her lawyers to present arguments, evidence and facts to justify their actions.

The mass swine flu vaccination campaign has galvanised France and led to the create of a new alternative or independent networks on the internet as people have become increasingly aware that the government and the mainstream and government-controlled media are not giving adequate information.

Criminal complaints have also been filed in France.

Also, an appeal is due to be launched in Belgium in January against a court ruling that the government did not violate laws by recommending the untested Pandemrix swine flu jab to pregnant women.

Science dictates that only a randomized double-blind, placebo-controlled study can generate unbiased results in any clinical trial. In the history of vaccine development, no such study has ever been performed. It is only unscientific opinions and pharmaceutical propaganda which have propelled the mythological validity, safety and effectiveness of vaccines. Dozens of controlled studies have scientifically verified the immunotoxicty, neurotoxicity and sterility of common vaccine ingredients which destroy human health, yet they are all ignored by conventional medicine,

- Definition - Randomized Double-blind controlled trial …
https://web.archive.org/web/20101220172150/http://www.lumrix.net/medical/epidemiology/randomized_controlled_trial.html

In a double-blind trial, one researcher allocates a series of numbers to 'new treatment' or 'old treatment'. The second researcher is told the numbers, but not what they have been allocated to. Since the second researcher does not know, they cannot possibly tell the patient, directly or otherwise, and cannot give in to patient pressure to give them the new treatment. In this system, there is also often a more realistic distribution of sexes and ages of patients. Therefore double-blind (or randomized) trials are preferred, as they tend to give the most accurate results.

Double Blind Study is an experimental procedure in which neither the subjects of the experiment nor the persons administering the experiment know the critical aspects of the experiment; "a double-blind procedure is used to guard against both experimenter bias and placebo effects".
https://web.archive.org/web/20110606105455/http://www.thefreedictionary.com/double-blind+study

A controlled trial in which neither the participants nor the experimenter or observer are aware of which group each participant is assigned to.

Schweinegrippe - Italiener fordern Geld zurück

Polskaweb News, 2 January 2010, um 22.30 Uhr
https://web.archive.org/web/20100116032138/http://polskaweb.eu/schweinegrippe-impfungen-in-italien-flop-6576576526.html

Rom – Während Italiens Premier Berlusconi sich möglicherweise gerade seine jüngsten "Verletzungen" im Gesicht vergolden lässt, gehen Politiker in Rom wegen dem nicht mehr zu übersehenden Betrug mit den neuen Grippen auf die Barrikaden. Nach Berichten der italienischen Nachrichtenagentur ANSA, fordern Politiker unter der Führung des Vorsitzende der Partei "Il Popolo della Libertà" Senator Maurizio Gasparri, eine parlamentarische Untersuchung zum Kauf von neuen Influenza-Impfstoffen gegen angeblich lebensgefährliche Grippen. Sie bezeichneten in diesem Zusammenhang Hersteller und involvierte Wissenschaftler als "Pharma-Haie" und sprechen von "illegalen Gewinnen" welche die Verantwortlichen nun an das italienische Volk zurückzahlen müssen. ANSA gibt zu, dass nur sehr wenige Italiener sich impfen liessen und Millionen Dosen Impfstoffe nun wertlos seien und ein Ende des "Kaufrausches" noch lange nicht abzusehen sei.

Auch in Italien entpuppte sich die von dubiosen Wissenschaftlern als A/H1N1- Grippe bezeichnete lebengefährliche Krankheit nur als Flop. Angeblich sollen 800 000 Italiener hieran erkrankt sein, doch "nur" 193 Menschen starben an den Folgen des Virus, also im Vergleich zu allen bisher dagewesenen Grippen praktisch fast niemand. Ebenso wie schon bei den Toten in Polen die angeblich an der Schweinegrippe gestorben waren, hatten auch sämtlich italienischen Opfer andere schwere- und vor allen Dingen chronische Erkrankungen. Das Gesundheitsministerium in Rom hatte auf Drängen der WHO und der Pharma- Industrie für rund 200 Millionen Euro dubiose und unerforschte Impfstoffe gekauft, die möglicherweise im gleichen Labor in Rotterdam erstmals gemixt wurden, wie schon auch der Erreger der laufenden Pandemie.

"Es ist kaum möglich in der Schweinegrippe Sache nicht an spekulative Manöver von skrupellosen Pharma-Multis zu denken. Solche Unternehmen sind Potent genug, um Medien und Informationen zu beeinflussen, die dem Bürger auch panikartig Haarwuchsmittel kaufen lassen. Diese "Pharma-Haie" dürfen nicht mit ihren illegalen Gewinnen entkommen" - sagte Maurizio Gasparri der Agentur ANSA und fügte hinzu, dass nun die Erwerber der Impfstoffe aus der Politik doch eigentlich alarmiert sein müssten und von sich aus dafür zu sorgen hätten, dass die durch "Lügen" verlorenen Gelder zurückgeholt werden. Die Weltgesundheitsorganisation WHO, Wissenschaftler aus Deutschland, Holland, Großbritannien, den USA und Italien und diverse Politiker sowie Behörden und staatliche Institutionen haben, nicht nur nach Überzeugung und Erkenntnissen von "Polskaweb", einen fortgesetzten Multimilliarden- Betrug zum Nachteil von über 200 Staaten der Welt hingelegt und Vogel- und Schweinegrippe in Europa sind Produkte eines Virologen aus Rotterdam.

THE FLU CASE

Senator calls for Parliamentary Inquiry in Italy:
says illegal profits must be returned:
Big Pharma earns 22 billion Euros in last quarter from Swine Flu jabs

The Flu Case, 7 January 2010, 12:00
https://web.archive.org/web/20100220012150/http://www.theflucase.com/index.php?option=com_content&view=article&id=2492%3Asenator-calls-for-parliamentary-inquiry-in-italy-says-illegal-profits-must-be-returned-big-pharma-earns-22-billion-euros-in-last-quarter-from-swine-flu-jabs&catid=1%3Alatest-news&Itemid=64&lang=en

Italian Senator Maurizio Gasparri from the "Il Popolo della Liberta" party is leading calls in Italy for a parliamentary inquiry into the swine flu vaccine orders, according to the Italan news agency ANSA, reports Polskaweb.

Few Italians have taken the swine flu jab, leaving the government sitting on millions of doses.

"It is hardly possible in the swine flu affair not to think on the unscrupulous manoeuvres of pharma multinationals. Such companies are powerful enough to influence media and information, which would lead citizens to by hair growth means in panic. These "pharma sharks" cannot be allowed to get away with their illegal profits," Gasparri said.

Polskaweb has estimated that the swine flu scam earned the pharma companies 22 billion euros in the last quarter alone.

Włochy: nowa grypa to blef?

Wiadomosci.One, 3 January 2010, 10:12
https://www.wnp.pl/wiadomosci/wlochy-nowa-grypa-to-blef,98005.html

Za wszczęciem parlamentarnego dochodzenia w sprawie masowego zakupu szczepionek przeciwko nowej grypie we Włoszech opowiedział się szef klubu rządzącej partii Lud Wolności w Senacie Maurizio Gasparri. Jego zdaniem za decyzją o zakupie milionów szczepionek stały potężne koncerny farmaceutyczne.

Polityk koalicji, cytowany przez agencję Ansa, przypomniał, że grypa typu A/H1N1 okazała się podobna do tej sezonowej i najczęściej lekka w przebiegu. Tymczasem - zauważył - kupiono ogromne zapasy szczepionek, które nie zostały wykorzystane. W ten sposób Gasparri odniósł się do doniesień o tym, że wykorzystano jedynie co 70. dawkę kupionej przez rząd szczepionki przeciwko nowej grypie, ponieważ zdecydowana większość Włochów nie skorzystała z możliwości zaszczepienia.

- Trudno nie myśleć o spekulacyjnych manewrach w wymiarze światowym ze strony pozbawionych skrupułów międzynarodowych koncernów farmaceutycznych, na tyle potężnych, by wpływać na informację, która ze swym alarmistycznym tonem służy tym rekinom - powiedział senator Gasparri. Dodał: - Nie ujdą im na sucho nielegalne zyski.

- Trzeba ustalić, czy ten, kto zarobił bez powodu, może zwrócić zyski zgromadzone dzięki kłamstwom - oświadczył włoski polityk.

Włoskie ministerstwo zdrowia planowało zaszczepienie 40 procent populacji przeciwko nowej grypie. Według prasy na szczepionki wydano około 200 milionów euro. Ale do tej pory zaszczepiło się około 800 tysięcy ludzi.

Na grypę typu A zachorowało około 4 milionów ludzi, a z powodu powikłań, wywołanych przez inne ciężkie schorzenia i chroniczne dolegliwości, zmarły 193 osoby.

Italy: the new influenza is a bluff?

Wiadomosci.Onet.Pl 5 January 2009
https://jagahost.proboards.com/thread/7611/polish-health-ministry-blasts-vaccinations

Italian Parliament To Investigate Fraudulent H1N1 Vaccine Contracts

(Polish Press Agency) For the initiation of parliamentary investigation into the mass purchase of a new influenza vaccines in Italy, opted the Club's head of the ruling People of Freedom Party in the Senate, Maurizio Gasparri.

In his opinion behind the decision to buy millions of vaccines are powerful pharmaceutical companies. The coalition politician, quoted by the Ansa agency, noted that type A/H1N1 flu turned out to be similar to the seasonal and usually mild. Meanwhile – he noted - huge stocks of vaccines were bought, which were not used.

In this way, Gasparri referred to the reports that only 1 in 70 doses were used, because the vast majority of Italians did not take the possibility of inoculation. It's hard not to think about speculative maneuvers on a global dimension by unscrupulous pharmaceutical multinationals concerns, powerful enough to influence the information that, with its alarmist tone, serves those sharks - said senator Gasparri.

He added: - They won't get away with the illegal profits. - We must determine whether the person who earned without a reason, can return the profits accumulated through the lies - said the Italian politician.

The Italian health ministry planned to immunize 40 percent of the population against the new flu. According to the press about 200 million euro has been spent on vaccines. But so far approximately 800 thousand people got immunised. Influenza type A sickened about 4 million people, but because of complications caused by other serious diseases and chronic ailments, 193 people died.

Grippe A: les critiques s'accumulent contre le surplus de vaccins

Le Parisien, 3 janvier 2010 à 15h45
https://www.leparisien.fr/societe/sante/grippe-a-les-critiques-s-accumulent-contre-le-surplus-de-vaccins-03-01-2010-763699.php

La revente d'une partie de 94 millions de doses de vaccin contre la grippe A à des pays étrangers, révélée ce dimanche dans les colonnes du Parisien-Aujourd'hui en France, suscite de vives critiques sur la façon dont le gouvernement a géré la campagne de vaccination, et notamment son coût.

Benoît Hamon, le porte-parole du PS, a ainsi dénoncé, lundi matin, les surplus de vaccins contre la grippe H1N1 en France estimant que les laboratoires pharmaceutiques sont «les grands vainqueurs dans cette affaire». «Je trouve ça pour le moins curieux qu'on achète pour l'équivalent de 90 millions» de doses de vaccin et qu'«il en reste 70 millions, c'est-à-dire qu'à peu près deux tiers de ce qui avait été prévu n'ait pas été utilisé», a déclaré M. Hamon sur Canal+. Le porte-parole du PS a également dénoncé de la part du gouvernement «une campagne bien anxiogène pour essayer d'écouler les stocks» et le fait qu'il tente «de justifier qu'on ait payé l'équivalent d'un milliard d'euros aux labos pharmaceutiques qui sont les grands vainqueurs dans cette affaire».

Pour Vincent Peillon, eurodéputé (PS), «ce gouvernement n'a pas été écouté ceux qui savent, ce n'est pas la première fois, il y a un mépris pour le savoir, il y a une gestion par la peur», a-t-il expliqué sur France 2.

A droite, certaines dents grinçaient dès dimanche. Le professeur Bernard Debré, député UMP de Paris et membre du Comité consultatif national d'éthique, a ainsi affirmé sur France Info que «le principe de précaution a été poussé à l'extrême stupidité». Il estime que la France a acheté de 50 à 70 millions de vaccins en trop et un tiers des réserves mondiales de l'antibiotique Tamiflu. La facture pourrait s'élèver, selon lui, à près de deux milliards d'euros, soit plus que les déficits additionnés de tous les hôpitaux de France.

Le professeur Marc Gentilini, spécialiste des maladies infectieuses et ancien président de la Croix-Rouge française, est «très sévère sur la façon dont on a agi parce qu'on n'a pas accepté un dialogue vrai sur les risques que faisait courir ce nouveau virus (...) alors que, globalement, il représente une mortalité inférieure à celle de la grippe saisonnière». «Je conçois très bien qu'on veuille prendre une assurance tous risques, mais quand une assurance coûte beaucoup plus cher que le risque, on doit quand même s'interroger», a-t-il poursuivi.

Le médecin estime aussi qu'avec «une mise hors-jeu du service de santé principal constitué par les médecins libéraux, on courait un risque de non-acceptation par la population». Il critique également une «campagne dispendieuse», en notant le prix des pages de publicité achetées par le ministère de la Santé pour promouvoir la vaccination, les 2 milliards de masques «gardés je ne sais où, et dont personne ne s'interroge sur leur utilisation».

Le député Jean-Marie Le Guen, médecin et spécialiste des questions de santé au PS, a réclamé dimanche une mission parlementaire pour faire le bilan du «fiasco» de la «la politique vaccinale» et «tirer des leçons pour le futur». «Nous avons le plus faible taux de personnes vaccinées des pays développés», écrit encore l'élu socialiste.

French Deputy Calls for Parliamentary Investigation into Swine Flu Vaccination "Fiasco"

The Flu Case, 4 January 2010, 12:37
https://web.archive.org/web/20100220012008/http://www.theflucase.com/index.php?option=com_content&view=article&id=2459%3Afrench-deputy-calls-for-parliamentary-investigation-into-swine-flu-vaccination-qfiascoq&catid=41%3Ahighlighted-news&Itemid=105&lang=en

French Deputy Jean-Marie Le Guen, a doctor and the health specialist for the PS Socialist Party, called on Sunday for a parliamentary inquiry into the "fiasco" of the swine flu vaccination campaign and "vaccination politics," according to Le Parisien.

The demand comes among growing criticism of the French government's handling of the swine flu vaccination campaign.

Professor Bernard Debré, UMP deputy, said that the "pincriple of precuation has been pushed to extreme stupidity" during the campaign.

He estimated that France had bought 50 to 70 million swine flu jabs too many as well as a third of world's reserves of Tamiflu, and the total cost of the swine flu campaign could come to 2 billion euros.

Professor Marc Gentilini, specialist for infectious diseases and former president of the Red Cross criticised the way the government had not been willing to enter into a real "dialogue" about the low risk of the swine flu virus.

Dalila B.

Dismissed for refusing to sign reports of the GSK vaccine

Ennahar, 5 January 2010, 11:52:00
https://web.archive.org/web/20100120054037/http://www.ennaharonline.com/en/news/2791.html

Algiers- credible sources from the Ministry of Health, Population and Hospital Reform, said that Minister Said Barkat has terminated the functions of the Director, responsible for customs clearance at the central pharmacy.

Ms. Rahal has lost her job for refusing to sign a report of clearance of the vaccine against influenza A (H1N1) imported by the Ministry of Health, produced by the British laboratory GSK. According the same source, the reasons for refusal would be linked to expiry of the vaccine in May this year, while the vaccination has not been started yet. That would mean the loss of a large quantity of vaccine that would not be used, while the citizens refuse to be vaccinated.

This redundancy adds to a series of dismisses by the Ministry of Health against the executives who refuse to play with the health of the Algerian people, like Mrs. Touabti, head of control at the Pasteur Institute, who was dismissed after the results on the vaccine produced by GSK, and the death of laboratory rats after inoculating doses of 0.5 mg, then doses of 0.2 mg, which was considered by the department as an unforgivable mistake.

In the same context, the Minister of Health, Population and Hospital Reform, terminated the functions of the Director of Pasteur Institute, Professor Abadi, for the delay on the importation of the vaccine against the seasonal influenza and influenza A (H1N1), and the appointment of Director of Prevention at the Department, Ismaïl Mesbah, acting director for a few days before the appointment of the Head of Department of Microbiology at Mustapha Pacha hospital, Professor Mohamed Tazir who has already served at the same post in the eighties.

THE FLU CASE

H1N1: 4 députés centristes pour une commission d'enquête, le PS veut une mission

The Flu Case, 6 January 2010.
https://web.archive.org/web/20100220012145/http://www.theflucase.com/index.php?option=com_content&view=article&id=2490%3Alikelihood-of-french-parliamentary-inquiry-into-swine-flu-vaccination-grows&catid=1%3Alatest-news&Itemid=64&lang=en

Quatre députés du Nouveau centre ont déposé une proposition de résolution demandant une commission d'enquête parlementaire sur la grippe H1N1, tandis que leurs collègues socialistes ont réitéré leur demande de mission d'information sur ce sujet.

Le groupe Nouveau centre décidera mardi prochain d'utiliser ou non, son droit de tirage, un nouveau droit constitutionnel permettant à un groupe de demander, une fois par session, une commission d'enquête, a précisé l'auteur de la proposition de résolution, Jean-Christophe Lagarde, lors d'un point de presse.

En principe, la demande de commission d'enquête ne peut être refusée que si les 3/5e des députés s'y opposent.

Le texte co-signé par M. Lagarde, Jean-Luc Préel, Maurice Leroy et Jean Dionis du Séjour, et déposé mardi soir, explique que "la France s'est montrée clairement en difficulté dans le dossier" de la vaccination contre la grippe H1NI.

Les 4 député jugent donc une commission d'enquête nécessaire, afin d'effectuer un "travail d'analyse transparent, public et contradictoire" pour "comprendre les dysfonctionnements du plan de vaccination et les améliorations à lui apporter".

"Il y aura un jour une pandémie plus mortelle, soyons prêt pour la prochaine fois", a expliqué M. Lagarde.

En revanche, le député centriste a jugé que la "polémique sur le nombre de vaccins était déplacée".

"La polémique du PS c'est une histoire de pognon", a-t-il dit. Mais le travail des parlementaires "c'est de dire que nous avons choisi la mauvaise voie et qu'il faut changer", a-t-il ajouté.

Mardi, Roselyne Bachelot (Santé) a indiqué qu'elle accepterait une commission d'enquête parlementaire et Jean-François Copé, le patron du groupe UMP "a dit qu'il ne s'opposerait pas" à son principe, a souligné M. Lagarde.

Il a par ailleurs critiqué la demande des députés PS d'une simple mission d'information, moins contraignante qu'une comission. Lundi, le porte-parole du PS, Benoît Hamon, avait demandé une "commission d'enquête" sur la grippe H1N1, tandis que le député PS de Paris Jean-Marie Le Guen avait réitéré sa demande de constitution d'une mission d'information.

A l'Assemblée, le groupe PS, qui a déjà utilisé son droit de tirage pour demander une commission sur les sondages, ne peut l'utiliser pour la grippe H1N1. "Mais les sénateurs PS pourraient le faire" sur la grippe H1N1, a fait valoir M. Lagarde.

"Il faut faire la clarté", a déclaré de son côté M. Ayrault lors de ses voeux à la presse. Selon lui, "il est urgent que l'Assemblée nationale et le Parlement fassent leur travail et que le gouvernement accepte une mission d'information parlementaire et pas seulement l'audition d'un ministre".

"Il faut l'installer dans les jours qui viennent", a-t-il lancé.

Pour sa part, le président de l'Assemblée nationale Bernard Accoyer (UMP) s'est dit "personnell-ement opposé" à une commission d'enquête, dans une interview au Quotidien du médecin.

Mercredi, il a simplement annoncé que Mme Bachelot répondrait aux questions de l'ensemble des députés à l'occasion de la "prochaine réunion de la commission des Affaires sociales".

"Il faudra que les gens qui refusent expliquent pourquoi", a répondu M. Lagarde.

Grippe: Roselyne Bachelot répondra aux députés devant la commission des affaires sociales, selon Accoyer

Fr.News, Yahoo, 6 janvier 2010, 10h52

https://web.archive.org/web/20100220012115/http://www.theflucase.com/index.php?option=com_content&view=article&id=2480%3Afrench-health-minister-to-be-grilled-by-parliamentary-committee&catid=1%3Alatest-news&Itemid=64&lang=en
http://fr.news.yahoo.com/3/20100106/r_t_ap_pl_other/tpl-grippe-a-h1n1-vaccination-bachelot-a-cfb2994_1.html?printer=1 (deleted)

La ministre de la Santé Roselyne Bachelot sera interrogée sur la grippe A/H1N1 à l'occasion de la prochaine réunion de la commission des affaires sociales qui se tiendra sur l'évolution de la pandémie, annonce le président de l'Assemblée nationale.

Alors que le Parti socialiste et le Nouveau centre ont réclamé une commission d'enquête parlementaire sur le sujet, Bernard Accoyer souligne dans un communiqué que la commission des affaires sociales a déjà auditionné la ministre sur cette question à trois reprises, en septembre, novembre et décembre derniers.

Roselyne Bachelot a fait savoir mardi qu'elle était prête à accepter le principe d'une commission et s'est dite à la disposition des députés pour répondre à leurs questions.

Le président de l'Assemblée nationale précise que la prochaine réunion de la commission des affaires sociales sur la grippe "sera élargie à l'ensemble des députés et ouverte à la presse. D'autres réunions identiques pourront être organisées". AP

French Health Minister to be Grilled by Parliamentary Committee

The Flu Case, 6 January 2010, 12:04

https://web.archive.org/web/20100220012115/http://www.theflucase.com/index.php?option=com_content&view=article&id=2480%3Afrench-health-minister-to-be-grilled-by-parliamentary-committee&catid=1%3Alatest-news&Itemid=64&lang=en

French Health Minister Roselyne Bachelot is set to be cross-examined by a parliamentary committee to answer questions about the swine flu pandemic and the mass vaccination campaign, the president of the National Assembly has said.

Bachelot's appearance in front of the committee on social affairs will be open to all deputies and also to the media, reports AP.

LA DÉPÊCHE

Vaccin contre la grippe A:
Roselyne Bachelot sur le gril

La Dèpèche, 7 January 2010, 08:22
https://www.ladepeche.fr/article/2010/01/07/750323-vaccin-contre-la-grippe-a-roselyne-bachelot-sur-le-gril.html

Début d'année sous pression pour Roselyne Bachelot. Sa gestion de la grippe H1N1 n'en finit pas de susciter des remous. Quatre députés du Nouveau centre, dont Jean Dionis du Séjour, ont déposé une proposition de résolution demandant une commission d'enquête parlementaire sur la grippe H1N1, tandis que leurs collègues socialistes ont réitéré leur demande de mission d'information. Le Nouveau centre décidera mardi prochain d'utiliser ou non son droit de tirage qui permet à un groupe de demander, une fois par session, une commission d'enquête. Mardi, Roselyne Bachelot a indiqué qu'elle accepterait une commission d'enquête parlementaire. «Il faut faire la clarté», a déclaré de son côté le socialiste Ayrault lors de ses vœux à la presse.

Pour sa part, le président de l'Assemblée nationale Bernard Accoyer s'est dit «personnellement opposé» à une commission d'enquête. Hier, il a annoncé que Roselyne Bachelot répondrait aux questions de l'ensemble des députés à l'occasion de la «prochaine réunion de la commission des Affaires sociales».

De son côté, la commission des Affaires sociales du Sénat a indiqué hier qu'elle souhaitait elle aussi « entendre rapidement » la ministre de la Santé.

Le Monde.fr

Grippe H1N1: le Conseil de l'Europe veut une enquête

Le Monde, 7 janvier 2010
https://web.archive.org/web/20100108160356/http://veilleur.blog.lemonde.fr/2010/01/07/grippe-h1n1-le-conseil-de-leurope-veut-une-enquete/

Alors que plusieurs pays européens commencent à revendre leurs surplus de vaccins contre la grippe A (H1N1) sur le marché mondial, les États membres du Conseil de l'Europe ont décidé de lancer une enquête sur l'influence qu'auraient pu avoir les compagnies pharmaceutiques sur la campagne de vaccination mondiale, révélait hier le quotidien belge De Morgen. Lire aussi Die Zeit.

C'est le Dr Wolfgang Wodarg, ex-député social-démocrate de l'arrondissement allemand de Flensburg-Schleswig et maintenant président du Comité européen de la santé, qui a lancé l'enquête en déposant une motion qui a été adoptée à l'unanimité par les membres du comité du Parlement européen à la santé, explique Ian Bussières sur le site du quotidien canadien Le Soleil.

Sur son site Web, le Dr Wodarg accuse les compagnies pharmaceutiques d'avoir incité les scientifiques et les agences officielles responsables de santé publique à alarmer les gouvernements mondiaux avec ce qu'il qualifie de «fausse pandémie» dans le but de faire la promotion de leurs médicaments et vaccins contre la grippe.

Des accusations qu'il réitère aujourd'hui dans L'Humanité au cours d'un long entretien accordé à Bruno Odent. Morceaux choisis (mais allez sur le site, il faut lire l'intégralité) :

«En avril quand la première alarme est venue de Mexico j'ai été très surpris des chiffres qu'avançait l'Organisation Mondiale de la Santé (OMS) pour justifier de la proclamation d'une pandémie. J'ai eu tout de suite des soupçons : les chiffres étaient très faibles et le niveau d'alarme très élevé. On en était à même pas mille malades que l'on parlait déjà de pandémie du siècle.»

«Dans les choses qui ont suscité mes soupçons il y a donc eu d'un côté cette volonté de sonner l'alerte. Et de l'autre des faits très curieux. Comme par exemple la recommandation par l'OMS de procéder à deux injections pour les vaccins. Ça n'avait jamais été le cas auparavant. Il n'y avait aucune justification scientifique à cela. Il y a eu aussi cette recommandation de n'utiliser que des vaccins brevetés particuliers (…) On ne l'a pas fait car on a préféré utiliser des matériaux vaccinaux brevetés que les grands laboratoires avaient élaborés et fabriqués pour se tenir prêts en cas de développement d'une pandémie. Et en procédant de cette façon on n'a pas hésité à mettre en danger les personnes vaccinées.»

« L'industrie pharmaceutique ne prenait aucun risque économique en s'engageant dans les nouvelles fabrications. Et elle était assurée de toucher le jack pot en cas de déclenchement d'une pandémie. »

«Nous voulons faire la lumière sur tout ce qui a pu rendre cette formidable opération d'intox. Nous voulons savoir qui a décidé, sur la base de quelles preuves scientifiques, et comment s'est exercé précisément l'influence de l'industrie pharmaceutique dans la prise de décision.»

«Nous nous pencherons sur l'attitude des instituts comme le Robert Koch en Allemagne ou Pasteur en France qui aurait dû en réalité conseiller leurs gouvernements de façon critique.»

«J'ai pu constater très concrètement par exemple comment Klaus Stöhr qui était le chef du département épidémiologique de l'OMS à l'époque de la grippe aviaire, et qui donc a préparé les plans destinés à faire face à une pandémie que j'évoquais plus haut, était devenu entre temps un haut cadre de la société Novartis. Et des liens semblables existent entre Glaxo ou Baxter (etc) et des membres influents de l'OMS.»

«Les vaccins ont été élaborés trop rapidement, certains adjuvants insuffisamment testés.»

THE FLU CASE

WHO and Big Pharma Officials
to be Summoned to Hearing at Council of Europe's Parliament

Le Monde // The Flu Case, 7 January 2010, 13:12
https://web.archive.org/web/20100108160356/http://veilleur.blog.lemonde.fr/2010/01/07/grippe-h1n1-le-conseil-de-leurope-veut-une-enquete/

Is the mass vaccination campaign with the untested and toxic swine flu jab really a gigantic operation orchestrated with the complicity of governments by Big Pharma for profit?

This is going to be the issue investigated by the Council of European Parliamentary Assembly at the end of January after a motion was submitted by former SPD MP Wolfgang Wodarg, an epidemiologist and lung specialist.

Officials from the WHO as well as representatives from the pharmaceutical industry are set to appear at a hearing scheduled for January 28th, though the official green light for the hearing is not expected to come until Monday, January 25th, the first technical day of the parliamentary session, and attempts to strike these items from the agenda cannot be excluded.

Even Le Monde is carrying a report (see below) on the upcoming hearing.

"In order to promote their patented drugs and vaccines against flu, pharmaceutical companies have influenced scientists and official agencies, responsible for public health standards, to alarm

governments worldwide. They have made them squander tight health care resources for inefficient vaccine strategies and needlessly exposed millions of healthy people to the risk of unknown side-effects of insufficiently tested vaccines," reads Wodarg's motion, which has gained the support of 14 MPs so far.

In parallel, the Council of Europe's influential health committee headed by Christine McCafferty, has also deposited a request for an „urgent debate" on the swine flu vaccination campaign during the next parliamentary session due to take place between January 25th and 29th in Strasbourg, France.

But what power does the Council of Europe parliamentary assembly have to reign in WHO and the pharmaceutical companies?

Angus McDonald from the Council of Europe explained that the Council of Europe is separate from the European Union and the European Parliament - and also older, having been founded in 1949.

The Council of Europe is composed of members of parliament drawn from all 47 European states, including Russia, the Ukraine and Norway, among others.

It oversees the operation of the European Court of Human Rights as well as the European Pharmacopoeia, a body sets down legally binding quality standards for medicines and pharmaceutical products inside European countries.

Because the members of parliaments who attend the Council of Europe parliament assembly are also directly elected members of their own national parliaments, the Council of Europe can be considered a more democratic body and also to be more representative of the views of Europe's 800 million citizens than the EU, argues McDonald.

MPS attending the Council of Europe sessions, held four times a year, can return to their own countries and initiate investigations or parliamentary inquiries there.

A debate at a Council of Europe parliamentary assembly sessions can conclude with either a resolution or a recommendation to European governments to undertake a specific course of action concerning, in this case, the handling of a pandemic.

But while the Council of Europe can highlight an issue, it has no binding leislative power to force governments to take action.

A Committee of Ministers made up of the foreign ministers of the 47 European countries is part of the Council of Europe. This body can compell governments to respond to assembly resolutions,

The hearing intiated by Wodarg is separate from the „urgent debate" expected to be held as a result of the submission of Christine McCafferty, head of the health and family affairs committee. However, both these events could represent a significant blow to the big pharma lobby.

Information that emerges from these hearings and circulates widely among European elected representatives could result in demands for parliamentary inquiries among the parliamentary base that the big pharma and banks do not appear to control to the same extent as they appear to control the higher echelons of government and the EU.

In addition, the swine flu vaccine scandal might add to the widespread anger among European citizens over their governments and their handling of the financial crisis, with the banks coming out the winners while public services undergo cuts – and lead to pressure for more transparency among Europe's governments.

German Journalists file Charges against Vaccine Body for Recommending Dangerous Swine Flu Jab

LifeGen.de, The Flu Case, 15 January 2010, 11:35

http://www.lifegen.de/newsip/shownews.php4?getnews=m2010-01-15-1401&pc=s02 (deleted)
https://web.archive.org/web/20100327040509/http://www.theflucase.com/index.php?option=com_content&view=article&id=2562%3Agerman-journalists-file-charges-against-vaccine-body-for-recommending-dangerous-swine-flu-jab&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Journalists at the German science website LifeGen.de have filed charges against Germany's National Vaccination Commission (STIKO) for recommending an inadequately tested swine flu jab to millions of Germans.

GlaxoSmithKline's Pandemrix was given approval in 2008 on the basis of a study on 240 adults without a clinical phase III data on safety and without an assessment of the impact of the vaccine on children, the journalists note in their charges.

Under special EU emergency pandemic licencing procedures, the swine flu vaccine has been allowed onto the market without having been tested for safety and efficacy - in spite of the fact there has been plenty of time for such tests since 2008 so that pretext given of having to skip clinical trials to rush through a vaccine is false.

Tests are all the more urgent as they contain the toxic ingredients mercury and the adjuvant squalene.

GSK is currently conduting a study for Pandemrix on 9000 patients in the UK but there are no details of this study available.

What is the point of conducting a study after the vaccine is given to ascertain its safety?

How independent can such a study by GSK, the manufacturer of the vaccine, be expected to be?

Once more, it is left to journalists to do the research and find the facts and call authorities to account when politicians have failed to do so, and continue to fail to do so.

Editorial: *The Need to File Charges against Swine Flu Vaccination Authorities*

Today LifeGen.de has filed charges against Germany’s National Vaccination Commission (STIKO) due to the admission and recommendation of swine flu vaccines. By this step we hope to help preventing a comeback of the Swine Flu Case in 2010 and in the future. According to a paper delivered by EMEA, the vaccine Pandemrix obtained the approval for the European Union in May 2008, exactly one year before WHO declared H1N1/A as a Pandemic and one year before the H1N1/A Pandemic strains were isolated in 2009. Moreover, the document delivered to LifeGen.de proves the fact that the vaccine’s safety had been tested on a cohort of 240 adults, clinical trial phase III data about safety and risk aspects for children is missing completely.

From our point of view German Health Care authorities missed to analyze such aspects, having started a unique clinical trial on national scale without having informed the population about the background and possible risks.

Now the office of public prosecution in Berlin will have to decide. The vaccination costs in Germany are said to exceed 400 Mio. EUR.

Польша единственная отказалась от импорта вакцин против гриппа A/H1N1

Фармацевтический вестник, 14 января 2010, 00:00
https://pharmvestnik.ru/content/news/17506.html

Решение об отказе от импорта вакцины на фоне предупреждений о распространении вируса кажется весьма странным. Но польское правительство поступило именно так, и Польша стала единственной страной в своем роде.

Как объяснили власти, подобное решение принято из-за сомнений в безопасности вакцин и недоверия к производящим их фармацевтическим компаниям, в чем их стараются переубедить международные эксперты.

Как бы то ни было, премьер-министр Польши Дональд Туск и министр здравоохранения страны Ева Копач получили широкую поддержку населения. Даже несмотря на то, что грипп A/H1N1 унес жизни 145 человек, многие поляки рассматривают отказ от вакцин как вызов фармацевтическим компаниям, которые, по их мнению, продают неапробированные вакцины.

Кроме того, в стране проходит массовая кампания против вакцинации. Как заявил премьер-министр, Польша проявила мужество, отказавшись от вакцин, которые, по его мнению, не прошли соответствующие испытания. «Мы приняли это решение исключительно в интересах пациентов и налогоплательщиков», - сказал он.

Из официальных лиц против действий правительства выступил только омбудсмен Януш Кочановски. Мнения врачей разделились, некоторые из них критикуют решение об отказе от закупки вакцин. «У пациента должно быть право выбора», – заявил один из врачей.

Schweinegrippe-Impfungen:
Ständige Impfkommission (STIKO) kassiert Strafanzeige

OTS, 15 Januar 2010, 15:41:33
https://www.ots.at/presseaussendung/OTS_20100115_OTS0011/schweinegrippe-impfungen-staendige-impfkommission-stiko-kassiert-strafanzeige

Osterode am Harz (ots) - Das von den Bestsellerautoren Marita Vollborn und Vlad Georgescu geführte Biotech Online-Magazin LifeGen.de hat auf Grund der erfolgten Schweinegrippe-Impfungen in Deutschland Strafanzeige gegen die am Robert Koch Institut angesiedelte Ständige Impfkommission (STIKO) eingereicht.

Nach Informationen von LifeGen.de wurde das von *GlaxoSmithKline den Ländern verkaufte Vakzin Pandemrix bereits im Mai 2008 zugelassen – ein Jahr vor Beginn der von der WHO ausgerufenen Pandemie und noch vor Isolierung des Schweinegrippe-Erregers im Jahr* 2009. Lediglich eine Anzahl von 240 Patienten diente damals als "Beweis" für die Sicherheit des Impfstoffs. Die Bevölkerung der Bundesrepublik avancierte ab Herbst 2009 damit de facto ohne vorherige Einwilligung zur humanen Ressource für einen klinischen Großversuch der Pharmaindustrie, nachdem die am RKI angesiedelte STIKO immer wieder die Impfung empfahl und selbst Gesundheitsminister Philipp Rösler an der Praxis der STIKO festhielt.

LifeGen.de LTD hat daher am 14.1.2010 *Strafanzeige und Strafantrag gegen die am RKI angesiedelte Ständige Impfkommission* (STIKO) und, um die Ermittlungen in alle Richtungen zu ermöglichen, auch gegen Unbekannt gestellt. Angesichts der Tatsache, dass die bestellten Impfstoffe nach Informationen der F.A.Z. die Kassen der GKV bislang rund 400 Mio. Euro kosteten, besteht nach Ansicht von LifeGen.de LTD ein öffentliches Interesse an Ermittlungen durch die Berliner Justiz.

Nach Meinung von LifeGen.de besteht der Verdacht von Verstößen gem. § 223, § 224 (1) Abs. 1, § 225 (3) Abs. 1. und 2, § 226 (3) sowie § 228 des StGB. Ebenso Verstöße gegen die Paragraphen 5, 10, 11, 11a, 14 und 15 des AMG zuletzt geändert durch Art. 1 V v. 28.9.2009 I 3172, (3578). Derzeit überprüft LifeGen.de auch die Chancen einer Verfassungsbeschwerde bez. § 20 Seuchenschutzgesetz. In der auf 10 Seiten verfassten Strafanzeige an die Berliner Staatsanwaltschaft weist LifeGen.de zudem darauf hin, dass das Vakzin im Jahr 2008 nur für Erwachsene zugelassen wurde, wie ein LifeGen.de vorliegendes, öffentlich zugängliches Originaldokument ebenfalls belegt.

Alle weiteren Infos finden Sie auf www.lifegen.de und Im Buch "Schweinegrippe als Jahrtausend-Fake", das bereits im November 2009 bei Books on Demand verlegt wurde und das im Laufe der dazugehörigen Recherchen zur Realisierung der Strafanzeige führte.

Schweinegrippe:
Sammelklagen gegen die Verantwortlichen rücken näher

Readers Edition, 19 Januar 2010, um 16:06 Uhr
https://web.archive.org/web/20100122072518/http://www.readers-edition.de/2010/01/19/schweinegrippe-sammelklagen-gegen-die-verantwortlichen-ruecken-naeher/

Die von LifeGen.de gestellte Strafanzeige gegen die Ständige Impfkommission bildet womöglich die Spitze eines juristischen Eisbergs. Nachdem in den USA über das elektronische Vaccine Adverse Event Reporting System (VAERS) mehr als 7800 Fälle von Nebenwirkungen nach Impfungen gemeldet wurden und 33 Verdachts-Todesfälle auftraten, könnten betroffene Ärzte und Patienten über eine Sammelklage Schadenersatzforderungen geltend machen. Die Chancen für einen Erfolg stehen nach Einschätzung von LifeGen.de gut. Denn von der europäischen Zulassungsbehörde EMEA veröffentlichte Dokumente belegen, dass in einem Fall lediglich 240 Patienten für die Zulassung des entsprechenden Vakzins herangezogen wurden.

Das von GlaxoSmithKline auch in Deutschland verkaufte Mittel (Pandemrix) wurde zudem an Kindern nicht getestet – und erhielt die Zulassung bereits im Mai 2008, also ein Jahr vor der Ausrufung der Pandemie durch die WHO. In einem Schreiben an LifeGen.de bestätigt die EMEA ferner, wichtige klinische Daten über Verträglichkeiten und Risiken erst während der Impfkampagne zu sammeln. Damit avancierte die hierzulande von der STIKO empfohlene und auch vom Bundesgesundheitsminister nahegelegte Impfung gegen H1N1/A zum Großversuch ohne vorherige Aufklärung der Teilnehmer über die fehlenden Daten.

LifeGen.de LTD hat daher am 14.1.2010 Strafanzeige und Strafantrag gegen die am RKI angesiedelte Ständige Impfkommission (STIKO) und, um die Ermittlungen in alle Richtungen zu ermöglichen, auch gegen Unbekannt gestellt. Nach Meinung von LifeGen.de besteht der Verdacht von Verstößen gem. § 223, § 224 (1) Abs. 1, § 225 (3) Abs. 1. und 2, § 226 (3) sowie § 228 des StGB. Ebenso Verstöße gegen die Pragraphen 5, 10, 11, 11a, 14 und 15 des AMG zuletzt geändert durch Art. 1 V v. 28.9.2009 I 3172, (3578). Derzeit überprüft LifeGen.de auch die Chancen einer Verfassungsbeschwerde bez. § 20 Seuchenschutzgesetz.

In der auf zehn Seiten verfassten Strafanzeige an die Berliner Staatsanwaltschaft weist LifeGen.de zudem darauf hin, dass das Mittel im Jahr 2008 nur für Erwachsene zugelassen wurde, wie ein LifeGen.de vorliegendes, öffentlich zugängliches Originaldokument ebenfalls belegt.

THE FLU CASE

Will Italy's class action lawsuit be the first of many?

The Flu Case, 25 January 2010.
https://web.archive.org/web/20100220012925/http://www.theflucase.com/index.php?option=com_content&view=article&id=2630%3Awill-italys-class-action-lawsuit-be-the-first-of-many&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The German online medical news site LifeGen says that the class action lawsuit filed in Italy against pharmaceutical companies over the swine flu jab could be just the start of a series of legal actions.

LifeGen reports that more than 7,800 side effects to the swine flu jab have been reported using the electronic Vaccine Adverse Event Reporting System (VAERS) system including 33 suspected deaths, raising the chances of a class action lawsuit.

Moves are also being made in Germany to launch a class action lawsuit.

LifeGen journalists filed criminal chages against the German government vaccine advisory body STIKO for allowing the Pandemrix vaccine that had been tested on only 240 people to be marketed.

Moreover, the European drug regulator, EMEA, which is two thirds funded by pharma industries, confirmed to LifeGen in a written reply that information about the side effects and risks would only be collected after the vaccine was given to people.

GlaxoSmithKline's Pandemrix vaccine, which has not been tested on any children, was given approval in 2008 - one year before the swine flu pandemic broke out.

See above: Vlad Georgescu. *Schweinegrippe: Sammelklagen gegen die Verantwortlichen rücken näher*. – Readers Edition, 19 Januar 2010, um 16:06 Uhr
https://web.archive.org/web/20100122072518/http://www.readers-edition.de/2010/01/19/schweinegrippe-sammelklagen-gegen-die-verantwortlichen-ruecken-naeher/

In law, a class action or a representative action is a form of lawsuit where a large group of people collectively bring a claim to court. This form of collective lawsuit originated in the United States and is still predominantly a U.S. phenomenon, at least the U.S. variant of it. However, in several European countries with civil law different from the English common law principle (which is used by US courts), changes have in recent years been made that allow consumer organizations to bring claims on behalf of large groups of consumers.

Grippe A: une commission d'enquête sur la vaccination

Challenges.fr, 19 Janvier 2010, à 16h02
https://www.challenges.fr/economie/grippe-a-une-commission-d-enquete-sur-la-vaccination_359828

Cette demande, faite par le Nouveau Centre, devrait prochainement voir le jour. L'UMP déplore cette initiative.

Une commission d'enquête parlementaire sur la campagne de vaccination contre la grippe A(H1N1) à la demande du Nouveau Centre (NC, partenaire de l'UMP) devrait prochainement voir le jour, a confirmé le président (UMP) de l'Assemblée nationale Bernard Accoyer, mardi 18 janvier. "Dans les semaines qui viennent, la commission d'enquête se mettra au travail", a-t-il ajouté.

Jean-François Copé et Jean Leonetti, président et vice-président du groupe UMP à l'Assemblée nationale, ont vivement déploré cette initiative.

"Je respecte cette décision mais je la regrette parce que je pense que Roselyne Bachelot a fait un travail tout à fait remarquable. J'espère en tout cas que, dans l'esprit de nos amis centristes, ce n'est pas une approche inamicale", a ironisé Jean-François Copé.

"On cherche des coupables"

Plus incisif encore, Jean Leonetti "dit très clairement" que la demande du NC est "inamicale". "Une mission d'information, ça recherche les éléments qui amènent à expliquer une situation particulière. Les Français s'interrogent et on aurait apporté des explications", a expliqué le député des Alpes-Maritimes. "Une commission d'enquête, la procédure est différente et, de toute évidence, on cherche la faute. Et donc, on cherche des coupables. Une commission d'enquête, c'est introduire un élément de suspicion qui n'a pas lieu d'être", a ajouté Jean Leonetti.

23 députés

Le groupe NC (23 députés sur 577) a fait valoir la semaine dernière son "droit de tirage" (tout groupe parlementaire peut demander une fois par session la création d'une commission d'enquête, qui doit être votée dans l'hémicycle) pour réclamer une commission d'enquête parlementaire sur "les conditions de vaccination" contre la grippe H1N1.

"Il ne s'agit pas de remettre en cause l'action du gouvernement mais de faire le point sur comment la campagne de vaccination s'est déroulée", a expliqué son président François Sauvadet. "Ca ne va pas être une commission d'enquête pour désigner Roselyne Bachelot, a-t-il encore déclaré dans la salle des Quatre-Colonnes. Je crois qu'elle a bien fait son job. C'est une commission pour accompagner tout gouvernement à mieux gérer les crises de pandémie et à répondre de manière efficace aux questions posées".

POLSKIE RADIO DLA ZAGRANICY ▸ thenews.pl

Poland praised for anti-swine flu strategy

Polskie Radio, 31 March 2010, 06:37
https://web.archive.org/web/20100403020128/http://www.thenews.pl/national/artykul128545_poland-praised-for-anti-swine-flu-strategy-.html

The Council of Europe has praised Poland's Health Minister Ewa Kopacz for her strategy against the swine flu virus.

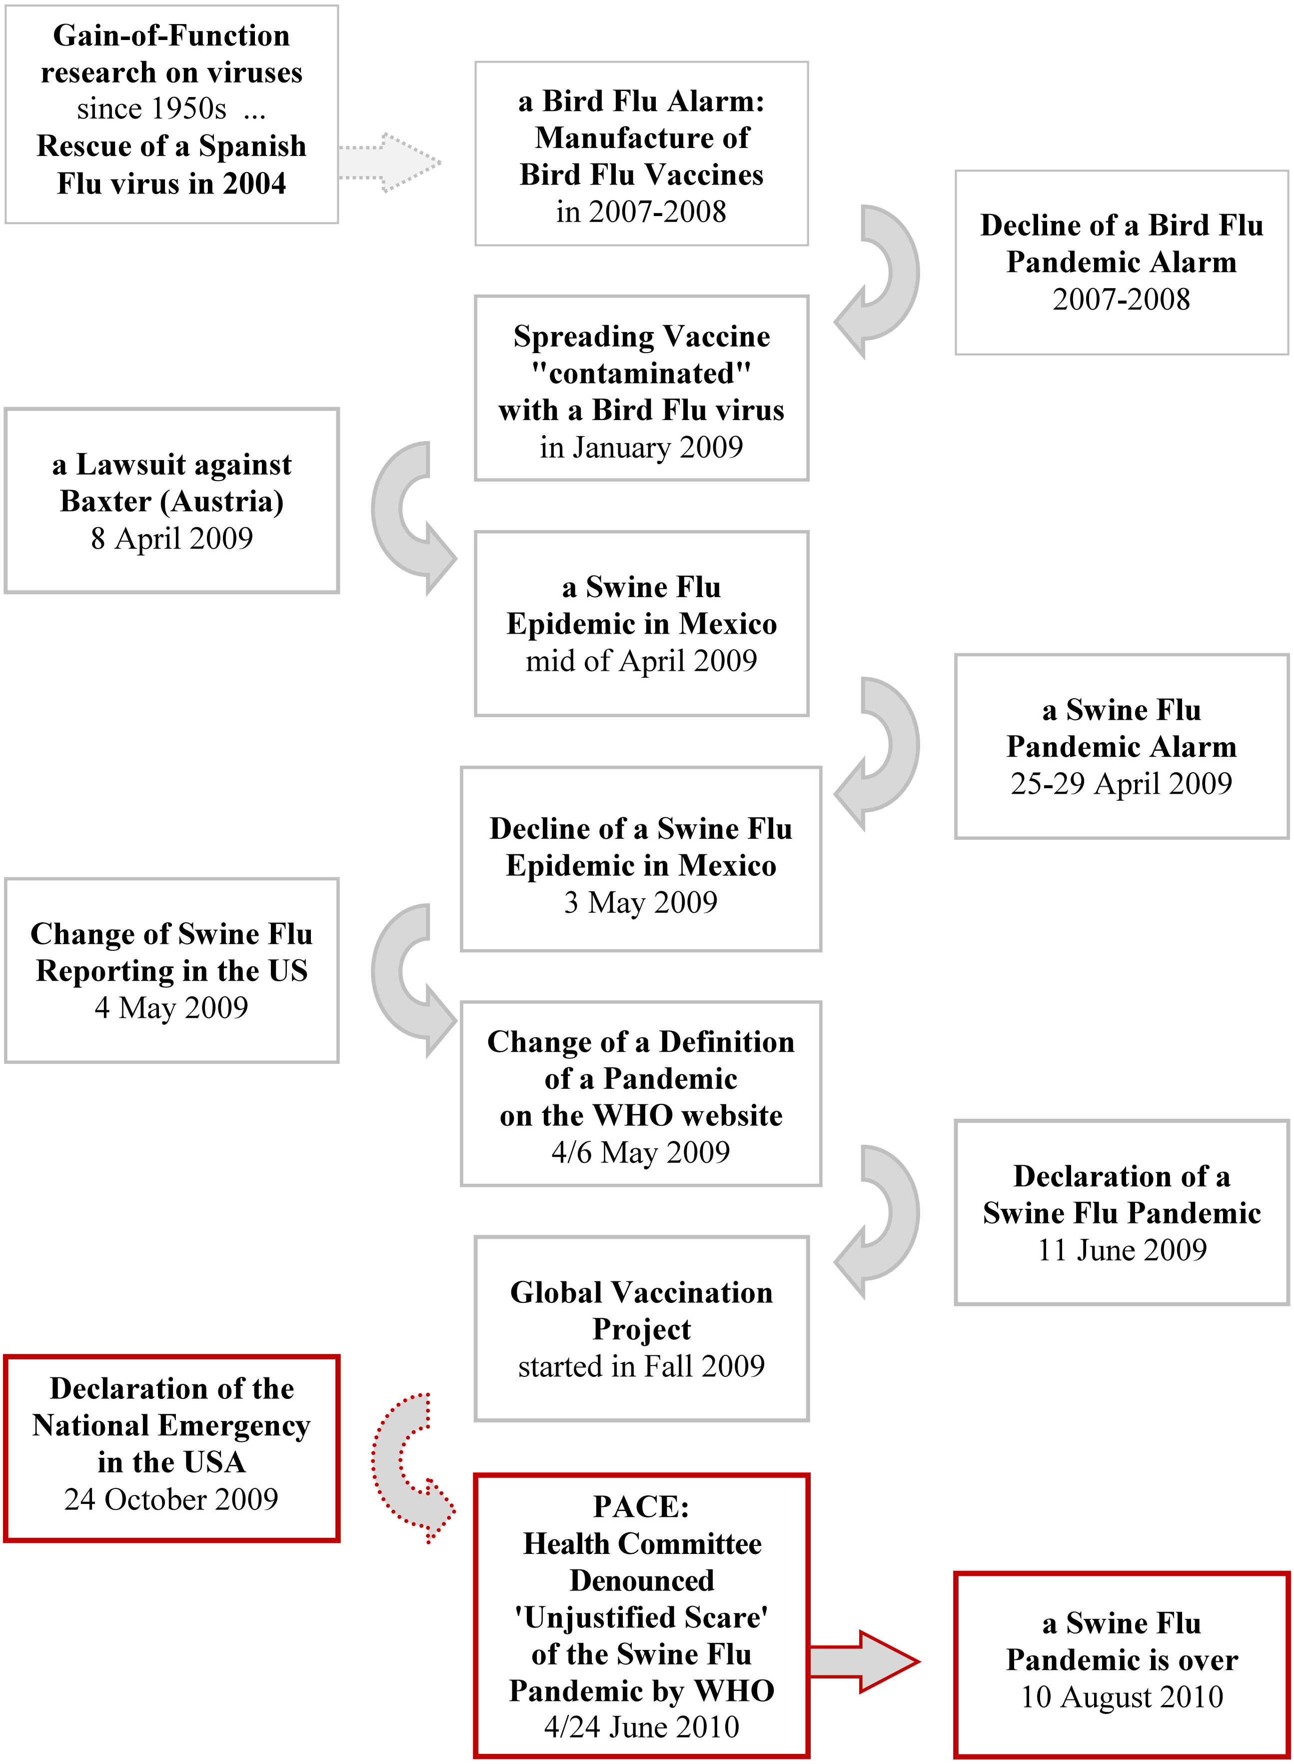
The council's Committee on Social, Health and Family Affairs said that the Health Ministry's decision not to order any A/H1N1 vaccines, in spite of pressure from pharmaceutical companies and health organizations, was correct.

Ewa Kopacz (right) who went to Paris to explain her government's response to the flu virus - which the World Health Organisation was wrongly predicting would turn into a full blown pandemic across Europe - said that Poland had considered buying an anti-flu vaccine but terms proposed by pharmaceutical companies were unacceptable.

Poland's Health Minister said that thanks to the anti-swine flu strategy adopted in Poland fewer fatal cases of the virus were reported and the virus was less virulent than in other countries.

Paul Flynn, who wrote the Council of Europe report, called the decision "an act of courage" and stressed that other countries spent millions of euro on vaccines.

Former head of the French Red Cross Prof. Marc Gentilini said that Poland can serve as an example of how to handle the threat of an A/H1N1 pandemic.



The Health Ministry's decision not to buy anti-flu vaccines was fiercely criticized in Poland during the outbreak. Ombudsman Janusz Kochanowski even threatened to sue Ewa Kopacz over the government's policy.

'At-risk' Scots face swine flu vaccination programme backlog, reports The Telegraph

The Flu Case, 1 January 2010, 6:00AM GMT
https://web.archive.org/web/20100102031500/http://theflucase.com/index.php?option=com_content&view=article&id=2441%3Aat-risk-scots-face-swine-flu-vaccination-programme-backlog-reports-the-telegraph&catid=1%3Alatest-news&Itemid=64&lang=en

Less than half of Scots deemed most at risk from swine flu have been vaccinated, despite ministers promising all would be offered help by the end of 2009. Official figures show only 42.4 per cent of those included in the first phase of a nationwide vaccination programme have been inoculated against the H1N1 virus. The group includes Scots with underlying health conditions such as asthma, for whom the disease poses a greater danger, and pregnant women.

Meanwhile, only half of front line health staff in Scotland's hospitals, clinics and pharmacies have been vaccinated despite also being deemed a priority. Scottish ministers insisted all health boards had either met, or were close to, a target of offering all priority cases the vaccine by the end of December.

But opposition politicians said they had become aware of a significant backlog of cases, with at-risk Scots being forced to wait more than a month for help.

David McLetchie MSP, Scottish Tory Chief Whip, said: "I know for a fact that the at-risk people in the under-65 group are being offered vaccination dates five weeks later. – "It's a bit disingenuous for ministers to argue that people are being offered the vaccine. The fact of the matter is there's a backlog."

He said GPs had informed him they had to pay overtime for staff to administer the drug, so some were choosing to offer only weekly vaccination sessions.

Jackie Baillie, Scottish Labour health spokesman, branded the uptake figure "disappointingly low", adding: "Concerns have been raised about the vaccine actually reaching GP surgeries and at-risk groups as a result."

Nicola Sturgeon assured MSPs in October that: "We expect all of the 1.3 million people in the priority groups to have been offered vaccination by Christmas."

But new figures show that at the end of 2009 only 45.8 per cent of those aged under 65 in the at-risk group have been vaccinated. This proportion dropped to 38.1 per cent for those aged above 65, while the uptake rate among pregnant women was 45.1 per cent. For front line health workers, the figure was 50.8 per cent and for social care staff 32.1 per cent. Meanwhile, it is estimated 7,240 Scots contracted swine flu in the past week, a 14.7 per cent increase on the previous seven days.

Sixty-two people north of the Border have so far died after contracting the disease, with the vast majority either pregnant or having an underlying health problem.

Miss Sturgeon insisted the rise in the number of cases was not "statistically significant", adding: "I would encourage all those who have been invited for vaccination to come forward. – "As the programme enters its second phase, with children under five being offered the jag, we should see a further decline in the number of cases."

A Scottish Executive spokesman said: "The majority of NHS Boards have now completed phase one and in those which have yet to finish, the programme is almost complete. – "Indications are that GPs should have invited everyone for vaccination by the end of December." He said anyone in the priority group not yet invited for a vaccination should contact their GP and make an appointment.

Berliner Morgenpost

"Der Vertragsabschluss war unprofessionell"

Berliner Morgenpost, 1 Januar 2010, 13:36
https://www.morgenpost.de/web-wissen/article104090781/Der-Vertragsabschluss-war-unprofessionell.html

Der Herausgeber des "Arznei-Telegramms", Wolfgang Becker-Brüser, sieht die Ursache für die Bestellung von zu viel Impfstoff gegen die Schweinegrippe in der Unfähigkeit der Gesundheitsbehörden. Dass gegen die Schweinegrippe nur eine statt zwei Impfungen nötig ist, sei für Fachleute keineswegs überraschend gewesen.

Die Bundesländer müssen wahrscheinlich nicht alle bestellten Dosen des Schweinegrippe-Impfstoffes abnehmen. Das erste Arbeitstreffen von Staatssekretären und Abteilungsleitern von Bund und Ländern mit dem Pharmakonzern GlaxoSmithKline (GSK) ist Teilnehmern zufolge konstruktiv verlaufen.

Die Vorsitzende der Gesundheitsministerkonferenz, Niedersachsens Ressortchefin Mechthild Ross-Luttmann (CDU), sprach anschließend von "harten, aber fairen Verhandlungen", die den Weg für einen "guten Kompromiss" freigemacht hätten. "Wir haben vom Pharmakonzern GSK Signale der Kulanz erhalten, einen größeren Teil der überschüssigen Impfstofflieferungen zu stornieren", sagte sie, ohne bereits Details nennen zu wollen. Das Verhandlungsergebnis stehe unter dem Vorbehalt einer Endabstimmung der Vertragspartner, die bis Mitte nächster Woche erwartet werde, hieß es. Am Freitag wollen sich die Gesundheitsminister in einer Telefonkonferenz zu dem Resultat der Verhandlungen verständigen.

Die Landesgesundheitsminister hatten 50 Millionen Impfstoff-Dosen für 416,5 Millionen Euro geordert, wollten zuletzt nur noch die Hälfte abnehmen, da nach neuen Erkenntnissen eine Schutzimpfung pro Person ausreicht. Ursprünglich waren die Experten von zwei nötigen Immunisierungen ausgegangen. Deshalb bleiben die Länder auf einem Großteil der Dosen sitzen, die sie allein bezahlen müssen.

Auch der Pandemrix-Hersteller GSK sprach nach dem Arbeitstreffen von einer "Lösung". Die Verhandlungen seien in "partnerschaftlicher Atmosphäre" gewesen, sagte eine Unternehmenssprecherin. Das Ergebnis solle erst später bekannt gegeben werden.

Der RKI-Präsident wandte sich zugleich gegen Vorwürfe, dass Politik, Wissenschaft und Medien eine unbegründete Hysterie wegen der Schweinegrippe verbreitet hätten. "Als das Virus im Frühjahr auftauchte, wussten wir sehr wenig darüber, wir haben dann gelernt, dass es relativ milde Verläufe gibt, aber es auch immer wieder zu schweren Verläufen kommt." Es sei richtig, dass der Impfstoff sehr schnell hergestellt und zugelassen worden sei.

Der Herausgeber des Informationsdienstes "Arznei-Telegramm", Wolfgang Becker-Brüser, sieht die Ursache für die Bestellung von zu viel Impfstoff gegen die Schweinegrippe in der Unfähigkeit der Gesundheitsbehörden. "Der Vertragsabschluss war einfach unprofessionell", sagte der Pharmazeut und Arzt der "Berliner Zeitung". "Da hat man sich viel zu sehr an der Vogelgrippe orientiert."

Dass gegen die Schweinegrippe – anders als gegen die Vogelgrippe - nur eine statt zwei Impfungen nötig ist, sei für Fachleute keineswegs überraschend gewesen. "Man hätte den Vertrag auf jeden Fall flexibler gestalten müssen", sagte Becker-Brüser der Zeitung. Auch die Verhandlungen mit der Herstellerfirma Glaxo-SmithKline über verringerte Abnahmemengen hätten "noch im Dezember" aufgenommen werden müssen.

Als Konsequenz aus den Fehlern forderte Becker-Brüser: "Derartige Großbestellungen bei der Pharmaindustrie müssen künftig transparent und mit öffentlicher Beteiligung erfolgen – begleitet von öffentlichen Anhörungen. Und es muss offen über Nutzen und Schaden gesprochen werden. Sonst fühlen sich die Menschen verschaukelt", sagte er der Zeitung.

Unterdessen warnte das Robert-Koch-Institut (RKI) vor einer zweiten Grippewelle. "Der Impfstoff ist nach wie vor notwendig, das Virus ist ja auch noch unter uns", sagte RKI-Präsident Jörg Hacker im ARD-"Morgenmagazin". Es sei durchaus möglich, dass im Februar oder März eine zweite Erkrankungswelle komme.

Rund 200.000 Menschen in Deutschland haben sich laut RKI bislang mit dem Virus infiziert, 159 sind daran gestorben. Die Neuerkrankungen waren zuletzt allerdings stark zurückgegangen auf 2000 in der vorletzten und 1000 in der vergangenen Woche. Etwa sechs bis zehn Prozent der Menschen in Deutschland haben sich bislang gegen Schweinegrippe impfen lassen.

Dennoch sieht Hacker keinen Grund zur Entwarnung: "Wir gehen davon aus, dass die Impfung weiter sinnvoll ist, insbesondere für Personen, die chronisch krank sind." Rund 80 Prozent der Todesopfer seien chronisch Kranke.

Gabriela Gätjens

200 mil dosis contra la gripe llegan al país

Al Día, 2 January 2010.
https://web.archive.org/web/20100106031200/http://www.aldia.cr/ad_ee/2010/enero/01/nacionales2211308.html

En el transcurso de esta semana llegan al país 200 mil dosis de vacunas contra la influenza humana. El medicamento se llama "Panenza", según confirmó la viceministra de salud, Ana Morice.

Con este primer paquete las autoridades esperan inmunizar a grupos de riesgo, como el personal de servicio de salud, de bomberos, de la Cruz Roja y la policía; "el objetivo es mantener la infraestructura de servicios, ellos tienen más contacto con la población", agregó Morice.

Se destinarán, aproximadamente 60 mil vacunas para estos funcionarios.

Posteriormente, se vacunará a ciudadanos que presentan factores de riesgo como la diabetes, asma, obesidad mórbida, hipertensión y bronquitis.

Las vacunas serán repartidas entre los diferentes Ebais, clínicas y hospitales del país, con el fin de que los asegurados reciban la atención en su comunidad.

La Caja Costarricense de Seguro Social (CCSS) asume el costo de las dosis; cada una tiene un precio de $7,5.

Para febrero, la Caja recibirá 500 mil vacunas más, y un millón cien mil adicionales a inicios de marzo, para sumar junto a las de esta semana, millón ochocientas mil dosis.

Palmares y la segunda ola

Sobre los festejos populares de Palmares, que se tienen previstos del 13 al 25 de enero, la viceministra dijo que por el momento van cumpliendo con los requisitos. "Con estas fiestas implementaremos lo mismo que con Zapote; se definieron lineamientos para festejos masivos, como tener agua, jabón, gel y rótulos en el campo ferial. Hay inspectores evaluando las comidas, nos ha ido funcionando muy bien", manifestó Ana Morice.

La segunda ola de la influenza se espera para febrero próximo. El año pasado la gripe mató a 47 personas en nuestro país; 26 hombres y 21 mujeres. Tres estaban embarazadas y otras tres padecían Síndrome de Down.

THE FLU CASE

Gabriela Gatgens

200,000 Doses against the Flu Arrive in the Country

Al Día // The Flu Case, 2 January 2010.
https://web.archive.org/web/20100322233927/http://www.theflucase.com/index.php?option=com_content&view=article&id=2446%3Acosta-ricas-mass-swine-flu-vaccination-to-start-in-january&catid=41%3Ahighlighted-news&Itemid=105&lang=en

This week, 200,000 doses of human influenza vaccine (H1N1) are set to arrive in the country. The deputy minister for Health, Ana Morice, confirmed the vaccine is Panenza.

Authorities are hoping to immunize risk groups, such as health personnel, firefighters, Red Cross and the police with the first consignment.

"The objective is to keep the service infrastructure going ; they have more contact with the population" Morice added.

Approximately 60,000 doses have been earmarked for these officials. Later, citizens with risk factors will be vaccinated - such as diabetics, asthmatics, the morbidly obese, and those who suffer from hypertension and bronchial illnesses.

The vaccines are to be distributed among the various health centers, clinics and hospitals throughout the country so that those people who are insured can get them in their community.

The Caja Costarricense de Seguro Social (CCSS) is assuming the cost of the shots ; each vaccine costs $7.5 In February, the CCSS is to receive 500.000 more vaccines, while another 1.100.000 doses are set to arrive in March, to equal -- including this week's consignment – a total of a 1.800.000 doses (the population is 4.4 million).

Palmares and the Second Wave

Concerning the popular festivities of Palmares scheduled for January 13 to 25, the vice minister said that they are taking the necessary steps for the moment.

"For these festivities, we are going to implement the same system we used for Zapote's: regulations have been laid down for large scale festivities, such as having water, soap, alcohol gel, and signs available everywhere on the fair grounds. Inspectors will be evaluating the food; it has been working very well," Ana Morice maintained.

The second wave of influenza is expected for February. Last year, the flu killed 47 people in our country: 26 men and 21 women. "Three were pregnant and three more suffered from Down Syndrome".

Last year, there were 1700 cases of swine flu in Costa Rica with 47 people deaths ; the average age was 40 years.

Saudi in nationwide swine flu vaccine drive

Maktoob News, 3 January 2010

https://web.archive.org/web/20100310055542/http://theflucase.com/index.php?option=com_content&view=article&id=2452%3Asaudi-arabia-launching-swine-flu-vaccination-despite-propaganda-failure&catid=1%3Alatest-news&Itemid=64&lang=en

DUBAI - Saudi Arabia is to launch a nationwide swine flu vaccination campaign as the country's death toll from the virus continues to rise, despite its previous drive to immunise school children failing to gain public support, Arab News reported on Sunday.

The Ministry of Health plans to begin vaccinating people of all ages against the deadly flu virus from Jan. 9, the daily newspaper reported. "Considering the onset of the third wave of the flu which will be more severe than the past ones, we are embarking on a programme to cover all people irrespective of their age groups," Khalid al-Mirghalani, a Health Ministry spokesman, was quoted as saying.

Saudi Arabia has recorded 124 fatalities from the virus out of some 15,500 cases, the newspaper reported. The ministry launched an immunisation drive for school children last month, but concerns over the vaccine's effectiveness and safety meant just a fraction of the children in the kingdom have been immunised. In some provinces fewer than 10 percent of children have received the vaccine, according to local newspaper reports.

Mirghalani said 60,000 children have been vaccinated since the programme for school children was launched on Dec. 19, Arab News reported. Sources at the ministry said it was facing problems convincing people take the vaccine "because they are apprehensive of its side effect", according to the newspaper.

TRIBUNE DE GENĒVE

H1N1: le gouvernement français critiqué pour sa gestion des vaccins

Tribune de Genēve, AFP, 4 Januar 2010, 18:26
https://web.archive.org/web/20100111130216/http://www.tdg.ch/depeches/people/h1n1-gouvernement-francais-critique-gestion-vaccins

Paris, 4 jan 2010 | Le gouvernement français était critiqué lundi par l'opposition et jusque dans les rangs de sa majorité pour sa gestion des vaccins contre la grippe H1N1 commandés en excédent.

Le gouvernement français était critiqué lundi par l'opposition et jusque dans les rangs de sa majorité pour sa gestion des vaccins contre la grippe H1N1 commandés en excédent.

Personne ne remet en cause le principe de précaution. Mais plusieurs partis, dont le Parti socialiste (PS, opposition) ou le Nouveau centre (NC, allié du parti présidentiel), ont demandé une enquête parlementaire pour faire le bilan de cette campagne après la révélation dimanche que la France avait commencé à écouler ses surplus de vaccins à l'étranger pour en alléger la facture.

Alors que l'Organisation mondiale de la santé (OMS) déclarait le monde en état de pandémie en juin, la France avait commandé à l'été 94 millions de doses de vaccins pour un montant de 869 millions d'euros, selon le ministère de la Santé qui tablait au départ sur une double injection par personne.

Mais il est apparu qu'une dose suffisait et seules quelque 5 millions de personnes ont été vaccinées dans le pays où la campagne a suscité peu d'enthousiasme et rencontré des difficultés logistiques.

A gauche, le PS a reproché au gouvernement d'avoir été la "victime consentante" des laboratoires pharmaceutiques. Ce sont les "grands vainqueurs dans cette affaire", a accusé son porte-parole Benoît Hamon qui dénonce également "une campagne anxiogène".

Les critiques viennent aussi des rangs de la majorité.

"La France est en échec dans cette affaire (...) malgré une débauche de moyens", a déclaré Jean-Christophe Lagarde, responsable de la composante centriste de la majorité.

Même au sein du parti présidentiel UMP, le député Bernard Debré, professeur de médecine, a vilipendé le "principe absurde, poussé à l'extrême, de précaution", estimant que le coût du plan vaccination était supérieur au "déficit de tous les hôpitaux français".

En a-t-on "trop" fait se demande la presse. "Les décisions d'achat se sont faites en période d'incertitude quand on ignorait tout de l'évolution de la pandémie", rappelle Libération (gauche). C'était "à une période où l'opinion était sous le choc", souligne Le Figaro (droite).

"Qu'est ce qu'on aurait dit si l'épidémie avait été grave (...) si les gens avaient risqué leur peau", a répliqué le ministre des Affaires étrangères Bernard Kouchner.

Mieux vaut une "polémique parce qu'on en fait trop qu'une polémique parce qu'on en fait pas assez", répond le porte-parole de l'UMP, Frédéric Lefebvre, en allusion à un scandale de sang contaminé par le virus du sida dans les années 80 ou à la canicule meurtrière de 2003 qui ont choqué la France.

"N'importe quel ministre aurait pris cette décision", abonde William Dab, qui occupa dans le passé en France le poste de directeur général de la santé .

Signalé pour la première fois fin mars au Mexique, le virus H1N1 a atteint son pic en décembre dans l'hémisphère nord, selon l'OMS mais s'avère pour le moment moins meurtrier que redouté. Fin décembre, il avait causé 12.200 décès dans le monde, dont 198 comptabilisés en France (hors outre-mer).

Critiqués, plusieurs laboratoires - dont le britannique GlaxoSmithKline ou Sanofi Pasteur (division vaccins du français Sanofi-Aventis) -, qui ont dopé leurs ventes en 2009 grâce à ce vaccin, se sont dits prêts à rediscuter leurs contrats.

Insects key to alternative swine flu vaccines

WebMD, 5 January 2010.
https://web.archive.org/web/20100109130925/http://www.webmd.boots.com/cold-and-flu/news/20100105/insects-key-to-alternative-swine-flu-vaccines
https://web.archive.org/web/20130718055629/http://www.webmd.boots.com/cold-and-flu/news/20100105/insects-key-to-alternative-swine-flu-vaccines

Scientists in Austria have developed a new technique for producing vaccines for swine flu based on cells from a moth.

They say this will cut down the production time for vaccines from the current methods using eggs, which can take several months. It could also be good news for people with egg allergies.

The Austrian team took just ten weeks to produce swine flu H1N1 influenza virus-like particles for immunological study in mice. Their research is published today in the *Biotechnology Journal*.

"Recent outbreaks of influenza highlight the importance of a rapid and sufficient vaccine supply for pandemic and inter pandemic strains," says co-author Florian Krammer from the University of Natural Resources and Applied Life Science in Vienna in a news release. "However, classical manufacturing methods for vaccines fail to satisfy this demand."

Chicken eggs мы moth cells

Traditional flu vaccines are produced using fertilised chicken eggs. This method can usually meet the demand for seasonal flu vaccines, but it is hard to ramp up production for a pandemic.

The researchers say limited egg supplies can be a problem, and using insect cells also removes the problems of allergic reactions to egg proteins and bio safety issues.

The helpful insect at the heart of the research is the 'fall army worm', a caterpillar that turns into a moth and is found in warmer parts of the US and South America.

"Our work demonstrates that recombinant influenza virus-like particles are a very fast, safe and efficient alternative to conventional influenza vaccines and represents a significant new approach for newly emerging influenza strains like swine-origin H1N1 or H5N1," says Dr Krammer.

"Virus-like particles will be one solution to tackle the biological variability of influenza pandemics," says journal editor Professor Alois Jungbauer. "Mutated strains can be quickly engineered. So in this respect the teams' work is an extremely valuable contribution to modern vaccine production."

Although the new technique looks promising, it could still be some years before it leads to a mainstream treatment for humans.

FINANCIAL TIMES

Scheherazade Daneshkhu and Andrew Jack

Sarkozy under fire on Flu Vaccine

Financial Times, 5 January 2009
https://www.ft.com/content/b2b61aae-f962-11de-80dc-00144feab49a

Nicolas Sarkozy, the French president, was at the centre of a political storm after health authorities admitted they had a huge oversupply of vaccines for the H1N1 swine flu virus and were trying to sell them on to other countries.

Several pharmaceutical manufacturers, led by Sanofi-Aventis, GlaxoSmithKline and Novartis, face the prospect of significantly lower flu vaccine sales than forecast as a growing number of governments seek to renegotiate purchases of unused stocks.

They will come under pressure to buy back doses or cease delivery without compensation.

France and the Netherlands have this week joined countries including Germany in trying to reduce large orders for vaccines to which they committed in expectation of a pandemic.

The French opposition Socialist party called for a parliamentary inquiry into what it described as the “fiasco” of the country’s 94m shots of H1N1 vaccine, saying the €869m ($1.25bn, £777m) cost had largely benefited the pharmaceutical companies. They “are the big winners in this affair”, said Benoit Hamon, Socialist party spokesman.

François Bayrou, head of the centrist Democratic Movement, lambasted the policy as “a very serious strategic mistake”.

The French health ministry said on Monday it had ordered the vaccinations thinking people would need two jabs. Only 5m people have been vaccinated in France, which has a population of 65m.

The affair has turned into an embarrassment for Mr Sarkozy and represents another political setback after his carbon tax was struck down last week by the constitutional council.

Mr Sarkozy defended government policy in his new year’s address, saying he did not have “the right to trivialise” the epidemic.

Bernard Debré, UMP parliamentarian, medical professor and an early critic of government policy, said France had over-reacted in buying up 10 per cent of the world’s production of the vaccine.

“The cost is more than the deficit of all France’s hospitals and is three times [the amount spent] on cancer care,” he said.

Take-up of the swine flu vaccine has been lower than expected, partly because of contradictory messages on the value of vaccination, a refusal to use GPs which slowed campaigns, suspicion about side effects and the limited severity of the epidemic.

The French health ministry is now under pressure to recoup some of the costs. It said on Monday it had sold 300,000 shots to Qatar and was set to sell 2m to Egypt. It was also in talks with Ukraine and Mexico.

German health authorities are also trying to offload surplus swine flu vaccines and renegotiate orders as they also realise they over-prepared for a potential crisis.

German authorities are due to start talks with GSK in Berlin on Thursday to try to negotiate a cut in the numbers of vaccines to be delivered.

GSK refused to provide details of its contracts, stressing they were confidential, but said: "We continue to support governments in managing the H1N1 influenza pandemic. This includes ongoing discussions about existing orders for our pandemic vaccines."

The Netherlands, which ordered 34m vaccine doses in July – enough to vaccinate the entire population with two doses – has denied over-reacting to the threat.

Europe 1

Bachelot va recevoir les syndicats

Europe 1, 5 janvier 2010, 20h07
https://www.europe1.fr/sante/Bachelot-va-recevoir-les-syndicats-459464

La ministre de la Santé Roselyne Bachelot recevra jeudi des représentants des syndicats médicaux et de l'Ordre des médecins à propos de la vaccination contre la grippe A, a annoncé mardi le ministère.

La ministre va évoquer avec eux les conséquences de la décision du gouvernement d'autoriser le recours aux médecins généralistes pour procéder à la vaccination, notamment en terme de rémunération.

Le Syndicat national des jeunes médecins généralistes a dénoncé la "brutale volte-face" du gouvernement. Il déplore dans un communiqué une "annonce bien tardive", en "totale ambulatoire" et qui "ne fait suite à aucune concertation avec des représentants.

THE FLU CASE

French Doctors to Meet Health Minister
over their new Role in Swine Flu Jab Campaign

The Flu Case, 6 January 2010, 12:11
https://web.archive.org/web/20100220012120/http://www.theflucase.com/index.php?option=com_content&view=article&id=2481%3Afrench-doctors-to-meet-health-minister-over-their-new-role-in-swine-flu-jab-campaign&catid=1%3Alatest-news&Itemid=64&lang=en

French Health Minister Roselyne Bachelot is set to meet with members of medical doctor's unions to discuss the continuation of the mass swine flu jab campaign after the government backtracked and said general practitioners should participate.

Until now, family doctors have been barred from the swine flu vaccination campaign, which has taken place in especially set up vaccine centers.

Doctors are meeting to discuss the terms of their participation.

The national union for young doctors criticised the government's "brutal volte face" and the way the announcement was made "much too late" and "without any consultation with doctor's representatives.

COLOMBIA REPORTS

Ashley Hamer

Colombia to receive 2 million swine flu vaccines in February

Colombia Reports, 6 January 2010, 06:12
https://web.archive.org/web/20100119235654/http://colombiareports.com/colombia-news/news/7555-colombia-to-receive-2-million-flu-vaccines-in-february.html

Two million vaccines against the swine flu virus will arrive in Colombia from February 25, stated the country's health minister on Wednesday.

Health Minister Diego Palacio said that the vaccinations would be distributed to the groups most at risk from the virus, with 580,000 doses for women in their second or third trimester of pregnancy. An estimated million will go to the parts of the population aged under six months or over 49 years, and some 200,000 will be kept for health workers, reported Colombian media.

A report from the Ministry of Social Protection confirmed that by December 29, the death toll in Colombia for the AH1N1 virus stood at 196.

WHO chief gets H1N1 flu vaccination

Reuters, 6 January 2010, 11:52
http://www.reuters.com/article/idUSTRE5BL2ZT20100105

Geneva (Reuters) - The head of the World Health Organization (WHO) has finally been vaccinated against H1N1 flu, a virus expected to infect more people in coming months, the U.N. agency said on Tuesday.

Margaret Chan, WHO director-general, was vaccinated on December 30, a day after admitting at a news conference that she had not got round to it due to travel and other demands.

"She is feeling very well, working and very busy as usual," WHO spokeswoman Fadela Chaib told a news briefing. "The flu will be with us for a few more months."

H1N1, commonly known as swine flu, has spread to 208 countries and territories, according to WHO which declared an influenza pandemic last June. The virus has officially killed at least 12,220 people, but the true death toll is much higher and could take two years to establish, it says.

Chan said last week it would take another six to 12 months for the first pandemic in more than 40 years to run its course.

She called for continued vigilance, noting that pregnant women, young people and those with chronic medical conditions like asthma are at greatest risk.

Azerbaijan and Mongolia are scheduled later this week to become the first developing countries to receive donated H1N1 vaccine doses, Chaib said.

In all, six drug companies and 14 industrialized countries have pledged nearly 190 million doses for use in 95 developing countries, she said.

GlaxoSmithKline, Novartis and Sanofi-Aventis are among major producers of H1N1 vaccine.

Lisa Schlein

Mongolia Receives First Batch of Swine Flu Vaccines

Voice of America, 6 January 2010, 7:00
https://www.voanews.com/a/mongolia-receives-first-batch-of-swine-flu-vaccines--80917832/111306.html

The World Health Organization says Mongolia became the first developing country to receive doses of donated H1N1 swine flu vaccines. A WHO spokeswoman tells VOA more vaccines will be distributed for use in 95 poor countries during the next few months.

The World Health Organization has divided the 95 developing countries into three groups. Mongolia is the first country in the first group of countries to receive the H1N1 vaccine donations.

WHO spokeswoman Nyka Alexander tells VOA a country must have measures in place for distributing the vaccine before it can become eligible to receive it.

"There is a whole stack of logistical issues behind that. But, we are very happy that the campaign has begun, the first arrivals have begun. The deployment has been going on for many, many months now. But, the actual first arrival of vaccines happened today," she said.

Alexander says the vaccines will be shipped to all of the first group of 35 countries within the next month. She says the World Health Organization is not releasing the names of the countries yet because the logistics of distribution keep changing.

"So, for now, we are just saying that the three countries that seem closest to receiving-well Mongolia, which did receive," she said. "Azerbaijan, which should receive within a few days and Afghanistan as well, looks pretty likely to be next on our list, next of the countries able to receive. So, there is that. The other countries on this first cluster of 35, there are several in our Western Pacific region and there are also Pacific island countries."

She says health care workers will be the first to be immunized, followed by people most at risk, such as pregnant women and very young children.

Western European countries are trying to unload surplus stocks of the H1N1 swine flu vaccine. Countries such as France, Spain, Germany and Switzerland find they are stuck with too much of the vaccine because of low public demand for the flu shots.

Alexander says the World Health Organization is not involved in any of the discussions going on between governments selling and purchasing the vaccines.

"However, if any of these countries with excess capacity wish to donate further vaccine to WHO, of course we would welcome that because there are countries that are still seeking vaccines. We have not with the most recent, in the past couple of weeks, we have not received any new commitments," she said.

Since the beginning of the pandemic, the World Health Organization has received pledges of 190 million doses of vaccine from 14 countries, which also includes pledges of money. Alexander says the money is important because that pays for the distribution of the vaccine to people who need it.

Polskaweb NEWS

AH1N1 Impfstoffe heimlich an Polen getestet

Polskaweb News, 6 January 2010, 13:14
https://web.archive.org/web/20100115031722/http://polskaweb.eu/illegale-ahn1n1-impfstoff-tests-in-polen-7367356752562.html

Warschau - Polnische Journalisten sind offenbar einem weiterem Piratenstück der Pharma- Industrie auf der Spur. Wie der Nachrichtensender TVN berichtet, soll der Schweizer Pharmakonzern Novartis illegal seinen Schweine-Grippe-Impfstoff "Focetria" an nichtsahnenden Polen getestet haben. In mindestens 10 öffentlichen und privaten Kliniken und Arztpraxen sei demnach Patienten, der bis dahin unerprobte Impfstoff, ohne Hinweis auf seinen Namen oder dessen Herkunft gespritzt worden. Die Novartis Niederlassung in Warschau hält sich gegenüber den Medien bedeckt und verweist bezüglich Informationen auf die Zentrale in der Schweiz. Das polnische Gesundheitsministerium und die Registrierungsbehörde für Arzneimittel bestreiten, dass den Schweizern eine ‚für solche Aktionen notwendige Genehmigung erteilt wurde, doch die Journalisten glauben, dass auch die Behörden in dem sich anbahnenden Skandal, ihre Finger im Spiel haben.

"Tests nur für Vogelgrippe- Impfstoff"

In einer Pressemitteilung des Gesundheitsministeriums in Warschau vom Montag heisst es: "Weder das Ministerium für Gesundheit, noch die Registrierungsstelle für Arzneimittel haben irgendwelchen Pharma-Unternehmen die Erlaubnis erteilt, klinischen Studien über einen Impfstoff gegen die "Schweine-Gripppe" (AH1N1) in Polen durchzuführen. Keine dieser Experimente wurden und werden nicht durchgeführt. Die Registrierungsstelle für Arzneimittel führt keine Eintragung über derartige Impfstoff-Studien ausländischer Pharma- Konzerne in unserem Lande". Wenige Stunden vor der Veröffentlichung von möglichem Beweis- Material in einer Sendung von TVN am Montag kurz vor Mitternacht, meldete sich von selbst das Gesundheitsministerium bei dem Sender und erklärte, dass man im September letzten Jahres einem Pharma Unternehmen eine Genehmigung erteilt habe, klinische Versuche mit Impfstoffen durchführen zu dürfen. Dies aber nur zu einem Medikament gegen die "Vogelgrippe". Ob dieses Mittel "Focetria" heissen könnte, oder gar die Schweizer Firma Novartis diese Genehmigung bekam, wollte oder konnte man nicht sagen.

Deutsche führend im schmutzigen Spiel

Inoffiziell erfuhr "Polskaweb" aus einer seriösen Quelle, dass ein deutscher Ableger der Novartis Gruppe in Marburg die heimlichen Tests an ahnungslosen Polen eingeleitet habe. Ärzte, Krankenhäuser und Kliniken sollen hierbei nicht einmal über die Herkunft und die Bezeichnung des Impfstoffes informiert gewesen sein. Deutsche Institute, Wissenschaftler, Mediziner, Medien und Politiker stehen schon seit einiger Zeit im Rampenlicht der EU- Grippe- Mysterien. Neben dem vermutlichen Erfinder neuer Grippe aus Holland, Albert Osterhaus, ist es vor allen Dingen der aus Sachsen stammende Virologe Klaus Stöhr, der zusammen mit Osterhaus und der chinesischen Virologin Margareth Chan bereits die Vogelgrippe- Hysterie zugunsten der Pharma- Industrie auslösten. Stöhr war Leiter des Global-Influenza-Programms und SARS-Forschungskoordinator der WHO. Osterhaus spielte und spielt die wichtigste Rolle im Pandemie- Ausschuss der Weltgesundheitsorganisation. Während der dubiosen SARS Panik hievte man gemeinsam Margareth Chan an die Spitze der WHO.

Rechtzeitig vor dem Ausbruch der Schweinegrippe wechselte der Deutsche in die Impfstoffentwicklung von Novartis und wurde deshalb weltweit heftig kritisiert. Durch den Erfolg bei der Grippe-Inszenierung, dürfte Stöhr heute nicht viel weniger verdienen als sein Chef und der verdient 40 Millionen Franken im Jahr.

Novartis heimlich und einzig in Polen getestet ?

Von der Website der Europäischen Arzneimittel-Agentur (EMEA) entnimmt man den Hinweis, dass der Schweizer Pharmakonzern Novartis weiterhin sein umstrittenes Produkt Focetria testet: "Wir haben bisher an 661 "gesunden" Erwachsenen jeder Altersklasse den Impfstoff ausprobiert. Eine ähnliche Studie ist auch mit 720 gesunden Kindern und Jugendlichen im Alter von sechs Monaten bis 17 Jahren durchgeführt worden." - liest man dort. Novartis schweigt darüber wo man diese Tests durchführte, aber nun deutet alles darauf hin, dass man heimlich 1381 Polen, Kindern und Erwachsenen, ohne ihr Wissen, als Versuchskaninchen mißbraucht hatte. Novartis weiss offenbar dass man in der Entwicklung von Impfstoffen spart und durch mögliche Korruption auch keine ehtischen Probleme bekommt, wenn man im Osten rekrutiert und testet. Neben dem britischen Pharma Produzenten GlaxoSmithKline dürften die Schweizer am Schweinegrippe- Betrug bisher am meisten verdient haben. Alleine in der EU hat man so im vergangenen Quartal einen Schaden von 22 Milliarden Euro Impfkosten verursacht und das Trauma ist noch nicht vorbei, da die Mafia unübersehbar von einflussreichen europäischen Politikern geschützt wird.

Auch deutsche Gesundheitsministerin immer dabei

Auch die deutsche Gesundheitsministerin Ursula Schmidt machte sich schon vor Jahren verdächtig Privat- Geschäfte mit der Pharma- Industrie zu machen. Im November 2002 bestellte sie z.B. über die Terror- Masche, wegen eines angeblich möglichen Anthrax- Anschlag durch Terroristen in den USA, 6 Millionen Dosen Pockenimpfstoff für etwa 100 Millionen DM bei einem Schweizer Pharmaunternehmen (Auch die WHO hat ihren Sitz in der Schweiz), obwohl selbst das damals noch ehrliche Paul-Ehrlich-Institut vor dem Kauf speziell dieses Impfstoffes warnte. Die Schweizer rieben sich die Hände, denn schon seit 20 Jahren lagerten die von der Deutschen gewünschten (!) Produkte in ihren Kellern und keiner wollte sie eigentlich mehr haben, dies aber nicht nur wegen des hohen Alters ihrer Medikamente wie "Triviraten", sondern weil sich schon bei einer vorangegangenen Mupsepidemie herausgestellt hatte, dass diese Produkte im Keller entweder völlig wirkungslos, wie heute Tamiflu, waren oder gar zu Gesichtslähmungen und andere schweren Nebenerscheinungen führte.

Anm. der Redaktion

Niemand kann derweil ausschliessen, dass Novartis den Impfstoff überhaupt nicht vor dem Verkauf getestet hatte und irgendjemand in Polen nun imaginäre Patienten über Gerüchte liefert (gegen gute Bezahlung versteht sich). Die Beweise gegen die Betrüger und den Betrug, auch am deutschen Bürger, verdichten sich stark, aber Politiker schweigen. Dies scheint uns ein klares Signal der Involvierung gerade höchster deutscher Regierungspolitiker, in den Multi-Milliarden-Betrug um die angeblich unser Leben bedrohenden Krankheiten vor unserer Haustüre, zu sein. Unsere Kollegen in Österreich möchten wir noch darauf hinweisen, dass die Firma Novartis früher Sandoz hiess, wie der heutige Pharmariese in Österreich. Die Sandoz GmbH gehört zur Schweizer Novartis. Der Direktor des Unternehmens, Ernst Meijnders, ist ein guter "Bekannter" des Hauptverdächtigen der Grippe- Mafia Albert Osterhaus, beide sind Holländer aus Rotterdam. Zur Gedächtnisauffrischung lesen Sie bitte auch nochmal wie z.B. das Magazin Focus schon 1996 mit einer anderen angeblich tödlichen Gefahr namens Ebola- Virus Hysterie übte: Hier klicken => (deleted)

THE FLU CASE

Novartis tested Swine Flu Vaccine on People in Poland without Authorisation

The Flu Case, 7 January 2010
https://web.archive.org/web/20100324230156/http://www.theflucase.com/index.php?option=com_content&view=article&id=2491%3Anovartis-tested-swine-flu-vaccine-on-people-in-poland-without-authorisation&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Swiss pharmaceutical company Novartis appears to have tested the swine flu jab with squalene on people in Poland without authorisation and without informing the participating doctors, hospitals and clinics about the content of the vaccine material, according to a report on Polskaweb.

Novartis tested its swine flu vaccine "Focetria" on Polish people without informing them or the doctors who administered it about its name or origin, investigative journalists from Poland's TVN found out.

The Polish health ministry has issued a statement saying that no authorisation for clinical trials involving the swine flu vaccine was given to Novartis, although trials for bird flu vaccines were authorised last September.

"Neither the Health Ministry nor the Registration Office For Drugs and Medicines have given any pharmaceutical company permission for clinical studies using a vaccine against the "swine flu" H1N! in Poland," the health ministry said in a press release.

Novartis has refused to confirm whether they received authorisation or not. The Novartis subsidiary in Warsaw has directed inquiries to the company headquarters in Switzerland.

The EMEA, the European drug regulator, website indicates Novartis has tested its Focetria drug.

"We have tested the vaccine until now on 661 "health adults of all age groups. A similar study has also been carried out with 720 health children and young people from 6 months to 17 years of age," material says.

Novartis has refused to comment on where these tests were carried out, but 1381 Polish children and adults could have been involved in these tests in Poland.

However, Polskaweb points out that Novartis may never conducted tests on the swine flu vaccine at all and have tested something else in Poland.

The New York Times

Donald G. McNeil Jr.

The Official Word to all, get a Swine Flu Vaccination now

The New York Times, 7 January 2010
https://www.nytimes.com/2010/01/08/health/policy/08flu.html

Citing mistakes made in the 1957 flu pandemic, federal officials on Thursday urged hesitant Americans to get vaccinated now against swine flu to prevent any possibility of another wave of illness and deaths.

Vaccine is now plentiful across the country, and most states are encouraging people of all ages to get shots, said Dr. Anne Schuchat, director of immunization and respiratory disease for the Centers for Disease Control and Prevention. When supplies were short, most states tried to limit the vaccine to children, pregnant women and others at higher risk.

In 1957, Dr. Schuchat said, officials "gave the all-clear whistle" in midwinter and did not encourage flu shots, which were then rarer and also less purified. As a result, she said, there was another substantial wave of deaths in March 1958.

But she conceded that no pandemic was identical to any other. The death rate from swine or H1N1 flu appears to be about a quarter of that of the 1957 flu, but that may be because of antiviral drugs and better ventilators, not the virus itself.

Flu activity across the country is far below its late-October peak, but still higher than normal for this time in most years. It is almost all still swine flu; almost no seasonal flu has been found, and Dr. Schuchat urged doctors to send more samples to state laboratories.

Pneumonia and flu deaths ticked up slightly, which officials were "really keeping our eye on," she said. The percentage of doctor visits that involved flu symptoms also rose, but that is normal during Christmas vacation because few people schedule routine checkups. There is no way to know if the unusually cold weather has played a part, she said.

The disease centers' "best guess" is that 60 million people have been vaccinated. There are now 136 million doses available from many sources, including city clinics, schools, private doctors and pharmacy chains.

The New York Times

The Official Word to All, Get a Swine Flu Vaccination Now

By Donald G. McNeil Jr.

EGYPT: Half of all schoolchildren to be offered H1N1 inoculations

IRIN News, 7 January 2010.
https://web.archive.org/web/20100114031537/http://www.irinnews.org/Report.aspx?ReportId=87647

CAIRO, 6 January 2010 (IRIN) - Egypt launched a programme on 3 January to inoculate half the country's schoolchildren against H1N1 influenza in a bid to prevent the spread of the virus.

Phase One, which ends on 13 January, involves inoculating some 1.2 million primary school children in six designated urban areas. Phase Two, the details and duration of which have not yet been fully set out, will aim to inoculate all schoolchildren, undergraduates, pregnant women and people with chronic diseases in the six areas.

The inoculations are optional, i.e. parents have to give consent for their children to be vaccinated before any inoculation can go ahead.

"The vaccine is very important," Amr Qandeel, head of the Department for Preventive Medicine at the Health Ministry, told IRIN. "It's the only way these students can avoid contracting the virus."

Phase One involves immunizing all primary school children in the six urban centres with the highest infection levels - Cairo, Alexandria, Giza, Helwan, Qaluibia and 6 October City (the latter four are areas of Greater Cairo). There have been very few H1N1 cases outside these areas.

These centres are home to more than half the nation's 17 million schoolchildren and undergraduates.

Strategy

So far, Egypt has obtained only one million influenza shots; 150,000 have already been used to inoculate pilgrims who went to Saudi Arabia to perform the Hajj at the end of November 2009.

The aim is to use one dose to vaccinate two primary school children in Phase One.

The Health Ministry's Qandeel said half a dose was sufficient for young children.

"This means that the 850,000 vaccines available will be enough to inoculate all primary school children in the above-mentioned six urban centres, in Phase One," he said.

Some parents have expressed concern about the safety of the vaccine after hearing reports from other countries about its possible side effects. The Health Ministry has sent letters to all parents asking whether they want their children vaccinated or not.

Earlier, the Ministry said it would not vaccinate nursery age children until the possible side effects were fully understood.

More doses expected soon

Egypt expects to receive about four million additional doses of the H1N1 influenza vaccine any time now, according to Mohamed Rabie, head of Vacsera, a government-owned company responsible for importing the vaccine.

These doses will be enough to inoculate all 8.5 million schoolchildren in the designated centres, he added.

Officials at the World Health Organization (WHO) expect infections and deaths from H1N1 influenza in Egypt to rise in January and February, the peak winter months.

“Egypt isn’t one of the 50 countries most affected by the virus yet,” Hassan al-Beshri, an adviser to the World Health Organization in Cairo, said. “Despite this, the virus can infect up to 20 percent of the population if people aren’t vaccinated.”

The Egyptian Health Ministry said on 5 January that 159 people had died of the H1N1 virus, and 4,000 had been infected since the first case in June 2008. Egypt’s population is about 80 million.

Ärzte machen sich für kritischen Arzneimittelprüfer stark

Speagel, 7 January 2010, 15.30 Uhr
http://www.spiegel.de/wissenschaft/medizin/0,1518,670564,00.html

Er ist Pharmaindustrie und schwarz-gelber Regierung ein Dorn im Auge: Die Koalition arbeitet an der Ablösung des Leiters des Instituts für Qualität und Wirtschaftlichkeit im Gesundheitswesen, Peter Sawicki. Nun fordern Ärzte in einer Petition an den Bundesgesundheitsminister, ihn weiter zu beschäftigen.

Peter Sawicki, Leiter des Instituts für Qualität und Wirtschaftlichkeit im Gesundheitswesen (IQWiG), ist der Pharmaindustrie schon lange ein Dorn im Auge. Das 2004 gegründete Institut soll die Vor- und Nachteile medizinischer Leistungen, vor allem aber die Wirksamkeit von Arzneimitteln bewerten. Fällt eine solche Bewertung negativ aus, werden die Kosten für das Mittel oft nicht mehr von den gesetzlichen Kassen übernommen - für den Hersteller bedeutet das Millionenverluste. Sawicki - ein scharfer Kritiker der Pharmaindustrie - sorgt kompromisslos dafür, dass bei den Bewertungen strenge wissenschaftliche Regeln eingehalten werden.

Jetzt betreiben Regierungskreise die Ablösung von Sawicki. In einem Papier ("Kernforderungen an eine schwarz-gelbe Gesundheitspolitik") sprechen sich die führenden Gesundheitspolitiker der Unionsfraktion für eine Neuausrichtung des IQWiG aus. Sawicki solle nach Ablauf seines Fünfjahresvertrags 2010 durch einen industriefreundlicheren Kandidaten ersetzt werden. Auch die von FDP-Mitglied Georg Baum geführte Deutsche Krankenhausgesellschaft hat angekündigt, Sawickis Vertragsverlängerung verhindern zu wollen.

Finanziert wird das IQWiG aus der gesetzlichen Krankenversicherung. Über die Leitung des Instituts entscheidet laut Satzung einstimmig der Vorstand des IQWiG. Dort sitzen neben Baum noch zwei Vertreter des GKV-Spitzenverbandes, der Vorstandsvorsitzende der Kassenärztlichen Bundesvereinigung und Stefan Kapferer, Staatssekretär im Bundesgesundheitsministerium.

Nun aber machen sich die Ärzte für Sawicki stark, obwohl stets behauptet wurde, dass sie angeblich seine Ablösung herbeisehnten. Schließlich müssten sie den Patienten vermitteln, wenn aufgrund einer IQWiG-Entscheidung die Krankenkassen die Kosten für ein Medikament ab sofort nicht mehr übernehmen.

600 Ärzte unterschrieben innerhalb von acht Tagen

Innerhalb von acht Tagen unterschrieben 600 im Gesundheitswesen Tätige - darunter mehrheitlich Hausärztinnen und Hausärzte aus der ganzen Bundesrepublik und 50 Professoren - eine Petition an Gesundheitsminister Philipp Rösler und an den IQWiG-Stiftungsrat, in der sie fordern, Sawicki in seinem Amt als IQWiG-Leiter zu bestätigen. Dass Sawicki bei den Ärzten unbeliebt sei, sei offensichtlich ein "Trugschluss", so der Organisator Günther Egidi, Allgemeinarzt aus Bremen von der Deutschen Gesellschaft für Allgemeinmedizin und Familienmedizin. "Die nicht selten unter Dauerfeuer von Pharmareferenten stehenden Hausärzte", sagt Egidi, "wünschen sich dringlich,

weiterhin über eine unabhängige Informationsquelle zu umstrittenen Medikamenten zu verfügen. Das Geld der Krankenkassen ist endlich. Deshalb möchten die Hausärzte sparsam sein, ohne ihren Patienten eine gute Behandlung vorzuenthalten. "

Sawicki, international bekannter Verfechter der sogenannten evidenzbasierten Medizin, machte strenge wissenschaftliche Regeln zur Bedingung für die Bewertungen seines Instituts - auch wenn klar war, dass das Ergebnis einen Sturm der Entrüstung bei Pharmaindustrie und Interessenverbänden hervorrufen würde. Kein Wunder, dass sich die Konflikte häuften. Zeitweise stand das IQWiG unter Dauerfeuer.

Einige der einschneidensten Bewertungen des IQWiG war das Urteil zu kurzwirksamen Insulinanaloga, die von der Pharmaindustrie mit perfektem Marketing in den Markt gedrückt wurden. Sie seien nicht besser als herkömmliches Humaninsulin, entschied das Institut. Auch die langwirksamen Insulinanaloga, die einen den Diabetes vergessen lassen sollten, bewertete das IQWiG negativ: Möglicherweise seien sie sogar krebserregend, ergab die Studie. Memamtin, hunderttausendfach an Alzheimerpatienten verordnet und oft deren letzte Hoffnung? Kein Beleg für einen Nutzen bei Alzheimer-Demenz, entschied das IQWiG unter schärfstem Protest von Pharmaindustrie und Patientenvertretern.

Formale Fehler bei der Auftragsvergabe führten zu Korruptionsvorwürfen

2007 sah sich Sawicki Vorwürfen der Vetternwirtschaft ausgesetzt, weil das IQWiG Aufträge an eine Einrichtung vergeben hatte, an der Sawickis Ehefrau beteiligt war. Externe Wirtschaftsprüfer wurden beauftragt, die Angelegenheit zu untersuchen. Sie kamen zu dem Ergebnis, dass es zwar formale Fehler bei der Auftragsvergabe gegeben habe, sprachen Sawicki jedoch von persönlicher Vorteilsnahme oder Begünstigung frei. Der IQWiG-Vorstand ermahnte Sawicki daraufhin, sprach ihm aber weiterhin das Vertrauen aus. 2008 gab es wieder Ärger: Ein IQWiG-Experte hatte zugleich die Pharmaindustrie beraten.

Sawicki, heißt es jetzt in der Ärzte-Petition, habe als Person maßgeblich dafür gesorgt, dass das IQWiG internationale Anerkennung gewonnen habe und in seiner Reputation mittlerweile seiner britischen Vorbild-Institution NICE in keiner Weise mehr nachstehe. Sawickis Ablösung an der Spitze des IQWiG füge der internationalen Vernetzung des Institutes wie auch der deutschen medizinischen Wissenschaft insgesamt schweren Schaden zu. "Sawickis Ablösung" so Egidi, "wäre der Anfang vom Ende des IQWIG."

Für die Krankenkassen könnte die Angelegenheit durchaus auch teuer werden, wie Gerd Antes, Direktor des Deutschen Cochrane Zentrums, meint: "Wenn Sawicki durch einen indurstriefreund-licheren Leiter abgelöst würde, könnte das einen erheblichen Qualitätsverlust in der Versorgung zur Folge haben - und es könnte die Krankenkassen möglicherweise Milliarden kosten."

La France et la grippe A, un mauvais dosage

Le Monde, 7 janvier 2010 à 15h 29
https://www.lemonde.fr/epidemie-grippe-a/article/2010/01/07/gripppe-a-un-mauvais-dosage_1288652_1225408.html

La France est l'un des rares pays à avoir décidé d'une stratégie de vaccination de masse contre la grippe A. C'est au mois de juillet, lors d'une réunion à Matignon, qu'ont été arrêtés les principes de la campagne de vaccination.

La pandémie, c'est la guerre. Face à une menace sanitaire, la mobilisation générale est de rigueur. Confronté à la nécessité d'agir dans une situation criblée d'incertitudes, le gouvernement français a opté, à l'été 2009, contrairement à d'autres, en faveur d'une stratégie de vaccination massive. Son objectif: être en mesure d'immuniser contre le virus H1N1 tous les Français qui le souhaitent.

Las !, fin décembre, seulement 5 millions de Français avaient choisi de se faire vacciner. Le ministère de la santé a annoncé, lundi 4 janvier, qu'il renonçait à l'achat de 50 millions de doses de vaccin sur les 94 millions commandées à quatre laboratoires. Et des parlementaires du Parti socialiste comme du Nouveau Centre réclament une commission d'enquête parlementaire sur la gestion de la pandémie. Comment et pourquoi en est-on arrivé là ? En laissant le politique primer sur le sanitaire.

Le 24 avril 2009, l'Organisation mondiale de la santé (OMS) a lancé une alerte mondiale après l'apparition d'une épidémie due à un nouveau virus grippal au Mexique et aux Etats-Unis. Le 11 juin, l'OMS a annoncé officiellement une pandémie. Le monde est alors pris par surprise: des préparatifs avaient été engagés, mais ils étaient calibrés pour le virus aviaire H5N1, extrêmement virulent mais très peu transmissible entre personnes. Tout le contraire de ce que se révélera être le H1N1.

Depuis octobre 2004, la France possède un plan de réponse à une pandémie grippale. La menace du H5N1 et le traumatisme de la canicule d'août 2003 et ses 15 000 morts sont passés par là. Actualisé à plusieurs reprises, ce plan prévoit l'acquisition de moyens de prévention et de lutte et, s'inspirant des préparatifs de réponse à des attaques bioterroristes, il retient un dispositif de vaccination de masse dans des centres ad hoc. Les stocks de Tamiflu et de masques sont déjà constitués. Sitôt le nouveau virus identifié, le Comité de lutte contre la grippe (CLCG), un organisme constitué par décret le 25 juillet 2008, recommande la constitution de stocks de vaccins contre le H1N1.

Six jours après l'alerte du 24 avril, Matignon convoque une première réunion interministérielle, qualifiée de "réunion de mise en alerte de l'appareil d'Etat". "A cette date, nous sommes polarisés sur la situation mexicaine, raconte un conseiller du premier ministre. Nous décidons la mise en place de passages particuliers dans les aéroports pour les passagers en provenance du Mexique. Nous activons la cellule interministérielle de crise, prévue dans le plan pandémie grippale."

La cellule se réunira chaque semaine. Elle fonctionne autour d'un tandem ministère de l'intérieur-ministère de la santé. Après le passage de témoin entre Michèle Alliot-Marie et Brice Hortefeux

place Beauvau, en juin, le ministre de l'intérieur s'attache à exécuter la volonté expresse de l'Elysée: contrôler le dispositif. Il peut s'appuyer sur les conclusions du Livre blanc sur la défense et la sécurité nationale, publié le 17 juin 2008, qui précise que "le ministère de l'intérieur coordonne en particulier la gestion des crises sur le territoire national", qu'elles soient sanitaires, terroristes ou climatiques.

A Brice Hortefeux la gestion et la communication sur le dispositif, les centres de vaccination, la gestion des flux ; à Roselyne Bachelot la communication sanitaire. Place Beauvau, on se garde bien de critiquer la ministre de la santé : "Roselyne Bachelot a fait tout ce qu'il fallait", soutient l'entourage de Brice Hortefeux, répondant à la consigne de solidarité de l'Elysée. Entourage qui prend tout de même soin de préciser que les vaccins ont toujours été "du ressort de la santé".

Très vite, le ministre de l'intérieur juge qu'il serait trop coûteux de faire appel aux médecins généralistes pour la vaccination : il aurait alors fallu ajouter le coût d'une consultation ou négocier un tarif. Le ministère de la santé y ajoutera la volonté de préserver le fonct.

U.S. A/H1N1 flu vaccine supply reaches 136 million doses

News XinhuaNet, 8 January 2010, 08:46:30

https://web.archive.org/web/20141001085754/http://news.xinhuanet.com/english/2010-01/08/content_12774248.htm

Houston, Jan. 7 (Xinhua) – The supply of A/H1N1 flu vaccine has reached 136 million doses in the United States, a high-ranking official from the federal Centers for Disease Control and Prevention (CDC) announced on Thursday.

"As of today, 136 million doses of H1N1 vaccine are available for ordering by the states," Dr. Anne Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases, said at an afternoon press conference in Atlanta.

"There are ample supplies of H1N1 vaccine in most of the country," she said. "The vaccine should be easily available pretty much anywhere you live."

During the past three months, limited supply of vaccine caused the CDC to advise state and local health officials to reserve doses for the targeted group, which includes pregnant women, children and young adults, health-care workers and people with asthma and certain other health problems.

"We believe there are vaccines all around the country right now," Schuchat told reporters, adding that most states are opening up vaccination to anyone who wants it.

The U.S. government ordered 251 million doses of A/H1N1 flu vaccine, and most states now offer the vaccine to people of all ages. While the shots and nasal sprays are paid for by the U.S. government, clinics can charge a fee around 20 dollars to administer them.

With 136 million doses now available, Schuchat advised Americans who have not yet been vaccinated to get the vaccine around the country.

"Whether it's at your doctor's office, through the health department, through the clinics that are being arranged for the community, school clinics that are being held at pharmacies and retail centers, more places and more providers are offering vaccines, making it even easier for those of you who want to be vaccinated to protect yourself and your families to be able to do that," she promised.

U.S. to start national Flu Vaccination Week

News XinhuaNet, 8 January 2010, 11:19:07

https://web.archive.org/web/20100126105054/http://news.xinhuanet.com/english/2010-01/08/content_12775897.htm

Houston, Jan. 7 (Xinhua) – An "influenza vaccination week" will be launched across the United States next week, a high-ranking health official from the Centers for Disease Control and Prevention (CDC) said Thursday.

"This next week, or beginning this weekend, we're going to kickoff the national influenza vaccination week," Dr. Anne Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases, told a press conference.

"This is a concerted effort by the CDC, (the department of) health and human services and all of our partners to encourage vaccination," she added.

Although only four states were reporting widespread A/H1N1 flu activity in the past week, U.S. health officials cautioned that a new outbreak was possible.

"The H1N1 virus is still circulating and still causing disease, hospitalizations and deaths," Schuchat said. "Many people are still susceptible to this virus and would benefit from vaccination."

The nation-wide vaccination week includes a focus on people at high risk for complications – adults with emphysema, pregnant women, seniors and children, encouraging vaccination for anyone who hasn't yet been vaccinated and wants to be, she added.

Two weeks ago, the CDC said that nearly 60 million Americans had received the A/H1N1 vaccine.

Schuchat urged Americans not to become complacent and skip the vaccine – particularly those with chronic health conditions who often do not realize that they fall in a group at high risk for developing complications from influenza.

"Complacency is probably our top enemy," Schuchat said. "I would hate for people to make decisions thinking there is no risk and then get sick or severely ill."

Schuchat noted that during the last flu pandemic in 1957, flu activity quieted down in December and January, and people weren't encouraged to get vaccinated. But the flu did return, and many more people died.

"We don't want to repeat the story from 1957," Schuchat explained. "The best thing for us to do is really focusing on the idea that vaccine is the best way for us to reduce the chances that we will have ongoing disease, hospitalizations and deaths."

With 136 million doses of the A/H1N1 vaccine available in the country, Schuchat advised Americans who have not yet been vaccinated to get the vaccine as soon as possible.

"The illness is down. There's plenty of vaccine. It's a key window of opportunity," she said, adding that "having as many people vaccinated as possible is our best course of action."

NEWS BBC

Talks to offload swine flu vaccine under way

BBC News, 8 January 2010, 16:28 GMT
http://news.bbc.co.uk/2/hi/health/8448080.stm

The government is making plans to offload millions of doses of swine flu vaccine amid predictions a "third wave" of the pandemic is unlikely to happen.

Officials are in discussion with manufacturer GSK over contracts for remaining doses purchased by the UK.

Options include selling surplus vaccine and donating it to poorer countries but a stockpile will remain in place.

Cases of swine flu have now dropped dramatically to well below what is usually seen in winter flu outbreaks.

Last week France announced it was selling millions of doses of swine flu vaccine after finding they had more than enough to cope with the outbreak.

The UK bought 60m doses of swine flu vaccine from GSK and 30m from Baxter but the smaller contract had a break clause should the doses not be needed.

To date 23.9m doses of GSK vaccine have been delivered for immunisation of priority groups in the UK as well as 5m Baxter vaccines.

An official figure for the cost of the vaccine to the UK has never been given but it is likely to run into hundreds of millions.

Discussions

In addition to selling or donating vaccine, another option under consideration is to keep supplies of the vaccine adjuvant, the booster chemical which is produced separately from the vaccine, to use in future pandemics.

It has a shelf life of five years.

Government immunisation lead Professor David Salisbury said: "We are in discussion with GSK about future supplies of the vaccine.

"We have to keep a stockpile for ourselves anyway because we don't know what's going to happen in 2010.

"If there was a resurgence we would look very foolish if we had disposed of a valuable stockpile."

He added that it remains important for high-risk groups, such as those with underlying illness and the under fives to be immunised as they are more likely to have severe complications.

Michael Summers, vice chair of the Patient's Association, said it would have been a "dereliction of duty" if the government had not ordered enough vaccine to cover everyone.

But he added there were "lessons to be learnt" about negotiating contracts of this size.

Hospital admissions

Although the number of cases of swine flu has fallen to a low of below 5,000 in England in the past week, the number of people in hospital after being infected has not dropped to the same extent.

There has also been a striking increase in critical care admissions in the over 65s who make up a quarter of the 103 patients currently taking up intensive care beds.

This could partly be due to the cold weather but the reason is not yet entirely clear.

Since swine flu was first reported in April 2009 there have been 360 deaths across the UK - 251 in England, 28 in Wales, 64 in Scotland and 17 in Northern Ireland - mostly in people with underlying health conditions.

Chief Medical Officer, Sir Liam Donaldson, said they would be calculating the economic costs of the pandemic at a later date.

"We're in the 21st century and people do not need to die from vaccine preventable illnesses.

"We want to prevent deaths, people going to hospital and that's generally been the approach we have taken."

Ian Dalton, national director of NHS flu resilience, said NHS staff were making huge efforts to keep services going amid pressures caused by the current cold weather.

"All the work done with flu preparedness will help us in the adverse conditions," he said.

LA NACIÓN
INDEPENDIENTE DESDE 1946

Campaign to start January 15

La Nacion, Costa Rica, 8 January 2010
Caja will call patients for H1N1 Vaccination
https://web.archive.org/web/20100329050123/http://www.theflucase.com/index.php?option=com_content&view=article&id=2521%3Acostan-ricans-face-mandatory-vaccinations-from-january-15th&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Health centers all around the country will be communicating next week with those patients who have been selected as the first to receive the vaccine against the pandemic flu H1N1.

Authorities will contact them by means of telephone calls. The benefit will be received by 200.000 people, equivalent to the amount of doses that are getting into the country next week.

The information was given by Maria Luis Aguilar, Health Minister, who participated in a discussion in nacion.com to evacuate doubts about the pandemic. According to her, the first beneficiaries of the immunization will be the asthmatics, hypertense, mordidly obese and pregnant women in their last trimester.

"Every health center of the Caja Costarricense de Seguro Social already has a list of the people to be vaccinated ; the immunization campaign could start on January 15", said the Minister to hundreds of people who participated in the internet chat. Besides the patients at risk, all the health personnel will be vaccinated, including those who work at private medical centers.

The Health Ministry hopes that, after the arrival of the first vaccines, the country will receive more doses on a weekly base. In total, Costa Rica requested 1.800.000 doses to the Panamerican Health Organization (regional for WHO).

Mandatory. Avila said the vaccine administration will be mandatory ´for those people who present health risk factors.

"We have authority (to force someone to be vaccinated) by the Ley General de la Salud. "If we consider that a person has to be vaccinated due to the risk factors, and not only for the person itself, but for the good of the collectivity, Health can act so this person has to accept the vaccination", the Minister said.

The vaccination campaign will be extended to the rest of the population as the vaccines reach the country. The first lot will be Panenza, who was developped by the Sanofi Pasteur laboratory.

No distinctions. To fight the spread of the H1N1 virus and minimize it's consequences in an eventual second wave of the pandemic, the Health Ministry will vaccinate every person with a risk factor, without distinctions. This includes those who are not affiliated to Social Security, and undocumented immigrants. In both cases, all they will need is a medical certification that they suffer from one of the conditions considered a health risk factor.

In the chat, the Minister said that the country is preparing for 4 possible scenarios for the next weeks. One has to do with the virus getting more lethal , another, that H1N1 becomes threatening in the provinces of Puntarenas, Guanacaste and Limón, which were not strongly affected in the first wave.

A third scenario -vand the most probable, according to Avilav- would be that the second wave is like the first. The fourth would be that there is no second wave at all on the nation's territory.

THE FLU CASE

Costan Ricans face Mandatory Vaccinations from January 15th

The Flu Case, 11 January 2010 16:39
https://web.archive.org/web/20100329050123/http://www.theflucase.com/index.php?option=com_content&view=article&id=2521%3Acostan-ricans-face-mandatory-vaccinations-from-january-15th&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Maria Luis Aguilar, the Health Minister of Costa Rica, has said that swine flu vaccinations will be mandatory ´for those people who present health risk factors," according to a report in La Nacion translated by Claudia Calvo below.

"We have authority (to force someone to be vaccinated) by the Ley General de la Salud. "If we consider that a person has to be vaccinated due to the risk factors, and not only for the person itself, but for the good of the collectivity, Health can act so this person has to accept the vaccination"Aguilar said.

the WHITE HOUSE
PRESIDENT BARACK OBAMA

Presidential Proclamation: National Influenza Vaccination Week

White House, 9 January 2010
https://obamawhitehouse.archives.gov/the-press-office/presidential-proclamation-national-influenza-vaccination-week

Since the first United States cases were identified in April of last year, our Nation has witnessed the worldwide spread of the H1N1 influenza virus. To date, tens of millions of Americans have contracted this virus. While the vast majority of those affected have recovered without incident, an unusually high proportion of children and younger adults have developed serious complications, resulting in hospitalization or even death. We know that influenza vaccination is the best way to protect ourselves against the flu, and my Administration moved swiftly to respond to this threat by assisting in the development of a vaccine, which is now widely available and has shown to be both safe and effective.

Every American has a role to play in fighting the H1N1 flu. Expectant mothers, children, young adults, and all those under the age of 65 with chronic health conditions are at high risk for H1N1 flu-related complications and should get the vaccine as soon as possible. Those not at high risk can protect themselves and prevent the virus from spreading to more vulnerable members of their families and communities by getting vaccinated as well.

This week presents a window of opportunity for us to prevent a possible third wave of H1N1 flu in the United States. I strongly encourage those who have not yet received the H1N1 flu vaccine to do so. Visit flu.gov to find vaccination sites in communities across our country and to stay informed. Together, we can all fight the H1N1 flu and help protect our families, friends, and neighbors.

Now, Therefore, I, Barack Obama, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim the week of January 10-16, 2010, as National Influenza Vaccination Week.

I encourage all Americans to observe this week by getting the H1N1 flu vaccine if they have not yet done so, and by asking their families, friends, and co-workers to do the same.

In Witness Whereof, I have hereunto set my hand this eighth day of January, in the year of our Lord two thousand ten, and of the Independence of the United States of America the two hundred and thirty-fourth.

/s/ Barack Obama

The Vaccine appals the Algerians more than the swine flu does

Echoroukonline, 10 January 2010
https://www.echoroukonline.com/the-vaccine-appals-the-algerians-more-than-the-swine-flu-does

Though it killed dozens and spread panic among the population, the H1N1 pandemic grew to become almost a "banal" and some even doubted its very existence amid growing fear over the dangerousness of the vaccine "Aribanrex", though considered as one o the most efficient by officials.

Al kettar hospital, upper Algiers, receives dozens of patients a day who rush to carry out analysis in order see whether they are affected by virus or not. We are stunned to notice the absence of protection's masks to prevent the spread of the pandemic.

"Moliere A" pavilion… mission impossible.
Two weeks after the kick off of the vaccination campaign in Algeria, I have succeeded to "infiltrate" into "Moliere" pavilion, specialized in the diagnosis of the disease, with the help of a nurse who provided me with gloves and masks asking me to appear sick in order to get checked.

The doctor started consulting me after forwarding a form to fill in which I had to answer to several question in details even on that related to my private life. She made a conclusion that I wasn't affected by the virus but a seasonal flu for which she prescribed the usual treatment including vitamins.

I took this opportunity to "crawl" inside the patients' room where we found three people affected by the virus including a Thirty year old man. While we were trying to approach him, one of the doctors ordered us to leave on account that the place was expressly to the medical staff.

We are not afraid of swine flu… we don't vaccinate
The striking thing is that two weeks after the launch of the vaccination campaign against swine flu, the vaccination department at the hospital was curiously empty because of a large scale boycott expressed by the medical personnel at all levels, especially after the tragic death of doctor few days ago following her vaccination against H1N1.

THE ECONOMIC TIMES | News

GSK to get 1 bn pound boost in 2010 due to swine flu medicine

Economic Times, 10 January 2010, 17:27 hrs IST, PTI
https://web.archive.org/web/20100220012252/http://economictimes.indiatimes.com/news/international-business/GSK-to-get-1-bn-pound-boost-in-2010-due-to-swine-flu-medicine/articleshow/5430851.cms

London: GlaxoSmithKline is likely to get 1 billion pound revenue boost in 2010, as governments stockpile swine flu medicines designed to combat a possible pandemic, media report says.

"Cash tills are ringing at GlaxoSmithKline thanks to soaring demand for its swine flu vaccine Pandemrix and Relenza, which treats the symptoms of the illness that has led to hundreds of deaths around the world," the Observer reported adding the revenue could be over 1 billion pound in 2010.

GSK has 22 government contracts since last summer. Besides, due to higher demand, the company which makes the vaccine in Dresden and Quebec is outsourcing production to third-party manufacturers, the report said.

GSK's chief executive Andrew Witty told the Observer that "the company has worked hard to come up with a vaccine and "it would be foolish to deny that events like these aren't good for business".

In the UK, there are plans to vaccinate the entire population if necessary, and the government has given the go-ahead for vulnerable people, such as pregnant women, frontline health workers and young children, to be inoculated.

GSK has been planning for a pandemic for three-and-a-half years and has spent more than 1 billion pound to ensure its factories could crank up production at short notice.

"We don't know how big this deal is going to be, but no one can say we aren't ready," Witty told the Observer.

Pew Research Center

UMB Chosen to Develop Swine Flu Vaccine

Pew Research Center, 11 January 2010.
https://www.pewresearch.org/journalism/2010/01/11/umb-chosen-develop-swine-flu-vaccine/

On Wednesday, July 22 {2009}, the University of Maryland, Baltimore announced that it had been selected as one of eight sites nationwide that would test a new H1N1 vaccine. The study, funded by the National Institutes of Health (NIH), would conduct a trial of vaccines from two different manufacturers. The university publicized its plan to begin the testing immediately with the goal of recruiting around 1,000 volunteers. The trial would take place at the university's Baltimore campus (UMB) at the Center for Vaccine Development.

Lessons from the coverage

- *Newspapers Dominated the Story.* A niche outlet (in this case, the legal and business paper Maryland Daily Record) can capitalize on its specialties by descending early on a story, but the Baltimore Sun ultimately provided the most depth and context.
- *A press release drove the coverage.* The story was characterized by a general lack of enterprise reporting. The outlets that covered the announcement mostly reacted to a press release and news briefing, and few addressed the lingering questions surrounding the safety of the vaccine.

Both niche and general interest newspapers played key roles in the coverage

The university announced the swine flu program the morning of Wednesday, July 22. At noon, the Maryland Daily Record, a five-day-a-week newspaper focused on a handful of specialty business beats, including law, real estate, biotech and health care, posted the first story on its website. The 603-word report covered the basic facts, including how the vaccine doses would be administered and the impact of H1N1 in Maryland and elsewhere.

By mid-afternoon (2:25 p.m.) the Baltimore Sun had weighed in with a sparse report on its website also based largely on the university news release. [UM one of 8 nationwide testing centers for swine flu vaccine – *this article has been deleted*]

https://web.archive.org/web/20090723082856/http://www.baltimoresun.com/ on 23 July 2009

Roughly 90 minutes later, (3:57 p.m.) WJZ.com, the website of the local CBS affiliate, published a story that covered the basic facts. [https://www.cbsnews.com/news/volunteers-needed-for-h1n1-flu-vaccine/]

The Washington Post also ran a story on the vaccine trials the next morning in its print edition. Of the 19 stories in PEJ's analysis, seven were from newspaper print editions or websites. Nine were from local TV websites or broadcasts. The rest appeared on local radio websites. No story appeared in any local blog captured by the study. [*this article, presumably, has been deleted*]

The next day – Thursday, July 23 – the Sun produced the most thorough treatment of the vaccine trial to appear all week. The 1,265-word Page 1 story contained interviews with sources that had not been featured before, including Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases. Reporter Kelly Brewington provided information about the other stakeholders involved in other nearby testing sites in Frederick and Annapolis. She revealed the name of the drug maker that would provide the vaccine, Sanofi Pasteur.

The Sun was also the only outlet that directly addressed the unknowns related to the vaccine, like safety concerns that are an issue when a vaccine is rolled out rapidly.[1] "There are unanswered questions about the campaign" and "There's still a lot that researchers don't know about the new virus," wrote Brewington. The article also described the reported side effects of a vaccine for a 1976 swine flu strain.

More stories appeared that day as well but few provided any new information.

The Daily Record's print edition expanded on its Wednesday web story, but not by much. It elaborated slightly on the spread of the flu thus far in Maryland and beyond. And it included a quote from John M. Colmers, secretary of Health and Mental Hygiene for the state. Local TV and radio websites, including wbal.com, foxbaltimore.com, wbaltv.com, and wjz.com, all posted or updated stories. But these contained few pieces of information not already reported in their previous evening's newscasts or in other outlets.

By Friday, July 24, newspapers had stopped covering the testing. No more broadcasts aired, and only wbal.com still had a story on its home page.

Lack of enterprise reporting

With only a couple of exceptions, most of the reporting came from the university news release from the morning of July 22 and the press conference held on campus later that afternoon.

In part, this stemmed from technology making the news something that can be produced immediately. For instance, the university press release stated that "the research is a first step toward the U.S. government's stated goal of developing a safe and effective vaccine," and the Daily Record story echoed with "Research on the vaccine is the first step toward the U.S. government's aggressive goal of developing a vaccine for the virus."

The first account is out, largely the way the originating news source framed it, and that stands as the basic outline.

In the end, only a few of the news reports on the announcement advanced the story significantly. Out of the 19 analyzed, just three added any significant new information (another three added some new minor details).

Even hours later, the account from the university press release and press briefing still framed what people knew. That evening, for instance, the local TV news teams aired packages on the announcement, but these veered only infrequently from the basic details from the university.

Only WJZ-TV advanced the story somewhat. Reporter Mike Helgren focused more on the impact of H1N1 so far in the state of Maryland, like the number of illnesses and deaths so far. The story included an interview with a local victim of the flu, Lori Tritto, as well as Secretary Colmers. Instead of dwelling on the vaccine testing news, the secretary discussed the possible benefits to Maryland residents that such a vaccine could hold.

In print, only the Baltimore Sun story on Thursday was marked by a significant level of enterprise.

The story advanced mainly as new breaking news came in. Around 4 p.m. on Thursday, for instance, wbal.com reported that the university's medical center was receiving calls from prospective volunteers. At 6:08 p.m., WJZ-TV aired information on a local company, MedImune, which would be producing some of the vaccine in nasal spray form.

It would not be until months later that questions about the safety of the swine flu vaccine would surface. This time, local outlets seemed to pay more attention, correspondent with a rise in public anxiety.

In all during the week, two-thirds of the stories originated from the University of Maryland. The university sent out a press release and followed that with a briefing. News outlets relied on these two points of dissemination for much of their reporting.

Footnote

1. WJZ's 6 p.m. broadcast from July 23 also addressed the safety issue, though indirectly. The anchor mentioned that drug makers will begin studies to make sure the H1N1 version in its vaccine causes no more side effects than its regular version.

THE FLU CASE

German Government moves to Axe Drug Regulator opposed by Big Pharma

The Flu Case, 11 January 2010, 17:07
https://web.archive.org/web/20100329171126/http://www.theflucase.com/index.php?option=com_content&view=article&id=2525%3Agerman-government-moves-to-axe-drug-regulator-opposed-by-big-pharma&catid=1%3Alatest-news&Itemid=64&lang=en

The removal of a key German government official who has refused to give approval to inadequately tested medicines was a "core" condition of the health factions of the Christian Democrats and the FDP for forming a coaliton government, it has emerged.

According to Der Spiegel, health officials from both parties pressed for the removal of Peter Sawicki from his position as head of a drug regulator and quality control institute in 2010 and for his replacement by someone "more friendly to the industry."

600 doctors, including 50 university professors, have, in the meantime, signed a petition in eight days in a bid to force the government to keep Sawicki, arguing they need objective and impartial information on medicines.

THE FLU CASE

German Government gave GSK and Novartis 10 Million Euros each to develop Pandemic Vaccine

The Flu Case, 11 January 2010, 16:56
https://web.archive.org/web/20100220012328/http://www.theflucase.com/index.php?option=com_content&view=article&id=2524%3Agerman-government-gave-gsk-and-novartis-10-million-euros-each-to-develop-pandemic-vaccine&catid=1%3Alatest-news&Itemid=64&lang=en

The German government gave 10 million euros to GlaxoSmithKline and 10 million euros to Novartis to produce pandemic vaccines, it has emerged after Green MP Harald Terpe tabled parliamentary questions on the contracts in December.

The contract to produce vaccines in the event of a pandemic was not put out to competitive tender.

It has also been revealed that the government appointed a group met as early as 2002 to prepare a pandemic plan involving a mass vaccination campaign.

The revelation that German tax payers even subsided the development of the pandemic vaccines underlines the influence the pharmaceutical companies have on the government.

The German tax payers have paid for the development of the pandemic vaccines, for 700 million euros worth of vaccines as well as for the government propaganda campaign to persaude people to take those vaccines, raising the issue of just who runs Germany?

The pharmaceutical companies?

LA DÉPÊCHE

Vaccin contre la grippe:
le gouvernement "n'en a pas trop fait", selon Sarkozy

La Depeche, 12 Januar 2010, à 12:51
https://www.ladepeche.fr/article/2010/01/12/753370-vaccin-contre-grippe-gouvernement-trop-fait-selon-sarkozy.html

Nicolas Sarkozy a une nouvelle fois justifié mardi la campagne controversée de vaccination contre la grippe A/H1N1 conduite par le gouvernement en estimant qu'il n'en avait "pas trop fait", lors de la présentation de ses voeux au monde de la santé à Perpignan.

"Le gouvernement n'en a pas trop fait. La campagne de vaccination se poursuit et il n'est pas trop tard pour se faire vacciner dans les centres, dans les grandes entreprises et les principales administrations, dans les hôpitaux ou auprès des médecins généralistes", a estimé M. Sarkozy.

"J'ai vu que les commentateurs, comme certains responsables politiques, ont reproché au gouvernement la gestion de la grippe. Moi, je pense que le gouvernement a tenu le cap et fait ce qu'il fallait faire pour protéger la population (...) mon devoir de chef de l'Etat, c'est de protéger les Français", a poursuivi le chef de l'Etat.

"Que m'auriez-vous dit si nous avions manqué de vaccins ? Qu'aurait-on dit de (la ministre de la Santé) Roselyne Bachelot si telle ou telle personne était décédée si elle n'avait pu se faire vacciner à temps ?", a-t-il demandé.

"On a trop de vaccins ? Eh bien on annule les commandes (...) et on revendra ceux qu'on a en trop, mais il n'y a pas un seul Français qui pourra dire à un ministre de la Santé, +je voulais être vacciné, je n'ai pas pu être vacciné+", a insisté le président.

Sortant de son discours, Nicolas Sarkozy a également évoqué les précédents de la canicule de 2003 et du scandale du sang contaminé dans les années 1980.

"Est-ce qu'on a déjà oublié la canicule ?", a-t-il demandé, rappelant la démission du ministre de la Santé de l'époque, Jean-François Mattéi, "parce qu'à tort ou à raison on avait estimé qu'il n'avait pas pris les mesures nécessaires pour protéger les Français".

"Quand il y a eu l'émergence du sida, la si douloureuse affaire du sang contaminé. Un ministre de la Santé (Edmond Hervé, ndlr) fut condamné (...) parce que les bonnes décisions n'ont pas été prises au bon moment", a également rappelé le chef de l'Etat.

"Je ne dis pas ça pour montrer du doigt qui que ce soit (...) mais mon devoir de chef de l'Etat, c'est de tenir compte des erreurs du passé pour faire en sorte qu'elles ne se reproduisent pas", a conclu M. Sarkozy, "je préférerai toujours être trop prudent pour la santé des autres que pas assez".

Le choix du gouvernement de faire vacciner les Français dans des centres ad-hoc qui ont été longtemps engorgés a fait l'objet de nombreuses critiques, notamment de la part des médecins libéraux qui viennent seulement d'être associés à l'opération près de trois mois après ses débuts.

Vacunarán contra AH1N1 en el Metro

El Universal, 12 de enero de 2010, 13:31
https://web.archive.org/web/20100115135724/http://www.eluniversal.com.mx/notas/651243.html

La próxima semana el gobierno del Distrito Federal iniciará una campaña de vacunación en la que se aplicarán 50 mil dosis entre pasajeros que presenten problemas como obesidad mórbida, así como a mujeres embarazadas.

A partir de la próxima semana las autoridades de la Secretaría de Salud capitalina pondrán en marcha en el Metro una campaña de vacunación contra el virus de la influenza AH1N1.

El secretario de Salud, Armando Ahued, dijo que se aplicarán 50 mil dosis de la vacuna entre pasajeros que presenten problemas como obesidad mórbida, a mujeres en cualquier periodo del embarazo, así como usuarios que se declaren diabéticos, hipertensos, con cáncer o con enfermedades respiratorias crónicas.

Habrá módulos de médicos y enfermeras de la Secretaría de Salud local en estaciones que aún están por definirse, para valorar y en su caso aplicar la vacuna a los pasajeros que requieran la inmunización.

Esta medida forma parte de una campaña que ha emprendido la dependencia para ampliar el espectro de personas a las que se les aplicará la vacuna, pues hasta el año pasado sólo se inmunizaba a personal de la Secretaría de Salud y a mujeres hasta con tres meses de embarazo.

Steuergeld für Impfstoff-Forschung

Taz.de, 12 January 2010.
https://web.archive.org/web/20100112035724/http://www.taz.de/1/zukunft/wissen/artikel/1/steuergeld-fuer-impfstoff-forschung/

Der Bund hat die Entwicklung eines Pandemie-Serums bei GSK und Novartis gefördert – mit 10 Millionen Euro. Bereits 2002 tagte eine Expertengruppe zum Thema Pandemie.

Kassel *taz* | Die Entwicklung eines Impfstoffs gegen eine Grippepandemie durch GlaxoSmithKline (GSK) ist vom Bundesgesundheitsministerium mit zehn Millionen Euro gefördert worden. Das geht aus Antworten des Ministeriums auf eine Anfrage grüner Bundestagsabgeordneter hervor. Auch dem Hersteller Novartis - ehemals Chiron-Behring - wurde demnach eine Förderung von zehn Millionen Euro gewährt. Mit beiden Firmen schlossen die Bundesländer später Verträge für den Pandemiefall.

Mit dem Pharmariesen GSK wurde der Vertrag 2007 geschlossen. Allerdings werden dem Hersteller schon mit dem Förderbescheid aus dem Jahre 2006 Lieferungsverpflichtungen auferlegt, bestätigt das Gesundheitsministerium. 2009 orderten die Bundesländer 50 Millionen Dosen des Schweinegrippeimpfstoffs. Einen Teil davon wollen sie inzwischen stornieren. Ob GSK ihnen dabei entgegengekommen ist, ist unklar.

Die Grünen-Abgeordneten um den Gesundheitsexperten Harald Terpe hatten Anfang Dezember 2009 nach Details der Verträge mit GSK gefragt. Die Antworten geben Einblick in frühe Weichenstellungen: Demnach setzte das Gesundheitsministerium bereits 2002, also zur Regierungszeit von Rot-Grün, eine Expertengruppe für die Pandemieplanung ein. Schon damals sei deutlich geworden, dass eine schnelle Versorgung mit Impfstoffen nur in Kooperation mit der Industrie möglich sein würde. 2005 habe die Regierung "angesichts der Bedrohung durch das äußerst gefährliche Virus H5N1" - also die Vogelgrippe - die Vorbereitungen für die Impfstoffversorgung im Pandemiefall vorangetrieben. Die Entscheidung, die Entwicklung zu fördern, basiere auf einem Konzept des Paul-Ehrlich-Instituts.

In ein "Interessenbekundungsverfahren" habe man die führenden acht europäischen Impfstoffhersteller einbezogen. Eine öffentliche Ausschreibung sei nicht in Betracht gekommen. Dass schließlich GSK und Novartis zu "zielführenden Gesprächen" geladen wurden, habe "ausschließlich auf fachlichen Gründen" beruht, schreibt Staatssekretär Daniel Bahr (FDP).

Harald Terpe überzeugt diese Antwort noch nicht: "Es bleibt im Dunkeln, welche fachlichen Gründe für die Bundesregierung letztlich ausschlaggebend waren." Terpe kritisiert, es habe kein transparentes Verfahren gegeben. Dass die Regierung sich gleichzeitig mit der Förderung zum Vertragsabschluss verpflichtet habe, halte er für problematisch. Auch dürfe ein Impfstoff, der mit staatlicher Förderung entwickelt wurde, nicht zu "einem so überhöhten Preis" an den Staat verkauft werden.

Die Antworten des Ministeriums lassen erkennen, dass viele EU-Staaten aus Sorge vor einer gefährlichen Vogelgrippepandemie um Produktionskapazitäten bei GSK konkurrierten. So waren Stornierungsregeln offenbar nicht durchsetzbar. Verhandlungen der Bundesregierung mit Pharmaunternehmen seien an sich kein Problem, urteilt Terpe. Aber er kritisiert, "dass sie sich beim Vertragsabschluss mit GSK die Bedingungen hat diktieren lassen".

Berliner Morgenpost

Berlin spart fünf Millionen Euro bei Impfstoff

Berliner Morgenpost, 12 January 2010, 17:18
https://www.morgenpost.de/berlin/article103921596/Berlin-spart-fuenf-Millionen-Euro-bei-Impfstoff.html

Die Hauptstadt muss nach Verhandlungen des Bundes und der Bundesländer mit dem Hersteller GlaxoSmithKline nur eine Million Schweinegrippe-Impfdosen abnehmen. Ursprünglich vereinbart war das Doppelte. Eine Dosis des Serums kostet rund acht Euro. Die Krankenkassen zahlen diese Summe aber nur, wenn das Serum auch gespritzt wird. Sonst bleibt das Land auf den Kosten sitzen.

Durch eine neue Vereinbarung für den Kauf des Schweinegrippe-Impfstoffs bleiben Berlin nach Angaben der Senatsgesundheitsverwaltung Ausgaben von 5,2 Millionen Euro erspart. Denn die Hauptstadt muss nach Verhandlungen des Bundes und der Bundesländer mit dem Hersteller GlaxoSmithKline nun nur eine Million Impfdosen abnehmen. Ursprünglich vereinbart war das Doppelte: Der Kauf von zwei Millionen Dosen. Eine Dosis des Serums kostet rund acht Euro. Die Krankenkassen zahlen diese Summe aber nur, wenn das Serum auch gespritzt wird. Sonst bleibt das Land auf den Kosten sitzen.

Mit der ursprünglichen Regelung hätte die Schweinegrippe Berlin auch aufgrund der verbreiteten Impfmüdigkeit der Bevölkerung mehr als 13 Millionen Euro kosten können. Denn bisher haben sich nur rund 120.000 Berliner gegen die Schweinegrippe immunisieren lassen.

Dass Berlin anfangs so viel Impfstoff orderte, lag auch an einer Fehleinschätzung der Impfkommission. Ursprünglich ging sie von einer Zweifach-Impfung aus. Nach ersten Erfahrungen korrigierte das Berliner Robert-Koch-Institut die Empfehlung: Eine Impfung reichte völlig aus. Berlin, das für 30 Prozent der Bevölkerung vorsorgen wollte, hatte nun plötzlich Überkapazitäten - für 60 Prozent aller Berliner.

Durch die neue Regelung ist das Land nun wieder bei der geplanten 30-Prozent-Marke angekommen, wie die Senatsverwaltung am Dienstag mitteilte. Und es gibt noch Spielraum. 370.000 der eine Million Dosen bleiben erst einmal beim Hersteller. Finden sich neue Abnehmer, muss das Land dafür auch nicht zahlen. In der Einsparsumme von rund fünf Millionen Euro ist diese Variante allerdings schon eingerechnet.

In Berlin sind bisher 8359 Schweinegrippe-Fälle registriert. Es gibt sechs Todesfälle im zeitlichen Zusammenhang mit der Infektion. Im Moment sind die Ansteckungszahlen sehr niedrig, Experten rechnen aber noch mit einer weiteren Grippewelle in diesem Winter. Die Schweinegrippe-Impfung wird deshalb weiter empfohlen - insbesondere chronisch kranken Menschen. Was die Schweinegrippe-Vorsorge Berlin am Ende genau kosten wird, hängt davon ab, wie viele Menschen sich impfen lassen. Das Serum ist rund zwei Jahre haltbar.

EDI lässt Impfstrategie evaluieren

News.Ch, 14 Januar 2010, 23:50 h
https://web.archive.org/web/20100116124728/http://www.news.ch/EDI+laesst+Impfstrategie+evaluieren/423770/detail.htm

Bern - Das Bundesamt für Gesundheit rechnet mit einem baldigen Ende der Schweinegrippe-Welle. Der Bundesrat hat sich am Mittwoch über die aktuelle Situation informieren lassen. Ein Urteil über die getroffenen Massnahmen und deren Wirkung will er noch nicht fällen. (bert/sda)

Grundsätzlich sei der Bundesrat der Meinung, dass sich im Zusammenhang mit der A(H1N1)-Pandemie Fragen ergeben hätten, die einer Klärung bedürften, teilte das Departement des Innern (EDI) mit. Solange keine Gesamtsicht existiere, seien detaillierte und abschliessende Antworten nicht möglich.

Antworten erhoffen sich die Behörden von einer Evaluation, die das EDI in Auftrag gegeben hat. Durchgeführt wird die Untersuchung von einer externen Firma in Zusammenarbeit mit einem internationalen Expertenteam.

Im Zentrum der Evaluation steht die Impfstrategie und deren Umsetzung. Ferner wird die Kompetenzverteilung und Kommunikation zwischen Bund und Kantonen unter die Lupe genommen. Diese hatten Anlass zu Kritik gegeben. Der Abschlussbericht wird für Mitte April 2010 erwartet.

Pandemie vor dem Ende

Die gegenwärtige Pandemie nähert sich dem Ende. Eindämmungsmassnahmen, die noch in Kraft seien, könnten «nach Prüfung der lokalen Gegebenheiten» beendet werden, schreibt das EDI.

In der ersten Kalenderwoche haben in der Schweiz hochgerechnet rund 7300 Personen wegen Schweinegrippe einen Arzt aufgesucht. Dies sind weniger als in der Vorwoche. Mit 92 Konsultationen pro 100'000 Einwohner liegt die Zahl jedoch immer noch über dem epidemischen Schwellenwert. Von einer Epidemie sprechen die Fachleute ab 50 Konsulationen pro 100'000 Einwohner.

THE FLU CASE

Swiss to Investigate Health Ministry over Swine Flu vaccine Campaign

The Flu Case, 15 January 2010 13:36
https://web.archive.org/web/20100220012612/http://www.theflucase.com/index.php?option=com_content&view=article&id=2572%3Aswiss-to-investigate-health-ministry-over-swine-flu-vaccine-campaign&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Swiss Department of Internal Affairs (EDI) is to conduct an investigation of how the Department of Health handled the swine flu pandemic and vaccination campaign, according to Swiss media.

The EDI has asked an "external company" to conduct the evaluation of the vaccine "strategy" together with international experts: the report is expected to be ready by the middle of April.

The move comes as the Department of Health has come under increasing fire for its its role in the swine flu vaccine progamme.

REUTERS

Glaxo shipped $1.4 bln of H1N1 vaccine in Q4

Reuters, 15 January 2010**,** 10:44am EST
https://web.archive.org/web/20100124123933/https://www.reuters.com/article/idUSLDE60E1SU20100115/?type=marketsNews

LONDON, Jan 15 (Reuters) **-** GlaxoSmithKline (GSK.L) shipped swine flu vaccine worth 835 million pounds ($1.36 billion) to governments in the last quarter of 2009 but the drugmaker said on Friday it was too early to say what the final total would be.

The quarterly total is less than the 1 billion pounds or so that many analysts had been forecasting.

The British company, which is the biggest supplier of H1N1 vaccines, has been hit in recent weeks by a series of order cancellations following slow uptake of the shots.

Belgium became the latest country to cut its order, cancelling a third of the supply originally booked from Glaxo earlier on Friday, in line with a similar reduction by Germany.

"Shipments of the vaccine continue to be delivered in the first half of 2010 and GSK is in ongoing discussions with many governments, as their needs evolve," the company said in a statement.

"This includes renegotiation of contracts with governments who have announced changes to their planned immunisation programmes and with governments who have placed new orders for the pandemic vaccine."

Glaxo said in October that it had booked orders to supply governments with 440 million doses of its Pandemrix vaccine in 2009 and the first part of 2010.

The group did not give an update to this figure on Friday but said it had shipped approximately 130 million in the last three months of 2009.

Shares in Glaxo, which have fallen in recent days on mounting concerns about declining swine flu orders, were 2 percent lower by 1530 GMT.

https://web.archive.org/web/20130310181317/http://www.washingtonpost.com/wp-dyn/content/article/2010/01/19/AR2010011903366.html

România liberă

Aida Danaila

Mai multe organizatii ale societatii civile
il ameninta pe secretarul de stat cu instanta pentru decizii considerate ilegale

România liberă, 15 Ianuarie 2010
https://web.archive.org/web/20100119022035/http://www.romanialibera.ro/eveniment/a174728-plangere-penala-contra-vaccinarii-impuse-de-cercel.html

Plangere penala contra vaccinarii impuse de Cercel

Eveniment - Plangere penala contra vaccinarii impuse de Cercel
Ministrul sanatatii, Cseke Attila, a corectat actiunile secretarului sau de stat si pregateste un ordin care sa stipuleze ferm ca nu se pot vaccina copiii fara acordul scris al parintilor.

»Pentru ca actiunile sale nu mai tin seama de nici un fel de respectare a legilor din Romania, dar si a diverselor conventii internationale, secretarului de stat Adrian Streinu-Cercel i se pregateste o plangere penala din partea mai multor organizatii ale societatii civile. Dispozitiile sale privind obligarea medicilor sa se vaccineze, precum si imunizarea copiilor fara acceptul scris al parintilor au fost stopate de ministrul Sanatatii.

Revoltati ca sunt amenintati cu desfacerea contractului de munca daca nu se vaccineaza impotriva gripei porcine, mai multi medici i s-au adresat senatorului Iulian Urban, presedintele Asociatiei de Asistenta pentru Consumatori. "In mod evident, dl Streinu-Cercel si-a depasit competentele. Am discutat cu ministrul Sanatatii, Cseke Attila, care mi-a spus ca dl Cercel a emis o dispozitie catre DSP-uri fara sa aiba acordul lui, iar aceasta dispozitie nu are nici un fel de valoare juridica. Acest om (Adrian Streinu-Cercel – n.n.) trebuie oprit. si nu doar prin destituire din functie, pentru ca poate veni altcineva care va incerca aceleasi metode ilegale, ci printr-unexemplu. Pentru ca intelege sa incalce drepturile si libertatile fundamentale ale medicilor, dar si pe cele ale copiilor, mai multe asociatii din domeniul societatii civile, ajutate de colegi avocati de la mine de la cabinet, vor depune plangere penala impotriva sa", ne-a declarat senatorul Urban.

Aroganta afisata tot mai frecvent de prof. dr. Adrian Streinu-Cercel, secretar de stat in Ministerul Sanatatii, care, peste capul ministrului Sanatatii, a inceput sa dea directive pe la toate Directiile de Sanatate Publica, a fost taiata de Cseke Atilla. In urma scandalului declansat de actiunile secretarului de stat Streinu-Cercel, ministrul Sanatatii s-a vazut obligat sa ia pozitie si sa readuca legalitatea. Acesta i-a linistit pe medici ca nu ii va obliga nimeni sa se vaccineze, decizia apartinandu-le in exclusivitate, la fel ca in cazul oricarui alt pacient roman. De asemenea, in privinta declaratiilor lui Cercel, care anunta fara drept de apel ca, in cazul in care nu va exista dezacordul parintilor, copiii vor fi vaccinati impotriva virusului A/H1N1 obligatoriu si pe banda rulanta, ministrul Atilla a facut precizari foarte clare. Vaccinarea copiilor cu varste cuprinse intre 6 si 16 ani va fi realizata numai cu acordul scris al parintilor, normele privind strategia imunizarii in scoli urmand sa fie stabilite printr-un ordin comun al ministrilor Sanatatii si Educatiei. "A fost o neintelegere asupra careia s-a revenit. Vom cere acordul scris al parintilor intrucat este vorba despre copiii cu varste intre 6 si 16 ani. Parintele raspunde pentru copii, asa ca vom cere acordul scris. Nota prin care li se cerea medicilor sa se vaccineze, pentru ca altfel nu vor mai avea acces la bolnavi, a fost reparata", a declarat ministrul Cseke Atilla.

Colegiul Medicilor din Romania asteapta ordinul ministrului Sanatatii privind necesitatea acordului scris al parintilor pentru vaccinarea copiilor si libertatea medicilor de a decide daca se vaccineaza sau nu, deci anularea deciziei lui Streinu-Cercel, actul semnat de ministrul Atilla urmand sa apara cel mai tarziu luni.

"Avem cuvantul ministrului, care deja i-a transmis secretarului de stat sa nu faca presiuni asupra medicilor. Prin declaratiile sale ca nu era nevoie de acordul scris al parintilor pentru vaccinarea copiilor, profesorul Cercel incalca o multime de acte normative. Este vorba de toate conventiile internationale privind drepturile copilului pe care Romania le-a semnat, Legea privind drepturile pacientilor si Codul deontologic al Colegiului Medicilor din Romania privind consimtamantul pacientilor. Daca la un pacient major se poate vorbi si de un consimtamant verbal, la minori este obligatoriu consimtamantul scris al parintilor sau al reprezentantilor legali ai acestora. In ceea ce ii priveste pe medici, profesorul Cercel incalca in primul rand Codul Muncii, contractul-cadru al Caselor de Asigurari de Sanatate, Ministerul Sanatatii nefiind parte in acel contract, Legea drepturilor pacientilor etc.", ne-a declarat prof. dr. Vasile Astarastoaie, presedintele Colegiului Medicilor din Romania.

Secretarul de stat Adrian Streinu Cercel nu a putut fi contactat in cursul zilei de ieri pentru a comenta aceste acuzatii.

THE FLU CASE

Conflict breaks out in Romanian Government over Mandatory Swine Flu Jab Order

The Flu Case, 17 January 2010 15:30

https://web.archive.org/web/20100220012708/http://www.theflucase.com/index.php?option=com_content&view=article&id=2590%3Aconflict-breaks-out-in-romanian-government-over-mandatory-swine-flu-jab-order&catid=1%3Alatest-news&Itemid=64&lang=en

Mandatory Flu shots required for medical staff in Romania.

The Romanian National Medical Council has opposed the decision of the Health Ministry to make swine flu shots mandatory - a decision that appears to have been taken without the agreement of the Health Ministre Cseke Atilla.

While in most European countries flu vaccines seem past history, in Romania the Secretary of the Health Ministry, Dr Adrian Streinu-Cercel, ordered on January 13 2010, and without the agreement of the Health Ministry Cseke Atilla, the manadatory vaccination of health care workers and the general vaccination of children in schools without parents consent.

The National Medical Council has opposed the administrative decision and will go to court to stop it.

Newly elected President Basescu supports the flu shot campaign but the Health Ministy has vowed to cancel by Monday the Adrian Streinu-Cercel's administrative order.

Schweinegrippe-Impfungen: Ständige Impfkommission (STIKO) kassiert Strafanzeige

OTS, 15 Januar 2010, 15:41:33
https://www.ots.at/presseaussendung/OTS_20100115_OTS0011/schweinegrippe-impfungen-staendige-impfkommission-stiko-kassiert-strafanzeige

Osterode am Harz (ots) - Das von den Bestsellerautoren Marita Vollborn und Vlad Georgescu geführte Biotech Online-Magazin LifeGen.de hat auf Grund der erfolgten Schweinegrippe-Impfungen in Deutschland Strafanzeige gegen die am Robert Koch Institut angesiedelte Ständige Impfkommission (STIKO) eingereicht.

Nach Informationen von LifeGen.de wurde das von *GlaxoSmithKline den Ländern verkaufte Vakzin Pandemrix bereits im Mai 2008 zugelassen – ein Jahr vor Beginn der von der WHO ausgerufenen Pandemie und noch vor Isolierung des Schweinegrippe-Erregers im Jahr* 2009. Lediglich eine Anzahl von 240 Patienten diente damals als "Beweis" für die Sicherheit des Impfstoffs. Die Bevölkerung der Bundesrepublik avancierte ab Herbst 2009 damit de facto ohne vorherige Einwilligung zur humanen Ressource für einen klinischen Großversuch der Pharmaindustrie, nachdem die am RKI angesiedelte STIKO immer wieder die Impfung empfahl und selbst Gesundheitsminister Philipp Rösler an der Praxis der STIKO festhielt.

LifeGen.de LTD hat daher am 14.1.2010 *Strafanzeige und Strafantrag gegen die am RKI angesiedelte Ständige Impfkommission* (STIKO) und, um die Ermittlungen in alle Richtungen zu ermöglichen, auch gegen Unbekannt gestellt. Angesichts der Tatsache, dass die bestellten Impfstoffe nach Informationen der F.A.Z. die Kassen der GKV bislang rund 400 Mio. Euro kosteten, besteht nach Ansicht von LifeGen.de LTD ein öffentliches Interesse an Ermittlungen durch die Berliner Justiz.

Nach Meinung von LifeGen.de besteht der Verdacht von Verstößen gem. § 223, § 224 (1) Abs. 1, § 225 (3) Abs. 1. und 2, § 226 (3) sowie § 228 des StGB. Ebenso Verstöße gegen die Paragraphen 5, 10, 11, 11a, 14 und 15 des AMG zuletzt geändert durch Art. 1 V v. 28.9.2009 I 3172, (3578). Derzeit überprüft LifeGen.de auch die Chancen einer Verfassungsbeschwerde bez. § 20 Seuchenschutzgesetz. In der auf 10 Seiten verfassten Strafanzeige an die Berliner Staatsanwaltschaft weist LifeGen.de zudem darauf hin, dass das Vakzin im Jahr 2008 nur für Erwachsene zugelassen wurde, wie ein LifeGen.de vorliegendes, öffentlich zugängliches Originaldokument ebenfalls belegt.

Alle weiteren Infos finden Sie auf www.lifegen.de und Im Buch "Schweinegrippe als Jahrtausend-Fake", das bereits im November 2009 bei Books on Demand verlegt wurde und das im Laufe der dazugehörigen Recherchen zur Realisierung der Strafanzeige führte.

THE FLU CASE

Will Italy's class action lawsuit be the first of many?

The Flu Case, 25 January 2010
https://web.archive.org/web/20100220012925/http://www.theflucase.com/index.php?option=com_content&view=article&id=2630%3Awill-italys-class-action-lawsuit-be-the-first-of-many&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The German online medical news site LifeGen says that the class action lawsuit filed in Italy against pharmaceutical companies over the swine flu jab could be just the start of a series of legal actions.

LifeGen reports that more than 7,800 side effects to the swine flu jab have been reported using the electronic Vaccine Adverse Event Reporting System (VAERS) system including 33 suspected deaths, raising the chances of a class action lawsuit.

Moves are also being made in Germany to launch a class action lawsuit.

LifeGen journalists filed criminal chages against the German government vaccine advisory body STIKO for allowing the Pandemrix vaccine that had been tested on only 240 people to be marketed.

Moreover, the European drug regulator, EMEA, which is two thirds funded by pharma industries, confirmed to LifeGen in a written reply that information about the side effects and risks would only be collected after the vaccine was given to people.

GlaxoSmithKline's Pandemrix vaccine, which has not been tested on any children, was given approval in 2008 - one year before the swine flu pandemic broke out.

The Washington Post

One in five Americans got swine flu vaccine, CDC reports

Washington Post, 16 January 2010
https://web.archive.org/web/20140603221525/http://www.washingtonpost.com/wp-dyn/content/article/2010/01/15/AR2010011503927.html

Atlanta - About one in five Americans has been vaccinated against swine flu, according to the government's first detailed estimates of vaccination rates against the pandemic.

The estimate is based on two government telephone surveys done in December and early January. The surveys concluded that an estimated 61 million people -- or about 20 percent of the population – got a shot or nasal spray vaccination against the H1N1 virus since the vaccine became available in the fall.

One spokesman from the Centers for Disease Control and Prevention said the numbers are good, considering that it was a hurried campaign against a novel flu virus using a vaccine that did not become available to the public until early October, and then, only in limited supplies.

"From our point of view, this looks very successful," said Richard Quartarone, the spokesman.

The report backs up a rough estimate used by health officials in recent weeks that more than 60 million Americans had been vaccinated.

It also shows that vaccination rates were a bit higher for people deemed to be especially vulnerable to the new influenza, including children, pregnant women and people with underlying health conditions

The results were released Friday through a CDC publication, Morbidity and Mortality Weekly Report. One survey involved about 6,000 people. The number who responded to the second survey was not included in the report.

CDC officials also released on Friday new estimates of the numbers of Americans who were sick, hospitalized or died as a result of the virus.

An estimated 55 million became ill from swine flu from the time it was first identified in April through mid-December. About 246,000 Americans were hospitalized and 11,160 died.

The CDC last estimated that through mid-November, the pandemic had sickened 50 million Americans and caused 10,000 deaths.

Swine flu infections have been waning since late October, and no states were reporting widespread cases as of last week.

Mike Adams

Thousands of Americans died from H1N1 even after receiving vaccine shots

Natural News, 18 January 2010, 22:16
https://www.naturalnews.com/027956_h1n1_vaccine_cdc.html

The CDC is engaged in a very clever, statistically devious spin campaign, and nearly every journalist in the mainstream media has fallen for its ploy. No one has yet reported what I'm about to reveal here.

It all started with the CDC's recent release of new statistics about swine flu fatalities, infection rates and vaccination rates. According to the CDC:

• 61 million Americans were vaccinated against swine flu (about 20% of the U.S. population). The CDC calls this a "success" even though it means 4 out of 5 people rejected the vaccines.
• 55 million people "became ill" from swine flu infections.
• 246,000 Americans were hospitalized due to swine flu infections.
• 11,160 Americans died from the swine flu.

Base on these statistics, the CDC is now desperately urging people to get vaccinated because they claim the pandemic might come back and vaccines are the best defense.

BUT HERE'S THE PART YOU'RE NOT BEING TOLD

The CDC statistics lie by omission. They do not reveal the single most important piece of information about H1N1 vaccines: How many of the people who died from the swine flu had already been vaccinated?

Many who died had already been vaccinated

The CDC is intentionally not tracking how many of the dead were previously vaccinated. They want you (and mainstream media journalists) to mistakenly believe that ZERO deaths occurred in those who were vaccinated. But this is blatantly false. Being vaccinated against H1N1 swine flu offers absolutely no reduction in mortality from swine flu infections.

And that means roughly 20% of the 11,160 Americans who died from the swine flu were probably already vaccinated against swine flu. That comes to around 2,200 deaths in people who were vaccinated!

How do I know that swine flu vaccines don't reduce infection mortality? Because I've looked through all the randomized, double-blind, placebo-controlled clinical trials that have ever been conducted on H1N1 vaccines. It didn't take me very long, because the number of such clinical trials is ZERO.

That's right: There is not a single shred of evidence in existence today that scientifically supports the myth that H1N1 vaccines reduce mortality from H1N1 infections. The best evidence I can find on vaccines that target seasonal flu indicates a maximum mortality reduction effect of somewhere around 1% of those who are vaccinated. The other 99% have the same mortality rate as people who were not vaccinated.

So let's give the recent H1N1 vaccines the benefit of the doubt and let's imagine that they work just as well as other flu vaccines. That means they would reduce the mortality rate by 1%. So out of the 2,200 deaths that took place in 2009 in people who were already vaccinated, the vaccine potentially may have saved 22 people.

61 million injections add up to bad public health policy

So let's see: 61 million people are injected with a potentially dangerous vaccine, and the actual number "saved" from the pandemic is conceivably just 22. Meanwhile, the number of people harmed by the vaccine is almost certainly much, much higher than 22. These vaccines contain nervous system disruptors and inflammatory chemicals that can cause serious health problems. Some of those problems won't be evident for years to come... future Alzheimer's victims, for example, will almost certainly those who received regular vaccines, I predict.

Injecting 61 million people with a chemical that threatens the nervous system in order to avoid 22 deaths -- and that's the best case! -- is an idiotic public health stance. America would have been better off doing nothing rather than hyping up a pandemic in order to sell more vaccines to people who don't need them.

Better yet, what the USA could have done that would have been more effective is handing out bottles of Vitamin D to 61 million people. At no more cost than the vaccines, the bottles of vitamin D supplements would have saved thousands of lives and offered tremendously importantly additional benefits such as preventing cancer and depression, too.

The one question the CDC does not want you to ask

Through its release of misleading statistics, the CDC wants everyone to believe that all of the people who died from H1N1 never received the H1N1 vaccine. That's the implied mythology behind the release of their statistics. And yet they never come right out and say it, do they? They never say, "None of these deaths occurred in patients who had been vaccinated against H1N1."

They can't say that because it's simply not true. It would be a lie. And if that lie were exposed, people might begin to ask questions like, "Well gee, if some of the people who were killed by the swine flu were already vaccinated against swine flu, then doesn't that mean the vaccine doesn't protect us from dying?"

That's the number one question that the CDC absolutely, positively does not want people to start asking.

So they just gloss over the point and imply that vaccines offer absolute protection against H1N1 infections. But even the CDC's own scientists know that's complete bunk. Outright quackery. No vaccine is 100% effective. In fact, when it comes to influenza, no vaccine is even 10% effective at reducing mortality. There's not even a vaccine that's 5% effective. And there's never been a single shred of credible scientific information that says a flu vaccine is even 1% effective.

So how effective are these vaccines, really? There are a couple thousand vaccinated dead people whose own deaths help answer that question: They're not nearly as effective as you've been led to believe.

They may not be effective at all.

Crunching the numbers: Why vaccines just don't add up

Think about this: 80% of Americans refused to get vaccinated against swine flu. That's roughly 240 million people.

Most of those 240 million people were probably exposed to the H1N1 virus at some point over the last six months because the virus was so widespread.

How many of those 240 million people were actually killed by H1N1? Given the CDC's claimed total of deaths at 11,160, if you take 80% of that (because that's the percentage who refused to be vaccinated), you arrive at 8,928. So roughly 8,900 people died out of 240 million. That's a death rate among the un-vaccinated population of .0000372

With a death rate of .0000372, the swine flu killed roughly 1 out of every 26,700 people who were NOT vaccinated. So even if you skipped the vaccine, you had a 26,699 out of 26,700 chance of surviving.

Those are pretty good odds. Ridiculously good. You have a 700% greater chance of being struck by lightning in your lifetime, by the way.

What it all means is that NOT getting vaccinated against the swine flu is actually a very reasonable, intelligent strategy for protecting your health. Mathematically, it is the smarter play.

Because, remember: **Some of the dead victims of H1N1 got vaccinated**. In fact, I personally challenge the CDC to release statistics detailing what percentage of the dead people had previously received such vaccines.

The headline to this article, "Thousands of Americans died from H1N1 even after receiving vaccine shots" is a direct challenge to the CDC, actually. If the CDC believes this headline is wrong -- and that the number of vaccinated Americans who died from H1N1 is zero -- then why don't they say so on the record?

The answer? Because they'd be laughed right out of the room. Everybody who has been following this with any degree of intelligence knows that the H1N1 vaccine was a medical joke from the start. There is no doubt that many of those who died from H1N1 were previously vaccinated. The CDC just doesn't want you to know how many (and they hope you'll assume it's zero).

Where are all the real journalists?

I find it especially fascinating that the simple question of "How many of the dead were previously vaccinated?" has never been asked in print by a single journalist in any mainstream newspaper or media outline across the country. Not the NY Times, not WashingtonPost.com, not the WSJ, LA Times or USA Today. (At least, not that I'm aware of. If you find one that does, let me know and I'll link to their article!)

Isn't there a single journalist in the entire industry that has the journalistic courage to ask this simple question of the CDC? Why do these mainstream journalists just reprint the CDC's statistics without asking a single intelligent question about them?

Why is all the intelligent, skeptical reporting about H1N1 found only in the alternative press or independent media sites?

You already know the answer, but I'll say it anyway: Because most mainstream media journalists are just part of the propaganda machine, blindly reprinting distorted statistics from "authorities" without ever stopping to question those authorities.

The MSM today, in other words, is often quite pathetic. Far from the independent media mindset that used to break big stories like Watergate, today's mainstream media is little more than a mouthpiece

for the corporatocracy that runs our nation. The MSM serves the financial interests of the corporations, just as the CDC and WHO do. That's why they're all spouting the same propaganda with their distorted stories about H1N1 swine flu.

But those who are intelligent enough to ask skeptical questions about H1N1 already realize what an enormous con the pandemic was. In the end, it turned out to be a near-harmless virus that was hyped up by the CDC, WHO and drug companies in order to sell hundreds of millions of doses of vaccines that are now about to be dumped down the drain as useless.

NEWS BBC

'Two-thirds' of NHS London nurses without swine flu jab

BBC News, 21 January 2010
http://news.bbc.co.uk/2/hi/uk_news/england/london/8471304.stm

Just one in three nurses in London has been vaccinated against swine flu, the NHS has admitted.

A BBC London Freedom of Information request has shown the majority of medical staff remain unprotected against the virus.

Although swine flu rarely kills healthy adults, it is dangerous to many patients in hospitals.

NHS London insisted the vaccine take-up was "encouraging" and rising, with more than 60,000 staff having had the jab.

But figures seen by BBC London reveal the take-up has reached a plateau, with a limited increase in the numbers of staff to have been vaccinated over the last month.

In mid-December, a total of 33% of frontline staff - including dentists and paramedics - had been vaccinated.

By 18 January that figure had risen to 40%.

'Best defence'

Kelly Gibson's eight-year-old daughter Holly daughter died from swine flu last year.

Holly, who lived in Erith, on the south London/Kent border, suffered from a chromosome disorder that made her particularly vulnerable.

Ms Gibson said: "If a nurse is dealing with a vulnerable person they could be passing swine flu on to the innocent. "They could contract swine flu and possibly die."

Swine flu has been shown to be extremely contagious, if typically mild among most people.

Currently, 38% of London's GPs and 45% of other doctors, such as hospital consultants, have received the jab.

Yet the take-up rates among NHS London staff appear to contradict the organisation's own advice.

Speaking in December, NHS London's head of pandemic flu, Dr Chloe Sellwood, said: "The vaccine is our best defence against the virus and that is why we are encouraging as many people as possible to take it."

While hosting a Downing Street reception for nurses, Prime Minister Gordon Brown said 60,000 people who work for the NHS in London had been vaccinated against swine flu.

He told BBC London: "Swine flu is a problem that many people have suffered from, and most people have come through after a few days with the treatment that is necessary, but equally of course it can be dangerous.

"Therefore we are encouraging all vulnerable groups in the population to get themselves vaccinated."

Mr Brown added: "It is voluntary but I would encourage health workers to take the vaccination if it is available to them."

Les centres de vaccination anti-H1N1 fermeront le 30/01

Reuters, 22 January 2010, 9:35 PM GMT+8
https://www.reuters.com/article/ofrtp-grippe-france-vaccination-20100122-idFRPAE60L0DP20100122/

PARIS (Reuters) - Les centres de vaccination contre la grippe A (H1N1) fermeront progressivement pour cesser totalement leur activité le 30 janvier, annonce le ministère de la Santé.

Les médecins libéraux, qui peuvent déjà vacciner depuis le 12 janvier contre cette grippe, pourront obtenir des vaccins en pharmacie à partir du 1er février.

Des centres de vaccination intégrés aux établissements de santé vont être ouverts dans les 100 établissements hospitaliers sièges de Samu jusqu'en septembre 2010, précise le ministère dans un communiqué.

"Le ministère de la Santé et des Sports rappelle que si la première vague épidémique est aujourd'hui passée dans notre pays, plusieurs pays ont connu deux vagues successives", lit-on dans le communiqué.

"La poursuite de la vaccination est le bon moyen d'augmenter le degré d'immunité de la population vis-à-vis du nouveau virus, et donc d'atténuer une éventuelle seconde vague", ajoute-t-on.

Selon l'Organisation mondiale de la santé, la grippe A a fait près de 14.000 morts dans le monde depuis son apparition, en avril 2009.

Selon le bulletin épidémiologique du 19 janvier de l'Institut de veille sanitaire, la France a enregistré 263 décès depuis le début de l'épidémie.

THE FLU CASE

All French vaccine centres to shut by January 30th

The Flu Case, 25 January 2010
https://web.archive.org/web/20100220012905/http://www.theflucase.com/index.php?option=com_content&view=article&id=2626%3Aall-french-vaccine-centres-to-shut-by-january-30th&catid=1%3Alatest-news&Itemid=64&lang=en

All 1,100 swine flu vaccine centres in France are to be closed down by January 30th, the ministry of health has said.

GPs, who wish to give the jab, can obtain it at pharmacies from February 1st.

Most vaccine centres have already been shut down with a few remaining open for shortened periods of time during the week.

THE WALL STREET JOURNAL.

Vasella's Impeccable Timing

The Wall Street Journal, 26 January 2010, 9:34 AM ET 15:44
https://www.wsj.com/articles/BL-SOURCEB-2230

Novartis had quite a surprise in store for its shareholders this morning. The Swiss drug maker's record results were overshadowed by news that Daniel Vasella is handing over the CEO title to Joe Jimenez, an American who joined Novartis a bit more than two years ago after a long career in the consumer goods industry.

Vasella has held the strategic as well as the executive top jobs at Novartis for 11 years. But recently he has come under pressure from vocal shareholders to split the roles. It was felt that holding both the Chairman of the board and the CEO title unified too much power in just one person and is not befitting to a company of Novartis' size.

The pressure increased in 2008, when cross-town rival Roche appointed Severin Schwan as CEO, thereby doing away with the double-role at the top for Schwan's predecessor and still Chairman Franz Humer. This change came close on the heels of Nestle's decision to separate the combined CEO-Chairman structure in 2007, and marked the beginning of the end of this style of boardroom structure for Swiss companies.

The decision to appoint Jimenez as the new CEO of Novartis was only just taken yesterday, Vasella told reporters at a news conference in Basel. Though it had obviously been in the making longer than that, he conceded, saying he had started to think about relinquishing the dual role at the top about a year ago.

Vasella could hardly have chosen a better time for stepping back from day-to-day management. Novartis' most recent earnings report confirmed that the Swiss group is currently the fastest-growing among the big drug companies, and one that has a relatively full pipeline of potential new drugs.

While he'll leave it up to his successor to wrap up the purchase of U.S. eyecare company Alcon, the foundations for integrating this profitable business into Novartis have been laid.

What remains to be seen, however, is in which direction Vasella will be pulling when he steps down as CEO on Monday. Some onlookers have expressed skepticism as to whether Vasella–who has a reputation of being a micro-manager–will be able to let the new leadership team run free.

But they forget that Vasella may have bigger ambitions than looking over the shoulder of a competent management team. And they neglect his genuine interest in improving the lives of people in need of medicines, which may well lead him to eventually assume a role in the public sector.

Vojáci dostali očkování proti prasečí chřipce befelem

iDNES.cz, 26 ledna 2010, 16:37

https://web.archive.org/web/20100129222239/http://zpravy.idnes.cz/vojaci-dostali-ockovani-proti-praseci-chripce-befelem-pfu-/domaci.asp?c=A100126_163642_domaci_kot

Šéf generálního štábu Vlastimil Picek nařídil všem vojákům povinné očkování proti prasečí chřipce, zjistila MF DNES. Kdo neuposlechne, toho čeká trest a dočasně mu může být snížen i plat. Mezi vojáky se zvedla silná vlna odporu.

Nadporučík M. K. to říká za všechny: "Nejsme pokusní králíci. Ať to nechají na naší volbě, jestli chceme být očkováni, či ne."

Armáda má nicméně na tento radikální krok ze zákona právo. V případě propuknutí pandemie prasečí chřipky totiž musí být schopna zajistit základní fungování státu.

Problém ale je, že generální štáb nařizuje povinné očkování i svým civilním zaměstnancům. Na ně se totiž povinné očkování podle právníků nevztahuje.

V rámci resortu obrany se očkování týká zhruba 16 tisíc lidí. "Do skupin, které se podrobí očkování, jsou zařazeni například pracovníci zdravotní a veterinární služby, jednotky vyčleňované ve prospěch IZS, jednotky vyčleňované do zahraničních misí, příslušníci Vojenské policie, speciální jednotky a podobně," říká mluvčí šéfa generálního štábu Jana Růžičková.

Dalším sporným krokem je zdůvodnění Pickova rozkazu. "Něco se vám nelíbí? Držte hubu, krok a splňte rozkaz," prosazují mnozí velitelé rozkaz z nejvyšších armádních míst.

"Nařízení je to v podstatě správné, ale forma jeho uplatnění je nešťastná. Může vyvolat odpor k očkování," obává se hlavní český hygienik Michal Vít.

Vláda v reakci na možnou pandemii prasečí chřipky rozhodla už loni o očkování osob nezbytných pro zajištění chodu státu. Očkováni jsou ale především lidé s nemocemi, které by chřipka mohla výrazně zkomplikovat. V lednu pak vláda okruh očkovaných osob rozšířila.

THE FLU CASE

Order to force Czech soldiers to take the swine flu jab ignites row

The Flu Case, 28 January 2010, 15:29

https://web.archive.org/web/20100220013151/http://www.theflucase.com/index.php?option=com_content&view=article&id=2653%3Aorder-to-force-czech-soldiers-to-take-the-swine-flu-jab-ignites-row&catid=41%3Ahighlighted-news&Itemid=105&lang=en

An order for the compulsory vaccination of the soldiers of the Czech Republic has been put on hold after Czech President Vaclav Klaus intervened.

On January 26th, the Chief of the General Staff of the Armed Forces of the Czech Republic Vlastimil Picek issued an order for the compulsory vaccination of thousands of soldiers as well as civilian employees of the military.

The vaccine to be used is GlaxoSmithKline's untested Pandemrix.

In 1918, the Spanish flu started when soldiers in the US were vaccinated before being sent to fight in the first world war.

WHO-affiliated Professor Bruno Lina is currently investigating how to make the mild H1N1 swine flu virus replicated in the lungs and more lethal in a lab in France.

Soldiers in the Czech Republic who refuse the jab are to be punished and could have their pay docked under the plans.

But Klaus has opposed the decision to make the unpopular jab compulsory.

"We are not a test lab rabbits. It should be our free will decision," a Czech soldier was quoted as saying in the local media.

On January 11th, the Czech government issued a law saying that members of the army, police and firefighters had to take the jab.

Klaus has asked the Ministry of Defence to review its decision.

"Our soldiers are NOT a living test subjects so we cannot vaccinate them especialy against their agreemen," he said.

"The negative impression among the public is increased because the potential risks of the vaccines, which are still being discussed by our health specialists, have not been properly explained."

Klaus has asked health officials to investigate whether the pandemic is so severe that the army has to be vaccinated.

But Picek has remained adamant.

"Soldiers must accept this command as soldiers do. Army rules are on my side."

95,000 Pandemrix vaccines were delivered to the Czech Republic at the start of November 2009.

The government plans to vaccinate about 1 million people with the police, army, doctors, nurses, chronically ill people being priority groups.

GOVERNMENT OF THE CZECH REPUBLIC

National Security Council in Session over the Swine Flu

Vlada.Gov, 29 January 2010, 10:58
https://vlada.gov.cz/en/media-centrum/aktualne/national-security-council-in-session-over-the-swine-flu--67812/

An emergency session of the National Security Council took place today at the Office of the Government of the Czech Republic with the President taking part. Influenza A (H1N1) virus was the main topic on the agenda. President Václav Klaus´s participation in the meeting ensued from his position of the Commander-in-Chief of the Armed Forces of the Czech republic.

The National Security Council evaluated the circumstances of the current development of the spread of the influenza A/H1N1 virus in the Czech Republic and the consequent vaccination of target groups. A report by the Czech Republic Chief Hygienist was presented at the meeting, based on which further conclusions were drawn, according to Prime Minister Fischer. “It is not necessary to change anything in the originally adopted strategy,” the Prime Minister said at the press briefing following the end of the session of the National Security Council.

The Prime Minister also said that should the situation in the development of the influenza A/H1N1 virus change, vaccination will become mandatory and the Government shall make the decision. “We shall authorize the Chief Hygienist to inform the Government of the beginning of pandemic, then we shall decide on the mandatory vaccination,” Prime Minister Jan Fisher stated.

The session also decided on the exact number of the members of the Army of the Czech Republic to undergo vaccination. The National Security Council decided that only eight thousand out of the original sixteen thousand soldiers would receive vaccination. The Government will again discuss the topic of H1N1 flu vaccination at its regular session on Monday.

World Health Organization

WHO hails new Gates Foundation support for decade of vaccines

Geneva: WHO, 29 January 2010
https://archive.ph/mwkru

Statement

WHO welcomes the Bill & Melinda Gates Foundation pledge of US$ 10 billion over the next ten years to accelerate global vaccine efforts.

"The Gates Foundation's commitment to vaccines is unprecedented, but needs to be matched by unprecedented action. It's absolutely crucial that both governments and the private sector step up efforts to provide life-saving vaccines to children who need them most," said Dr Margaret Chan, WHO Director-General.

Vaccines and immunization have played a major role since the last century in overall health gains. Smallpox has been eradicated, polio is on the verge of being eradicated and more than 2 million deaths are averted each year.

"Building on these achievements, we can take immunization to the next level, with the expanded uptake of new vaccines against major killers such as pneumonia and rotavirus diarrhoea," said Dr Chan. "An additional two million deaths in children under five years could be prevented by 2015 through widespread use of new vaccines and a 10% increase in global vaccination coverage."

Vaccines join other proven measures, such as micronutrient supplements, oral rehydration therapy, and community delivery of antibiotics, that form an integrated approach to child health and have already brought much progress.

The Bill & Melinda Gates Foundation announcement comes on the tenth anniversary of the establishment of the Global Alliance for Vaccines and Immunization (GAVI). Dr Chan also congratulated the GAVI Alliance on their accomplishment of reaching 257 million additional children with new and underused vaccines.

INDEPENDENT

Gates pledges 10 billion dollars for vaccines for poor

Independent, 29 January 2010, 01:00 GMT
https://www.independent.co.uk/life-style/health-and-families/health-news/gates-pledges-10-billion-dollars-for-vaccines-for-poor-1883647.html

Microsoft co-founder Bill Gates pledged 10 billion dollars over the next decade Friday to research and deliver vaccines to the world's poorest countries.

Increased vaccination could save more than eight million children by 2020, said the entrepreneur-turned-philanthropist, announcing the commitment by the Bill and Melinda Gates Foundation he heads with his wife.

But he added that money was needed and called on governments and the private sector to do more.

"We must make this the decade of vaccines," said Gates at the World Economic Forum (WEF) in Davos. "Vaccines already save and improve millions of lives in developing countries.

"Innovation will make it possible to save more children than ever before."

Gates, who is a regular at the annual Swiss ski resort meeting of political and business leaders, called on others to "fill critical financing gaps in both research funding and childhood immunisation programmes."

"Increased investment in vaccines by governments and the private sector could help developing countries dramatically reduce child mortality by the end of the decade," said a Foundation statement.

The projections were based on research by experts at the Johns Hopkins Bloomberg School of Public Health in the United States, on the potential impact of vaccines on childhood deaths over the next 10 years.

By boosting the delivery of vaccines in developing countries to 90 percent coverage, the experts' model suggested that the lives of 7.6 million under-fives could be saved in the next decade.

An additional 1.1 million youngsters could be saved by rapid introduction of a malaria vaccine in 2014, bringing the total lives saved to 8.7 million.

Melinda Gates, who heads the couple's Foundation with her husband, added: "Vaccines are a miracle – with just a few doses, they can prevent deadly diseases for a lifetime.

"We've made vaccines our number-one priority at the Gates Foundation because we've seen firsthand their incredible impact on children's lives," she added at the annual meeting of political and business leaders in the Swiss ski resort.

Commenting on the announcement, WHO chief Margaret Chan said the Gates' commitment was "unprecedented, but just a small part of what is needed.

"It's absolutely crucial that both governments and the private sector step up efforts to provide life-saving vaccines to children who need them most," she added.

REUTERS

Bill Gates promises $10 billion for vaccines

Reuters, 30 January 2010, 2:57 AM GMT+8
http://www.reuters.com/article/idUSTRE60S3K420100129

DAVOS, Switzerland (Reuters) - Bill and Melinda Gates said on Friday they would spend $10 billion over the next decade to develop and deliver vaccines, an increased commitment that reflects progress in the pipeline of products for immunizing children in the developing world.

Over the past 10 years, the Microsoft co-founder's charity has committed $4.5 billion to vaccines and has been instrumental in establishing the GAVI alliance, a public-private partnership that channels money for vaccines in poor countries.

By increasing immunization coverage in developing countries to 90 percent, it should be possible to prevent the deaths of 7.6 million children under five between 2010 and 2019, Gates told reporters at the World Economic Forum.

Margaret Chan, director-general of the World Health Organization described Gates' commitment to vaccines as "unprecedented" and called on governments around the world and the private sector to match it with "unprecedented action."

Vaccination rates have already climbed remarkably in recent years, with even a poor African country like Malawi now boasting coverage rates similar to those in many Western cities.

"Over the last 10 years, the success of both increased vaccine coverage and getting new vaccines out has been phenomenal," Gates said.

More cash is now needed to make the most of new vaccines becoming available, including ones against severe diarrhea and pneumococcal disease from GlaxoSmithKline, Merck and Pfizer.

"We can take immunization to the next level, with the expanded uptake of new vaccines against major killers such as pneumonia and rotavirus diarrhea," Chan said in a statement.

She said an extra two million deaths in children under five could be prevented by 2015 by widespread use of new vaccines and a 10 percent increase in global immunization coverage.

Further off, Glaxo is also in the final phase of testing a vaccine against malaria that Gates said could slash deaths from the mosquito-borne disease.

Gates warned against the risk of governments diverting foreign aid funding for health toward climate change, arguing that health should stay a top priority -- not least because better health leads to a lower birth rate.

Curbing the globe's population growth is critical for tackling global warming.

Anyone who takes the time to properly research the origins of the “population control” movement will come to understand that the Rockefeller-Turner-Gates agenda for drastic population reduction has its origins in the age-old malevolent elitist agenda to cull the human “chattel” as one would do to rodents or any other species deemed a nuisance by the central planning authorities.

Current situation and prospect on Influenza A(H1N1) 2009 vaccine in Japan

Clinical Virology, 31 January 2010, 38(1): 3-54, revised 7 March 2010
https://web.archive.org/web/20100525030305/http://www.theflucase.com/index.php?option=com_content&view=article&id=2961%3Aharumi-kuno-sakai-reports-on-japans-swine-flu-vaccination-campaign-in-clinical-virology&catid=1%3Alatest-news&Itemid=64&lang=en

English translation

Summary

None of Japanese people has received imported A(H1N1)2009 vaccines, such as GlaxoSmith Klein's Pandemrix/Arepanrix or Novartis Pharma's Focetria. Japan is using totally made-in-Japan inactivated influenza HA vaccine without adjuvant, i.e., A(H1N1)2009 inactivated split monovalent vaccines (without adjuvant), which were made by four Japanese manufacturers, i.e., Research Foundation for Microbial Diseases of Osaka University, Kitasato Institute, Denka Seiken, and Chemo-Sero -Therapeutic Research Institute.

All four manufacturers produced the vaccines in 1 mL vials. Chemo-Sero's vaccine contains phenoxyethanol and other three manufacturers' vaccines contain thimerosal as preservatives. In addition to the 1 mL vials, Chemo-Sero produced the vaccine in 10 mL vials and Kitasato Institute produced thimerosal-free vaccine in prefilled syringe for one dose (0.5 mL), both vaccines have been on the market during last 6 months.

In Japan, influenza epidemic started in September 2009 and ended in February 2010. Almost all of influenza virus isolated during this epidemic were A(H1N1)2009. (Table 1)

During this influenza season 195 person died of influenza. Population of Japan is 127,771,000. Therefore 1.53 out of 1 million people died of influenza during this flu season.

As of February 8, 2010, on the other hand, 22,070,000 (17% of total population) received A(H1N1)2009 inactivated split monovalent vaccines. As of February 16, 2010, 126 vaccinees died after receiving the A(H1N1)2009 inactivated split monovalent vaccines. Therefore, 5.71 per 1 *million people died after receiving A(H1N1)2009 vaccines*.

Table 2 depicts intervals between vaccination and onset of the diseases directly connected with deaths. Seventy-six per cent (96/126) of the fatal diseases occurred within 4 days after vaccination. This suggests that the death might be related with administration of influenza vaccines in most of the cases. *Death rate after vaccination* (5.71/million dose) was 3.7 *times more frequent than death rate by natural infection with influenza* (1.53/million population).

One hundred and nineteen cases of *anaphylactic reactions* after receiving A(H1N1)2009 inactivated split monovalent vaccines have been reported. Fifty one cases out of 119 (43%) had history of some kind of *allergic diseases* such as bronchial asthma, food allergy, drug allergy, allergic rhinitis, etc. Although patients with bronchial asthma or allergic diseases are among high risk groups of infection with influenza virus, those patients are inclined to suffer from severe adverse reactions of influenza immunization. *They are at high risk to influenza vaccination itself*!

In last fall four Japanese manufacturers were in the process of producing a total of 54,000,000 doses of A(H1N1)2009 inactivated split monovalent vaccines (without adjuvant). The total price of Japanese vaccines was 25,900 million yen (288 million US dollars). Price for one dose of Japanese vaccines was 480 yen (5.3 US dollars, when 90 yen was one US dollar).

In October 2009 Japanese Government contracted with GlaxoSmith Kline and Novartis Pharma to import 74,000,000 doses and 25,000,000 doses of vaccines, respectively, i.e., 99,000,000 doses in total. These foreign vaccines were Influenza A(H1N1)2009 monovalent vaccines with adjuvant, which is oil in water emulsion, even though Japan does not have any experience with the vaccines with oil in water adjuvant whatsoever. The price of vaccines of those two manufacturers was 112,600 million yen, (1,251 million US dollars). Price for one dose of imported vaccines was 1,137 yen, which was 2.4 times higher than price of Japanese vaccines.

Altogether, Japanese government prepared a total of 153 million doses of vaccines for 128 million population. As of 2010/ 05 week, 43,279,320 doses of vaccines were delivered and 22,066,750 doses of vaccines were injected. Therefore 32,000,000 doses of Japanese vaccines are sleeping at storage spaces somewhere in Japan.

On January 25, 2010 Japanese Minister of Health Labour and Welfare, Mr.Nagatsuma announced at the parliament that Japanese government was negotiating with 2 foreign vaccine manufacturers to re-evaluate the contract and to cancel the order partially. On February 12, distribution of foreign vaccines started but as little as 135 doses were requested from all over Japan. Now foreign vaccines are arriving batches after batches. Japanese government is getting the bits from Japanese vaccine manufacturers about the price of storing the foreign vaccines. The imported vaccines will be stored until they expire. Since the vaccines are governmental propriety, they cannot be discarded before they expire and should be stored in good condition.

Table 1. Influenza surveillance (number of influenza patients per doctor per week), Estimated number of vaccine doses, Reported number of adverse reactions, Deaths.
Table 2. Intervals between vaccination and onset of the diseases.
Table 3. Cumulative number of delivered vaccines and injected vaccines (Japanese vaccines only).

〔論文要旨〕

日本では，2010年１月までに，インフルエンザ（A(H1N1)2009）[注1]に罹患して死亡したのは146人．死亡率は人口100万あたり1.14．一方，A(H1N1)2009＜単価ワクチン＞接種を受けたのは1,647万人，死亡は107例．接種を受けた人の死亡率は100万あたり6.5，自然感染による死亡率の5.7倍であった．

A(H1N1)2009＜単価ワクチン＞接種で，アナフィラキシー例が101例報告され，そのうちの49例 49%にアレルギー性疾患の既往歴があった．アレルギー性疾患，気管支喘息はインフルエンザに罹患すると重症化しやすいハイリスク者であるが，ワクチンで重症なアレルギー反応を起こす可能が高い「ワクチンのハイリスク者」でもある．2010年１月から幼児，学童，中高校生への A(H1N1)2009＜単価ワクチン＞接種が開始されるが，若年者には喘息などのアレルギー疾患を有するものが多い．学童接種で多数を対象に接種をすれば，重症副反応例，死亡例が出ることが懸念される．今シーズン A(H1N1)2009の流行は既に終焉した．（表１）[1]，最早幼児，学童，中高生，成人，高齢者へのワクチン接種は単に副反応例の蓄積を招くだけとなることが否定できない．

2009年10月に日本政府はアジュバント添加 A(H1N1)2009＜単価ワクチン＞をグラクソスミスクライン社（GSK）とノバルティスファーマ２社合わせて1,126億円で購入する契約を締結した．両社のアジュバント（oil in water emulsion）添加 A(H1N1)2009＜単価ワクチン＞はわが国での使用経験が全くないが，ヨーロッパ諸国で重症副反応例，死亡例が多発して社会問題化している．わが国の健常者にはこの輸入ワクチンが割り当てられる方針であるが，接種対象者7,250万人の19～64歳健常者に一斉に接種を行えば，多数の重症副反応例，死亡例が発生することが強く懸念される．A(H1N1)2009＜単価ワクチン＞は任意接種であるとはいえ，ワクチンを独占的に購入し，肉牛同様厳密なトレーサビリティの下，優先順位の厳守を各都道府県に通知する方針をたて，国家統制を行った行政の責任はのがれられないであろう．

欧州各国では，接種率の低さからワクチンが大量に余り，転売，製薬会社との売買契約解除の動きが加速している．WHO が２回接種を推奨したため，各国が必要量の２倍のワクチンを発注したことも背景にあり，欧州各国は WHO に対する批判を強めている．2010年１月12日 WHO と新型インフルエンザ

Suomeen tullut 4,2 miljoonaa rokoteannosta

STMfi, 1 February 2010, 13:21
https://stm.fi/en/-/suomeen-tullut-4-2-miljoonaa-rokoteannosta

Sosiaali- ja terveysministeriö ja Terveyden ja hyvinvoinnin laitos tiedottavat

Suomeen on tullut tähän mennessä 4,2 miljoonaa sikainfluenssarokotetta. Viimeisin Suomeen saapunut, 1,4 miljoonan rokoteannoksen erä jaetaan kunnille tällä viikolla. Loput 1,1 miljoonaa rokotetta saapunevat lähiviikkoina.

Suomessa sikainfluenssatilanne on pysynyt rauhallisena, vaikkakin tartuntoja vielä esiintyy. Sikainfluenssaepidemian toinen aalto rantautuu Suomeen todennäköisesti viimeistään ensi syksynä. Hyvällä rokotuskattavuudella pystytään jopa estämään uuden epidemian puhkeaminen. Tähän mennessä arviolta noin kaksi miljoonaa suomalaista on jo käynyt rokotuttamassa itsensä. Sikainfluenssarokotuksen ottamista suositellaan edelleen kaikille. Varsinkin rokottamattomien riskiryhmiin kuuluvien henkilöiden kannattaa ottaa rokotus, vaikka käynnissä ovatkin terveen aikuisväestön rokotukset.

Sosiaali- ja terveysministeriö suosittelee kunnille, että rokotukset suoritettaisiin ripeästi ja joustavasti loppuun. Rokotusten erityisjärjestelyt voitaisiin siten purkaa maaliskuun loppuun mennessä ja palata terveydenhuollossa normaaliin päiväjärjestykseen. Tämänkin jälkeen rokotetta on syytä tarjota normaalisti terveydenhuollossa varsinkin aiemmin rokottamattomille riskiryhmiin kuuluville, kuten raskaana oleville, sikainfluenssan vakaviin tautimuotoihin altistaville perussairauksia sairastaville ja yli 6-kuukautisille pikkulapsille.

Työterveyshuollot ovat mukana rokotuskampanjassa ja edelleen työnantajat voivat sopia työntekijöidensä rokottamisesta työterveyshuoltonsa kanssa. Rokotuksista on saatavissa tietoa muun muassa Terveyden ja hyvinvoinnin laitoksen verkkosivuilta www.thl.fi, kuntien verkkosivuilta ja terveyskeskuksista.

Yksi rokoteannos riittänee

Tämän hetken tiedon mukaan yksi rokoteannos riittänee antamaan kattavan suojan sikainfluenssaa vastaan niin lapsilla kuin aikuisillakin, eikä Euroopan lääketurvallisuusvirasto EMEA suosittele kahta rokotusannosta. Aiemman tiedon mukaan esimerkiksi lasten arveltiin tarvitsevan tehosterokotuksen.

Maassamme käytettävä sikainfluenssarokote on hyvin siedetty. Haittavaikutusten kirjo ja yleisyys eivät anna aihetta epäillä rokotteen turvallisuutta ja ne vastaavat yleisesti influenssarokotteilla todettuja haittavaikutuksia. Tavallisin haittaa aiheuttanut oire on pistosalueen paikallisreaktio. Kuumeen nousua, lihassärkyä ja väsymystä tai päänsärkyä ilmenee yli 10 prosentilla rokotetuista.

Sikainfluenssarokotteiden ottamiseen ajallisesti liittyviä oireita seurataan kaikissa rokotteita käyttävissä EU:n jäsenvaltioissa. Oireet raportoidaan Euroopan lääkevirastoon, jossa käydään läpi järjestelmällisesti epäiltyjä rokotteiden haittavaikutuksia ja joka julkaisee turvallisuusanalyysin viikoittain.

Kysy influenssasta puhelimen aukioloajoissa muutoksia. Kysy influenssasta -puhelin palvelee jatkossa arkisin kello 12-17. Puhelimesta saa vastauksia yleisiin sikainfluenssaa ja sikainfluenssarokotuksia koskeviin kysymyksiin. ...

Ministry of
Social Affairs and Health

Finland has received 4.2 million doses of vaccine
Ministry of Social Affairs and Health, Press Release

The Flu Case, 1/8 February 2010
https://web.archive.org/web/20100220013457/http://www.theflucase.com/index.php?option=com_content&view=article&id=2708%3Afinland-takes-delivery-of-42-million-swine-flu-jabs-for-qsecond-wave-probably-next-autumnq&catid=1%3Alatest-news&Itemid=64&lang=en

Finland has so far received 4.2 million doses of the swine flu vaccine. The 1.4 million doses that arrived recently will be distributed to municipalities this week. The rest of the vaccines, a total of 1.1 million doses, should arrive in a few weeks.

In Finland the swine flu situation has remained stable, although infections still occur. The second wave of the swine flu epidemic will probably arrive in Finland next autumn at the latest. Good vaccination coverage could prevent a new outbreak of the epidemic. So far around two million Finns have already been vaccinated. Vaccination against swine flu is still recommended to everyone. Especially the persons in the at-risk groups who have not yet been vaccinated should get the vaccine even though at present the vaccinations are targeted at the healthy adult population.

The Ministry of Social Affairs and Health recommends that municipalities complete the vaccinations swiftly and flexibly. The special vaccination arrangements could then be dismantled by the end of March, and a return to normality would be possible in health care. Even after this the health services should offer the vaccine as usual especially to persons in the at-risk groups who have not yet been vaccinated; these include pregnant women, persons with medical condition causing a risk of developing a serious illness, and children aged over six months.

Occupational health services have taken part in the vaccination campaign, and employers can still enter agreements to vaccinate their employees through the occupational health services. Information on the vaccinations is available at the National Institute for Health and Welfare webpage http://www.thl.fi/, the municipalities' own webpages, and the health centres.

Single dose should be enough The data available at present indicates that a single dose of the swine flu vaccine should be enough to immunise both children and adults against swine flu, and the European Medicines Evaluation Agency (EMEA) does not recommend two doses of vaccine. Earlier it was assumed that for example children would need a second dose.

The swine flu vaccine used in Finland is well tolerated. The range and prevalence of side effects do not give any reasons to suspect the safety of the vaccine and the side effects are similar to those of influenza vaccines in general. The most common side effect has been local reactions where the injection was given. Over 10 per cent of the vaccinated have experienced fever, muscle ache and fatigue or headache.

All the EU Member States using the swine flu vaccines follow up the symptoms that in temporal terms can be linked to the vaccination. The symptoms are, then, reported to EMEA, which systematically goes through the suspected adverse reactions to the vaccines and publishes a pharmacovigilance report every week.

Changes in the influenza hotline opening hours The influenza telephone hotline operates on weekdays from 12 to 17. The hotline answers general questions about swine flu and swine flu vaccinations. Advice regarding the health status of callers is not given via telephone. The telephone number of the service is 0800 02277 in Finnish and 0800 02278 in Swedish.

The telephone hotline has been in operation since the end of July. The number of calls has decreased in recent weeks to around 30 per day.

THE FLU CASE

Finland takes delivery of 4.2 million swine flu jabs for "second wave probably next autumn"

The Flu Case, 8 February 2010, 15:06
https://web.archive.org/web/20100220013457/http://www.theflucase.com/index.php?option=com_content&view=article&id=2708%3Afinland-takes-delivery-of-42-million-swine-flu-jabs-for-qsecond-wave-probably-next-autumnq&catid=1%3Alatest-news&Itemid=64&lang=en

France and Switzerland are among the European countries to have declared the swine flu pandemic is almost over. But the Finnish government has taken delivery of 4.2 million swine flu vaccines in the expectation that there will be a second wave in autumn.

"The second wave of the swine flu epidemic will probably arrive in Finland next autumn at the latest," the government said in a press release without clarifying what is the scientific basis for this prediction or explaining how come the pandemic is over in other European countries close by but not in Finland.

An estimated two million Finns took the swine flu vaccine, according to the government.

THE FLU CASE

German govenrment gives incomplete answers to swine flu vaccine probe

The Flu Case, 4 February 2010 16:09
https://web.archive.org/web/20100220013410/http://www.theflucase.com/index.php?option=com_content&view=article&id=2693%3Agerman-govenrment-gives-incomplete-answers-to-swine-flu-vaccine-probe&catid=41%3Ahighlighted-news&Itemid=105&lang=en

German taxpayers will have to pay 238 million euros plus VAT or 7 euros plus VAT (8.33 euros) for each unused dose of a contingent of 34 million swine flu jabs , according to answers by the German government to questions tabled by German MPs from the Linke fraction.

The German government document dated January 20th gives unsatisfactory answers to the key issues raised by the mass swine flu vaccination campaign.
=> http://dip21.bundestag.de/dip21/btd/17/004/1700491.pdf

The govenrment revealed there were no clauses allowing for the cancellation of orders for pandemic vaccines in the contracts the government had sealed with pharmaceutical companies.

The states had only managed to reduce the swine flu vaccine order by using a clause taking into account the number of pandemic doses to be administered. In the end, one dose, not two, was recommended.

As a result, the states have to pay for 34 million swine flu jabs even if they are not going to be used.

In addition, it emerged that contracts the pharmaceutical companies have sealed with the individual German states will remain secret due to a „confidentiality“ clause.

Furthermore, the government said it had no precise information about how many people had taken the jab: estimates range between 2 million to 5.8 million people.

The Paul Ehrlich Institute’s estimate for the Pandemrix jab involved a span of between 4 to 5.8 million people as of December 12th 2009 - this, in spite of a requirement to keep track of the number of vaccinations given for an accurate assessment of the adverse events rections in proportion to the total number of vaccines administered.

Also, the *government said it knew about the financial links between the members of the govenrment’s vaccine advisory body* (STIKO) and pharmaceutical companies. But it claimed that STIKO members had acted impatially in recommending the untested and toxic swine flu vaccinations for a mild flu.

It referred to a WHO web page and the vote of a secretive International Health Regulations Emergency Committee – the names of whose members have not been made known – as evidence that WHO had acted transparently and had not influenced by the pharmaceutical companies in its decision to declare a pandemic level 6 emergency on June 11th 2009.

Also, the German government confirmed that it had begun preparing for a bird flu pandemic as early as 2002 with the establishment of a group of experts to prepare a national pandemic plan in spite of the fact there was no scientific basis for believing a bird flu pandemic was inevitable

The closest the world has come to a bird flu pandemic was in February 2009 when Baxter contaminated 72 kilos of vaccine material with the live bird flu virus and distributed it to 16 labs in four countries.

Furthermore, the government maintained that the safty of the Pandemrix vaccine for pregnant women had been proven in "practical" use in the last few weeks of the vaccination campaign with reference to the figures of the European Medicines Agency, which is two thirds funded by pharmaceutical companies.

In the same document (page 17. Answer to question 33), the government admits that clinical studies are the only way of accurately assessing adverse reactions but no clinical studies on the Pandemrix jab on pregnant women have been carried out.

It emerged that as of 12 January 2010 178 people have been confirmed by lab tests to have died from the swine flu but not clear how many had been vaccinated.

Flu Vaccine in America: Epidemic of Ambivalence

NPR, 5 February 2010, 3:05 PM ET
https://www.npr.org/sections/health-shots/2010/02/flu_vaccine_in_america_epidemi.html/

Right now my right deltoid is slightly tender from two needle pokes yesterday--one for swine flu, one for the seasonal flu.
The swine flu shots came eventually but there weren't many takers. (Thierry Zoccolan/AP)

A new government-funded flu poll reveals I'm among just one out of five adults to get vaccinated against swine flu. That's right, just 21 percent have done what I did, despite the biggest push ever to persuade Americans to get immunized.

Even among "high priority" adults--those with heart and lung disease, neurological conditions, HIV and other conditions that put that at risk of flu complications and death--the score isn't much higher. Just 28 percent of them are protected.

The season isn't over, of course. Another 13 percent of adults say they still intend to get vaccinated. But even if they follow through, three-fifths of adults will remain unvaccinated.

The record's better among children. Pandemic H1N1 has hit children unusually hard. Forty percent of parents say they've gotten their kids vaccinated and another 13 percent intend to. If they follow through, just over half of US children will have gotten vaccinated.

Why have so many Americans sat the pandemic out? Most people say it wasn't as serious as the government made out and didn't think they were at risk of serious illness. But among those who didn't seek vaccine and aren't sure they will, more than half say they're worried about the vaccine's safety.

But Americans are nothing if not ambivalent. A straight-on question about vaccine safety found only 15 percent who say it's unsafe. And when asked what the government should do about ordering vaccine, three in five say officials should buy enough for everyone and guarantee there's no shortage--even if that means a lot of leftover vaccine.

The poll is the eighth in a series conducted by Harvard researchers under contract with the Centers for Disease Control and Prevention.

Oh, and why did I decide to get flu shots in February? Well, I wasn't in any priority group urged to be first in line. I was at the doctor's office anyway. The shots were free. It's an excellent bet that the pandemic H1N1 will be in next fall's seasonal vaccine, so my immune system will be primed against it. And maybe H3N2, a component of the seasonal vaccine, will resurface. You never know.

THE FLU CASE

Use of Pandemrix among young people and elderly appears to be unauthorised in EU

The Flu Case, 9 February 2010, 11:30

https://web.archive.org/web/20100220013536/http://www.theflucase.com/index.php?option=com_content&view=article&id=2717%3Ause-of-pandemrix-among-young-people-and-elderly-appears-to-be-unauthorised-in-eu&catid=41%3Ahighlighted-news&Itemid=105&lang=en

EU and national regulators have allowed the Pandemrix swine flu vaccine to be given to young people and elderly even though the *vaccine is **not authorised** for use in these age groups*, according to the EU medicines regulator documents.

According to documents by the European Medicines Agency, Pandemrix was granted marketing authorisation in the EU in May 2008 with use being restricted to people between 18 and 60 years of age.

In spite of this restriction, Pandemrix has been given to children under 18 and the elderly in the course of the mass swine flu vaccine campaign launched this autumn after WHO declared a pandemic emergency.

In fact, children under 18 have been made priority groups for vaccination with Pandemrix by governments and WHO even though the use of Pandemrix in this group appears to be illegal.

The document CHMP Variation Assement Report Type II, Variation dated the 17th December 2009 contains the statement on page 2 that Pandemrix's marketing authorisation is restricted to subjects aged 18-60.

Every document on a list of variation procedures sent to me by the EMEA carries this statement as the introduction, even though most of the documents date from after Pandemrix was administered to children and the elderly..

https://web.archive.org/web/20100601073748/http://www.ema.europa.eu/humandocs/Humans/EPAR/pandemrix/pandemrixM2.htm

The role of the regulator is to enforce drug safety provisions.

However, it appears in this case that the EMEA has turned a blind eye as national governments, WHO and pharmaceutical companies have targetted young children with an unauthorised and potentially harmful vaccine.

The EMEA is two thirds funded by the pharmaceutical industry.

ACADÉMIE NATIONALE DE MÉDECINE

Pierre Bégué

Nouveau communiqué sur la grippe A (H1N1)v

MOTS-CLÉS : grippe, pandemie, vaccination, sante publique

Academie Nationale de Medicine, 9 février 2010
https://www.academie-medecine.fr/nouveau-communique-sur-la-grippe-a-h1n1v/

Rapports et communiqués
Nouveau communiqué sur la grippe A (H1N1)v

*Au nom de la Commission VII (Maladies infectieuses et médecine tropicale) et de la Sous-commission des Vaccinations**

En complément de son communiqué du 13 octobre 2009, l'Académie nationale de médecine fait les remarques suivantes Ã propos du déroulement de la campagne de vaccination contre la grippe A(H1N1)v, dont les bases sanitaires étaient justifiées :

· La communication médiatique intense et les propos alarmistes ont fait naître rapidement des doutes dans le public sur la réalité des dangers alors difficilement évaluables. Un tel excès risque d'émousser l'adhésion de la population en cas d'une nouvelle alerte de santé publique.

· La stratégie vaccinale imposée par le Ministère de la santé avec recours aux «centres de vaccination» s'est heurtée Ã des difficultés logistiques et psychologiques dans la population française, où la vaccination est assurée depuis longtemps Ã 90% par la médecine libérale (médecins généralistes et pédiatres). L'association d'emblée de ces praticiens de proximité au plan de vaccination aurait sensiblement amélioré l'adhésion de la population.

· Le choix entre une vaccination de masse et une vaccination ciblée pour les personnes Ã risques n'a pas fait l'objet d'un débat préalable. L'acquisition des vaccins aurait du se faire par étapes en fonction de l'évolution de la pandémie au sein de la population générale. La décision d'une vaccination de masse aurait dû être expliquée et justifiée.

· L'évolution actuelle de la pandémie est rassurante, mais un ou plusieurs rebonds ne peuvent être exclus, légitimant la poursuite de la vaccination.

· A la fin de cette première campagne, l'efficacité, les effets secondaires et le coût de la vaccination (H1N1)v devront être évalués avec précision.

L'Académie nationale de médecine considère que dans de telles circonstances une meilleure concertation entre les autorités sanitaires, les comités d'experts, l'industrie pharmaceutique, les sociétés savantes et les praticiens (généralistes et pédiatres) est indispensable et elle souhaiterait être associée Ã l'évaluation de cette vaccination

THE FLU CASE

French Academy for Medicine fiercely criticises mass swine flu vaccination campaign

The Flu Case, 1 March 2010, 16:10

https://web.archive.org/web/20100525024504/http://www.theflucase.com/index.php?option=com_content&view=article&id=2874%3Afrench-academy-for-medicine-fiercely-criticises-mass-swine-flu-vaccination-campaign&catid=1%3Alatest-news&Itemid=64&lang=en

The French government has come in for criticism over its handling of the mass swine flu vaccination campaign from the country's prestigious National Academy for Medicine.

The Academy said the mass swine flu vaccination campaign was ill conceived, fraught with logistical problems and also counter productive in as far as it had led to more scepticism in the population about mass vaccination campaigns.

In a press release issued in the name of the Commission for Infectious Diseases and the Sub Committee on Vaccinations, the Academy accused the media and government of alarmism over the mild swine flu.

Furthermore, the Academy said that the decision to set up vaccination centers to administer the jab created logistical and pyschological problems. This was because people in France are used in nine cases out of ten to getting their vaccinations from GPs.

The Academy also raised concerns about the decision to mass vaccinate the entire population instead of just people who were at an especial risk, saying such a campaign needed a better justification and explanation.

Finally, the Academy called for a proper review of the effectiveness and the secondary effects of the vaccination as well as the cost of the vaccination campaign.

The San Diego Union-Tribune

Sanofi-Aventis Q4 profit up on swine flu vaccines

[Greg Keller]

San Diego Union-Tribune, 10 February 2010, 3:11 a.m. // 30 August 2016 at 6:34 a.m.

https://www.sandiegouniontribune.com/2010/02/10/sanofi-aventis-q4-profit-up-on-swine-flu-vaccines/

PARIS – Sanofi-Aventis reported a 10 percent increase in fourth quarter net profit Wednesday as strong sales of its swine flu vaccine drove full year earnings above expectations.

France's largest drug maker said net profit rose to euro1.8 billion ($2.5 billion) in the three months ending Dec. 31 from euro1.63 billion a year earlier.

The company, whose Sanofi Pasteur division is the world's biggest vaccines manufacturer, said the fourth quarter performance was lifted by a record rise – 64.6 percent – in revenue from its human vaccines business.

Sales of 100 million doses of pandemic vaccines last year helped lift earnings per share on an adjusted basis by 13.1 percent at constant exchange rates, above the 11 percent target Sanofi-Aventis had set in October.

Chief Executive Christopher Viehbacher, who took the reins at Sanofi-Aventis early last year, said in a statement that "major steps have already been achieved in strengthening our growth platforms and reinforcing our R&D pipeline while delivering a double-digit EPS growth."

Since taking the helm, Viehbacher has led a program to help the company take on generic competition and replace aging blockbuster drugs with new treatments.

The company spent euro6.6 billion last year in 33 new partnerships and acquisitions, including Chattanooga, Tenn.-based consumer healthcare products maker Chattem Inc. and Brisbane, California-based biopharmaceutical company BiPar Sciences.

Sanofi-Aventis is also narrowing its research focus to fewer disease areas, something top competitors including Pfizer Inc. and Merck & Co. have already done.

Sales of what Sanofi-Aventis calls its eight "flagship" drugs slid 8.6 percent in the fourth quarter, as generic competition nearly wiped out sales of its Eloxatin cancer treatment, and also hurt its Plavix blood thinner.

For the full year, Sanofi-Aventis' net profit grew 18 percent to euro 8.5 billion, on sales of euro 29.3 billion.

By 2013, Sanofi-Aventis aims to be less dependent on the classical patent-protected blockbusters such as Plavix and Lovenox, as the company leans more heavily on five markets where it sees the most growth: vaccines, diabetes products, emerging markets, over the counter medicines, Japan, and new treatments.

Sanofi-Aventis shares rose 21 percent in 2009, but have slid back 6 percent since the start of the year as stock markets have become more volatile in recent weeks on over the strength and sustainability of the global economic recovery.

Sanofi-Aventis shares fell 0.2 percent to euro 52.59 in early tradinng Wednesday.

The French drug maker's earnings were "roughly in line with what we expected, driven by the swine flu vaccine," said Dominic Valder, pharmaceutical industry analyst at Evolution Securities in London.

"Their forecast for 2-5 percent earnings per share growth this year is what we have in our numbers already, but these might go up on dollar appreciation," Valder added. Last year Sanofi-Aventis' revenue in the United States rose 2.8 percent to euro 9.4 billion.

Queensland Government
The Queensland Cabinet and Ministerial Directory

Paul Lucas
The Honourable, Deputy Premier and Minister for Health

School Swine Flu Vaccine Program set to Roll Out

Media Statements, 10 February 2010
https://web.archive.org/web/20190207104216/http://statements.qld.gov.au/Statement/Id/68429

Queensland is set to roll out a programme of school vaccination clinics for school children, their families and the public, Deputy Premier and Minister for Health Paul Lucas announced today.

The Panvax® H1N1 vaccine will be provided through clinics held in each Queensland State high school, through a collaborative effort between Queensland Health and Education Queensland.

In September 2009 the vaccine was registered for use in people aged 10 years and over, and in *December approval was extended to give the vaccine to everyone above the age of 6 months*.

This vaccine has been shown to be safe and effective in both adults and children.

Mr Lucas said the clinics would operate on a Saturday or Sunday, with the vaccine to be available not only to all Queensland schoolchildren, but all members of their family and any other member of the public who wishes to be vaccinated for free.

“As a parent I know there are some things we just can’t protect our kids from – no matter how hard we try,” Mr Lucas said.

“That’s why, where medical science means we can protect them, especially from things like preventable diseases, that we owe it to our kids to do so.”

“Through this initiative the Bligh Government is helping to ensure the swine flu vaccine is now even more accessible for Queensland children and their families.

“This is in addition to the vaccine already being available through GP clinics and community health clinics.

“Over 550,000 Queenslanders are now reported to have received the vaccine – around 13 per cent of the State’s population.

“But that also means some 87 per cent of the State’s population has not.

“With schools now returned for the year, there is a great opportunity to redouble our efforts to vaccinate both children and their families through this school-based clinic program,” he said.

Parents of children in Queensland schools will soon receive a letter from the Chief Health Officer providing advice about the vaccination and giving details of the clinics that will be held in high schools in their area.

Information on clinics will also be available from schools, childcare centres and the Queensland Health Call Centre, 13HEALTH, when details have been finalised.

The first clinics will start from February 27 and will be completed by the end of Term 1.

Mr Lucas said the swine flu pandemic had continued throughout the Northern Hemisphere, demonstrating Queenslanders could not become complacent about vaccination.

"We know many countries in the northern hemisphere have suffered a second wave of the pandemic during the winter flu season and globally the World Health Organization has now reported nearly 15,000 deaths from this disease," Mr Lucas said.

"Their experience in terms of illnesses, hospitalisations and deaths has been similar to ours' last year.

"Expert advice from world and national health authorities is that a second wave of the pandemic is likely to occur in Australia, and that it will appear in April or May this year.

"During the first wave of the pandemic last year, nearly 12,000 Queenslanders were confirmed with the disease, over 1,200 people were hospitalised and 163 were admitted to intensive care.

"Sadly, 41 Queenslanders died, many of them in vulnerable groups but some 30 percent with no known risk factors.

"Additionally, young children under 5 years of age had the highest rate of hospitalisation due to Pandemic (H1N1) influenza of all age groups.

"The impact of a second wave can be greatly reduced if Queenslanders are vaccinated.

"I urge all Queensland families to take advantage of this opportunity to get vaccinated," he said.

Ends.

MEDIA: 0458 449 267

Rapport de surveillance du vaccin
Les effets secondaires suivant l'immunisation

ASPC, PHAC, 11 février 2010
https://web.archive.org/web/20100412091431/http://www.phac-aspc.gc.ca/alert-alerte/h1n1/vacc/addeve-fra.php

La deuxième vague de grippe H1N1 est en déclin, et le nombre de doses de vaccin contre la grippe H1N1 administrées a diminué. Le prochain rapport de surveillance du vaccin sera donc affiché au cours de la première semaine de mars.

Tous les vaccins homologués au Canada font l'objet d'essais d'innocuité rigoureux. L'utilisation du vaccin contre la grippe H1N1 a été autorisée en fonction de données d'essais cliniques préliminaires, et le vaccin continue de faire l'objet de surveillance et d'essais à mesure qu'il est administré partout au pays.

L'Agence de la santé publique du Canada (ASPC) et Santé Canada, en collaboration avec les provinces et les territoires, la Société canadienne de pédiatrie et un réseau de chercheurs, surveillent activement les effets secondaires consécutifs à l'administration du vaccin contre la grippe H1N1 au Canada. Il s'agit d'un élément essentiel de la stratégie du gouvernement du Canada en matière d'innocuité des vaccins, qui sert à établir des rapports réguliers sur l'innocuité du vaccin contre la grippe H1N1.

...

Analyse

Jusqu'à présent, l'examen détaillé des données de surveillance confirme toujours l'innocuité du vaccin.

- Les 250 cas graves signalés, autres que les cas d'anaphylaxie décrits ci-dessous, ne révèlent pas de tendance particulière pour les effets secondaires. Treize décès ont été déclarés jusqu'à présent et font l'objet d'une enquête.

- Aucune donnée recueillie jusqu'à maintenant ne remet en doute l'innocuité du vaccin contre la grippe H1N1 donné aux femmes enceintes. La plupart des effets secondaires signalés étaient bénins, et le nombre de pertes fœtales est de loin inférieur au nombre de pertes fœtales auquel on peut s'attendre chez autant de femmes enceintes.

- Vingt-six cas de syndrome de Guillain-Barré (SGB) ont été signalés jusqu'à maintenant (1,0 cas par million de doses distribuées). Les cas déclarés à la suite de l'administration du vaccin contre la grippe H1N1 font toujours l'objet d'une enquête.

- Le SGB est une maladie aiguë qui se caractérise par une faiblesse ou une paralysie soudaine (voir la foire aux questions sur le syndrome de Guillain-Barré). Au Canada, on enregistre chaque année de 600 à 700 nouveaux cas de SGB. La maladie peut apparaître à la suite d'une infection causée par une bactérie d'origine alimentaire, d'une infection respiratoire, notamment une infection d'allure grippale, et d'interventions chirurgicales. Depuis 1997, au cours de 12 campagnes annuelles de vaccination contre la grippe saisonnière, on a enregistré un total de 79 cas de SGB à la suite de l'administration du vaccin contre la grippe. Le risque d'être atteint du syndrome de Guillain-Barré

(SGB) après vaccination contre la grippe est d'au plus un cas supplémentaire par million de doses administrées. En fait, les Canadiens risquent bien davantage d'être atteints du SGB par suite d'une grippe qu'après avoir reçu un vaccin contre la grippe.

- Selon les données de surveillance canadiennes et internationales des cas de SGB consécutifs à l'immunisation, l'administration du vaccin contre la grippe H1N1 n'a suscité aucune inquiétude relativement à ce syndrome.

- Plus de la moitié des cas d'effets secondaires graves signalés, soit 131, étaient des cas de réactions anaphylactiques. Aux fins des déclarations, on utilise la définition type d'anaphylaxie publiée par la Brighton Collaboration. Le nombre de déclarations correspond aux cas qui ont été examinés par les autorités de santé publique fédérales, provinciales et territoriales et qui atteignaient un niveau élevé de certitude diagnostique.

- La fréquence globale des cas d'anaphylaxie suivant l'immunisation contre la grippe H1N1 est de 0,52 cas par 100 000 doses distribuées, un taux qui n'excède pas les limites normales observées après toute vaccination..

- L'un des cas d'anaphylaxie signalés plus tôt au cours de la vaccination de masse a été fatal et fait l'objet d'une enquête. Dans les autres cas, les sujets ont été traités et se sont rétablis.

- Plus de 500 cas de réactions allergiques bénignes consistant en divers signes et symptômes ont été signalés à l'ASPC. Dans la plupart des cas, ces réactions sont apparues dans les minutes suivant la vaccination et ont été rapidement traitées par le personnel des cliniques.

THE IRISH TIMES

Carl O'Brien

Almost 1,000 reactions to flu jab

Irish Times, 12 February 2010
https://www.sott.net/article/241492-Almost-800-adverse-reactions-to-swine-flu-vaccine-identified

Almost 1,000 reported cases included vomiting or diarrhoea, fever, swollen glands and injection-site swelling

The Swine flu vaccine caused almost 1,000 suspected adverse reactions last year, more than any other vaccine or medicine over the past five years.

However, health authorities insist the vaccine is safe and that the balance of risk and benefits for the vaccine remains positive.

The Irish Medicines Board (IMB) says the most frequently reported reactions for the vaccine have been relatively mild injection-site reactions (such as swelling), gastrointestinal problems (such as vomiting or diarrhoea) and flu-like symptoms (such as fever and swollen glands).

The Irish Times requested a breakdown of the drugs or vaccines responsible for the highest number of adverse reactions from the IMB under the Freedom of Information Act over the past five years.

The data shows there were about 11,500 adverse reaction reports for drugs or vaccines submitted to health authorities between 2005 and the end of 2009.

The number of adverse reactions does not necessarily represent the risk profile of each drug or vaccine, as figures for the number of people using each drug are not available. Also, it does not provide a breakdown of the number of serious or mild adverse reactions.

The figures show that the anti-psychotic drug Clozapine, also known as Clozaril, ranks second-highest in the number of adverse reactions (883).

Common adverse effects of the drug include dizziness, rapid heartbeat, constipation, excess saliva production and weight gain.

Another drug used to treat psychosis, which has attracted a relatively high number of adverse reactions, is Risperidone (154), which is more commonly known as Risperdal.

The childhood combination vaccines, which includes jabs for whooping cough, measles, mumps and rubella, ranked third highest (722) in the number of adverse reactions.

Again, health authorities insist the vaccine is safe and that most adverse reactions are mild, such as swelling, redness or fever.

Paracetamol (715), one of the most commonly used pain killers, is sometimes associated with minor issues such as hives, rashes or – if taken at high levels over a prolonged period of time – kidney damage.

Lipitor, also known as Atorvastatin, was linked to 225 adverse reactions. Studies show these typically range from joint pain and stomach upset to more serious issues such as severe muscle problems.

A spokesperson for the IMB said adverse reaction reporting rates were influenced by the seriousness of the reactions, their ease of recognition and the extent of use of a particular medicine.

In addition, reporting rates are also influenced by campaigns aimed at healthcare professionals to submit reports on specific drugs or vaccines, often as part of ongoing post-marketing surveillance.

Publicity about a particular medicine or its safety may also lead to increased reporting.

The two swine flu vaccines available in Ireland since November – GlaxoSmithKline's Pandemrix and Baxter's Celvapan – have been subjected to a particular vigilance.

In the first two months of 2010, more than 400 additional adverse reactions had been recorded, meaning that the overall total tops 1,400.

Adverse Reactions

Drugs or vaccines with the most adverse reactions between 2005 and 2009:

1. H1N1 vaccine: 934 (Swine flu vaccine.)

2. Clozapine: 883 (Anti-psychotic drug, also known as Clozaril.)

3. Childhood combination vaccines: 722 (Typically the six-in-one to prevent diseases such as diphtheria, tetanus, etc.)

4. Paracetamol: 715 (Pain killer.)

5. Atorvastatin: 225 (Lowers blood cholesterol, also known as Lipitor.)

6. BCG vaccine: 207 (A vaccine to protect against tuberculosis.)

7. Adalimumab: 170 (A medication for the treatment of rheumatoid arthritis, also known as Humira.)

8. Varenicline: 155 (Anti-smoking drug, also known as Champix.)

9. Venlafaxine: 155 (Anti-depressant, also known as Efexor.)

10. Risperidone : 154 (Anti-psychotic medicine, also known as Risperdal.)

THE FLU CASE

Is the use of the Pandemrix swine flu jabs in children illegal?

The Flu Case, 17 February 2010, 14:12
https://web.archive.org/web/20100219081651/http://www.theflucase.com/index.php?option=com_content&view=article&id=2761%3Ais-the-use-of-the-pandemrix-swine-flu-jabs-in-children-illegal&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Pandemrix swine flu vaccine does not appear to have been given the standard authorisation for use in the under 18 age group by the European Medicines Agency (EMA), the EU drug regulator, and it is not clear whether its use in these age groups is legal.

Pandemrix received a marketing authorisation as a so-called 'mock-up vaccine' in May 2008 with use restricted to the age groups 18-60.

A press officer from the EMA said that GlaxoSmithKline's.Pandemrix was authorised without any age limitation on 30 September 2009 on the basis of a report by the Committee for Medicinal Products for Human Use (CHMP) submitted on 24 September 2009.

"The assessment report for Pandemrix, outlining the scientific rationale for the recommendation made on 24 September 09 is available here" – said the press officer. =>
http://www.ema.europa.eu/humandocs/PDFs/EPAR/pandemrix/Pandemrix-H-832-PU-17-AR.pdf

However, the positive opinion of the CHMP assessment report is restricted specifically to one on a change in the pandemic strain to A/California/07/2009 (H1N1), which is the update requested by GSK.

"On 22 September 2009 the Marketing Authorisation Holder (MAH) applied for a variation according to Article 8 of the Commission Regulation (EC) No. 1085/2003 in order to update to the composition of the strain of Pandemrix to those officially recommended by WHO and CHMP for the Pandemic Influenza A (H1N1)v, and this is the following: A/California/07/2009 (H1N1)v like strain (X-179A)"

In spite of requests, the EMA press officer has not supplied a CHMP document in which a positive opinion to give Pandemrix to children has been made. It is, therefore, not clear what the basis for changes in the production information suggesting that the Pandemrix vaccine can be given to children is.

The CHMP Assessment report for Pandemrix from September 24th contains data from only one study on children aged 3-9 years of age, and in which one child died highly likely due to the vaccine and there was a very high rate of adverse event reactions.

The study called H5N1-009-022/-023 and conducted in Spain was divided into three parts, phases A,B and C and evaluated full and half dose of the vaccine with the H5N1 Vietnam virus.

405 children were enrolled and 388 completed the study to D42.
One child died during phase C of the study, and the death was considered to be possibly linked to the Pandemrix vaccine, according to the CHMP report.

"In study H5N1-009 (-022/-23), no SAEs or deaths have been reported in phases A and B. In Phase C one subject in the AS03 group developed an AE of uveitis for which subsequent details specified a unilateral anterior chamber uveitis at 8 days after the second dose of the H5N1 vaccine, which was considered to have a potential causal relationship to vaccination."

Information about discontinuation due to adverse events in the trial 009 is omitted on page 57 and 58. It is, therefore, not clear whether any of the 17 subjects who discontinued the 009 trial did so because of adverse events in phase A and B or not.

The report does mention that in study 002 the only early discontinuation was due to the death that was "unrelated to the vaccine."

In study 008, three subjects dropped out due to severe adverse events.

The incidence of adverse events for children aged 6-9 years of age in phase A of study 009 who took the jab with the adjuvant AS03 was 96.1%.

The report says that the adverse events (AE) had a causal relation to the vaccination.

"The incidence of AE with causal relations to the vaccination in the subjects aged 6-9 years was 94.1%," it says on page 49 , that is to say, almost all children aged between 6-9 who took the jab suffered a side effect and this was due to the vaccine in almost every single case according to the phase B data.

"The incidence of AE with causal relationship to the vaccination in the subjects aged 6-9 years was 75.5% in the AS03 vaccine," the report says on phase B of the trial.

A vaccine can be authorised if the benefits are judged to outweigh its risks, but it is not clear how the death of at least one child highly likely due to the vaccine reported in the 009 study as well the high numbers of adverse events reactions can be considered to justify an authorisation on this basis as the risks appear to far outweigh potential benefits.

This appears to be the reason why the CHMP has skirted the issue altogether.

Since September 2009 a number of changes have been introduced to the Product Information for Pandemrix but it is not clear what the basis for these changes are when the CHMP has not issued a positive opinion.

http://www.ema.europa.eu/humandocs/PDFs/EPAR/pandemrix/emea-combined-h832en.pdf

"Further changes were recommended by the Agency's Committee for Medicinal Products for Human Use (CHMP) during its January 2010 meeting. While the transformation of the Committee's recommendations into a binding decision by the Commission is awaited, please see the recommended updates to the product information here:

http://www.ema.europa.eu/influenza/vaccines/pandemrix/pandemrix_pi.html," says the EMA press officer.

According also to information in the CHMP report from September 24th, the CHMP has not adopted a positive opinion on the use of the Pandemrix vaccine in children.

The only recommendation concerning children dates from September 1st and is to "include information supporting the introduction of paedatric datafrom study H5N1-009 (-022/023) in section 5.1 of the SPC for Pandemrix H1N1 on September 2009."

Without such a positive opinion and explicit recommendation, the use of Pandemrix for children might be illegal even by the EMA's own standards.

http://www.ema.europa.eu/humandocs/PDFs/EPAR/pandemrix/Pandemrix-H-832-PU-17-AR.pdf

1.2 Steps taken for the assessment of the product

The application was received by the EMEA on 2 February 2007.

Accelerated Assessment procedure was agreed-upon by CHMP on 14 December 2006.

The procedure started on 21 February 2007.

The Rapporteur's first Assessment Report was circulated to all CHMP members on 11 May 2007. The Co-Rapporteur's first Assessment Report was circulated to all CHMP members on 9 May 2007.

During the meeting on 22 May 2007, the CHMP agreed on the consolidated List of Questions to be sent to the applicant. The final consolidated List of Questions was sent to the applicant on 22 May 2007.

The applicant submitted the responses to the CHMP consolidated List of Questions on 31 October 2007.

The Rapporteurs circulated the Joint Assessment Report on the applicant's responses to the List of Questions to all CHMP members on 28 December 2007.

During a meeting of BWP Working Party on 14-15 January 2008, experts were convened to address the outstanding quality issues identified in the Joint response assessment report.

During the CHMP meeting on 24 January 2008, the CHMP agreed on a list of outstanding issues to be addressed in writing by the applicant.

The applicant submitted the responses to the CHMP list of outstanding issues on 31 January 2008.

The Rapporteurs circulated the Joint Assessment Report on the applicant's responses to the List of Outstanding issues to all CHMP members on 8 February 2008.

During a meeting of BWP Working Party on 11-13 February 2008, experts were convened to address the responses to the outstanding quality questions.

During the meeting on 18-21 February 2008, the CHMP, in the light of the overall data submitted and the scientific discussion within the Committee, issued a positive opinion for granting a Marketing Authorisation under exceptional circumstances to Pandemrix on 21 February. The applicant provided the letter of undertaking on the specific obligations and follow-up measures to be fulfilled post-authorisation on 19 February 2008.

On 29 May 2009 the CHMP adopted a positive Opinion on a type II variation (II-04) to update sections 4.2, 4.4, and 5.1 of the summary of product characteristics (SPC) to include the possibility of administering one dose of Pandemrix after primary immunisation with the MAH's prepandemic vaccine containing H5N1 antigen from a different clade of the same influenza subtype, based on the data from clinical trials (H5N1-012 and -015). The package leaflet (PL) was updated accordingly. The European Commission adopted a positive Commission Decision for variation II-04 on 10 July 2009.

On 29 May 2009, the CHMP adopted a positive Opinion on a type II variation (II-05) to update sections 4.2 and 5.1 of the SPC to include treatment in subjects aged 61 years and above based on clinical trial data. from study H5N1-010 Annex II and the PL were updated accordingly. . The European Commission adopted a positive Commission Decision for variation II-05 on 10 July 2009.

On 29 May 2009, the CHMP adopted a positive Opinion on a type II variation (II-06) to update section 5.1 of the SPC regarding the interval between 2 doses for the primary vaccination schedule based on data from a clinical trial (H5N1-012). The PL was updated to reflect the results of user testing. The European Commission adopted a positive Commission Decision for variation II-06 on 10 July 2009.

On 1 September 2009 an interim Opinion on a rolling review (RR/01) was adopted by the EMEA Task Force (ETF)/CHMP to include information supporting the introduction of paediatric data from study H5N1-009 (-022/023) in section 5.1 of the SPC for Pandemrix H1N1.

On 21 September 2009 an interim Opinion on a rolling review (RR/02) was adopted by the ETF/CHMP to include information on the drug substance to support a change on the pandemic strain vaccine composition to A/California/7/2009 (H1N1)v like strain (X-179A).

On 21 September 2009 an interim Opinion on a rolling review (RR/03) was adopted by the ETF/CHMP to include information on the drug product to support a change on the pandemic strain vaccine composition to A/California/7/2009 (H1N1)v like strain (X-179A); a revision of the Product Information (PI), responses to Questions from RR01 and RR02 the Pharmacovigilance and Risk Management Plan to support a change on the pandemic strain vaccine composition to A/California/7/2009 (H1N1)v like strain (X-179A) and preliminary data from study H1N1-021.

On 22 September 2009, the MAH submitted a variation to introduce the pandemic strain A/California/7/2009 (H1N1)v like strain (X-179A).

On 24 September 2009, the CHMP adopted a positive Opinion on a variation (PU-17) to change the pandemic strain vaccine composition to A/California/7/2009 (H1N1)v like strain (X-179A).

Le Monde

L'Assemblée nationale lance une commission d'enquête sur la grippe A

Le Monde, 17 Février 2010 à 14h01 // 24 Février 2010, à 18h53

https://www.lemonde.fr/societe/article/2010/02/17/vers-une-commission-d-enquete-sur-la-grippe-a_1307385_3224.html

Le Nouveau Centre a demandé cette commission pour comprendre, notamment, les raisons de la faiblesse du nombre de vaccinations constaté fin 2009.

L'Assemblée nationale a donné, mercredi 24 février, son feu vert à la création d'une commission d'enquête parlementaire sur la campagne de vaccination contre la grippe H1N1, réclamée par le groupe Nouveau Centre (NC, partenaire de l'UMP).

Seuls les groupes Nouveau Centre et GDR (communistes et Verts) ont voté pour. Estimant la demande "superfétatoire et inutile", le groupe UMP s'est abstenu, de même que le groupe socialiste, radical et citoyen (SRC), qui a jugé le champ d'investigation trop étroit. En dépit de ces abstentions des deux principaux groupes à l'Assemblée, la demande de commission d'enquête a été acceptée. Pour qu'une telle demande soit rejetée, il aurait en effet fallu que les trois cinquièmes des votants s'y opposent.

"Il Ne S'agit pas d'accuser mais d'enquêter"

"Il ne s'agit pas d'accuser mais d'enquêter", a lancé Jean-Luc Préel, député NC, en présentant la demande de commission d'enquête de son parti. "Il nous faut connaître les raisons de ce non-succès de la vaccination pour pouvoir faire face à d'éventuelles nouvelles pandémies", a-t-il ajouté.

La ministre de la santé Roselyne Bachelot a été vivement critiqué pour la gestion de la pandémie de grippe A (H1N1). Même si elle dit avoir appliqué le principe de précaution, elle a reconnu qu'un trop grand nombre de vaccins avaient été commandés, laissant notamment entrevoir le paiement par l'Etat d'indemnisations à l'industrie après l'annonce de son intention de résilier des commandes portant sur 50 millions de doses de vaccin, sur 94 millions initialement commandées. Des vaccins ont été revendus à certains pays, mais la France se retrouve avec des millions de doses inutiles alors que cinq millions de personnes ont été vaccinées à ce jour et que l'épidémie est officiellement terminée.

Roselyne Bachelot, a pris acte mercredi de la décision de l'Assemblée et s'est déclarée prête à "apporter tous les éléments d'information" nécessaires pour alimenter ses travaux. "Je souhaite qu'elle soit l'occasion d'une analyse, de revenir sur le passé sans évidemment se livrer aux délices de la lucidité a posterori ni à l'expertise de la troisième mi-temps", a-t-elle toutefois averti.

NBC NEWS

Fighting swine flu fatigue with weird marketing

NBC News, 19 February 2010, 8:08 AM +08
https://www.nbcnews.com/id/wbna35467666

Some clinics now are practically begging people to get vaccinated, in a dramatic shift from just a few months ago when people stood in long lines and waited to get the scarce vaccine.

Marco Torres stood on a busy road and waved an oversized yellow arrow with an unconventional message for a street marketing campaign: “FREE TODAY: H1N1 Flu Shots for All.”

Local health officials launched the human billboard campaign at a time when health departments around the country are going to great lengths to spread the word that swine flu shots are available for free to anyone who wants one.

Their advertising tactics include horseback banners at rodeos and wristbands handed out at nightclubs. Maine officials set up a flu clinic at the high school basketball playoffs this week, while other health departments are giving patients shots at airports, malls and even a trade show.

The fact that clinics are practically begging people to get vaccinated is a dramatic shift from just a few months ago when people stood in long lines and waited – sometimes for hours – to get the scarce vaccine.

While the outbreak has waned, the virus is still circulating and authorities warn that another wave of infections could hit. The 2009 H1N1 flu strain was first identified in April and a second wave of illnesses followed in the fall. At least 15,000 people have died worldwide, according to the World Health Organization, most of those in the U.S.

No-return policy

Since October, some 126 million vaccine doses have been shipped to states, but only about 75 million Americans have been vaccinated. The federal government has spent $1.6 billion on swine flu vaccine production.

In the past, doctors and other providers were able to return unused doses to vaccine makers and get reimbursed. That’s not the case this year since the government bought the vaccines and distributed them free to states. Federal health officials are working out a plan to deal with leftover doses, though some local health departments have said they planned to throw away expired ones.

“The efforts need to be made to encourage people to get vaccinated. It is still a serious disease,” said Robert Pestronk, executive director of the National Association of County and City Health Officials.

Health officials in Riverside, east of Los Angeles, noticed a drop in vaccine demand after lifting restrictions on who can get it. When it was in scarce supply, the vaccine was rationed to pregnant women, children and young adults, health care workers and people with health problems.

So health officials turned to a sign company to position twirlers outside clinics, borrowing an advertising tactic used by the construction industry during the housing boom to promote unsold homes in new subdivisions.

“Since we’re a commuter-driven society, this was a good way to do it,” said Riverside County health officer Dr. Eric Frykman.

The walking billboards were part of a broader two-week effort to bring awareness to the availability of vaccine that also included buying traditional newspaper and radio ads – at a cost of $25,000.

It seems to be working. Nurses in Riverside County vaccinated 399 people last week – triple from the week before when there were no sign twirlers. The health department attributed the increase mostly to the hired hands.

Reaching young people

Concerned about lack of demand at its vaccination clinics, the Okaloosa County Health Department in Florida flocked to unconventional venues, doling out shots to hundreds attending the annual Snowbird expo and hanging out at local malls.

Health officials also printed 16,500 “FREE H1N1 SHOT” wristbands at a cost of $615 so that two popular night clubs can hand them out to patrons.

“It was a way to reach the 20-somethings. We wanted to be where they were,” said Dr. Karen Chapman, director of the Okaloosa County Health Department.

Though health officials don’t know how many young people came in as a result of the promotion, the outreach allowed them to vaccinate people they wouldn’t otherwise reach.

During the basketball playoffs in Maine, health officials set up a flu clinic off the court for players, coaches and spectators. Last month, the Colorado Department of Public Health and Environment took the vaccination message to a heavily attended stock show and rodeo.

They blitzed restrooms with ads. Horseback riders carried bilingual banners promoting vaccinations during the Mexican rodeo segment while an announcer drove home the point in English and Spanish.

It’s too soon to know if the effort paid off. But with plentiful vaccine, health officials wanted to target large crowds and Hispanics.

“You don’t want to waste vaccine so of course, you want people to know it’s available,” said health department spokeswoman Lori Maldonado. “The risk is still there. We’re still in flu season.”

In the past, local health departments ran public service announcements, took out ads and worked with community leaders to get the vaccination message out. But with swine flu being a new threat, health departments have had to employ new tricks to keep people’s interest.

Erik Gordon, a professor and analyst at University of Michigan’s Ross School of Business, said vaccine fatigue is to be expected as fear of the virus dims.

“It’s fairly common to have a rush of people waiting in lines to get something when they think, ’If I don’t get this, I may die’,” he said. “Then, when the danger passes and it’s pretty much over, it’s not unusual for the demand to fall off the cliff immediately.”

As Torres twirled his sign while jamming to reggaeton music, Ana Gutierrez strolled into the Riverside Neighborhood Health Center on Wednesday for another appointment and decided to roll up her sleeve for the shot.

“I saw it and said, ‘I’m getting it,”’ said Gutierrez, who tried unsuccessfully to find the vaccine in the fall during the height of the shortage.

A steady steam of others followed — some lured by the sign and others who found out about the free vaccine through other means.

“Let’s get these vaccines moving. Otherwise they expire and then you’re stuck with thousands of vaccines and we don’t want that,” said assistant nurse manager Sandra Garcia.

Torres, who kept the arrow pointing at the clinic, wasn’t interested: “I’m afraid of shots. Been afraid since I was a little kid.”

THE FLU CASE

H1N1 Au Senat: Les questions posées à Roselyne Bachelot

The Flu Case, 23 February 2010
http://www.theflucase.com/index.php?option=com_content&view=article&id=2807%3Afrench-commission-of-inquiry-into-mass-swine-flu-vaccination-campaign-to-start-in-march&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Politique et santé

Quelle que soit la forme de l'enquête à laquelle la Ministre de la Santé devra répondre sur la gestion nationale de la grippe A/H1N1, en attendant, les questions en francs-tireurs des parlementaires ne manquent pas. Exemple, lors d'une séance de questions aux ministres au Sénat, le sénateur Nicolas About a posé la question qui pourrait fâcher…

«Après l'affaire du sang contaminé, la canicule et l'inscription - peut-être à tort - du principe de précaution dans notre Constitution, quelle peut bien être la marge d'action des pouvoirs publics en matière de risque sanitaire?». Pourquoi, M. About ? Parce que «soit ils n'agissent pas et sont comptables de toute réalisation du risque, soit ils prennent la menace au sérieux et s'exposent à l'écueil inverse: se voir reproché d'avoir surréagi».

Nos pouvoirs publics ont-ils «surréagi» face à l'annonce d'une pandémie dont le vecteur pouvait être si variant (le vaccin 2008-2009 contenait 2 souches A: H1N1 et H3N2 et 1 souche B) qu'il nécessiterait peut-être 2 injections au lieu d'une en saison normale de grippe, le «très important dispositif mis en place contre la pandémie» -qui n'avait chez nous qu'un caractère épidémique) se justifiait-il alors que cette grippe a touché (seulement) 3 millions de personnes et causé 269 décès (seulement ?) en France à mi-janvier-?

Conclusion du sénateur About: «Or le virus s'est révélé beaucoup moins virulent qu'on aurait pu le craindre et la campagne de vaccination n'a pas rencontre le succès escompté: les décisions prises se sont donc trouvées invalidées par les faits ». Le sénateur conclut: «Nous ne vous blâmons pas d'avoir pris ces décisions».

Quelles leçons tirer de tout cela ? Les parlementaires veulent la transparence des décisions, sur le rôle de l'OMS et des comités d'experts incitant à commander 94 millions de doses, «dont 88 millions sont toujours inutilisées», dont toutes n'ont pas été livrées et à sur-stocker antiviraux et masques. Bref: combien cela coûte, quels sont les accords avec les laboratoires, quelles leçons tirer de tout cela?

Comme d'autres pays (à qui il reste aussi des stocks inutilisés), la France a décidé de mener une vaste campagne de vaccination car « cette grippe avait une typologie différente de celle des autres grippes », donc l'offre du nouveau vaccin devait être large. Mais ce choix de stratégie « s'explique par une raison technique mais aussi par une raison éthique », dit Madame Bachelot.

Sur le plan éthique «nous nous sommes référés à l'avis n° 106 du Comité consultatif national d'éthique, selon lequel, au nom du principe de l'égalité républicaine, dans le cadre d'une pandémie grippale, tous nos concitoyens qui le souhaitent doivent pouvoir être vaccinés».

Sur le plan technique «les autorités sanitaires nationales et internationales nous ont indiqué qu'il s'agissait d'une vaccination à deux doses mais que, à l'évidence, certaines personnes n'allaient recevoir qu'une seule dose: en tenant compte d'un taux d'attrition de 25 %, nous avons donc acheté 94 millions de doses».

Ce n'est en fait que fin novembre que les autorités sanitaires européennes et internationales ont fait savoir qu'une seule dose vaccinale suffisait à établir l'immunité spécifique, ce qui a conduit la France à résilier une commande de 50 millions de doses.

Bilan à mi-janvier: 5,5 millions de doses utilisées, 10 millions de doses offertes à l'OMS sur 44 millions de doses. Il reste environ 25 millions de doses utilisables, et que l'on va utiliser, car la vaccination contre le virus A/H1N1 est toujours d'actualité, au moins jusqu'au septembre - jusqu'à l'apparition de la grippe de la saison.

«Le risque pandémique est toujours là et nos compatriotes doivent se faire vacciner car c'est la meilleure technique de prévention», conclut la Ministre de la Santé. La vaccination anti-pandémique est désormais confiée aux médecins traitants. Car comme dit le Dr Keiji Fukuda, conseiller spécial de l'OMS pour la grippe pandémique, «Nous espérons, c'est que le pire est derrière nous», ce que devrait déterminer un Comité d'urgence de l'OMS à la fin de ce mois, pour déterminer une éventuelle nouvelle stratégie de l'OMS si une seconde vague s'annonce ou si la situation redevient analogue à celle d'une grippe saisonnière.

THE FLU CASE

French commission of inquiry into mass swine flu vaccination campaign to start in March

The Flu Case, 23 February 2010
http://www.theflucase.com/index.php?option=com_content&view=article&id=2807%3Afrench-commission-of-inquiry-into-mass-swine-flu-vaccination-campaign-to-start-in-march&catid=41%3Ahighlighted-news&Itemid=105&lang=en

An inquiry into the influence of pharmaceutical companies on the French government's handling of the mass swine flu vaccination campaign is set to be held in March in the Senate, the Upper Chamber of the French Parliament, following a decision by the Senate Conference of Presidents on Wednesday 17th, February.

A second commission of inquiry is expected to be announced soon in the National Assembly.

Le Parisien reported that 15 of the 17 experts in the French government's swine flu committee had links with the pharmaceutical industry with six of the experts having receiving money directly from pharma companies in 2009.

The French government ordered 94 million doses of swine flu jabs but only 5.5 million doses were administered in spite of an unprecedented campaign.

Only 269 deaths have been attributed to the swine flu in France as of the middle of January.

L'Assemblée va enquêter sur la gestion de la grippe A(H1N1)

Reuters, 24 February 2010, à 18:15
https://www.boursier.com/actualites/reuters/l-assemblee-va-enqueter-sur-la-gestion-de-la-grippe-ah1n1-61133.html
http://fr.reuters.com/article/topNews/idFRPAE61N0RV20100224

PARIS - L'Assemblée nationale a décidé, par un vote à mains levées, de créer une commission d'enquête parlementaire sur la manière dont a été conduite la campagne de vaccination contre la grippe A(H1N1).

L'Assemblée nationale a décidé, par un vote à mains levées, de créer une commission d'enquête parlementaire sur la manière dont a été conduite la campagne de vaccination contre la grippe A(H1N1). La commission d'enquête, composée de 30 députés, sera constituée dans les tous prochains jours. (Reuters/Jean-Paul Pélissier)

Pour être rejetée, il aurait fallu que les 3/5e des députés s'opposent à cette demande du groupe du Nouveau centre (NC).

Les députés NC et du groupe de la gauche démocrate et républicaine (GDR, PC et Verts) ont voté pour.

Estimant la demande "superfétatoire et inutile", le groupe UMP s'est abstenu, de même que le groupe socialiste, radical et citoyen (SRC), qui a jugé le champ d'investigation trop étroit.

Roselyne Bachelot, ministre de la Santé, a pris acte de cette décision et s'est déclarée prête à "apporter tous les éléments d'information" nécessaires pour alimenter ses travaux.

"Je souhaite qu'elle soit l'occasion d'une analyse, de revenir sur le passé sans évidemment se livrer aux délices de la lucidité a posteriori ni à l'expertise de la troisième mi-temps", a-t-elle toutefois averti.

Roselyne Bachelot fait face aux vives critiques de l'opposition de gauche visant la gestion de la pandémie de grippe A (H1N1), qualifiée d'échec.

Même si elle dit avoir appliqué le principe de précaution, elle a confirmé en partie les problèmes qui font l'objet des critiques, laissant notamment entrevoir le paiement par l'Etat d'indemnisations à l'industrie après l'annonce de son intention de résilier des commandes portant sur 50 millions de doses de vaccin, sur 94 millions initialement commandées.

Des vaccins ont été revendus à certains pays, mais la France se retrouve avec des millions de doses inutiles alors que cinq millions de personnes ont été vaccinées à ce jour et que l'épidémie est officiellement terminée.

Enquête Sur le Rôle des Laboratoires

L'Organisation mondiale de la santé (OMS) est quant à elle accusée d'avoir exagéré les risques d'une pandémie de grippe A sous l'influence des laboratoires pharmaceutiques.

L'épidémie de grippe A (H1N1) a provoqué pour l'instant, en un peu moins d'un an, 14.000 décès dans le monde, c'est-à-dire moins que la grippe saisonnière, alors que 175 millions de doses ont été administrées, selon les chiffres de l'OMS.

La ministre de la Santé a souhaité que cette commission d'enquête "soit aussi l'occasion de réfléchir à un certain nombre de pistes, de tirer toutes les leçons que nous pouvons ensemble tirer sur l'acceptation de la vaccination et de la prévention dans notre pays".

La commission d'enquête, composée de 30 députés, sera constituée dans les tous prochains jours.
Elle disposera d'un délai de six mois pour enquêter "sur la manière dont a été programmée, expliquée et gérée la campagne de vaccination de la grippe A (H1N1) dans le but de faire des propositions au gouvernement pour rendre plus opérationnels, efficaces et réalistes nos futurs plans de vaccination contre les pandémies".

Le Sénat avait décidé le 11 février, à la demande du groupe communiste et apparentés, de créer une commission d'enquête sur le rôle des firmes pharmaceutiques dans la gestion de la crise.
Wolfgang Wodarg, médecin allemand et ancien député social-démocrate, a reproché le 26 janvier à l'OMS d'avoir "semé la panique", lors d'une audition devant l'assemblée parlementaire du Conseil de l'Europe.

Selon lui, l'OMS a affirmé que le virus ferait "au moins 500.000 morts", ce qui aurait permis "à l'industrie pharmaceutique d'engranger des recettes très juteuses".
Il en est résulté, a-t-il dit, un surcroît de dépenses de 18 milliards de dollars pour les systèmes de santé publique.

Keiji Fukuda, conseiller spécial auprès du directeur général de l'OMS sur les pandémies grippales, avait défendu devant le Conseil de l'Europe la stratégie de l'organisation.
nié que la décision de l'agence des Nations unies de déclarer l'état de pandémie ait été influencée par les liens qu'entretiennent nombre d'experts de l'OMS, scientifiques ou chercheurs, avec les laboratoires pharmaceutiques.

THE FLU CASE

French National Assembly to launch commission of inquiry into mass swine flu vaccination campaign

The Flu Case, 26 February 2010, 13:29

https://web.archive.org/web/20100301040411/http://www.theflucase.com/index.php?option=com_content&view=article&id=2835%3Afrench-national-assembly-to-launch-commission-of-inquiry-into-mass-swine-flu-vaccination-campaign&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The National Assembly in France, the main chamber of the French parliament, is to hold a commission of inquiry into the mass swine flu vaccination campaign, it was decided on Wednesday.
The commission will be composed of 30 deputies who will dig through documents and cross examine the Health Minister Roselyne Bachelot over the controversial role played by pharmaceutical companies in the government mass vaccination campain.
It has emerged that 15 of the 17 experts of a key French government vaccine advisory group have links to pharmaceutical companies. Bachelot herself worked for pharmaceutical companies before entering politics fuelling fears that the campaign was launched for the profit of big pharma.
Only 5.5 million people in France took the untested jab in spite of an unprecedent government effort to vaccinate the entire population in especially established vaccine centers. As part of the campaign, unwilling nurses and doctors were requisitioned by police to administer the vaccines.
The French Senate is also to hold an inquiry into the vaccination campaign.

Grippe A: les critiques de l'Académie de médecine

Le Figaro, 25 février 2010, à 12h45
https://sante.lefigaro.fr/actualite/2010/02/25/10073-grippe-critiques-lacademie-medecine

L'institution tire les leçons de l'échec de la vaccination tandis que l'Assemblée crée une commission d'enquête.

La gestion de l'épidémie de grippe A (H1N1) en France et dans le monde n'a pas fini de faire des vagues. L'objectif n'est pas tant de mettre en cause la manière dont les politiques, l'administration ou les experts ont géré l'irruption de ce nouveau virus pandémique, mais surtout d'en tirer des leçons pour les prochaines crises sanitaires liées à la grippe qui ne manqueront pas de se produire. Dans ce cadre, mardi dernier, l'Académie nationale de médecine, dans un communiqué rédigé par le professeur Pierre Bégué, au nom de la commission maladies infectieuses et médecine tropicale et de celle des vaccinations, a estimé que les bases sanitaires de la vaccination contre la grippe A (H1N1) étaient justifiées. Mais «la communication médiatique intense et les propos alarmistes ont fait naître rapidement des doutes dans le public sur la réalité des dangers alors difficilement évaluables. Un tel excès risque d'émousser l'adhésion de la population en cas d'une nouvelle alerte de santé publique». Toute la problématique tient à la difficulté de communiquer en période d'incertitudes.

Mais c'est surtout sur les modalités de vaccination que l'académie se montre le plus sévère et propose pour l'avenir un autre mode de gestion: «La stratégie vaccinale imposée par le ministère de la Santé avec recours aux centres de vaccination s'est heurtée à des difficultés logistiques et psychologiques dans la population française, où la vaccination est assurée depuis longtemps à 90 % par la médecine libérale (médecins généralistes et pédiatres). L'association d'emblée de ces praticiens de proximité au plan de vaccination aurait sensiblement amélioré l'adhésion de la population.»

Fallait-il choisir tout de suite l'option d'un vaccin pour tous ? «Le choix entre une vaccination de masse et une vaccination ciblée pour les personnes à risques n'a pas fait l'objet d'un débat préalable. L'acquisition des vaccins aurait dû se faire par étapes en fonction de l'évolution de la pandémie au sein de la population générale, répond l'Académie. La décision d'une vaccination de masse aurait dû être expliquée et justifiée.L'évolution actuelle de la pandémie est rassurante, mais un ou plusieurs rebonds ne peuvent être exclus, légitimant la poursuite de la vaccination.»

À ce jour, le bilan de la vaccination ne met pas en évidence d'effets secondaires inquiétants liés aux produits utilisés. Néanmoins, l'Académie estime « qu'à la fin de cette première campagne, l'efficacité, les effets secondaires et le coût de la vaccination (H1N1) devront être évalués avec précision». L'Académie nationale de médecine considère que dans de telles circonstances «une meilleure concertation entre les autorités sanitaires, les comités d'experts, l'industrie pharmaceutique, les sociétés savantes et les praticiens (généralistes et pédiatres) est indispensable » et elle souhaiterait être associée à l'évaluation de cette vaccination.

Nouveaux foyers en Afrique

Mercredi, l'Assemblée nationale a donné son feu vert à la création d'une commission d'enquête parlementaire sur la campagne de vaccination contre la grippe A (H1N1), réclamée par le groupe Nouveau Centre. Seuls les groupes Nouveau Centre et GDR (communistes et Verts) ont voté pour, UMP et SRC (socialistes et apparentés) se sont abstenus. En dépit de l'abstention de ces deux principaux groupes, la demande de commission d'enquête a été acceptée. Pour qu'elle soit rejetée, il aurait en effet fallu que les 3/5 des votants s'y opposent. «Il ne s'agit pas d'accuser mais d'enquêter», a lancé Jean-Luc Préel, en présentant la demande de commission d'enquête du Nouveau Centre. «Il nous faut connaître les raisons de ce non-succès de la vaccination pour pouvoir faire face à d'éventuelles nouvelles pandémies», a-t-il ajouté.

L'Organisation mondiale de la santé (OMS) a estimé mercredi qu'il était trop tôt pour prétendre que le pic de l'épidémie était complètement passé. À l'issue d'une téléconférence, les experts de l'OMS ont estimé que la situation mondiale était double, avec d'un côté «des preuves d'un déclin ou d'une faible activité de la pandémie dans de nombreux pays et de l'autre de nouveaux foyers de transmission en Afrique de l'Ouest». La pandémie est «clairement en déclin» en Amérique du nord ainsi qu'en Europe de l'Ouest, mais encore active en Europe de l'Est ainsi qu'en Asie, en Afrique de l'Ouest, notamment au Sénégal et en Mauritanie. En France, l'épidémie est terminée, selon les réseaux de surveillance.

Panama waits for 200,000 swine flu jabs

The Flu Case, 25 February 2010 10:54
https://web.archive.org/web/20100301040320/http://www.theflucase.com/index.php?option=com_content&view=article&id=2825%3Apanama-waits-for-200000-swine-flu-jabs-&catid=1%3Alatest-news&Itemid=64&lang=en

Panama waits for 200,000 A/H1N1 flu vaccine dosages

PANAMA CITY, Feb. 16 (Xinhua) – Panama waits for 200,000 dosages of vaccines to prevent the A/H1N1 influenza, to arrive before the end of February, chief of Epidemiology of the Panamanian Health Ministry, Gladys Guerrero said on Tuesday.

The purchase of the vaccines was done through the Pan American Health Organization, and it is part of a pack bought by the Panamanian government to be used with the groups of most vulnerable people.

Guerrero said that the first to get these vaccines will be those children under 5 years old, the senior citizens and those patients with chronic diseases.

Guerrero said that last year the country received 100,000 vaccines, and 83 percent of them were already used during the first stage of sanitary campaign.

Villeurbanne demande Ã se faire rembourser le coût de la vaccination H1N1

Actualites News Environnement, 1 March 2010, 17:20
https://www.actualites-news-environnement.com/23044-Villeurbanne-rembourser-cout-vaccination-H1N1.html

La mairie Villeurbanne (Rhône), commune limitrophe de Lyon, va demander Ã l'Etat le remboursement des frais engagés pour la vaccination contre la grippe H1N1. Avec un coût qui s'élève Ã 96.400 euros pour la commune, la préfecture souhaite que l'Etat lui rembourse 80.000 euros.

Le centre de cette commune avait vacciné entre le 12 novembre et le 30 janvier, environ 10.000 habitants de Villeurbanne et de la commune voisine de Vaulx-en-Velin. La ville de Villeurbanne met en avant les dépenses de gardiennage et de nettoyage du site, la mobilisation du personnel administratif et la consommation en énergie. Elle doit envoyer prochainement un courrier dans ce sens Ã la préfecture, peut lire dans un communiqué de presse.

La vaccination contre la grippe A (H1N1) de 2009-2010 est inédite Ã l'échelle internationale Ã la fois par la rapidité avec laquelle les vaccins ont été développés, par les campagnes de vaccinations organisées, ainsi que par l'ampleur des polémiques déclenchées. De plus, s'appuyant sur les structures mises en place suite Ã l'épisode de grippe aviaire A(H5N1), cette campagne est exceptionnelle par la coordination internationale qui s'est instaurée autour de cette pandémie, notamment sur les dispositifs de pharmacovigilance instaurés pour le suivi des effets indésirables des vaccins.

Ces vaccins ont été rapidement mis sur le marché Ã large échelle auprès de nombreux pays dans le cadre de campagnes de vaccination massives destinées Ã enrayer la propagation de l'épidémie avant la saison hivernale.

Ces campagnes ont eu un succès variable suivant les pays. Des polémiques ont surgi, portant Ã la fois sur les risques médicaux potentiels associés Ã une opération de cette envergure avec des produits développés rapidement mais aussi sur les aspects sociaux et politiques de ces campagnes (la logistique employée, les coûts induits par l'achat des vaccins et par l'organisation de la vaccination, la communication gouvernementale, etc.).

La France a commandé 94 millions de vaccins, plus 34 millions optionnels pour 2010 auprès de trois laboratoires (Sanofi-Pasteur, GlaxoSmithKline (GSK) et Novartis). Les premiers vaccins ont été réservés aux personnes travaillant dans les secteurs de la santé, des secours et de la sécurité. Les centres de vaccination ont été ouverts au public le 12 novembre 2009. Le montant total de la commande serait d'environ 712 millions d'euros.

En France, le coût du plan de vaccination mis en place par la ministre de la Santé Roselyne Bachelot est estimé Ã un montant de 1,5 milliard d'euros en octobre 2009, dont 800 millions d'euros pour la fourniture des vaccins auprès des laboratoire GSK, Sanofi-Pasteur, Novartis et Baxter. La majeure partie doit être prise en charge par le budget de la Sécurité sociale, cependant une participation de 230 Ã 280 millions d'euros, fixée légalement, sera demandée aux mutuelles complémentaires. Celles-ci annoncent pour 2010 une augmentation de leurs cotisations de 1 % directement due au financement des vaccins H1N1, et de 4 % Ã 7 % en tenant compte de la prise en charge de dépenses dans d'autres domaines, jugés non prioritaires par l'État, et qui ne seront plus en charge par la Sécurité sociale.

À partir de novembre 2009, les autorités françaises essaient de revendre une partie des 27 millions de doses déjÃ livrées Ã des pays non pourvus. Les premiers acheteurs sont le Qatar (300 000 doses) et l'Égypte (2 millions de doses), la France étant par ailleurs en compétition avec

l'Allemagne et les Pays-Bas pour la fourniture de vaccins Ã l'Ukraine qui finira par les refuser et qui ne s'entendra qu'avec la Russie pour en produire par eux-mêmes de manière Ã contrôler intégralement leur composition et réduire leur toxicité. Le député socialiste Jean-Marie Le Guen fustige «une politique gouvernementale hyperactive et anxiogène».

En janvier 2010, le coût global de la campagne de vaccination en France est estimé Ã 2,2 milliards d'euros (vaccins et antivirus, communications renforcées, charges des salles réquisitionnées, coût du personnel...) alors que seulement 8 % des Français se sont fait vacciner.

Le 4 janvier 2010, Roselyne Bachelot annonce la résiliation de la commande de 50 millions de vaccins, sur les 94 millions de doses commandées. Fin janvier 2010, tous les centres de vaccination sont fermés «alors que des millions de Français continuent de recevoir leur bon de vaccination, avec l'adresse d'un centre» comme l'avait souligné Le Canard enchaîné.

Le Parisien

Villeurbanne veut se faire rembourser

le Parisien, 2 mars 2010 à 07h00

https://www.leparisien.fr/societe/villeurbanne-veut-se-faire-rembourser-02-03-2010-833041.php

La ville de Villeurbanne (Rhône) compte demander à l'Etat le remboursement des frais engagés pour la vaccination contre la grippe A/H1N1, a annoncé hier la mairie.

Le coût s'élève à 96 400 â? – pour la commune qui, déduction faite de l'avance versée par la préfecture, souhaite que l'Etat lui rembourse encore la somme de 80 000 â?

La ville met en avant les dépenses de gardiennage et de nettoyage du site, la mobilisation du personnel administratif et la consommation en énergie.

Elle doit envoyer prochainement un courrier dans ce sens à la préfecture. Entre le 12 novembre et le 30 janvier, le centre de Villeurbanne a vacciné environ 10 000 habitants contre l'épidémie de grippe A.

THE FLU CASE

French mayor demands reimbursement for swine flu vaccination centre

The Flu Case, 1 March 2010, 16:07

https://web.archive.org/web/20100525024938/http://www.theflucase.com/index.php?option=com_content&view=article&id=2873%3Afrench-mayor-demands-reimbursement-for-swine-flu-vaccination-centre&catid=1%3Alatest-news&Itemid=64&lang=en

A mayor in France has asked the government to reimburse his commune for money spent on the swine flu vaccination centre.

The mayor of Villeurbanne, close to Lyon, has asked the government to pay back 80,000 of the 96,000 euros that the local authorities spent on setting up a mass swine flu vaccination centre, including the cost of energy, personnel for administration and site maintainance.

The centre vaccinated about 10,000 people between November 12th and January 30th.

Paul Joseph Watson

Government Swine Flu Ad portrays vaccine skeptics as Raving Lunatics

Prison Planet, 4 March 2010,
https://web.archive.org/web/20100306164034/http://www.prisonplanet.com/government-swine-flu-ad-portrays-vaccine-skeptics-as-raving-lunatics.html

Glib propaganda fails to mention fact that H1N1 scare was "one of the greatest medical scandals of the century," according to investigation chief.

(prisonplanet.com) A glib 33 second propaganda ad produced by the Kentucky Department for Public Health portrays skeptics of the swine flu vaccine as raving lunatics, despite the fact that the head of the Council of Europe's investigation into the 2009 outbreak labeled it "one of the greatest medical scandals of the century."

The commercial, which is entitled 'H1N1 Vaccine Myths,' features a group of office workers spewing ridiculous theories about the swine flu vaccine that have never been embraced by any vaccine skeptic, in an attempt to build a classic straw man and smear people who question the necessity for taking the shot as unstable lunatics.

The actors in the ad debate whether the H1N1 vaccine was "made from platypus milk," or whether it "makes you susceptible to hypnotic suggestion."

The clip ends by another actor in the ad stating, "It was made from secret alien technology found on the moon."

"Some folks believe anything," states an assertive female voice, "The swine flu vaccine is safe, effective, and you still need it, learn more at Kentucky's flu website, that way you can separate the fact from the fiction."

Unfortunately, Kentucky health authorities have completely failed to separate the fact from the fiction during the course of their 33 second ad, because they attribute outlandish theories about the vaccine to skeptics who have never even uttered such things.

While the advertisement frames suspicion about the vaccine in the context of tin-foil hat wearing madness, in reality the swine flu pandemic has been denounced as a gargantuan hoax not by demented paranoid psychotics, but by the head of the Council of Europe's Sub-committee on Health, Dr. Wolfgang Wodarg, who as the chief of a major investigation into the H1N1 outbreak, labeled the case a "fake pandemic" manufactured by pharmaceutical companies in league with the WHO to make vast profits while endangering public health.

In a separate interview, Wodarg labeled the pandemic, "One of the greatest medical scandals of the century."

Makers of the swine flu vaccine such as CSL Limited and GlaxoSmithKine saw their profit margin soar by 63 per cent and 30 per cent respectively on the back of swine flu fearmongering that was dutifully practiced in spades by the corporate media throughout 2009. Roche made a whopping 12 times the profit during the second quarter of 2009 compared to the same period in 2008 as a result of the scare.

As we highlighted at the time, the very vaccine inserts that were publicly available clearly stated that the shot could cause Guillain-Barre Syndrome, Vasculitis, Paralysis, Anaphylactic Shock And Death. The vaccines also contained mercury and squalene, which have been directly linked with autism and Gulf War syndrome respectively.

Concerns about such dangers grew to such an extent that the majority of Americans told a Fox News poll that they thought the vaccine was more risky than catching the actual swine flu virus. Separate polls showed that the majority of doctors, nurses and health workers in the UK refused to take the shot.

In November 2009, take up of the vaccine was so slow that the U.S. government was forced to appoint what the media ludicrously billed as an "independent" group of health advisors whose job it was to whitewash adverse reactions to the swine flu vaccine and "explain" them to the public as mere coincidence. The "independent" group was lead by Dr. Marie McCormick of the Harvard School of Public Health, who had spent the last 10 years whitewashing reports of a link between vaccines and autism.

Suspicions surrounding the safety of the vaccine were confirmed when it was revealed that German Chancellor Angela Merkel and government ministers would be taking a shot that did "not contain disputed additives – contrary to the vaccine for the remainder of the population."

This commercial represents a desperate last ditch effort on behalf of health authorities to try and shift the endless batches of unused H1N1 vaccines that still remain precisely because millions of Americans believed the lunatics who warned them about the dangers of the shot and refused to take it.

So if you really do think you "still need" the H1N1 shot after it has been completely exposed as an international scandal by one of the premiere investigatory bodies in Europe, then roll up your sleeve and knock yourself out, after all, it's "safe" and "effective" according to the government, but apparently not "safe" and "effective" enough for the political class in major western countries to take the same injection that you'll be getting.

Watch the commercial below... (deleted)

THE TIMES OF INDIA

H1N1 shots from next week

Times of India, 4 March 2010, 02:26 IST
https://timesofindia.indiatimes.com/india/h1n1-shots-from-next-week/articleshow/5638121.cms

New Delhi: Mass vaccination against the deadly H1N1 swine flu virus are likely to begin in India next week. The 1.5 million doses of vaccines imported by the government from Sanofi Pasteur have passed the safety test.

The French vaccine manufacturers submitted the results of their clinical bridge study – conducted in Delhi and Pune on 100 adult subjects -- to the Drug Controller General of India on Wednesday. The trials were completed on February 21. The results were then checked thoroughly in Lyon before being submitted to DCGI.

DCGI Dr Surinder Singh told TOI, "The trials of the vaccine have proven its safety profile. By Friday, we will vet the results and give its clearance for use on humans in India. By next week, the vaccination should begin."

According to Union health ministry officials, 10 lakh doses of the vaccine will be sent to all Central government hospitals for administering on all frontline health workers and those at highest risk of getting infected.

The rest will be given to the armed forces while some doses will be retained by the ministry.

The ministry was more concerned about the vaccine's safety. The vaccine's safety profile was checked twice – first for seven days and then for 21 days. The trials took place in Kalavati Saran Hospital in Delhi and Bharatiya Vidyapith in Pune and the vaccines were found to be safe.

Dr Singh said, "We didn't want it to cause side-effects like the Guillain-Barri syndrome (GBS) – a rare disease in which the body damages its own nerve cells, causing muscle weakness and sometimes paralysis. The company will, however, continue to check the vaccine's immunogenecity results, which will come in six weeks time."

Meanwhile, India's indigenous H1N1 vaccine is expected to be available by April 15 and could cost between Rs 80 and Rs 100.

Cadila Healthcare had on January 3 started human trials of India's live and inactivated indigenous H1N1 vaccine on 200 subjects. Three other Indian companies – Serum Institute (Pune), Bharat Biotech International (Hyderabad) and Panasia Biotec (New Delhi) – were also given clearance by DCGI to conduct human trials in January. These are expected to start soon.

While Serum will test the trials on around 350 people, Panacea has a subject size of over 1,100 and Bharat of 160.

Dr Singh said, "If all goes well with the Indian vaccines and they prove safe and effective, they should be available commercially between April 15 and 30.

Experts, however, say no vaccine is 100% safe for everyone. People with allergies to eggs, for example, can't take flu vaccines because eggs are involved in the manufacturing process.

H1N1 has spread to 210 countries. In India, it has infected over 29,710 people and killed 1,376 among them.

The World Health Organisation recently came out with a new warning that the H1N1 pandemic may not have peaked as yet. It also said that H1N1 has been by far the dominant virus round the world over the past year and all indications are that the virus will be around for quite a long time.

Over 300 million people have been vaccinated globally so far against influenza, and the shots, which have an excellent safety record, have proved 70-75% effective.

PR Newswire

CDC Awards Abt Associates Additional Contracts to Evaluate Effectiveness of H1N1 Vaccine

PR Newswire, Abt Associates, 5 March 2010, 09:43 ET
https://www.prnewswire.com/news-releases/cdc-awards-abt-associates-additional-contracts-to-evaluate-effectiveness-of-h1n1-vaccine-86587487.html

New Studies Include Evaluation of Vaccine Among Health Care Workers and Children.

Cambridge, Mass., March 5 /PRNewswire/ - The Centers for Disease Control and Prevention (CDC) has awarded Abt Associates two new contracts to evaluate the effectiveness of the H1N1 vaccine among health care workers and children under the age of 18. In December 2009 the CDC awarded the company a related contract to evaluate the vaccine's effectiveness among pregnant women. All three groups are considered high risk populations by CDC either because of increased risk for complications or because of increased risk of contracting or spreading the disease. The combined value of all 3 contracts total $12.8 million.

As with the original contract, Abt Associates will prepare detailed protocols for the studies, identify and enroll study participants, coordinate testing of participants for infection with influenza viruses, develop and maintain all study databases, and assist the CDC with data analysis.

To carry out this work Abt is partnering with two distinguished health services researchers: Adrienne G. Randolph, M.D., M.Sc., and Allison Naleway, Ph.D. Dr. Randolph is Associate Professor of Anesthesia at Harvard Medical School and the Chair of the Pediatric Acute Lung Injury and Sepsis Investigators (PALISI) network. The Palisi network will serve as the clinical partner for the children's study. Dr. Naleway, a senior researcher at Kaiser Permanente Northwest, will be the lead partner for the health care worker study for the Kaiser Permanente sites, which include Northwest, Hawaii and Georgia. Dr. Naleway is also the lead partner for the pregnant women study.

"Abt Associates is uniquely equipped to conduct an examination of the H1N1 vaccine," said Dr. Scott Royal, the company's Division Vice President for Domestic Health. "These studies will benefit from our highly experienced staff in the areas of epidemiology and biostatistics, our experience managing complex projects and large surveys, and our distinguished research partners."

Abt Associates, an employee-owned company, applies scientific research, technical assistance, survey, and consulting expertise to a wide range of social, economic and health policy issues; international development; clinical trials and registries; and complex business problems. Founded in 1965, the company provides services to U.S. federal, state and local governments; universities and foundations; media; and major corporations. In fiscal year 2009, the company had revenue of $264 million. Its staff of over 1,500 is located in Cambridge, Massachusetts; Atlanta, Georgia; Bethesda, Maryland; Durham, North Carolina; Lexington, Massachusetts (Abt Bio-Pharma Solutions, Inc.); New York, New York (Abt SRBI); and in Africa, Asia, Central Asia, Europe, Latin America, and the Middle East.

Supreme Court accepts appeal over vaccine safety

CNN, 8 March 2010
http://edition.cnn.com/2010/HEALTH/03/08/vaccine.dangers/

Washington (CNN) – Parents who say that a range of preventive vaccines given their young children can cause serious health problems will have their appeal heard by the U.S. Supreme Court.

The justices Monday agreed to decide whether drug makers can be sued outside a special judicial forum set up by Congress in 1986 to address specific claims about safety. The so-called vaccine court has handled such disputes and was designed to ensure a reliable, steady supply of the drugs by reducing the threat of lawsuits against pharmaceutical firms.

The questions in the latest case are whether such liability claims can proceed, if the vaccine-related injuries could have been avoided by better product design, and if federal officials had approved another, allegedly safer drug. Oral arguments in the dispute will be held in the fall.

The lawsuit was brought by the parents of Hannah Bruesewitz, a girl from the Philadelphia, Pennsylvania, area. They said she was in fine health as an infant in 1992 when given a series of DPT shots – a combination of vaccines to prevent diphtheria, pertussis (whooping cough) and tetanus. After the third series, according to court briefs, the child began having seizures and became disabled. Now a teenager, Hannah continues to suffer what is described as "residual seizure disorder."

The Bruesewitzes alleged Wyeth Laboratories failed to adequately warn them and other parents of the risks associated with the vaccine. The vaccine court rejected the initial claim, so the family tried to revive the lawsuit in the federal courts. Their lawyers said the 24-year-old law does not ban all lawsuits, especially those filed when the harmful side effects were avoidable.

A federal appeals court eventually ruled for Wyeth, now owned by Pfizer Inc., concluding that all design-defect claims were barred under statute. Despite that victory, the company urged the high court to hear the case, saying it seeks final resolution on broader legal questions. The Obama administration also urged review and is supporting the company and the federal law in question.

Wyeth and other drug manufacturers say their products are generally safe, but side effects can occur in very rare cases. They also say that the vaccine industry is generally not profitable, but that the health benefits for society in general have kept them in the business. For that, they say, legal protection provided by Congress is essential to ensure such drugs are widely available and affordable.

The high court did not act immediately on a another related, pending appeal. The Georgia Supreme Court last year became the first appeals court in the U.S. to allow families to sue outside the special vaccine court. That case involved Atlanta-area parents who said their son Stefan Ferrari suffered severe neurological damage 12 years ago from booster shots, by Wyeth and GlaxoSmithKline, containing the mercury-based preservative thimerosal. Now 12, the boy is unable to speak, say his parents, Stefano and Carolyn Ferrari. The preservative has since been taken out of nearly all standard vaccines.

Despite winning at the state level, the family has since withdrawn its case, but the liability on drug companies resulting from that decision remains in force in Georgia.

The National Childhood Vaccine Injury Compensation Act was passed to establish a nationwide strategy to ensure a secure vaccine supply, promote safety and future research, and compensate innocent victims. Those goals were listed at the time as a "top public health priority."

Lawmakers acknowledged the vaccine supply was suffering under rising company costs from potential liability claims. Despite Food and Drug Administration approval for the vaccines, companies said they were being driven out of the market. The special federal court created under the legislation was a liability shield, designed to be a reliable, relatively quick, no-fault solution to various claims. Unresolved over the years is whether and when certain exceptions to liability should be in play in specific cases.

The case accepted is Bruesewitz v. Wyeth (09-152). The pending case is American Home Products Corp. v. Ferrari (08-1120)

Desi swine flu vaccine ready for commercial use by April-May

Times of India, 9 March 2010, 04.50am IST
https://timesofindia.indiatimes.com/india/desi-swine-flu-vaccine-ready-for-commercial-use-by-april-may/articleshow/5661122.cms

NEW DELHI: Pune-based Serum India's swine flu vaccine 'Fluvac' will be ready for commercial use by April-May, subject to all regulatory clearances. The Pune-based company received the drug regulators go-ahead on March 5 to carry out advanced safety tests on the vaccine – Phase II/III clinical trials crucial for its introduction in the market.

On Monday, it started clinical trials of nasal form of vaccine on 300 subjects at different locations around the country. After Ahmedabad-based Zydus Cadila, Serum Institute becomes the second company to have started Phase II/III trials, pushing it closer to the finishing line.

"The single dose vaccine will be available in two forms – nasal spray and as an injectable. The inhalation vaccine uses a live virus, which will be administered to three age groups. Further trials will be carried out later to test safety of the injectable vaccine on another set of people", Serum Institute of India's executive director S Jadhav told TOI.

The age group on which these trials will be administered is 9-19 years, 20-48 years and 48 and above. A single dose of the vaccine developed with egg-based technology will be initially tested in four cities across the country. The vaccine developed by indigenous players will most likely be administered as a single dose, and priced around Rs 150-200, sources close to the development said. (H1N1 vaccine globally cost between $9-15)

Brazil to launch massive swine flu vaccination drive

Earth Times, 9 March 2010, 13:58

https://web.archive.org/web/20100525025641/http://www.theflucase.com/index.php?option=com_content&view=article&id=2946%3Abrazil-to-launch-massive-swine-flu-vaccination-drive-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Brasilia - Brazil is to launch a *massive campaign aimed at vaccinating 91 million people* against the new H1N1 influenza virus, the Health Ministry said Thursday.

The campaign, which is to start Monday, targets just under half of Brazil's total population.

For the first two week, it will focus on *health-sector professionals* and *indigenous communities*.

In the second stage, from March 22 to May 21, it will be extended to pregnant women, people with chronic diseases, those above 60 years and children under 2 years.

The government currently has 83 million doses of the vaccine and is to acquire 30 million more doses in the coming months.

Campaña de vacunación contra la influenza A H1N1,
no tiene ningún sustento técnico, ni epidemiológico

Asociación Médica Peruana, 11 Marzo 2010
https://web.archive.org/web/20100406141542/http://www.asociacionmedicaperuana.org/vacunacioncontralainfluenzaAH1N1.html

- La incidencia y letalidad de casos reportados no justifica campaña y gasto.
- Existe el riesgo de que la población desarrolle reacciones adversas a esta vacuna nueva.
- No evitará la enfermedad por que el virus muta permanentemente.

La Asociación Médica Peruana (AMP) ha puesto de manifiesto que la vacuna contra la influenza AH1N1 no fue considerada en la Planificación de actividades de Atención Primaria 2010. Sus directivos sostienen que desde Noviembre del 2009, en que se inició la planificación de actividades, a la fecha, los informes de perfil de demanda y de vigilancia epidemiológica no reportan cambios en la incidencia del virus A H1N1 en el País.

"Los virus y sobre todo los del tipo RNA tienen la capacidad de mutar, por lo que la vacuna preparada serviría para la cepa de la epidemia de hace 1 año, más no para la que aparecería en el 2010", señaló Herberth Cuba, presidente de la Asociación Médica Peruana.

El dirigente sostuvo que la epidemia reportada de AH1N1 durante el 2009 ha demostrado ser una enfermedad con baja mortalidad (sólo 0.03% y asociada predominantemente a problemas médicos serios, no controlados), cuya posibilidad como en toda enfermedad infecciosa se da dependiendo de diferentes mecanismos: uno es el agente infeccioso y otro la respuesta del huésped.

La Dra. Flora Luna, por su parte, señaló, que existe la posibilidad de reacciones adversas con esta vacuna, lo que se incrementa con los adyuvantes como el Escualeno (núcleo básico del colesterol, y que su uso en vacunas se asocia a problemas de tipo inmunológico y endocrino) y Polisorbato 80 cuestionados adyuvantes, y sino el también cuestionado preservante Timerosal (etilmercurio).

Componentes de estas vacunas que han reportado reacciones adversas en el hemisferio norte, entre setiembre y noviembre del 2009, en países donde se realizo la campaña de vacunación como Holanda, Suecia, Francia y España.

"La mayor parte de cuadros de infecciones virales dentro de ellos la influenza son casos leves, autolimitados, algunos moderados que requieren solo de tratamiento sintomático. Lo que debe enfatizarse son las campañas educativas a la población" afirmó.

De acuerdo a la indicación del MINSA en una primera fase deberían vacunarse niños mayores de 6 meses, gestantes, trabajadores de salud; en una segunda fase adultos mayores con morbilidad. En este último grupo predominan los diabéticos y los hipertensos quienes por su enfermedad de fondo ya presentan alteración endotelial (daño del epitelio de los vasos sanguíneos).

La aplicación de la vacuna no protege de la infección de una epidemia de A H1N1 porque las cepas mutan constantemente; sin embargo, conlleva el riesgo de desarrollar reacciones adversas que

pueden ser graves si existe una base de disfunción endotelial. Las reacciones al escualeno no son inmediatas, sino que pueden presentarse tiempo después como fue demostrado en la campaña de vacunación experimental de los combatientes de la guerra del Golfo quienes presentaron Síndrome de Guillén Barre motivo por el cual la FDA suspendió el uso de escualeno, en el 2004.

De otro lado, la AMP sostiene que el Consejo Europeo ha abierto un debate cuestionando la decisión de la OMS sobre su accionar durante la epidemia de A H1N1, como el cambio en la definición de pandemia, que ha conllevado a decisiones alarmistas en salud pública como las que estamos experimentando. Así mismo, al Dr Albert Osterhaus asesor principal de la OMS, sobre el virus de la influenza, se le ha descubierto serios conflictos de interés, por su relación con laboratorios fabricantes de estas vacunas. (Revista Science 19 Octubre 2009)

La Asociación Medica Peruana concluye que la campaña de vacunación contra el influenza A H1N1 no tiene ningún sustento técnico; ni epidemiológico; la incidencia y letalidad de casos reportados no justifica el riesgo de la población de desarrollar reacciones adversas a una vacuna que no va a evitar la enfermedad.

Además, nuestro país carece de un Fondo de Compensación (indemnización) por reacciones adversas a las vacunas de aplicación obligatoria, como en EEUU. Por lo tanto, por esta decisión del gobierno en relación a esta vacuna nueva, ¿quién y cómo se responsabilizará por los daños?

Swine flu: World Cup supporters 'should have vaccination'

The Telegraph, 18 March 2010, 5:45PM GMT
https://web.archive.org/web/20100322200509/https://www.telegraph.co.uk/health/healthnews/7474223/Swine-flu-World-Cup-supporters--should-have-vaccination.html

Experts warn that with the southern hemisphere due to begin its flu season, those who have not had the jab could be leaving themselves at risk.

Officials have changed the rules on the vaccination so that those travelling to the southern hemisphere can now get the injection from their GP.

Previously the jabs were given only to those in the groups thought most at risk.

These included NHS staff, pregant women, those with underlying health conditions and healthy children aged between six months and five years.

Experts have predicted that there could be a "third wave" of the pandemic in Britain this winter.

They point out that the last pandemic, in the late 1960s, was more serious during the second year of the outbreak than the first.

Sir Liam Donaldson, the Chief Medical Officer for England, said: "The next 'flu season in the southern Hemisphere will be starting soon and the pandemic 'flu virus is expected to return.

"Travellers should protect themselves by getting the vaccine well before they travel.

"Those attending the World Cup in South Africa in June should also take advantage of the protection the vaccine can offer."

Dozens of Countries to Receive Swine Flu Vaccine

Voice of America, Geneva, 20 March 2010
https://web.archive.org/web/20100325065551/http://www1.voanews.com/english/news/health/Dozens-of-Countries-to-Receive-Swine-Flu-Vaccine-88722057.html

The World Health Organization says it is stepping up the delivery of millions of doses of H1N1 Swine flu vaccine to dozens of developing countries. WHO says about one dozen African countries will be among the recipients.

The World Health Organization says so far, it has delivered more than four million doses of the H1N1 swine flu vaccine to 17 countries. The stocks are among 180 million doses of the vaccine donated to the WHO from pharmaceutical companies and industrialized countries.

WHO spokesman Gregory Hartl says 95 developing countries have requested the vaccine. And he says in the coming weeks the WHO plans to ship millions of doses to some 25 countries in Africa, Central America and Eastern Europe.

"The countries were identified and the countries then had to express interest themselves," said Hartl. "So, they asked. So, it is their wish to receive the vaccine. And so those countries, which are ready and have expressed the wish, are those that will get it first. So, obviously, there are some countries that are further along then others."

Mongolia, Azerbaijan and Afghanistan were the first three countries to receive donations of H1N1 vaccines. Hartl says Togo, on Thursday, became the first African country to receive the vaccine. He says more African countries will follow, including Nigeria, Kenya and South Africa.

The World Health Organization says nearly 17,000 people in more than 213 countries and territories are confirmed as having died from H1N1 Swine Flu. It says the most active areas of pandemic influenza transmission continue to be in Southeast Asia and West Africa.

WHO says 167 deaths have been confirmed in Africa. Limited data suggests the spread of the pandemic flu virus has not yet peaked in West Africa. And localized outbreaks of the disease recently have been reported in parts of East Africa, particularly in Rwanda.

Hartl says countries have to meet certain criteria before they can become eligible to receive the donations.

"There have to be in place at each country level a national deployment plan that has certain elements in it in order to ensure that when the vaccine arrives in the country, it actually is received properly in cold storage and then distributed properly. So, there were a number of steps that had to be gone through. And, that is also then how quickly a country goes through these steps determines in part how quickly it gets the vaccine," he said.

Hartl says countries will receive enough vaccine to immunize up to 10 percent of the population. That includes health care workers, pregnant women and young people, who are at high risk of getting the disease.

The World Health Organization says it has delivered a first shipment of vaccine to Cuba, which has reported 54 deaths from H1N1, the greatest number in the Caribbean. It says Nigeria, Africa's most populous country, will receive about 2.8 million doses.

THE FLU CASE

Chile: Mass Swine Flu vaccination campaign starts today

The Flu Case, 22 March 2010, 17:02
https://web.archive.org/web/20100525024907/http://www.theflucase.com/index.php?option=com_content&view=article&id=3110%3Achile-mass-swine-flu-vaccination-campaign-starts-today-reports-andrea-santander&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Chile's Minister of Health is planning to role out the mass swine flu vaccination campaign from today.

The schedule is:

(1) From March 22th: Vaccination for all health workers in government employment.

(2) From March 29th to April 11th: Vaccinations for all pregnant women of 13 weeks and for kids between 6 months to 2 years old.

(3) Between April 12th and April 30th: All senior population older than 65 years old and chronical sick people.

Extra Vaccination: Special vaccinations will occur for kids in school from 2 years old to 14 years old.

This is in the regions more affected by earthquake (we´ve had a huge 8.8 earthquake on February 27th), and this means from region 6th to 9th.

Mobile vaccination centers will be settled.

The former government had planned to give the the swine flu shot to 2 million people, but the new government has set a target of 4 million people.

Chile has a population of around 16 million people.

THE DAILY JOURNAL

Cuba to vaccinate more than 1.1M against swine flu

The Daily Journal, 27 March 2010
https://www.smdailyjournal.com/news/world/cuba-to-vaccinate-more-than-1-1m-against-swine-flu/article_0710e03c-512b-5155-abc7-1212c0ffd405.html

HAVANA – Cuba will begin vaccinating nearly 10 percent of its citizens against swine flu next week, reversing its previous skepticism about the high cost and effectiveness of immunization to combat the virus.

Communist Party newspaper Granma said Friday that the vaccinations will come in two waves, the first beginning April 1. More than 1.1 million Cubans deemed particularly vulnerable to swine flu will get them in a country of about 11.4 million.

The vaccinations come from stocks *donated by the World Health Organization*.

Granma said about 80,000 of those to receive the vaccine are *pregnant women*. The list also includes *health and education workers*; airport employees and others who come into contact with foreigners; and islanders 6 months and older who suffer from specific health problems that swine flu can exacerbate.

President Raul Castro said in late December that 41 *Cubans had died of swine flu*. Officials have released no additional statistics.

Most of those killed by the virus suffered from chronic ailments and came into contact with visitors from the U.S., Mexico or other countries hit especially hard by the flu outbreak, the government says.

Health officials said last summer that Cuba preferred to rely on the army sealing off areas where the virus was spreading and mass quarantines to fight swine flu — rather than using imported vaccines that would be expensive and potentially only minimally effective.

Authorities softened that stance dramatically, however, after WHO Secretary-General Margaret Chan said during a visit to Havana in October that the organization would distribute 200 million doses of swine flu vaccine to 100 developing countries, including Cuba.

Swine Flue" Topples down Bulgaria's Health Minister

Standard, 31 March 2010
https://web.archive.org/web/20100726161759/http://paper.standartnews.com/en/article.php?d=2010-03-31&article=32664

The swine flu overthrew a Bulgarian minister. Bozhidar Nanev - minister of health tabled his resignation after the prosecution's office accused him of signing an unprofitable deal. "With that deal the minister has defrauded the state revenue by 2.5 million leva (1 euro=1.95 leva)," announced Margarita Nemska - monitoring prosecutor on the first case against a minister from the incumbent cabinet. She explained that Bozhidar Nanev has signed two contracts for delivery of "Tamiflu" - vaccine combating swine flu, at a price was much higher than the offered by another company.

The delivery of medicines occurred a month and a half after the officially announced end of the flue epidemics.

"The case is really a very grave one," Nemska was explicit.

Nanev's case has been investigated by agents from the State Agency for National Security and the PM reportedly ordered the checks personally. A day ago SANS discovered the fraud and reported to Bulgaria's Prosecutor General who ordered an investigation and according to the conclusions of the prosecutors, charges were launched.

Association between the 2008–09 Seasonal Influenza Vaccine and Pandemic H1N1 Illness during Spring–Summer 2009: Four Observational Studies from Canada

PLOS Medicine, 6 April 2010 // https://doi.org/10.1371/journal.pmed.1000258
https://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.1000258

Abstract

Background: In late spring 2009, concern was raised in Canada that prior vaccination with the 2008–09 trivalent inactivated influenza vaccine (TIV) was associated with increased risk of pandemic influenza A (H1N1) (pH1N1) illness. Several epidemiologic investigations were conducted through the summer to assess this putative association.

Findings: ... estimates from the sentinel and three other observational studies, involving a total of 1,226 laboratory-confirmed pH1N1 cases and 1,505 controls, indicated that *prior receipt of 2008–09 TIV was associated with increased risk of medically attended pH1N1 illness during the spring–summer 2009*, with estimated risk or odds ratios ranging from 1.4 to 2.5. Risk of pH1N1 hospitalization was not further increased among vaccinated people when comparing hospitalized to community cases.

Conclusions: Prior receipt of 2008–09 TIV was associated with increased risk of medically attended pH1N1 illness during the spring–summer 2009 in Canada. The occurrence of bias (selection, information) or confounding cannot be ruled out. Further experimental and epidemiological assessment is warranted. Possible biological mechanisms and immunoepidemiologic implications are considered.

In summary,
we report findings from four epidemiologic studies in Canada showing that *prior receipt of 2008–09 TIV was associated with increased risk of medically attended pH1N1 illness during the spring–summer 2009*. Bias cannot be ruled out in observational studies, and therefore these findings cannot be considered conclusive. If these observations do reflect a real biological effect, however, they raise important questions that warrant further scientific investigation.

Cécile Viboud, Lone Simonsen

Does Seasonal Influenza Vaccination Increase the Risk of Illness with the 2009 A/H1N1 Pandemic Virus?

PLOS Medicine, 6 April 2010 // https://doi.org/10.1371/journal.pmed.1000259
https://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.1000259

Unexpected Findings in a Sentinel Surveillance System

The spring 2009 pandemic wave was the perfect opportunity to address the association between seasonal trivalent inactivated influenza vaccine (TIV) and risk of pandemic illness. In this issue of *PLoS Medicine*, Danuta Skowronski and colleagues report the unexpected results of a series of Canadian epidemiological studies suggesting a counterproductive effect of the vaccine [4]. The findings are based on Canada's unique near-real-time sentinel system for monitoring influenza vaccine effectiveness. Patients with influenza-like illness who presented to a network of participating physicians were tested for influenza virus by RT-PCR, and information on demographics, clinical outcomes, and vaccine status was collected. In this sentinel system, vaccine effectiveness may be measured by comparing vaccination status among influenza-positive “case” patients with influenza-negative “control” patients. This approach has produced accurate measures of vaccine effectiveness for TIV in the past, with estimates of protection in healthy adults higher when the vaccine is well-matched with circulating influenza strains and lower for mismatched seasons [5]. The sentinel system was expanded to continue during April to July 2009, as the pH1N1 virus defied influenza seasonality and rapidly became dominant over seasonal influenza viruses in Canada.

...

Policy Implications and a Way Forward

The putative association between seasonal vaccination and 2009 pH1N1 illness remains an open question, given the conflicting evidence from available research. Canadian health authorities debated whether to postpone seasonal vaccination in the autumn of 2009 until after a second pandemic wave had occurred, but decided to follow normal vaccine recommendations instead, in part because of uncertainty about a resurgence of seasonal influenza viruses during the 2009–10 season [17]. This illustrates the difficulty of making policy decisions in the midst of a public health crisis, when officials must rely on limited and possibly biased evidence from observational data, even in the best possible scenario of a well-established sentinel monitoring system already in place.

INDEPENDENT

Alistair Dawber

Government cuts H1N1 vaccine order by two-thirds

Independent, 7 April 2010, 00:00 BST
https://www.independent.co.uk/news/business/news/government-cuts-h1n1-vaccine-order-by-twothirds-1937544.html

The Department of Health and GlaxoSmithKline yesterday agreed to cut the number of doses of swine flu vaccine the Government will buy from the group by about two-thirds, after the H1N1 virus proved to be far less devastating than first feared.

Last year, when concerns about the the virus were high, the Government ordered enough vaccine for everyone in Britain from GSK and the US pharmaceutical group Baxter. Health officials yesterday said that they would now take just 34.8 million doses of GSK's treatment, after initially ordering 90 million batches. The company had recommended at the start of the pandemic that each patient take two doses of the drug. The Government terminated its contract with Baxter in February.

"This deal means that the UK will save approximately one third of the original value of the orders with GSK," said the Health Secretary, Andy Burnham. "I am pleased we have reached an agreement that is good value for the taxpayer and means the department has retained a strategic stockpile to protect the UK population without incurring a cancellation fee."

While the Government is not paying a cancellation fee, it is paying substantially more per dose for the vaccine. GSK said that the Government would receive other treatments, such as H5N1 *bird flu* vaccine and courses of the anti-viral Relenza, to balance the deal.

The Department of Health said that the UK now has a stockpile of 23.6 million doses and confirmed that those deemed vulnerable to the virus, such as pregnant women and health workers, would continue to get the drug. The Government said it would donate 3.8 million batches of swine flu vaccine to the World Health Organisation.

Both the Government and GSK have refused to say how much the UK has paid for swine flu vaccine. A Freedom of Information request submitted by The Independent to force the Government to disclose how much it was paying per dose was rejected on the grounds that the details would "prejudice the commercial interests" of GSK and the Government's ability to negotiate with its commercial partners.

GSK has charged governments on a sliding scale, from €7 for the most developed economies, to 50 million free doses submitted for distribution by the World Health Organisation. The UK was offered a discount, but the size of the cut has not been made public.

Yesterday's deal is the result of lengthy negotiations between the Government and GSK and follows similar action from the German authorities, who agreed to take and pay for 70 per cent of its original order in January.

GSK is in talks with a number of other administrations over plans to par back vaccine orders. A host of northern hemisphere countries are known to want to slash orders after the initial spike in incidents of swine flu cases quickly tailed off. Among them, France, Belgium and Spain are thought to be in talks with GSK.

The company said that it would not be altering its earnings estimates for 2010, saying that it expects to see swine flu vaccine sales of about £880m this year, a similar amount to 2009.

The New York Times

H1N1 Vaccine, Still Available

The New York Times, 7/8 April 2010, A30
http://www.nytimes.com/2010/04/08/opinion/08thu3.html

[*Editorial*]: Just a few months ago, nervous Americans were clamoring for access to vaccines that could protect them against the swine flu. Now there is a glut of vaccine available, and American health officials are renewing their calls for more people to get vaccinated – just in case the virus resurges in coming months.

Meanwhile, the World Health Organization is scrambling to defend itself against baseless charges that it conspired with the pharmaceutical industry to exaggerate the dangers. Our fear is that the public and officials will get blasé about the next flu outbreak.

Efforts to rush vaccine into production did not go well. This dry run should lead health officials to push the vaccine makers even harder to adopt new technologies that can turn out vaccine more quickly. International organizations should also streamline procedures for transferring excess vaccine from advanced countries that typically buy up almost all of the supply to poorer nations whose citizens are at risk.

The swine flu virus first burst into public consciousness about a year ago when it sickened and killed people in Mexico and soon spread elsewhere, leading the W.H.O. to declare that a pandemic was under way. That was not based on the virus's virulence. Most of the early cases were relatively mild, but there was no way of knowing how bad it might get. It was instead based on the geographic reach of the virus and the fact that it was a new strain, which meant a vast majority of people had no immunity against it.

American health officials began a vigorous effort to vaccinate half the population and pushed manufacturers to speed production of a vaccine. The manufacturers couldn't supply vaccine as fast as needed. Luckily, the outbreaks proved relatively mild, and it turned out that a single dose of vaccine would provide protection for most people, another reason for the current glut. Now the epidemic appears to be waning in most, but not all, areas of the country, further diminishing demand for the vaccine.

Despite the excess vaccine, it would be wrong - and dangerous - to fault health authorities for the steps they took to protect their populations. Had the virus been more lethal, the penalty for late delivery and insufficient supplies of vaccine would have been a public health catastrophe. We may not get as lucky next time.

RP to get 1.9M doses of A(H1N1) vaccine

Inquirer, 7 April 2010, 17:17
https://web.archive.org/web/20100409010909/http://newsinfo.inquirer.net/breakingnews/metro/view/20100407-262911/RP-to-get-19M-doses-of-AH1N1-vaccine

Manila, Philippines – Health Secretary Esperanza Cabral said Wednesday that the Philippines will receive anytime this week about 1.9 million doses of vaccines against A(H1N1) flu virus, which will be distributed to high-risk groups.

Cabral said the vaccines donated by the World Health Organization (WHO) will be distributed for free among high-risk groups individuals such as those who are pregnant, health workers, children below five years and the elderly.

She said the DoH will post notices at barangay (village) health centers to notify high-risk groups of their vaccination schedule.

Under WHO guidelines, at least ten percent of the general population or 9 million Filipinos should be able to avail of the A(H1N1) vaccination but high-risk groups will be given priority.

How £ 300 million was squandered on swine flu jabs that we didn't need

The Daily Mail, 8 April 2010, 00:47
http://www.dailymail.co.uk/news/article-1263975/Swine-flu--300m-squandered-jabs-didnt-need.html#ixzz0kT9ejScp

Up to £300million of taxpayers' money has been wasted on swine flu jabs that were never needed.

Ministers ordered 90million doses of a vaccine last year at a cost of £540million as panic over the illness gripped the country.

But as the 'pandemic' failed to materialise it soon became clear that the order was far too large.

The Department of Health tried to get out of the enormous contract but the drug firm, GlaxoSmithKline, refused to back down.

Yesterday the Government announced it had signed a compromise deal that caps the number of shots of Pandemrix at 34.8million - but, astonishingly, at twice the price first agreed.

It means the Government will pay for two-thirds of the original deal but only receive just over a third of the doses.

The mild nature of the illness meant only 5.1million doses have been used.

The deal was yesterday criticised by the Tories and pressure groups, who said it proved the Government had mismanaged the seven-month outbreak.

The Department of Health ordered enough vaccine to cover the entire population, with three-quarters to be supplied by GlaxoSmithKline.

But it did not have a break clause in the contracts signed with GSK - unlike with the drug firm Baxter, which had its order cancelled for all but nine million of 36million doses.

The cost of the original GSK order has never been revealed but at £6 a dose it could have reached £540million.

The contract is now being capped at 34.8million doses, including those already received, with a one-third cut in the price.

The Department of Health also announced yesterday there would be no cancellation fee.

Under the agreement, the Government will also purchase an as yet undefined amount of the H5N1 bird flu vaccine as well as courses of GSK's anti-viral flu treatment Relenza.

Health Secretary Andy Burnham insisted that 'significant savings' had been made.

'I am pleased we have reached an agreement that is good value for the taxpayer and means that the department has retained a strategic stockpile to protect the UK population without incurring a cancellation fee,' he said.

'This both protects the public purse and ensures the UK remains at the forefront of pandemic preparedness worldwide.'

Britain will donate 3.8million doses of the vaccine to the World Health Organisation for use in Africa ahead of the rainy season.

Tory health spokesman Andrew Lansley accused Gordon Brown of 'seeking to bury bad news' on the day the election was called.

'This is a careless waste of precious NHS money,' he added.

'Labour failed to ensure there were proper break clauses in the contracts which means that British taxpayers have got an extremely bad deal.'

The TaxPayers' Alliance strongly criticised the mismanagement of the seven-month outbreak.

Chief executive Matthew Elliott said: 'It's an outrage that the Government has squandered millions of pounds of taxpayers' cash because they did a poor job of negotiating the contract for the swine flu vaccine.

'That money could have gone towards life-saving drugs for NHS patients but instead we have a huge stock of surplus vaccines and an excessive bill for doses we never needed.

'While there is obviously a margin of error in any assessment of the possible need for pandemic vaccines, this is an eye-watering amount of money to waste.'

Simon Jose of GlaxoSmithKline said: 'Understanding of the H1N1 pandemic has significantly evolved since the declaration (of a pandemic) by the World Health Organisation last June and we recognise that governments' needs and public health priorities are changing.

'We are committed to working with them to respond to their needs as the pandemic evolves and find appropriate and fair solutions.

'In line with these principles, we are pleased to have reached a settlement, which has been mutually agreed as representing fair value for the UK Government and for GSK.'

The drug firms that cashed in on a 'crisis'

The Mail investigated in February how drug firms, the World Health Organisation and ministers helped stoke fears of the swine flu 'pandemic'. Here is an abridged version of our disturbing findings:

Scientists and pharmaceutical companies that profited from the swine flu scare stand accused of grossly exaggerating the risks of the outbreak.

In Britain it was predicted up to 65,000 would die from the virus. The Government sprang into action and spent £1billion stockpiling anti-virals such as Tamiflu and ordering enough vaccines to give two doses to every man, woman and child.

The National Pandemic Flu Service or 'Swine Flu Hotline' was set up to take the pressure off GPs and 'diagnosed' 1.7million as suffering from the illness. Of these 1,125,000 collected free Tamiflu prescriptions.

The Government also launched a mass vaccination programme which gave 4.25million the jab and stockpiled between 90 and 120million doses of the vaccine.

But the Doomsday scenario never unfolded. Just 457 people died of swine flu, but as 80 per cent of these had underlying health problems, only around 100 died of swine flu alone.

The Government argues this relatively small impact is thanks to its prudence.

But in Poland, which refused to inoculate against swine flu, only 150 people died from the illness out of a 40million population.

And research suggests as many as eight out of ten people diagnosed with swine flu by the hotline did not have it.

This means more than 800,000 of the million-odd packets of Tamiflu were given needlessly.

The World Health Organisation stands accused of announcing 'a false pandemic' in June last year.

Critics claim the drug firms manipulated the WHO into downgrading its definition of a pandemic so they could cash in.

In all, the companies behind the vaccines and anti-virals will pick up an estimated £4billion windfall from swine flu.

GlaxoSmithKline has revealed sales of its H1N1 vaccine reached £835million in the fourth quarter of last year.

In the same period, Novartis notched up vaccine sales of more than £800million, the vast majority from H1N1 sales.

Swiss drugs firm Roche reported profits up 14 per cent to £8.89billion last year, helped by sales of Tamiflu.

These companies vehemently deny having influenced the way in which the swine flu pandemic was managed.

Scientists warn it is far too early to say that the threat from the H1N1 virus is over and that next winter swine flu will return.

But with a perception that the scientific community has cried wolf one too many times, the fear is that individuals will be less inclined to follow such advice.

Governments wasted millions on H1N1 advertising: Schabas

The Intelligencer, 8 April 2010, 10:10:16 EDT AM
https://web.archive.org/web/20160604173319/http://www.intelligencer.ca/2010/04/08/governments-wasted-millions-on-h1n1-advertising-schabas

The federal and Ontario government wasted millions of dollars with badly-timed advertising for H1N1 influenza shots, the local medical officer of health says.

"The real problem is not so much how much money was spent but how the money was used and when it was used," Dr. Richard Schabas said Wednesday.

"A great deal of the advertising and in fact most of the immunization happened after the problem had essentially come and gone."

Government figures obtained through a federal information request by The National Post showed the Canadian government spent $37 million on advertising and other communication about last year's flu outbreak.

The newspaper quoted an estimate showing the Public Health Agency of Canada spent $322 million on pandemic campaign. Hundreds of millions more were spent by provinces and their health units on vaccine and advertising, the report said, putting the total federal and provincial H1N1 spending at a minimum of $1 billion.

Schabas told The Intelligencer much of the vaccinations themselves came too late – the vaccine wasn't available when the outbreak arrived earlier than the usual flu season. He questioned the need for the extensive advertising for something he said may not have been necessary in the first place.

"People should understand that the H1N1 outbreak in Canada and Ontario and certainly Hastings and Prince Edward Counties reached its peak in the last week in October and by the middle of November there was really no value in immunization," he said. "But the provincial government and the federal government persisted promoting immunization long after the danger had passed and spent a great deal of money doing that."

"The lesson is look at the evidence and base your decisions on the evidence, not on pre-existing plans. If you have a plan that you wrote years ago and you just stick to that regardless of changing circumstances you're going to end up frightening people unnecessarily, disrupting people's lives and wasting money."

Schabas has long been a critic of government response to pandemics. Prior to the fall H1N1 outbreak, he predicted it would not cause significant illness and related problems. Statistics later showed that to be the case.

He said his latest comments weren't intended to remind governments he and others were correct in earlier critiques, but that the outbreak's results were predictable.

"This is not an observation in hindsight," said Schabas.

"The evidence was there and at least some people, including me, spoke out about this before the fact and not just after the fact."

Debra Lynkowski, chief executive officer of the Canadian Public Health Association, defended the advertising campaign.

She said it would have been needed had the outbreak been worse.

"It's the difference between dealing with the health of an individual and dealing with the health of a population," she told The Post.

"If we hadn't implemented the plan and we hadn't invested and the outbreak was more severe, we can only guess what the price might have been in human lives or the health-care system."

Schabas dismissed that stance.

"That's a little bit like saying, 'If the Maple Leafs had won the Stanley Cup we wouldn't have been prepared for the victory parade,'" he said.

"This is not a what-if situation anymore. The facts are there. And the facts are very clear. The fact is the outbreak wasn't worse. In fact it was predictable it wasn't going to be worse. The vaccine didn't arrive until at or after the peak of the outbreak.

"Canada did more immunization, I think, than did any other country in the world.

"Poland did no immunization at all ... and their rates of disease were about the same as ours."

THE FLU CASE

UK government to buy bird flu vaccine

The Flu Case, 9 April 2010

https://web.archive.org/web/20100613225210/http://www.theflucase.com/index.php?option=com_content&view=article&id=3252%3Auk-government-to-buy-bird-flu-vaccine&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The UK government has committed itself to buying an unspecified amount of bird flu vaccine from GlaxoSmithKline as well as to replacing its depleted stocks of Relenza, as part of a deal with the pharmaceutical company limiting the purchase of swine flu vaccine.

GlaxoSmithKline: H1N1 hype unfounded as UK caps vaccine order

Apr 08, 2010 (Datamonitor via COMTEX) – Following poor uptake of the vaccine in several European markets, the UK Department of Health has opted to limit its H1N1 contract with GlaxoSmithKline to 34.8 million doses. Despite the media hype surrounding the influenza outbreak, the mild course of the pandemic and negative public opinion of the vaccine means that its commercial impact will be significantly reduced.

The UK government's restriction of its order at 34.8 million doses includes those already received. As part of the deal with GlaxoSmithKline, the government will purchase the H5N1 vaccine against bird flu and replace the antiviral stocks of Relenza (zanamivir) that were used during the outbreak.

The influenza A (H1N1) pandemic began in Mexico, where the first cases of an influenza-like illness of unknown origin were reported in mid-March 2009. The infection spread throughout Mexico and the US in the following weeks. Initially, H1N1 seemed to be associated with a high fatality rate and a sufficient supply of H1N1 vaccine became a key concern for governments and health authorities. Consequently, most countries, including the seven major markets, invested huge amounts in vaccine supply contracts.

Public awareness campaigns, press coverage of H1N1 and a fear of a 1918 or H5N1-like influenza pandemic created political pressure and further contributed to the stockpiling of vaccines by respective governments. This translated into a large commercial windfall for the major flu vaccine players, namely GlaxoSmithKline, Sanofi Pasteur and Novartis. In 2009, their combined pandemic flu sales amounted to $3 billion.

The cap in the vaccine order by the UK government is the result of several factors. Initial fears of a clinically severe pandemic have subsided over recent months, and despite the rapid spread of the virus, the course of disease has been mild to moderate in most patients. Furthermore, vaccine uptake has been limited, particularly in Europe, and governments have tried to re-negotiate with manufacturers in order to cut back on the supplies that were initially ordered.

This appears to have been a less of an issue in the US, where coverage amounted to approximately 25% of the total population. Across Europe, however, coverage rates have been less than 10%; in the UK, it is estimated that only 5.5 million doses of H1N1 vaccine were used. One explanation for this may be the use of new technologies such as adjuvants in manufacturing the H1N1 vaccine for the European markets. The lack of long-term safety data for such technologies has led to a negative public opinion, and therefore poor uptake.

Thus, despite the hype surrounding the H1N1 pandemic, its commercial impact for the major vaccines players will be significantly lower than expected. Additionally, the poor uptake of the vaccine has also resulted in losses for those governments which invested substantial amounts in supply contracts.

La grippe A(H1N1) a dopé la recherche dans les vaccins

RTBF.Info, 21 Avril 2010, 20:53
https://web.archive.org/web/20100424221815/http://www.rtbf.be/info/societe/sante/la-grippe-h1n1-a-booste-la-recherche-dans-les-vaccins-209432

Forts des leçons tirées de la pandémie de la grippe H1N1, autorités sanitaires et laboratoires aux Etats-Unis accélèrent le développement de nouvelles techniques de production de vaccins plus rapides et fiables que les méthodes traditionnelles.

Il s'agit des vaccins à base de cultures cellulaires et ceux plus récents produits grâce à des techniques de recombinaison génétique.

"*Nous n'avons jamais été dans une position aussi favorable pour créer de nouveaux et meilleurs vaccins*", a déclaré cette semaine Kathleen Sebelius, la ministre américaine de la santé à l'occasion du premier anniversaire de la découverte du nouveau virus (A) H1N1.

L'une des leçons de la dernière pandémie (...) a été de confirmer la nécessité de "*faire entrer la technologie de développement et de production de vaccin anti-grippe dans le XXIe siècle*", a expliqué à l'AFP le Dr Anthony Fauci, directeur de l'Institut américain des maladies infectieuses et des allergies (NIAID), partie des Instituts nationaux de la santé (NIH).

Le gouvernement américain investit des milliards de dollars dans le secteur privé sous forme de partenariats pour encourager cette conversion qui permettra de mieux combattre les futures pandémies qui sont imprévisibles et aussi inéluctables, a-t-il dit.

Il a rappelé que malgré la rapidité de la mobilisation aux Etats-Unis en 2009 pour identifier le nouveau virus (deux semaines et demi), isoler la souche pour être cultivée dans des oeufs, et procéder aux essais cliniques, il n'a pas été possible de produire le nombre de doses prévues car ce pathogène se développait lentement.

Bien que prouvée, la technologie traditionnelle "*à base d'oeuf reste fragile et soumise à des aléas qui sont hors de contrôle*", a observé le Dr Anthony Fauci.

Cette conversion vers de nouvelles techniques de production de vaccins se fera en deux phases avec tout d'abord le développement de la production de vaccin anti-grippe à partir de cellules animales, a-t-il poursuivi.

Ce processus n'est pas beaucoup plus rapide -quelques semaines à un mois de moins- mais est beaucoup plus prévisible et fiable, a expliqué cet infectiologue. Avec des oeufs, la production de vaccin peut prendre de six à neuf mois.

Supprimer la culture de virus

Mais l'objectif ultime est de convertir entièrement la production de vaccins anti-grippe basée sur la recombinaison génétique qui ne nécessite plus de cultiver un virus pour fabriquer un vaccin.

Cette technologie moléculaire permettra de produire très rapidement des vaccins, probablement en deux mois, a prédit le directeur du NIAID.

"*Nous devons maîtriser la technologie qui est à la mesure de notre réponse aux grandes menaces sanitaires mondiales*", a-t-il insisté.

Le Dr Fauci a cité l'exemple du laboratoire de la firme pharmaceutique suisse Novartis qui construit une usine en Caroline du Nord, avec des subventions du gouvernement fédéral, pour produire dans un délai raisonnable des vaccins à base cellulaire.

Le Ministère américain de la santé, qui coiffe les NIH, a passé aussi passé plusieurs contrats avec des firmes de bio-technologie comme Protein Sciences Corporation pour mettre au point des vaccins basés sur la recombinaison génétiques, a-t-il précisé.

Selon lui "*on verra les premiers vaccins produits ainsi, à destination humaine, d'ici environ un an*".

Le "*Saint Graal*" reste toutefois le développement d'un vaccin anti-grippe universel efficace d'une pandémie à l'autre, a noté ce chercheur estimant que cela est possible. "*Mais cela prendra entre cinq et dix ans*", a-t-il prédit. **AFP**

Ananya Mandal

Swine flu vaccine blues

News Medical, 22 April 2010
https://www.news-medical.net/news/20100422/Swine-flu-vaccine-blues.aspx

Exactly a year after the swine flu outbreak vigilance, newer vaccine techniques and other measures are being emphasized by researchers and key decision makers. Dr. Harvey Fineberg, chairman of the World Health Organization's pandemic review committee and President of the U.S. Institute of Medicine says, we need to look at the past to learn from it. "This is one of the really, I would say, 'sine qua non' of a fair assessment…You have to look at each decision from the vantage point of what was understood and known at that time. You still may be very critical, or you may be laudatory or you may be somewhere in between. But it's certainly inappropriate to look at it from a vantage point after the fact…Even prospectively you can still attend to errors of calculation and insufficient utilization of available information, failure to outline all of the options, failure to think about alternatives, failure to communicate successfully…That's part of what I hope we'll look into. And part of what I hope we can maintain as a committee, is this sense of looking retrospectively but with a prospective attitude." The pandemic had assumed huge proportions with over 12,000 Americans affected with H1N1 infections so far and WHO reports that nearly 18,000 people have died worldwide.

This statement comes after the critics' protests of wastage of precious tax-payers funds by procuring vaccines that remained unused and suggestions related to vaccine manufacturers who were hand in glove with the decision makers in creation of this over-hyped panic situation. The current review committee with 29 people from different countries assesses the situation of the swine flu scare. The committee, which met for the first time last week, is to report to WHO Director General Dr. Margaret Chan in time for her to present the findings to the World Health Assembly – the WHO's annual meeting – in May 2011.

Promises of new vaccine

Researchers are also looking into newer flu vaccine techniques for more effective coverage. According to US Health and Human Services Secretary Kathleen Sebelius, "We have never been in a stronger position to create new and better vaccines." Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, part of the National Institutes of Health also believes that the pandemic served to "bring the technology of influenza vaccine development and manufacture into the 21st century." Fauci also said that there has been a partnership with Novartis in building a cell-based flu vaccine production unit in North Carolina. "It will be a gradual process," he said. "In the next year or so, you will be seeing some of these recombinant products ready to be used in humans," he said.

Surplus of spoiling vaccines

In another development the British Columbian government is looking to recover at least some of the $20-million swine flu vaccines that are spoiling before their expiry dates and have to be disposed. There are a surplus of 2.5 million doses that were promised to last one and a half year and are spoiling at six months. The government is in talks with manufacturer GlaxoSmithKline about recovering some of the cost. B.C. Health Living Minister Ida Chong said in a statement on Wednesday, "We're

working … to see what we can do to find out if there is any kind of recovery….No one wants to see unused vaccines discarded in this way. Certainly no-one would have expected this, but it was a very novel virus." There were a little over 1000 cases of swine flu in B.C. last year and according to Chong, "It was important that we ordered enough vaccine for all British Columbians, which is what we did."

B.C.'s chief medical health officer, Dr. Perry Kendall said people should make use of this opportunity. "If someone is worried, hasn't been vaccinated, is in a high-risk group, or newly pregnant, I'd suggest they take an opportunity to get the vaccine while we know we have ample supplies this month or next month," he said

News of Tomorrow

Jean-Jacques Crèvecœur

Se préparer au retour en force de la vaccination

News of Tomorrow, 23 avril 2010
https://web.archive.org/web/20100426041152/http://www.newsoftomorrow.org/spip.php?article7958

Madame, Monsieur, Chers amis,

Ce 25 avril 2010, nous célébrons le premier triste anniversaire du début de l'alerte à la pandémie de grippe porcine, rebaptisée grippe mexicaine, puis grippe A H1N1. Les «experts» corrompus de l'Organisation Mondiale de la Santé nous promettaient une hécatombe pire que celle de 1918 ! Et les pantins de Santé-Canada ont cherché tout l'automne à nous terroriser, nous annonçant que 25 à 35 % de la population québécoise serait touchée par le redoutable virus. Un an plus tard, vous n'avez certainement plus envie d'en entendre parler. Et je vous comprends. Moi aussi, j'aurais envie qu'on me foute la paix avec cette mascarade qui a coûté au Canada (c'est-à-dire à nous, les contribuables) plus d'un milliard de dollars. J'aurais envie de retourner à ce qui m'a toujours passionné, à savoir la santé, l'équilibre et la fluidité.

Pourtant, que vous le vouliez ou non, l'OMS continue de nous prendre pour de sinistres crétins en niant l'évidence de sa situation de corruption (voir référence -1), mais en plus, on nous annonce que les autorités sanitaires et les laboratoires états-uniens accélèrent le développement de nouvelles techniques de production de vaccins, à base de cultures cellulaires cancérisées (bonjour l'explosion des cancers dans les prochaines années) et à base de technique de recombinaison génétique (bonjour les humains OGM dégénérés !) (voir référence - 2).

(1) => https://web.archive.org/web/20100417163022/http://www.rtbf.be/info/economie/h1n1-des-experts-de-loms-dementent-toute-influence-du-secteur-pharmaceutique-206750

(2) => https://web.archive.org/web/20100424221815/http://www.rtbf.be/info/societe/sante/la-grippe-h1n1-a-booste-la-recherche-dans-les-vaccins-209432

Quand vous aurez lu ces deux petits articles, vous comprendrez que nous ne pouvons pas prendre ces informations à la légère. Car si nous ne faisons rien, cette vaccination obligatoire à laquelle nous avons échappé de justesse nous retombera sur la figure beaucoup plus rapidement que nous ne l'imaginons, et sans laisser, cette fois, aux lanceurs d'alertes la possibilité d'alerter la population…

Je ne vous cache pas que je suis extrêmement préoccupé et inquiet de ce qui se prépare. Dans ce contexte, il m'est difficile de ne pas me poser certaines questions…

* Pourquoi depuis fin février, plusieurs experts nous annoncent que la prochaine pandémie (prévue l'automne prochain) verra l'arrivée d'un nouveau virus, résultant de l'hybridation du virus de la grippe aviaire (H5N1 – très virulent) et celui de la grippe porcine (H1N1 – très contagieux). Et comment le savent-ils? (référence)

=> https://web.archive.org/web/20100329194832/http://www.businessweek.com/lifestyle/content/healthday/636221.html

Pourquoi le ministère de la santé français a-t-il demandé au professeur Bruno Lina (chef d'un laboratoire de biologie à Lyon – France, conseiller de Roselyne Bachelot et de l'OMS) d'arrêter tous ses travaux en cours pour se concentrer sur l'hybridation du H5N1 et du H1N1? (référence)

=> https://web.archive.org/web/20100501090431/http://www.leprogres.fr/fr/france-monde/article/2859863,192/A-Lyon-on-essaie-de-croiser-les-virus-H1N1-et-H5N1de-la-grippe.html

Pourquoi en Pologne, où la courageuse ministre de la santé a refusé de commandé le moindre vaccin, le nombre de victimes officielles du H1N1 est de 2,6 décès par million d'habitants, alors qu'au Canada, ce nombre est de 12 décès par million d'habitants;

Pourquoi en Europe, le vaccin fabriqué par Glaxo-Smith-Kline fait-il l'objet de beaucoup plus d'effets secondaires déclarés par millions de personnes (référence - 1) qu'au Canada, alors qu'il s'agissait du même vaccin, de la même composition et du même dosage ? Nous cacherait-on des choses ici au Canada? (référence)

=> 1. https://web.archive.org/web/20100531002635/http://www.ema.europa.eu/pdfs/influenza/25590710en.pdf
=> https://web.archive.org/web/20100412091431/http://www.phac-aspc.gc.ca/alert-alerte/h1n1/vacc/addeve-fra.php

Comment se fait-il que personne ne se soit interrogé sur la véritable raison de l'explosion du nombre de patients et de morts aux urgences en février dernier, alors que le Canada détient le record du monde du taux de vaccination?

Pourquoi aucun Québécois n'est descendu dans la rue quand on nous a annoncé qu'il faudra payer pour se présenter aux urgences et qu'il faudra payer, de plus, une taxe de 200 $ par personne (référence-1) pour soutenir les efforts de la santé publique, alors que Santé Canada a dilapidé notre argent pour des vaccins inutiles, dangereux et mortels et que les gouvernements provincial et fédéral ont fait, cet automne, un cadeau de 60 millions de dollars à Glaxo-Smith-Kline pour les soutenir dans leurs efforts de modernisation ? (référence-2)

=> 1- *Budget du Quebec: les contribuables devront payer* - https://web.archive.org/web/20100401210102/ (+) http://biz.branchez-vous.com/actuaffaires/2010/03/budget_quebec_bachand_impot_taxe_tarif.html

=> 2 - *GlaxoSmithKline obtient 20M$ de Québec* - https://web.archive.org/web/20100109023603/http://www. (+) lesaffaires.com/secteurs-d-activite/biotechnologies-et-pharmaceutique/glaxosmithkline-obtient-20m-de-quebec/498273

Pourquoi le docteur Wakefield (célèbre gastro-entérologue anglais interviewé dans le documentaire «Silence, on vaccine») vient d'être condamné et rayé de l'ordre des médecins, alors qu'il avait non seulement établi un lien entre la vaccination ROR et l'autisme, mais aussi qu'il avait soulagé et guéri des centaines d'enfants de l'autisme dont ils étaient atteints ? (référence)

=> https://web.archive.org/web/20100426041152/http://linabmoreco.wordpress.com/2010/02/04/le-lancet-et-le-dr-wakefield/

Pourquoi les articles de ce même docteur ont-ils été retirés des archives du journal dans lequel il les avait publiés (Le Lancet), douze ans plus tard, alors que ses travaux avaient été validés par des comités d'experts indépendants avant publication?

Pourquoi aucun médecin n'avertit les parents du danger mortel que représente le vaccin contre la coqueluche? Pourquoi nous cache-t-on que 70 % des morts subites du nourrisson (cause du tiers des décès des enfants entre 0 et 1 an) surviennent dans les trois semaines qui suivent la vaccination contre la coqueluche? Pourquoi?

Pourquoi ne nous dit-on pas que le mercure présent dans les vaccins occasionnent des dégâts neurologiques irréversibles, rendant l'acquisition des compétences cognitives et intellectuelles beaucoup plus difficile ? Pourquoi personne ne fait-il le lien entre la dégénérescence progressive des enfants et l'alourdissement du calendrier vaccinal ? (référence)

=> https://web.archive.org/web/20100426041152/http://commons.ucalgary.ca/mercury/

Pourquoi persiste-t-on à nous présenter le vaccin contre le papillomavirus comme le miracle anti-cancer du col de l'utérus, alors qu'aucune étude au monde n'a démontré sa capacité à réduire ce cancer qui ne représente qu'un pourcent de la mortalité par cancer chez les femmes ? Pourquoi nous cache-t-on les centaines de morts et les nombreux effets secondaires de ce vaccin coûteux et totalement inutile, tandis qu'on l'impose systématiquement dans les écoles de nos enfants à partir de l'âge de 10 ans?

Plus que jamais, les québécois auront besoin de gens comme vous pour relayer des informations qui pourront les protéger de ces poisons hautement toxiques, lorsque la nouvelle campagne de peur s'abattra sur nous.

Restons debout et conscient, plus que jamais !

Cordialement,

THE FLU CASE

We must prepare for another round of forced vaccinations, argues Jean-Jacques Crevecoeur

The Flu Case, 3 May 2010, 11:50

https://web.archive.org/web/20100517152640/http://www.theflucase.com/index.php?option=com_content&view=article&id=3377%3Awe-must-prepare-for-another-round-of-forced-vaccinations-argues-jean-jacques-crevecoeur&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Dear Ladies and Gentlemen,

On 25th April 2010, we mark the first and sad anniversary of the beginning of the swine flu pandemic alert, renamed the Mexican flu, then the influenza A H1N1 The corrupt "experts" in the World Health Organisation promised us a holocaust worse than in 1918! And the puppets in Canada-Health (Santé-Canada) sought throughout the Fall to terrorize us, telling us that 25-35% of Quebec 's population would be affected by the dreaded virus.

A year later, you certainly don't want to hear any more about it. And I understand you. Me too, I want to be left in peace by this charade that has cost Canada (that is to say, us the taxpayers) more than one billion dollars. I want to return to what has always fascinated me, namely health, balance and fluidity.

However, whether we like it or not, the WHO is still taking us for utter idiots by denying the evidence of its state of corruption (see reference), but in addition, we are told that American health authorities and laboratories are accelerating the development of new techniques for vaccine production based on cancerous cell cultures (look forward to an explosion of cancers in the coming years) and based on the technique of genetic recombination (look forward to degenerate GMO human beings!) (see reference).

When you have read these two short articles, you will understand that we cannot take this information lightly. Because if we do nothing, this mandatory vaccination that we have narrowly escaped will come back and hit us much faster than we imagine, and without letting people launch warnings to alert the population this time …

I do not deny that I am extremely concerned and worried about what is going on. In this context, it is hard not to ask questions…

Why since late February, have several experts told us that the next pandemic (expected this fall) will see the arrival of a new virus, resulting from the hybridization of the avian influenza virus (H5N1 - highly virulent) and swine flu (H1N1 – highly contagious). How do they know?

Why did the French Ministry of Health ask Professor Bruno Lina (leader pf a biology laboratory in Lyon - France, advisor for Roselyne Bachelot and the WHO) to stop all ongoing work in order to focus on the hybridization of H5N1 and H1N1?

Why in Poland , where the courageous Minister of Health refused to order any vaccine, was the official number of victims of H1N1 2,6 deaths per million inhabitants, whereas in Canada, the figure is 12 deaths per million inhabitants?

Why, in Europe, did the vaccine manufactured by Glaxo-Smith-Kline have more side effects reported by millions of people (reference) than in Canada , although it was exactly the same vaccine, same composition and same dosage? Are they hiding things from us here in Canada? (ref)

How is it that no-one has questioned the real reason for the explosion in the number of patients and deaths in emergency wards last February, while Canada holds the world record for vaccination rates?

Why did no-one in Quebec come out and demonstrate in the street when they announced that we would have to pay for emergency health care and that we would have to pay in addition, a tax of 200 $ per person (reference) to support the efforts of public health, while Health Canada (Santé Canada) has squandered our money on unnecessary, dangerous and deadly vaccines, and that the provincial and federal governments have made, this fall, a gift of 60 million dollars to Glaxo-Smith-Kline to support them in their modernization efforts?

Why has Dr. Wakefield (a famous English gastroenterologist interviewed in the documentary «Silence, we're vaccinating») just been convicted and removed from the medical association, when he had not only established a link between the MMR vaccine and autism, but had also relieved and cured hundreds of children suffering from autism? (reference)

Why were the articles by this same doctor removed from the archives of the newspaper in which he had published them (*The Lancet*), twelve years afterwards, when his work had been validated by panels of independent experts before publication?

Why did no doctor warn parents of the mortal danger posed by the vaccine against whooping cough (pertussis)? Why do they hide from us that 70 % of sudden infant death syndrome (the third cause of death of children between 1 and 1 year) occur three weeks after vaccination against whooping cough (pertussis)? Why?

Why don't they tell us that the mercury present in vaccines causes irreversible neurological damage, making the acquisition of cognitive and intellectual skills much more difficult? Why does no-one establish a connection between the progressive degeneration of children and the increases in the vaccination schedule? (ref)

Why do they persist in presenting the vaccine against HPV as a miracle cure against cervical cancer, while no study has shown the world its ability to reduce this cancer, which accounts for only one percent of deaths from cancer among women? Why do they hide from us the hundreds of deaths and many adverse effects of an expensive and totally unnecessary vaccine, while it is consistently being imposed on our children's schools from the age of 10?

If you want answers to these questions (with all the scientific references), and many others, I invite you to participate in two activities that we have prepared, my wife and I. I NOW SPECIFY *that the information we will give during this conference and on the training session day is new*, compared to what we sent last fall during our lecture tour, in the thick of the battle against the H1N1 vaccination.

We have organised these activities because, more than ever, complete and independent information is our only weapon to counter propaganda and disinformation perpetrated by Canada-Health (Santé-Canada) officials.

More than ever, Quebec will need people like you to relay information that will protect them from these highly toxic poisons when the new campaign of fear befalls us.

Read this information and sign up quickly. We will hold these lectures and these days only once, in Montreal and Quebec.

Let us stand up and be aware, more than ever!

Jean-Jacques Crèvecœur"

INDEPENDENT

A year on, swine flu shows need for new vaccine technology

Independent, AFP, 24 April 2010, 00:00 BST
https://www.independent.co.uk/life-style/health-and-families/a-year-on-swine-flu-shows-need-for-new-vaccine-technology-5536978.html

A year after the emergence of swine flu, US health authorities and laboratories say the pandemic illustrated the need for new vaccine production techniques that are faster and more reliable.

At present, vaccines like the one used against the swine flu are developed inside eggs, into which scientists implant a weakened version of the virus that will grow into a form suitable for inoculation.

But that process is relatively slow and unpredictable, and experts say the future lies in developing vaccines at the cell and DNA-level.

"We have never been in a stronger position to create new and better vaccines," US Health and Human Services Secretary Kathleen Sebelius said this week on the anniversary of the discovery of the A(H1N1) virus.

The swine flu pandemic illustrated the need "to bring the technology of influenza vaccine development and manufacture into the 21st century," said Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, part of the National Institutes of Health.

The US government is now partnering with the private sector and investing billions of dollars into research to foster new vaccine development methods in time for future pandemics, Fauci told AFP in an interview.

He said US laboratories were able to quickly identify the A(H1N1) virus, isolate a "seed" for implantation in eggs and carry out clinical trials.

But despite their speed, they failed to produce the number of vaccine doses expected because growing the vaccine remained so slow.

"It's still a fragile technology, it's subject to vicissitudes that are beyond the control of the people that are making the vaccine," said Fauci. "Unfortunately that's what happened," he added. "We were fortunate that a single dose worked."

He said bringing vaccine development "into the 21st century" would occur in two phases.

"The first phase is to make a conversion from growing viruses in eggs to growing viruses in cells, which is much more reliable, and being able to scale up," he said.

Cell-based development of vaccines is still not a speedy process, Fauci said. But the development of vaccines in eggs can take between six and nine months, and cell-based vaccine development is much more reliable.

Eventually, the second phase of perfecting production techniques will be a move to so-called recombinant DNA technology, where pieces of different DNA strands are combined.

The technology would eliminate the need for scientists to grow the target virus in order to extract a vaccine, speeding up the process to as little as two months, Fauci said.

Informed by its experience with the swine flu pandemic, the US government is now partnering with the private sector to speed the emergence of quicker and more reliable vaccine development methods.

Fauci cited a partnership with Novartis, which has built a plant for the production of cell-based flu vaccines in North Carolina.

"It will be a gradual process," he said. "In the next year or so, you will be seeing some of these recombinant products ready to be used in humans."

Another field of continued research is a so-called "universal vaccine" for influenza.

"That's the Holy Grail," Fauci, adding that it wasn't likely to emerge for another five to 10 years, though he remained hopeful. "I think it's possible," he said.

SWEDEN'S NEWS IN ENGLISH

Swine flu bill tops 900 million kronor

The Local, 5 May 2010, 15:10 CET
https://web.archive.org/web/20100508144653/http://www.thelocal.se/26474/20100505

The swine flu vaccine is set to cost the Swedish tax payer 900 million kronor ($121 million), according to new figures released by the National Board of Health and Welfare.

The figure is 300 million kronor less than forecast after the vaccine's manufacturer Glaxo Smith Kline (GSK) agreed to cut the number of supplied doses by 25 percent from 18 to 13.5 million doses.

Since the launch of the mass vaccination programme last autumn six million doses have been used, with the remaining seven million doses held in central reserve in the instance of a new outbreak.

"It is a good guarantee for the future and a good base," said Anders Tegnell at the board.

According to the agreement with GSK the firm has committed itself to upgrading the existing vaccine stocks if the virus changes or if another strain of influenza develops into a pandemic.

Furthermore the portion of the vaccine that helps to strengthen the immune system will be replaced at no cost if it is shown that it expires within three years.

The pandemic petered out in December after a peak in the late autumn but despite the anti-climax, Tegnell defended the decision to offer the vaccine to everyone.

"We have learnt just how unpredictable pandemics can be," he said.

SPIEGEL Wissenschaft

Bundesländern droht Millionenverlust durch Impfstoff-Überschuss

Spiegel, 7 May 2010, 08.43 Uhr
https://www.spiegel.de/wissenschaft/medizin/schweinegrippe-bundeslaendern-droht-millionenverlust-durch-impfstoff-ueberschuss-a-693500.html

Die Restbestände an Schweinegrippe-Impfstoff werden zum finanziellen Risiko für die Länderkassen. Sollten die Schutzmittel ihre Wirkung verlieren, droht ein Verlust von einer Viertelmilliarde Euro. Fieberhaft wird deswegen nach einem Abnehmer im Ausland gesucht - bislang ohne Erfolg.

Essen - Die befürchtete Schweinegrippe-Pandemie ist in Deutschland ausgeblieben. Doch nun sitzen die Bundesländer auf zahlreichen ungenutzten Impfdosen, die zu einer finanziellen Belastung für die Kassen werden könnten. Wegen der übermäßigen Bestellung drohe den Ländern ein finanzieller Verlust von mehr als 250 Millionen Euro, berichten die Zeitungen der WAZ-Gruppe am Freitag.

Allein Nordrhein-Westfalen habe 6,4 Millionen Impfdosen im Wert von 53,3 Millionen Euro auf Lager, hieß es. An Rhein und Ruhr ließen sich demnach nur knapp eine Million Menschen gegen die Schweinegrippe impfen.

Bundesweit blieben die Behörden auf rund 30 Millionen Impfdosen sitzen, weil sich viel weniger Bürger als ursprünglich angenommen schützen ließen. Die Uhr tickt: Spätestens Mitte 2011 läuft die Haltbarkeit des Serums ab. Dann wären die Mittel unbrauchbar.

Mögliche Verkäufer machen Rückzieher

Alle Bemühungen, wenigstens einen Teil des Serums ins Ausland zu verkaufen, seien vorerst gescheitert, sagte eine Sprecherin des niedersächsischen Gesundheitsministeriums. "Es brennt nicht. Es gibt zurzeit keine Interessenten." Niedersachsen hat derzeit den Vorsitz der Gesundheitsministerkonferenz und sucht bereits seit Januar im Namen aller 16 Bundesländer nach Abnehmern für den überschüssigen Grippeschutz.

Dem Bericht zufolge hatten Staaten wie Albanien, Moldawien, Mazedonien, der Kosovo und die Mongolei zunächst Interesse gezeigt. Sie machten aber einen Rückzieher, als die Angst vor der Schweinegrippe deutlich abgenommen hatte.

Nun hoffen die Länder, wenigstens einen Teil des Serums im Herbst zu Geld machen zu können. Experten untersuchten derzeit, ob der Impfstoff auch gegen die saisonale Grippe eingesetzt werden könne.

German government looks to give swine flu jab to people as regular flu shot

The Flu Case, 8 May 2010
https://web.archive.org/web/20100517160459/http://www.theflucase.com/index.php?option=com_content&view=article&id=3435%3Agerman-government-looks-to-give-swine-flu-jab-to-people-as-regular-flu-shot&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The untested swine flu vaccine could be given to Germans as a regular seasonal flu jab later this year, according to Der Spiegel. Gerrman government officials are looking to see if they can shift surplus stocks of swine flu vaccines by using them as flu jabs before the expiration date is reached in the middle of 2011 at the latest, reports Der Spiegel.

The German government is sitting on 30 million unused jabs after people refused to take the untested and toxic vaccine for the mild swine flu. No country has offered to buy the surplus stocks.

The cost to the German tax payer of the unused jabs is an estimated 250 million euros.

The swine flu jab contains squalene believed to cause the Gulf War Syndrome and is allowed to be used in Europe and the USA even though there is inadequate clinical studies data showing its safety only because WHO has declared a pandemic emergency level 6.

It is not clear how the swine flu jab can be interchanged with the seasonal flu jab -- also because people who take the swine flu jab have to sign special consent forms.

Klaus Stöhr

Vaccinate before the next pandemic?

Nature, 12 May 2010; 465, 161
https://doi.org/10.1038/465161a // https://www.nature.com/articles/465161a#citeas

Klaus Stöhr of Novartis argues that pre-pandemic immunization with a cocktail of likely strains could be a cheap, practical and equitable way to protect people against influenza.

The past 12 months are testimony that alternative ways are needed to prepare for pandemics. When swine influenza spread around the world from Mexico during April and May last year, governments and vaccine producers faced the same dilemma: no one knew how much vaccine to order or produce. There was little option but to prepare for the worst, because it takes at least six months to produce significant quantities of vaccine. Several companies, including Novartis, stepped up preparations in May. By the time the World Health Organization (WHO) declared the outbreak a pandemic in June[1], manufacturers were geared up to maximum capacity.

By December, with the outbreak already past its second peak, 495 million doses had been made – a record rate of production, yet only enough to cover 10% of the world's population. The WHO estimates that by June 2010 global supply will have reached around 1.3 billion doses, far too little too late if the worst forecasts had played out. Had that happened, governments would have been blamed for not securing more pandemic vaccine earlier. Yet many governments are now being criticized for squandering taxpayers' money on supplies that were not needed.

There is no sign that global equitable access to influenza vaccines could be established any time soon[2]. And if it was, how could it be successful if the limited supply was only reallocated and not increased?

A different approach is needed. An increasingly discussed method is to immunize people against pandemic-type viruses before a pandemic strikes. This could limit the spread of the virus in the early stages of a pandemic and significantly reduce the peak demand for vaccine. It would thus free up supply for countries where vaccination is patchy, or that do not have the infrastructure or budget to purchase any vaccine.

Existing infrastructure

Pre-pandemic immunization could be done cost-effectively via existing immunization infrastructure. For example, where there is universal seasonal immunization, such as in the United States and Ontario, pandemic-type vaccines could be added to and administered with seasonal vaccines; other regions could offer them as stand-alone formulations. A more radical suggestion is to add pandemic antigens to routine child-immunization programmes, a method likely to work best in developing countries that do not have regular adult-immunization programmes. People may need immunizing only once or twice to get at least some protection from a virus for years or even for life. Furthermore, vaccinating 20% of a population before a pandemic would prevent as many cases as vaccinating 60% after the first wave has struck, because it could mean that a certain number of people would never get infected and would not pass on the virus (see graphic).

Pre-pandemic vaccination has been controversial for two major reasons. The first is efficacy, because there is no way of telling which influenza subtype will hit next. Pre-pandemic formulations would contain a cocktail of strains most likely to cause the next pandemic, generally agreed to be H2, H5, H7 and H9. They should also enhance the effectiveness of the antigens by including adjuvants designed to provoke a long-term immune response to a range of virus subtypes, even viruses genetically different from the original strain[3]. Studies are ongoing on two further important questions: how long people remain protected after being primed with a pre-pandemic vaccine; and whether giving several antigens together interferes with the length of the immune response.

The other main concern is safety. Adequate safety data are lacking on the large-scale, repetitive and long-term use of recently approved adjuvants, but the use of millions of doses of adjuvant-containing vaccine in the recent H1N1 pandemic has helped to plug that gap. In March, the European Medicines Agency reported that since October more than 42 million Europeans, nearly half a million of whom were pregnant, had been vaccinated with one of the three pandemic vaccines authorized for use in the European Union, with no more adverse reactions than would be expected from a seasonal influenza vaccine[4]. And by the end of last year, more than 10 H1 vaccines were developed through clinical trials involving tens of thousands of subjects around the world, again with safety profiles comparable to seasonal flu vaccines.

Political difficulties

Despite the compelling case for pre-pandemic immunization, few public-health decision-makers are taking it seriously. Spending money on a medical threat that hasn't yet materialized is politically difficult and requires strong justification. Integrating pre-pandemic immunization into existing immunization programmes around the world would also take several years.

Yet the stage is set for a global public-health leader to carry out an in-depth assessment into the practicalities and cost-effectiveness of this approach and its long-term effect on public health. I invite those who find it unsurprising that an employee of a leading vaccine-producer holds this view to come up with alternative solutions to the sobering reality of 'too-little-too-late' supply when vaccine production begins after a pandemic strain emerges. One thing is clear: something has to change, because the current approach would leave at least 80% of the world's population unprotected in the face of a new pandemic, most of them in developing countries – and that is unacceptable.

Proposal for prepandemic vaccination sparks discussion

CIDRAP, 13 May 2010
https://www.cidrap.umn.edu/h1n1-2009-pandemic-influenza/proposal-prepandemic-vaccination-sparks-discussion

May 13, 2010 (CIDRAP News) – An influenza expert who formerly headed the World Health Organization's (WHO's) flu program and now works for Novartis has suggested developing a prepandemic vaccine to get the jump on the next flu pandemic – an idea that other experts are greeting with caution or skepticism.

Dr. Klaus Stohr, former director of the WHO's Global Influenza Programme, proposes developing a vaccine containing a "cocktail" of flu strains deemed likely to cause the next pandemic, along with an adjuvant (immune-system stimulant). He presents the idea in an opinion article released online yesterday by *Nature.*

The idea of prepandemic vaccination has been around for years, fueled by some studies suggesting that adjuvants can make flu vaccines protective against more than just the specific viral strain they are based on. But because of the many uncertainties facing such an approach – including safety questions and the unpredictable timing of pandemics – it has never gained much traction.

Stohr says prepandemic vaccination would help address the problem that when a pandemic virus emerges, it takes about 6 months to develop and produce a well-matched vaccine for it – as was demonstrated last year with the pandemic H1N1 virus. He says this approach could also help mitigate the huge shortage of production capacity to meet global needs.

Stohr is vice president of influenza strategy at Novartis Vaccines and Diagnostics in Cambridge, Mass. The company makes flu vaccines and the adjuvant MF59, which is used in the Focetria vaccine for pandemic H1N1, licensed in Europe.

"An increasingly discussed method is to immunize people against pandemic-type viruses before a pandemic strikes," Stohr writes. "This could limit the spread of the virus in the early stages of a pandemic and significantly reduce the peak demand for vaccine. It would thus free up supply for countries where vaccination is patchy, or that do not have the infrastructure or budget to purchase any vaccine."

He suggests a prepandemic vaccine could contain H2, H5, H7, and H9 flu subtypes, plus adjuvants "designed to provoke a long-term immune response to a range of virus subtypes, even viruses different from the original strain."

Stohr says prepandemic vaccine could be added to or given along with seasonal flu vaccines in countries where seasonal vaccination is recommended for nearly everyone. Another option, particularly for developing countries, would be to include the prepandemic vaccine in routine childhood immunizations, he writes.

He acknowledges that few public health leaders take the idea of prepandemic vaccination seriously but says it deserves careful study. "I invite those who find it unsurprising that an employee

of a leading vaccine producer holds this view to come up with alternative solutions to the sobering reality of 'too-little-too-late' supply" in the event of a pandemic, he states.

Views of other experts

Other experts who spoke with CIDRAP News about Stohr's article agreed that new approaches are needed to solve the problem of providing pandemic flu vaccines, but they said the strategy would face serious obstacles, including possible public rejection of an adjuvanted vaccine against an uncertain future threat.

Dr. Gregory A. Poland, director of the Mayo Clinic's Vaccine Research Group in Rochester, Minn., said, "I think he's right in raising an important issue, and it's worth study and consideration, recognizing that it would raise a host of scientific questions that would have to be answered before we embark on it. . . . The thinking is right in that we need to do something innovative, because what we know to do is insufficient."

He said one form of prepandemic vaccination that might be considered would be to include a vaccine against one potential pandemic subtype in the seasonal flu vaccine each year, along with an adjuvant.

Including an adjuvant in the vaccine would be necessary because otherwise it would not generate sufficient long-term immune memory, Poland said. But using an adjuvant would raise safety questions, since adjuvanted flu vaccines have not been used widely, and not at all in the United States.

He said the public is likely to be skeptical about the need for and safety of a prepandemic vaccine. The pandemic H1N1 vaccine "was basically identical in safety to standard seasonal vaccine, and yet all sorts of safety misconceptions and fears were widely promoted, with no evidence," he commented.

Michael T. Osterholm, PhD, MPH, public health expert and director of the University of Minnesota Center for Infectious Disease Research and Policy, which publishes CIDRAP News, called Stohr's suggestion "not really practical."

One problem is that a vaccine against a given flu subtype does not guarantee protection against another strain of the same subtype, as was demonstrated in the H1N1 pandemic, he said. Vaccination against the seasonal H1N1 virus was not found to confer significant protection against the pandemic virus.

As to the assertion that adjuvants may provide some protection against flu strains other than what's in the vaccine, Osterholm said, "But the problem is that even if this is scientifically true, we learned [in the H1N1 pandemic] that the use of adjuvants might be a major deterrent to a large segment of the population even taking the vaccine, because of safety concerns." (In Europe, public reluctance to take the H1N1 vaccines was attributed in part to the use of adjuvants, which were seen as a new technology.)

Further, the production capacity to make a prepandemic vaccine is lacking, and it's not clear that money would be available. "I'm not convinced at this point that if you launched such a program the funding would be there," he said.

"I think the bottom line is we need new influenza vaccines that have heterotypic [broader] subtype protection, but I'm not convinced that they're going to be the same old vaccines," Osterholm said. He said that goal may require a vaccine that targets a viral comoponent other than the traditional antigen, hemagglutinin, and that induces both humoral and cellular immunity.

John Treanor, MD, a vaccine researcher at the University of Rochester in New York, noted that the idea of "priming" the population with a prepandemic vaccine has been under discussion for a while. He is a professor of medicine and of microbiology and immunology.

"There's some data that one thing that could work would be to prime people with a single vaccine now and then boost them with the pandemic strain that could emerge in the future," he said, adding that the priming vaccine could be part of routine immunizations.

Concerning whether adjuvants would make a vaccine sufficiently broadly protective to justify prepandemic vaccination, Treanor said, "I think that's a very complicated question; it's hard to say definitively one way or the other. There's a lot of data that say that adjuvants would be useful. Does that mean we should vaccinate the whole world with adjuvanted flu vaccines? I don't know. These are difficult issues."

From a practical point of view, the biggest advantage of adjuvants is that they lower the dose of vaccine needed, stretching the supply, Treanor said. The use of adjuvants and low-dose flu vaccines could be an important strategy for battling flu in developing countries, he observed.

"There's a good argument to say this [prepandemic vaccination] is the way to go, but you have to realize that he [Stohr] represents a company that makes the adjuvanted influenza vaccine that he's saying should be given to the entire world," Treanor commented.

Stohr K. Vaccinate before the next pandemic? (Commentary) Nature 2010 May 13; 465 (7295): 161

Daniel Purt

Former WHO flu head calls for development of pandemic flu vaccine

Vaccine News Daily, 15 May 2010
https://web.archive.org/web/20101129123814/http://vaccinenewsdaily.com/news/213057-former-who-flu-head-calls-for-development-of-pandemic-flu-vaccine

CIDRAP News reports that the former head of the World Health Organization's flu program, Dr. Klaus Stohr, believes scientists should attempt to develop a prepandemic vaccine in an effort to "get the jump" on the next flu pandemic.

The report states that the idea was met with skepticism by other experts in the field.

Stohr, according to the report, now works for Novartis. In an opinion article recently published in the journal Nature, Stohr wrote that an effort should be made to pair an immune-system stimulant with a "cocktail" of flu strains that might be the next cause of a pandemic outbreak.

The report states that the idea has been floated previously, but safety concerns and the unpredictable nature of a pandemic flu have been some of several reasons the idea has not gone far past the drawing board.

The report states that Stohr believes such a vaccine would help alter the current response to a pandemic, such as the H1NI virus, which he said involves waiting for one to arise and then taking half a year to create a vaccine capable of fighting it off.

"An increasingly discussed method is to immunize people against pandemic-type viruses before a pandemic strikes," Stohr wrote, according to CIDRAP News. "This could limit the spread of the virus in the early stages of a pandemic and significantly reduce the peak demand for vaccine. It would thus free up supply for countries where vaccination is patchy, or that do not have the infrastructure or budget to purchase any vaccine."

While scientists generally agree that new efforts must be made to prevent and contain pandemics, Michael T. Osterholm, PhD, MPH, public health expert and director of the University of Minnesota Center for Infectious Disease Research and Policy, which publishes CIDRAP News, called Stohr's suggestion "not really practical."

Le Point

Grippe H1N1: il reste 10 millions de doses utilisables d'ici décembre

Le Point, (AFP), 10 June 2010, 16:41
https://www.lepoint.fr/societe/grippe-h1n1-il-reste-10-millions-de-doses-utilisables-d-ici-a-decembre-10-06-2010-465412_23.php

Paris – Il reste entre 20 et 25 millions de doses de vaccins contre la grippe H1N1 dans les stocks, dont quelque 10 millions sont utilisables jusqu'à la fin de l'année 2010, a indiqué jeudi Didier Houssin, directeur général de la santé, devant une commission d'enquête de l'assemblée.

Devant la commission d'enquête sur la gestion de la vaccination, M. Houssin a précisé qu'il restait 9,7 millions de vaccins Pandemrix (GlaxosmithKline), 9,3 millions de Panenza (Sanofi-Pasteur), 2,9 de Focetria (Novartis) et 15.000 de Celvapan (Baxter).

De ces quantités, environ 10 millions sont utilisables jusqu'à la fin de l'année, les autres ayant des dates de péremption plus précoces, a-t-il dit.

Il a reconnu aussi que les négociations étaient toujours en cours avec GSK pour les compensations à verser suite à l'annulation de commandes de vaccins.

Plus de la moitié du total des 94 millions de doses commandées l'avaient été auprès de ce laboratoire. Sur la base d'une compensation équivalant à 16% des contrats, le ministère de la Santé a estimé à 48 millions d'euros le coût total des indemnités à verser, mais, a dit le Pr Houssin, "on ne peut pas affirmer avec certitude" que ça reste à ce niveau-là à l'issue des négociations avec GSK.

A propos des chiffres avancés dimanche par la ministre de la Santé Roselyne Bachelot, qui avait estimé à quelque 500 millions d'euros le coût total de la campagne, incluant les 48 millions d'euros de dédit pour les laboratoires, il a rappelé qu'il n'incluait pas les 73 millions d'euros des vaccins donnés à l'Organisation mondiale de la santé.

Ce chiffre de 500 millions ne concerne que la campagne vaccinale, et non celle liée à la pandémie, c'est-à-dire les masques, les antiviraux, les respirateurs, la communication...

Toutes données incluses, le chiffre fourni à la Cour des comptes a été en mai de 700 millions d'euros, mais devrait être un peu inférieur selon M. Houssin, du fait d'une baisse de l'estimation des dépenses pour les professionnels de santé.

Le Pr Houssin a admis aussi qu'il allait falloir "réexaminer" le plan national de lutte contre la pandémie grippale en le présentant différemment, sous forme de "questionnements aux gestionnaires de crise", du type "Vous êtes dans cette situation, voici les questions qu'il faut vous poser et le guide mis a votre disposition". "Il y a des points d'amélioration incontestables", a-t-il noté.

WHO chief says H1N1 flu pandemic is over

Reuters, 10 August 2010

https://web.archive.org/web/20221115034321/https://www.reuters.com/article/idINIndia-50750620100810

GENEVA (Reuters) - The H1N1 pandemic is over and the global outbreak turned out to be much less severe than was feared just over a year ago, the head of the World Health Organization (WHO) said on Tuesday.

WHO director-general Margaret Chan once again rebutted criticism that the United Nations agency had hyped the first pandemic in more than 40 years, whose mildness left some Western governments holding huge stockpiles of unused vaccines.

The Hong Kong public health expert said the world had been lucky the H1N1 virus had not mutated into a more deadly form and that a safe vaccine developed in record time remained effective against it.

"We are now moving into the post-pandemic period. The new H1N1 virus has largely run its course," Chan said.

"That was the right call," she said, defending the decision taken in June last year to declare a pandemic.

The swine flu virus will continue to circulate as part of seasonal influenza for years to come, requiring health authorities to remain vigilant, she told a news conference.

It still threatens high-risk groups including pregnant women who would benefit from vaccination, she said.

Stockpiled H1N1 vaccines remain effective against the strain and so far the virus has not developed widespread resistance to the antiviral oseltamivir, the best treatment, she said.

The WHO's downgrading of the H1N1 outbreak to "post-pandemic" was based on recommendations by external influenza experts who conducted a review earlier in the day.

"I think even if we see severe outbreaks occurring in some countries – which is still definitely possible – that the global threat is really much lower and much different than a year ago," Keiji Fukuda, WHO's top flu expert, told reporters.

Continued Vigilance

In June 2009, the WHO said a new swine flu virus, H1N1, that emerged in the United States and Mexico and spread around the world in six weeks, was the first pandemic since 1968. A full pandemic corresponds to phase 6 on the WHO's six-point scale.

"We need to continue to maintain our vigilance and not be complacent," Chan said, noting that outbreaks continued in countries including India and New Zealand.

The behavior of influenza viruses is notoriously difficult to predict and no two pandemics are alike, flu experts say.

“I am very pleased that European member states prepared for something worse. I’d rather have it go that way than their planning for less or not being prepared at all,” Angus Nicoll, influenza program coordinator at the European Center for Disease Prevention and Control, told Reuters Tuesday.

The WHO has also rejected allegations that it acted under the influence of drug companies in declaring a pandemic.

Chan said that three viruses were now circulating as part of a “mixed virus pattern” in many countries, typically seen during seasonal epidemics. These were H1N1 and H3N2 -- both type ‘A’ influenza -- as well as type ‘B’.

Either H1N1 vaccine or a trivalent (triple shot) vaccine against the three strains should be used to inoculate those at risk, depending on their availability, she said.

“Pandemic and seasonal vaccine in both hemispheres confer the same protection (against H1N1),” Fukuda said.

An estimated 350 million people worldwide have been vaccinated against H1N1, he said.

Dozens of companies make influenza vaccines, including Sanofi-Aventis SASY.PA, GlaxoSmith Kline GSK.L, Novartis NOVN.VX, AstraZeneca AZN.L and CSL CSL.AX. Roche DNA makes the frontline antiviral oseltamivir, marketed as Tamiflu.

The U.S. Centers for Disease Control and Prevention said the WHO pronouncement will not alter U.S. plans for the upcoming flu season. The CDC recommends that everyone over 6 months of age be vaccinated against seasonal flu this year, the most universal recommendation yet for flu vaccines.

SPIEGEL Wissenschaft

Bund und Länder streiten über Millionenkosten

Spiegel, 11 August 2010, 12.23 Uhr
https://www.spiegel.de/wissenschaft/medizin/schweinegrippe-impfstoffe-bund-und-laender-streiten-ueber-millionenkosten-a-711246.html

Rund 30 Millionen ungenutzte Impfdosen gegen die Schweinegrippe gibt es noch in Deutschland. Nun ist die Seuche offiziell vorbei - und die Bundesländer befürchten, auf den Millionenkosten sitzenzubleiben. Ein Krisentreffen soll Abhilfe bringen.

Seit Dienstag ist die Schweinegrippe-Pandemie offiziell vorbei: Die Weltgesundheitsorganisation hat die Infektions-Warnstufe gesenkt.
https://www.spiegel.de/wissenschaft/medizin/who-schweinegrippen-pandemie-ist-offiziell-zu-ende-a-711180.html

Doch was passiert jetzt mit den überschüssigen Impfstoffdosen, die in den Lagern der deutschen Bundesländer auf ihren Einsatz warten? Weil sich nur ein Bruchteil der Bevölkerung impfen ließ (siehe Tabelle unten), dürften noch rund 30 Millionen Dosen übrig sein - auch wenn genaue Zahlen derzeit schwer zu beschaffen sind.

Die Bundesländer haben den Impfstoff gekauft und befürchten, auf den Millionenkosten sitzenzubleiben - weil die Krankenkassen nur für tatsächlich geleistete Impfungen zahlen. Nun haben die Länder ein Krisentreffen mit dem Bund angesetzt. Am Donnerstag trifft sich die aktuelle Chefin der Gesundheitsministerkonferenz, Aygül Özkan aus Niedersachsen, dazu mit Eckart von Klaeden, Staatsminister im Bundeskanzleramt. "Der Bund soll die Kosten für den nicht verimpften Impfstoff übernehmen", fordert Özkans Sprecher Thomas Spieker schon jetzt.

Nach einem Bericht der "Frankfurter Allgemeinen" besitzt etwa Baden-Württemberg noch 3,7 von 4,2 Millionen Impfdosen. Der Wert der ungenutzten Vakzine belaufe sich auf 35 Millionen Euro. In Nordrhein-Westfalen sei Wirkstoff im Wert von 50 Millionen Euro nicht genutzt worden.

Wird der Bund einen Teil davon übernehmen? Und welche Kosten werden die Länder am Ende selbst schultern? "Es ist eine Frage der Fairness, die Höhe der Forderungen dem Gesprächspartner selbst als Erstes kundzutun", sagt der niedersächsische Ministeriumssprecher Spieker. Im Grundsatz fordern die Länder vom Bund, aus "nationaler Verantwortung" die Kosten der Impfung zu übernehmen. Einen entsprechenden Beschluss hat die Gesundheitsministerkonferenz zuletzt Anfang Juli getroffen. In Zukunft, so die Forderung, solle sich der Bund außerdem komplett um die Pandemievorsorge kümmern. Das betreffe die Versorgung sowohl mit Arzneimitteln als auch mit Impfstoffen.

Die Hoffnung der Länder, ein Teil des überschüssigen Impfstoffs könne in der kommenden Grippesaison zum Einsatz kommen, hat sich inzwischen erledigt. Der empfohlene neue Impfstoff umfasst sowohl die Schweinegrippe als auch die normale saisonale Grippe. Eine gesonderte Impfung ist nicht mehr nötig.

Quellen: Gesundheitsministerium Niedersachsen, Wikipedia; Stand: Mai 2010

Anmerkung der Redaktion: In einer früheren Version des Textes hieß es fälschlicherweise, die Chefin der Gesundheitsministerkonferenz werde sich mit Vertretern des Bundesgesundheitsministeriums und nicht des Kanzleramts treffen. Wir bitten, den Fehler zu entschuldigen.

Ungenutzter Impfstoff kostet Berlin Millionen

Berliner Morgenpost, 13 September 2010, 08:44
https://web.archive.org/web/20220119221351/https://www.morgenpost.de/berlin-aktuell/article104631694/Ungenutzter-Impfstoff-kostet-Berlin-Millionen.html

Berlin muss Millionen für den Impfstoff gegen das Schweinegrippe-Virus H1N1 zahlen - Impfstoff, den niemand wollte. Dafür wird nun unter anderem an der Sanierung der DRK-Kliniken gespart.

Die Schweinegrippe und die weitgehend unterbliebene Massenimpfung der Bevölkerung als Schutz vor dem Ausbruch einer Pandemie haben das Land Berlin 10,7 Millionen Euro gekostet. Hinzu kommen weitere 2,5 Millionen Euro, die die regionalen Krankenversicherungen und Beihilfestellen tragen müssen.

Das geht aus einem Bericht von Gesundheitsstaatssekretär Benjamin Hoff (Linke) ans Abgeordnetenhaus hervor. Da der Bund die Kosten absehbar nicht übernehmen werde, müssen die Kosten für den nicht verwendeten Impfstoff durch das Land Berlin getragen werden, heißt es darin. Das Geld muss bezahlt werden, auch wenn nur ein Bruchteil der beschafften Impfdosen tatsächlich genutzt wurde, um Menschen vor der Schweinegrippe zu schützen. Versuche des Landes Niedersachsen, das der Gesundheitsministerkonferenz derzeit vorsitzt, die Medikamente zu verkaufen, sind gescheitert.

Auf dem Höhepunkt der Schweinegrippendebatte im Juni 2009 waren die Gesundheitsminister der Länder davon ausgegangen, 30 Prozent der Bevölkerung zweimalig impfen zu müssen. Für Berlin hätte das zwei Millionen Impfdosen bedeutet, die jeweils acht Euro kosten. Die Kosten für das Mittel des Pharmakonzerns GlaxoSmithKline hätten sich auf 17 Millionen Euro belaufen.

Als man feststellte, dass es doch ausreiche, die Menschen nur einmal zu impfen, reduzierten die Gesundheitsminister die Bestellung von zunächst 50 Millionen Dosen bundesweit auf 34 Millionen Portionen des Impfstoffes Pandemrix. Berlin hat sich verpflichtet, davon 1,4 Millionen Dosen abzunehmen und zu bezahlen.

Nach dem Beginn der Impfungen gegen das H1N1-Virus wurden schließlich 737.000 Dosen nach Berlin geliefert. 272.000 Dosen Pandemrix lieferte die Gesundheitsverwaltung an Arztpraxen und andere Impfstellen aus. Tatsächlich verabreichten die Mediziner aber nur 152.000 Impfungen. 120.000 Portionen liegen noch in den Praxen oder wurden inzwischen entsorgt. Der Berliner Senat sitzt derzeit auf 464.000 Impfdosen Pandemrix sowie 5200 Dosen des für Schwangere beschafften Mittels CSL.

Das Dilemma Berlins, für die nicht benötigten Vorsichtsmaßnahmen nun teuer zur Kasse gebeten zu werden, teilen alle Bundesländer, die im vergangenen Jahr einen gemeinsamen Fonds zum Ankauf eines Großteils des flüssigen Impfstoffs bei den Herstellern gegründet haben. Laut dem Bericht ans Abgeordnetenhaus lagern noch 16,1 Millionen Impfdosen zentral, darunter sind auch die 664.000 Dosen, die Berlin nie erreicht haben, für die der Senat aber dennoch bezahlen muss.

Ein Teil der in Berlin benötigten Summe bringt die Gesundheitsverwaltung aus ihrem eigenen Haushalt auf. So werden 690.000 Euro eingebracht, die eigentlich für den zweiten Bauabschnitt bei der Sanierung der DRK Kliniken Köpenick geplant waren. Auch der Berliner Betrieb für zentrale gesundheitliche Aufgaben muss mit einem um 200.000 Euro abgesenkten Zuschuss auskommen. Den Löwenanteil der 10,7 Millionen übernimmt jedoch der Finanzsenator, der Gewinnabführungen landeseigener Unternehmen nutzt, um die Kosten zu decken.

Denis Campbell and Sarah Boseley

Swine flu: top doctor warns of crisis as few have H1N1 jab

The Guardian, 21 December 2010, 21.06 GMT

'Shockingly few' health professionals have been vaccinated as more than 300 people lie in critical care beds

The NHS may become unable to cope with the rapid spread of influenza because shockingly few people, including health professionals, have been vaccinated, a senior doctor warns today.

Professor Steve Field, who until last month was the chairman of the Royal College of General Practitioners, spoke out as the Department of Health revealed there are more than 300 people in critical care beds with flu and 17 people have died.

Field said the decision not to encourage the public to have a jab to protect themselves was "ill-advised" and needed to be urgently reversed.

The NHS should have acted more decisively to encourage people to have the jab because it was known that H1N1 swine flu was still circulating and that few NHS staff had the swine flu vaccine when it was offered to them late last year.

"Rates of uptake are shockingly low," said Field. "It was ill-advised not to have the public awareness campaign on seasonal flu jab uptake that we usually have, because we knew that the public and healthcare professionals were likely to become complacent after last year's swine flu pandemic wasn't the serious attack on the country that we thought it could be. With the added winter pressures on the NHS, we need NHS staff to be vaccinated as soon as possible, so that they can continue working,and we also need pregnant women and people who are vulnerable to have a flu jab that includes the swine flu vaccine as soon as possible."

He warned that there could be big problems after Christmas as the numbers build. "This is getting to the point where it's becoming an emergency for the public's health and also the NHS's ability to cope, and we want to avoid that," he said.

Yesterday, health secretary Andrew Lansley briefed the cabinet on flu and told colleagues the NHS had plenty of capacity to cope with an upsurge in cases. David Cameron told a press conference at Downing Street that the flu figures were a little worse than last year, but that despite a doubling of cases in the last week, the Department of Health had things under control. "I think there is a very good grip in the Department of Health on this issue. Andrew Lansley has a great grip over that department," he said.

The government's interim chief medical officer, Sally Davies, said at a briefing that England was experiencing a normal flu season. It was "just winter flu" but with swine flu as the dominant strain. "We have not got a pandemic," she said.

Of the 17 deaths so far, 14 have been confirmed as due to swine flu and none of the victims have been 65 or over. Eight are known to have been considered "at risk", such as people with asthma or heart problems – but that leaves nine who appear to have been previously healthy.

Most of those now in critical care are younger than is usual for a flu outbreak. While 23 of the 302 are aged 65 or over, 243 are aged 16 to 64. There are 12 children between the ages of five and 15 and 24 under-fives.

Take-up of the flu vaccine, which includes H1N1, has been very slow. Last year, on the back of the flu pandemic, the government spent £177,573 on advertising to persuade the elderly and those in at-risk groups to come forward.

This year, it was left to primary care trusts and GPs to tell people the vaccine was available. Davies said the Department of Health had been constrained by government spending curbs. "The government freeze on media meant we had to decide how best to use our resources, which were ploughed into local campaigns and local work. At the end of the winter we will have to assess where we are for future years," she said.

Professor Lindsey Davies, president of the UK Faculty of Public Health, said not enough had been done to persuade people to be vaccinated. "It may well be that the lack of a national campaign is making the difference to the take-up at the moment, and that's regrettable." It was "disappointing" that last year's Catch It, Bin It, Kill It anti-swine flu campaign had not been continued, she added.

The shadow health secretary, John Healey, said the government needed to "get a grip" on the outbreak. Lansley had been , suggesting he had been obsessed with reorganising the NHS and had "The only attention he's paid to the preparations for this winter's flu outbreak is to axe the autumn advertising campaign to encourage people to get vaccinated and make them aware of the risks. He made the wrong judgement and it's "left too many people without the flu protection they should have".," he said.

Davies sought to reassure people on the spreading flu outbreak, saying "the numbers are not massive and we are not at anything like capacity [in the NHS]".

However, she urged at-risk groups to get themselves protected. "We want more people to come forward for the vaccine, particularly pregnant women," she said.

But critical care beds around the country have come under pressure as the numbers taken ill have increased. In some places, this has led to the suspension of routine heart surgery and other procedures where critical care beds are essential for recovery.

For some of the sickest victims of swine flu, a procedure called ECMO, in which blood is oxygenated outside the body, has been used. But the UK has only a small number of ECMO beds. The main centre is Glenfield hospital in Leicester, which has five ECMO beds. Last week, because of demand, extra beds were commissioned at four other major centres – Papworth, the Royal Brompton in London, South Manchester and Newcastle. There are now 16 patients on ECMO treatment in England.

Julian Winston

Influenza-1918: Homeopathy to the Rescue

The New England Journal of Homeopathy, Spring/Summer 1998, V 7 N 1
https://nesh.com/the-new-england-journal-of-homeopathy/vol-7-no-1-springsummer-1998/influenza-1918-homeopathy-to-the-rescue/

The following is an extract of the chapter on the influenza epidemic of 1918 from Julian Winston's upcoming history of homeopathy book-which does not yet have a title. Watch these pages for a review when it does come out. ed

It was called "the Great White Plague." It is hard to imagine the devastation caused by the Flu Epidemic of 1918-19. People who lived through it reported that someone who was up and well in the morning could be dead by evening.

Dr. H. A. Roberts was a physician on a troop ship at the time. Another boat pulled alongside to get any spare coffins- it's mortality rate was so high. On his return to port, the commander said to Roberts, "used all your coffins?" To which Roberts, who had been treating his ship with homeopathy, replied, "Yes, and lost not one man!"

The following is an extract from an article entitled "Homeopathy In Influenza- A Chorus Of Fifty In Harmony" by W. A. Dewey, MD that appeared in the Journal of the American Institute of Homeopathy in 1920.

Dean W. A. Pearson of Philadelphia collected 26,795 cases of influenza treated by homeopathic physicians with a mortality of 1.05%, while the average old school mortality is 30%.

Thirty physicians in Connecticut responded to my request for data. They reported 6,602 cases with 55 deaths, which is less than 1%. In the transport service I had 81 cases on the way over. All recovered and were landed. Every man received homeopathic treatment. One ship lost 31 on the way. – H. A. Roberts, MD, Derby, Connecticut.

In a plant of 8,000 workers we had only one death. The patients were not drugged to death. Gelsemium was practically the only remedy used. We used no aspirin and no vaccines. – Frank Wieland, MD, Chicago.

I did not lose a single case of influenza; my death rate in the pneumonias was 2.1%. The salycilates, including aspirin and quinine, were almost the sole standbys of the old school and it was a common thing to hear them speaking of losing 60% of their pneumonias. – Dudley A. Williams, MD, Providence, Rhode Island.

Fifteen hundred cases were reported at the Homeopathic Medical Society of the District of Columbia with but fifteen deaths. Recoveries in the National Homeopathic Hospital were 100%. – E. F. Sappington, M. D., Philadelphia.

I have treated 1,000 cases of influenza. I have the records to show my work. I have no losses. Please give all credit to homeopathy and none to the Scotch-Irish-American! – T. A. McCann, MD, Dayton, Ohio.

One physician in a Pittsburgh hospital asked a nurse if she knew anything better than what he was doing, because he was losing many cases. “Yes, Doctor, stop aspirin and go down to a homeopathic pharmacy, and get homeopathic remedies.” The Doctor replied: “But that is homeopathy.” “I know it, but the homeopathic doctors for whom I have nursed have not lost a single case.” – W. F. Edmundson, MD, Pittsburgh.

There is one drug which directly or indirectly was the cause of the loss of more lives than was influenza itself. You all know that drug. It claims to be salicylic acid. Aspirin’s history has been printed. Today you don’t know what the sedative action of salicylic acid is. It did harm in two ways. It’s indirect action came through the fact that aspirin was taken until prostration resulted and the patient developed pneumonia. – Frank L. Newton, MD, Somerville, Massachusetts

Aspirin and the other coal tar products are condemned as causing great numbers of unnecessary deaths. The omnipresent aspirin is the most pernicious drug of all. It beguiles by its quick action of relief of pain, a relief which is but meretricious. In several cases aspirin weakened the heart, depressed the vital forces, increased the mortality in mild cases and made convalescence slower. In all cases it masks the symptoms and renders immeasurably more difficult the selection of the curative remedy. Apparently aspirin bears no curative relation to any disease and it ought to be prohibited. – Guy Beckly Stearns, MD, New York

Three hundred and fifty cases and lost one, a neglected pneumonia that came to me after she had taken one hundred grains of aspirin in twenty-four hours. – Cora Smith King, MD, Washington, DC

I had a package handed to me containing 1,000 aspirin tablets, which was 994 too many. I think I gave about a half dozen. I could find no place for it. My remedies were few. I almost invariably gave Gelsemium and Bryonia. I hardly ever lost a case if I got there first, unless the patient had been sent to a drug store and bought aspirin, in which event I was likely to have a case of pneumonia on my hands. – J. P. Huff, MD, Olive Branch, Kentucky.

In reading the accounts of the epidemic it seems that most of the deaths were caused by a virulent pneumonia that was especially devastating to those who depressed their system with analgesics-the most common being aspirin.

The Physician from whom I first learned homeopathy, Raymond Seidel, MD, HMD, said that he decided to be a homeopathic doctor during the flu epidemic when he was working as a delivery boy for a homeopath in New Jersey. Raymond Seidel told me that he decided to become a homeopathic doctor when he was a ten-year old delivery boy for a local homeopath. He said, “I saw that the people who were taking aspirin were dying, about half those who were drinking a lot were dying, and those that received homeopathic remedies were living.”

Chinese Herbs Prove Effective in the Cure of Influenza A (H1N1)

Bernama, 24 July 2009 (this post has been deleted)
http://www.bernama.com.my/bernama/v5/newsgeneral.php?id=427649

Beijing, July 23 (Bernama) – Chinese herbs have proved effective in the cure of Influenza A(H1N1) in Ditan Hospital, Beijing where 88 out of 117 patients treated for the disease only on the herbs fully recovered and were discharged.

"From our clinical tests and observation, the traditional method of treatment left no after effects and it is safe, more over the recovery period was shorter and the cost relatively lower as compared to Tamiflu treatment," said Wang Yuguang, spokesman of Ditan Hospital at a special briefing for the media at Ditan Hospital Wednesday afternoon.

He said the advantage of using herbs on these patients was that the doctors could prescribe different combination of herbs according to the individual's health condition.

"Treatment cost per patient using Tamiflu is about RMB56 a day whereas using traditional herbs it cost only around RMB12."

Ditan Hospital first started using traditional medicine in combination with Tamiflu on H1N1 patient from May 15 to June 15, and when the method proved effective, started treating many patients solely on Chinese herbs.

"We have even tested using the method on high risk patients since July 1, and the results proved favourable." said Wang.

However, Wang did not reveal the herbs used to cure the patients.

Ditan Hospital is one of the two hospitals specially designated for H1N1 patients in Beijing since the pandemic started from May in China.

Built in 1946, Ditan Hospital is the highest-grade hospital for infectious diseases and comes under the supervision of the Ministry of Health, Beijing Municipal Health Bureau and the Chinese Centre for Disease Control and Prevention.

The hospital had excelled in 2003 and 2004 in the fight against SARS.

Meanwhile, Beijing Traditional Chinese Medicine Hospital has introduced an Influenza A(H1N1) prevention herbal medicine pack.

The Deputy Director of the hospital, Jin Wei, told a press conference earlier that the herbal pack contained seven little packs of four types of herbs in combination, which were said to be effective in the prevention of H1N1. "Just dip a small pack of herbs in a teapot of hot water and drink it like tea, or used it as mouthwash, and it helps to prevent people for being infected," said Jin.

She said the pack could even cure mild cases of H1N1. However if patients do not recover after taking the herbs for seven days, they are advised to go to the hospital for further treatment.

The combination of the herbs is as follows: Lonicera Japonica Thund - 3 grammes, Isatis Indigodica - 3 gms, Mentha Haplocalyx Brip.-3 gms and Glycyrrhiza Glabra - 3 gms. These herbs are available in Chinese herbal medicine shops.

Chinese Herbs prove effective in the Cure of Inlfuenza A

J37 Forums, 24 July 2009, 06:45
https://www.j37.com/forums/3317/topics/369468/

BEIJING, July 23 (Bernama) – Chinese herbs have proved effective in the cure of Influenza A(H1N1) in Ditan Hospital, Beijing where 88 out of 117 patients treated for the disease only on the herbs fully recovered and were discharged.

The combination of the herbs is as follows: *Lonicera Japonica Thund* – 3 g, *Isatis Indigodica* – 3 g, *Mentha Haplocalyx Brip*. – 3 g and *Glycyrrhiza Glabra* – 3 gms. These herbs are available in Chinese herbal medicine shops.

"From our clinical tests and observation, the traditional method of treatment left no after effects and it is safe, more over the recovery period was shorter and the cost relatively lower as compared to Tamiflu treatment," said Wang Yuguang, spokesman of Ditan Hospital at a special briefing for the media at Ditan Hospital Wednesday afternoon.

He said the advantage of using herbs on these patients was that the doctors could prescribe different combination of herbs according to the individual's health condition.

"Treatment cost per patient using Tamiflu is about RMB56 a day whereas using traditional herbs it cost only around RMB12."

Ditan Hospital first started using traditional medicine in combination with Tamiflu on H1N1 patient from May 15 to June 15, and when the method proved effective, started treating many patients solely on Chinese herbs.

"We have even tested using the method on high risk patients since July 1, and the results proved favourable." said Wang.

However, Wang did not reveal the herbs used to cure the patients.

Ditan Hospital is one of the two hospitals specially designated for H1N1 patients in Beijing since the pandemic started from May in China.

Built in 1946, Ditan Hospital is the highest grade hospital for infectious diseases and comes under the supervision of the Ministry of Health, Beijing Municipal Health Bureau and the Chinese Centre for Disease Control and Prevention.

The hospital had excelled in 2003 and 2004 in the fight against SARS.

Meanwhile, Beijing Traditional Chinese Medicine Hospital has introduced an Influenza A(H1N1) prevention herbal medicine pack.

The Deputy Director of the hospital, Jin Wei, told a press conference earlier that the herbal pack contained seven little packs of four types of herbs in combination, which were said to be effective in the prevention of H1N1.

"Just dip a small pack of herbs in a teapot of hot water and drink it like tea, or used it as mouthwash, and it helps to prevent people for being infected," said Jin.

She said the pack could even cure mild cases of H1N1. However if patients do not recover after taking the herbs for seven days, they are advised to go to the hospital for further treatment.

Effective H1N1 Cure Found: Mystery Chinese Herbs

Heritage Tech Net, HTNet, 24 July 2009
https://www.heritage-tech.net/1138/effective-h1n1-cure-found-mystery-chinese-herbs/

This is probably the most engaging and equally uninformative news surrounding the swine flu pandemic. Quoting *Bernama*:

> *Beijing, July 23 (Bernama) – Chinese herbs have proved effective in the cure of Influenza A(H1N1) in Ditan Hospital, Beijing where 88 out of 117 patients treated for the disease only on the herbs fully recovered and were discharged.*

Holy pigs! This is good news, right? That was my first impression too. Seriously, 88 out of 117 is over 75% success rate. Amazing is an understatement!

As I continued reading, I was happy to find out that this treatment is not only effective, it's also very cheap:

> "*Treatment cost per patient using Tamiflu is about RMB56 a day whereas using traditional herbs it cost only around RMB12*."

Google tells me that RMB56 is about USD$8.20; whilst RMB12 is just above USD$1.75 (RM29 and RM6.20 respectively).

Then comes the clincher:

> "We have even tested using the method on high risk patients since July 1, and the results proved favourable." said Wang.
>
> However, Wang did not reveal the herbs used to cure the patients.

Depressing isn't it? Especially considering that 90% of all medical news for the past two months has been about H1N1.

And here I was, thinking that this would potentially be Nobel prize winning stuff. But until I see real evidence; I count this as vaporware.

THE HINDU

Ananth Krishnan

Herbal remedy for A(H1N1) flu in China

The Hindu, 24 July 2009
https://web.archive.org/web/20090727154538/http://www.thehindu.com/2009/07/24/stories/2009072455271300.htm

Beijing: Chinese doctors say they have found a herbal remedy for preventing and treating the A(H1N1) Influenza which is both more cost-effective and better resistant to the virus than the drug Tamiflu.

Hospitals in Beijing have in the last month begun treating A(H1N1)-infected patients with this herbal remedy instead of the World Health Organisation-recommended Tamiflu, which is also being used to treat A(H1N1) in India. Doctors in two Beijing hospitals told The Hindu the results have so far been successful.

At Ditan hospital, where most of Beijing's patients are being treated, doctors have treated 117 out of 297 admitted patients with the herbal remedy, and 88 of them have been cured. The others are undergoing treatment.

There have so far been 1,668 reported cases of A(H1N1) flu in China, though no deaths have been reported. The government's Ministry of Public Health has expressed concern that as the winter flu season approaches, the chances of a serious outbreak are high. With some concern about Tamiflu's decreasing resistance to the virus and fears regarding the drug's side-effects, the government appears to have given full-backing to promoting a herbal treatment.

Meanwhile, two Chinese pharmaceutical companies this week have begun two month-long clinical trials for a vaccine to the infection.

In China, treatment and prevention of infections with herbal remedies as opposed to drugs – the practice is known as Traditional Chinese Medicine (TCM) – is common, and the cost-effectiveness of herbal cures has seen a popular resurgence in TCM in recent years.

TCM, mainly known overseas for its acupuncture therapies, is regarded as mainstream medicine in China, but not in the West.

The government has now sanctioned hospitals to launch TCM-based treatments for A(H1N1) on a large scale, Tu Zhitao, dean of the research and education department at the Beijing Administration of TCM told The Hindu. "We have found that Tamiflu is not sufficient, and it also weakens the body and has adverse affects on body tolerance," said Mr. Tu.

"This treatment is a better alternative, and we have begun to promote this treatment among the public."

Essential difference

Mr. Tu said the essential difference was that while the TCM remedy works to build up the body's resistance in a holistic way, the Tamiflu drug focuses on attacking the infection.

The herbal treatment is a mixture of four locally-used medicinal herbs: Jin yin hua (lonicera japonica), Da qing ye (Isatis indigodica), Bo he (Mentha haplocalyx) and Sheng gan cao (Glycyrrhiza glabra).

Doctors in Beijing first began using the remedy on May 15, treating patients with a combination of the herbal remedy and Tamiflu.

After successful trials, doctors have since June 15 begun prescribing only the herbal treatment. Ninety per cent of all A(H1N1) flu patients in China have been treated with a combination of the two treatments. Wang Yuguang, head of the Centre of Integrated Chinese and Western medicine at Ditan Hospital, said the treatment time for the herbal remedy was comparable with that of Tamiflu treatments. The big difference, he said, was the cost of the two treatments. The TCM remedy only costs between 10 and 13 Yuan (between Rs. 70 and Rs. 91) per day, while Tamiflu costs 56 Yuan (Rs. 392).

Mr. Wang said the herbal treatment was now undergoing clinical trials “to show concrete evidence that the treatment is scientific.”

He said the government had invested 10 million Yuan (Rs. 7 crore) in conducting a comparative study of herbal and Tamiflu treatments.

Mao Yue, president of the Ditan Hospital, said there was a “serious possibility” of a large-scale outbreak of the flu in the autumn and winter of this year, and that the government has already begun procuring enough herbs to treat a possible 2 million patients.

THE FLU CASE

Jane Burgermeister

Why there is no reason to fear this "swine flu" virus or any "virus"

The Flu Case, 31 July 2009, 00:00
https://web.archive.org/web/20090819235920/http://www.theflucase.com/index.php?option=com_content&view=article&id=126:why-there-is-no-reason-to-fear-this-swine-flu-virus-or-any-virus-&catid=41:top-headlines&lang=en

Colloidal silver

As the scare-mongering over the "swine flu" continues, it is important to remember that *colloidal silver* has been proven to kill every virus as Dr Rebecca Carley, expert on vaccines, has noted. (www.drcarley.com)

Under a recent EU directive, colloidal silver manufacturers were obliged to dilute their silver by 90 per cent, making it much less effective; in the USA, this powerful tool to kill every virus has also been marginalised. Nevertheless, a colloidal silver generator is easy to make yourself. You just need some distilled water, a couple of silver rodes attached to batteries and a dark glass bottle.

Drew Malone gives the low-down on making your own generator: "Gang, I've researched this and this and regardless of what you are told, and promised this is the cats meow… you can make this and it's not hard, anyone with any mechanical background can and should have a **Collodial Silver** generator in their possision asap ... check these direct links out…

http://www.atlasnova.com/ http://www.atlasnova.com/CSMakingInfo.htm

Everything can be purchase at 80% of the malls around the USA…. radio shack has the 33 OHM resisters, aligator clips etc. any jewelery store has 9999 silver rods voltage use is 3 or 4.9 volt batteries (I have used 4 and 3 both work) the only difference is the time form 13min – 20 min extra hints, email me your question if need be…

Semper Fi, Drew Malone; Raines III; Master Electronics Engineer; USMC 1967-1977

Owner: H.E.A.R.T. & Associates; 1983-Present; 3423 Avery Road; Little Rock, Arkansas 72209; http://www.amd.elequity.com; SKYPE: drewmalone.rainesiii 501.565.1833″

In the view of experts like Dr Carley, there is no better investment you can make of your time or money right now than in building or buying a colloidal silver generator. If you generate extra colloidal silver, you can also help your neighbours and your community. If you are really desperate, just put a silver coin or rod into some water and leave it there for a while.

Two things are important to remember about colloidal silver generators; firstly, a possible overdose of large silver particles and argyria, which is not toxic but which can you turn blue or grey if you drink large enough quantities; and secondly, the particle size may not be effective enough to penetrate all areas of the body.

However, a colloidal silver generator along with vitamins and minerals to strengthen your immune system will be a big help to anyone.

Another helpful product is Bionaid and ZeoHeal.

Bionaid's primary particle is below .004 microns in size, thus not tecnically classified as a colloid, so referring to Bionaid as a colloidal silver is not accurate.

Being that Bionaid is under 3ppm, no dilution is necessary, and even when it is diluted in water it is still quite lethal on pathogens. 4 oz per gallon of pure water is one of the suggested uses, mainly to encourge hydration at the same time and flush the body. The water base in Bionaid penetrates the cells as well, faster than any water tested.

What is important about Bionaid is not so much the silver in it, with other monatomic trace minerals, but the trioxide covalently bonded to all the monatomic minerals, including silver. Oxygen is the key, and the superior ability to enter through the aquaporin channel of the cells. The natural immunization with the oxygen is the key to its effetiveness. Bionaid uses NASA technology in Bionaid and has $1million dollar reward regarding superior safety and efficact (that has never been claimed by vaccine and drug proponents).

The particle is permanently suspended and the product is nonperishable and non-photosensitive.

ZeoHeal attacks pathogens also, chelates and clathrates the die-off and many other foreign metals and chemicals.

The fact that the US government has not investing in stockpiling these products as a way of combatting a so-called "pandemic" virus makes them guilty of gross negligence.

The existence of colloidal silver and bionaid make a forced vaccination with a vaccines full of disease and squalene at gunpoint in a quarantine center superfluous, even supposing the virus were dangerous, which it isn't.

David MacLucas has given his assessment of squalene, its impact and how to counter act it if you should ever find yourself being injected with the stuff under duress.

"I researched the Squalene extensively today… wow! What a catch 22 immune system quagmire that is. Squalene is both good and bad, but its how and how much that causes the variances of immune problems. When injected it bypasses the liver and overloads the immune system. Since the Squalene gets stored in fat and is what your body already uses theres no real way to eliminate it naturally. Basically it will really effect overwieght people, stressed people, and / or anyone with liver problems since Squalene is a super enzyme that eventually gets converted into Cholesterol by your liver.

Anything that lowers cholesterol, stress, balances the immune system and improves liver function will help… but still not a silver bullet to remove the Squalene.

However!

Best recommendations for anyone that HAPPENS to get the Vaccine, here is the beginning of a protocol… meaning not complete, nor approved

Firstly, Bionaid is a must must must. Anyone who understands the principles of Oxygen therapy and the effects of Collodial silver on viruses will have their jaw drop open when they learn how Bionaid is made. Bionaid is a 1, 2 punch of godly proportions on killing a virus that gave me butterflys when I learned how they made it.

Secondly, I have done years of research on Zeolite and have included it in my Cancer Elimination Kit. Zeolite is uncontestable and irrefutable at removing heavy metals… the molecular structe could not be more perfect at this task.

Thirdly, things like excercise increase your livers ability to process cholesterol and mediate enzymes. Eliminate the bad cholesterol from your diet now.

Fourth, if you do get the vaccination… relax, relax, relax for 2 weeks non-stop and reduce your bodys immune system response while the Squalene gets removed from your body naturally. I only found advance research done using a rat liver to accelerate the removal of Squalene – not a realistic choice."

It is important to recognise just how damaging stress is. Indeed, some have even said the international crime syndicate has collapsed the US and European economy also to induce massive amounts of stress in people, so making them more susceptible to illness.

Fight back today by taking charge of your mental household and throwing out the old furniture of thoughts that create anxiety, worry, stress or fear and bringing in thoughts that bring power, energy, inspiration, confidence and hope.

The biggest single thing you can do to stop stress in the long term is to help pave the way to the return of the rule of law. Then those responsible for these mass vaccinations with toxins can be made accountable for their actions once and for all.

Health Gem

Dr. Olson

Influenza Part 3:
Seasonal Flu vs. Swine Flu

Our Firm Foundation, August 2009, 24(8): 23-27
https://dn720001.ca.archive.org/0/items/2009-olson-influenza-part-1-4/2009_Olson_Influenza_Part%201-4.pdf

***Dr. Olson** comes from a long line of health professionals including MDs, naturopaths, and osteopaths. Having early wanted to help people, especially in the area of health, she was a missionary to Belize and Korea. A national speaker, an RN for years, a certified herbologist, and a naturopathic doctor, Dr. Olson is utilizing this experience and wealth of knowledge for the benefit of people all over the world*

How was Spanish flu defeated? Were vaccines effective? What can you do to prepare your body and mind in case of a deadly global pandemic? Last month I left off at these questions, and today I'll cover all this, and more!

Were Vaccines Effective at All?

So, how WAS the Spanish Flu ultimately defeated? Was there some wonder pill or vaccine that ended it?

At the height of the 1918 flu pandemic, acting Surgeon General, Dr. Victor Vaughn, reached a frightening conclusion. "If the epidemic continues its mathematical rate of acceleration," he announced, "civilization could easily disappear from the face of the earth within a few weeks."

"The death rate in Washington kept rising. A resolution shot through Congress, giving the Public Health Service a million dollars to fight the flu. Biochemists around the country worked feverishly to develop a vaccine. Hundreds were produced. Then, a researcher in Massachusetts came up with the most promising solution. Hopes rose: perhaps a cure was at hand. San Francisco's mayor wired for a huge shipment; a special envoy carried the vaccine across the country on the fleet Twentieth Century Express. Soon over 18,000 people in the city had been inoculated… But the vaccines didn't help. They thought it was caused by bacteria, so they made up a vaccine with the bacteria they thought was influenza ... But, you can't make a vaccine if you're looking at the wrong causative organism. They were on the wrong track; the influenza was caused by a virus." (1)

You'll note that before they knew if it worked or not, they were injecting this vaccine into thousands of people, giving them false hopes (and of course making money).

"Doctors gave out elixirs and vaccinated people against the flu, but to no avail. Crosby [an historian studying the flu of 1918] wondered about those flu vaccines. What was in them when no one knew what was causing the flu? He interviewed a doctor who had helped produce flu vaccines in 1918. The doctor, Crosby said, told him that the vaccines were just a "soup" made of blood and mucus of flu patients that had been filtered to get rid of large cells and debris. When they injected it into people's arms, their arms became sore "so they thought it really worked." (2)

This was a doctor, a medical doctor, saying this. Their arms became sore after the injection, so they "thought it really worked". And the people lined up to be inoculated. Why? Because the people trust the doctors and the vaccine-makers. They trust that they aren't just in it for a buck, but are actually there to help them.

What Can We Do?

So how did the Spanish Flu end? Sad to say, no one ever found an effective antidote, and the flu essentially killed until it could not kill anymore. Just as suddenly as it struck, the calamitous disease abruptly began to vanish. It essentially ran out of fuel and "burned out" so to speak, which can often happen to viruses. Fast forward to 2009, and the medical and scientific communities are on the edge of their seats hoping that the current Swine Flu will run out of fuel before it mutates and becomes more deadly. But no one can foresee the course the virus will take and how it may mutate, so all we can do is get ready.

So, the first question people ask is, "What can I do?" Usually followed closely by "Should I take the vaccine?" First, there are many things you can do to prepare for something like this. You can make sure your body and immune system are as strong as they can be through diet, exercise, lifestyle, and supplementation. I know you have heard it all before but it bears repeating. If this virus becomes deadly, you will wish you had heeded the warnings and supplied your body the necessary requirements to fight the virus or prevent it from ever taking hold. What happens if the virus putters out and goes away? Your body will still be stronger, healthier, and you will generally feel better all over. So it's a win/win situation! Here are some ways to prepare your body to meet this mighty foe:

1. *Get plenty of rest!*

Try to get to bed by 9 p.m. or earlier if at all possible. Lack of rest can hinder the body's defense mechanisms and prolong infection. When you rest in bed, and especially when you sleep, powerful immune-strengthening substances are released, enhancing the potency of immune functions.

In addition, during deep sleep, the production of growth hormone is at its peak. Growth hormone speeds the absorption of nutrients and amino acids into your cells and aids the healing of tissues throughout your body. This hormone also stimulates your bone marrow, where your immune system cells are born. Melatonin, often called the "sleep hormone," is also produced during sleep. This hormone inhibits tumors from growing, prevents viral infections (remember, the flu is a virus), stimulates your immune system, and has antioxidant properties.

So much of the body's healing occurs during the nighttime hours! It is vital to your health to get plenty of rest at night (especially between the hours of 8 pm and midnight). In fact, getting fewer than six hours of sleep each night increases your risk of contracting colds and the flu by a whopping 300 percent! Start getting to bed early and you will feel the difference. It could quite literally, save your life!

2. *Drink water, drink water, and when you're done… drink some more water.*

What does water have to do with the flu? In order to stay healthy, the mucous membranes lining the respiratory tract must be kept hydrated. When they become dry, they offer a desirable breeding ground for viruses (such as the flu). A moist respiratory tract repels viral infections. So drink plenty of water throughout the day. Daily, you should try to drink half of your body weight in ounces. (For example, a 150 pound person needs 75 ounces per day). No coffee, black tea, or colas as they dehydrate the body and weaken the immune system. Which leads me to the next item:

3. *Stop drinking coffee (and other caffeinated beverages)!*

Contrary to recent marketing as a source of antioxidants, coffee, tea (other than herbal tea), colas, and chocolate are some of the worst things you can do for your immune system and your health. Caffeine robs your body of minerals and vitamins, and it dehydrates you – leaving you more vulnerable to infection. A vitamin and mineral-robbed immune system is a weak immune system, and you are much more likely to get sick.

If you do drink caffeinated beverages, there are still things you can do to try to counteract the damage they cause. (First, try to limit your intake of these products as much as possible). Also, make sure you add an additional two glasses to your water intake per cup of caffeinated beverage you drink. A high quality vitamin/mineral supplement such as Mega Multi will help to offset caffeine's damage, too.

4. *Quit eating refined white sugar!*

If you do only one thing to boost your immune system, eliminating sugar should be it. When you stop eating refined sugar, you will see noticeable results in your energy levels, weight distribution, immunity, and your ability to think clearly. Many holistic nutritionists actually consider sugar a drug since it has such a dramatic impact on the human body!

Sugars depress the immune system, period. This limits the body's ability to kill bacteria and viruses (like the flu). In addition, blood sugar and vitamin C compete for entry into white blood cells. Which do you want to win?

To show how much sugar affects the immune system, consider this: eating or drinking 8 tsp. of sugar (the equivalent of one 12-ounce can of soda) can reduce the ability of white blood cells to kill germs by forty percent. The immune-suppressing effect of sugar starts less than thirty minutes after ingestion and may last for five hours. If only one can of soda can depress your immune system for 5 hours, think about people who drink a few sodas a day, or a couple 24 oz. bottles of soda per day. Just one 24 oz. bottle would be 10 hours of depressed immune function. Add in a cookie here, a piece of candy there, or any number of sweet treats – and you are living with a constantly depressed immune system.

Healthier sugars such as agave and stevia exist, but even natural sugars should be taken in moderation. Avoid artificial sweeteners such as Aspartame (NutraSweet or Equal), Saccharin, Sucralose (Splenda), etc.; they are more toxic than cane sugar!

6. *Quit Smoking!*

Obviously, anything that weakens the lungs will make the flu a more dangerous foe. Research shows smokers face a higher risk of flu infections and flu mortality (death from the flu) than nonsmokers, so smoking cessation is essential in preventing the flu. If you've been planning on quitting, but just haven't taken that final step, now is the time.

You don't want to still be smoking when this flu season hits. It may be the difference in your life or death!

7. *Quit Drinking Alcohol!*

Alcohol can depress the body's immune system in many ways. First, drinking alcohol produces an overall nutritional deficiency, depriving the body of valuable immune-boosting nutrients. This is the last thing you need coming into what could be the next big pandemic. Second, alcohol, like sugar, can directly lead to a weakened immune system by reducing the ability of white blood cells (B-cells and T-cells) to kill germs. B-cells and T-cells (the most abundant lymphocytes – immune system "soldiers") are essential for fighting foreign microorganisms that cause infections, bacteria, and viruses. In people who drink, the activity of these lymphocytes is suppressed, leading to a higher risk of infection and disease.

8. *Talk to your doctor if you are taking immunosuppressant drugs*!

The main problem with immunosuppressants, is that they suppress the immune system! Not surprisingly though, since that is what they are supposed to do. Unfortunately, modern immuno-suppressant drugs are not specific, meaning they suppress ALL of the immune system, leaving the patient vulnerable to a variety of infections that would normally be prevented by the immune system. Patients taking immunosuppressant medications are thus often called immuno-compromised (i.e. their immune system is compromised) and are at risk for numerous complications. These are usually given for auto-immune disorders (such as: Crohn's disease, eczema, lupus, rheumatoid arthritis, etc.) or to prevent transplant rejection. Check with your doctor if you are on an immunosuppressant drug to find out if there are other options for you.

9. *Don't take antibiotics unless you absolutely have to!*

Taking antibiotics before a swine flu infection greatly increases your risk of being killed by swine flu. How do we know that? Because antibiotics wipe out the friendly flora that have been scientifically proven to boost the body's defenses against influenza!

While the above information was mostly related to things you shouldn't do, here are some things that you should do that can help to boost your immune system and help prevent or fight the Swine Flu:

10. *Eat lots and lots of raw fruits and vegetables!*

Fruits and veggies are high in antioxidants, vitamins, minerals, fiber, and enzymes. The nutritional content that you receive from raw fruits and veggies is unparalleled. Many vitamins are also anti-oxidants that protect cells of your immune system from damage by toxins in the environment. Natural foods that are high in antioxidants such as vitamins A, C, E, B-6, folic acid, and zinc are particularly beneficial in supporting the immune system. Kiwi, oranges, grapefruit, cantaloupe, spinach, broccoli, strawberries, blueberries, carrots, bell peppers, cauliflower, and sweet potatoes are full of antioxidants and are fantastic for your immune system. Dark-colored produce (berries, kale, broccoli) tend to be higher in flavonoids and are powerful immune stimulators. Lemons are the ideal food for restoring acid-alkali balance.

Drinking freshly squeezed lemon juice in water helps maintain the body's internal "climate" at a healthy pH. A balanced pH supports healthy bacteria instead of the harmful bacteria and viruses that thrive in a more acidic environment. Regularly eating fresh fruits and vegetables is one of the best ways to naturally boost your immune system! If you do not eat, or cannot tolerate, many fruits and vegetables, try our nutrient rich Fruitilicious or Living Green Energy, to supply your body with whole food nutrients.

11. *Spend some time outside in the fresh air and sunshine!*

Exercise can make a noticeable difference to your health and happiness. Just 20-30 minutes of exercise daily outside in the fresh air (preferably in the sunshine) will help expel toxins and boost the immune system to fight infections. It will also help increase draining of the lymphatic system, which in turn, expels toxins. Only 10 minutes in the sunshine is enough to boost the immune system and help prevent both bacterial and viral infections from taking hold. One way it does this is by boosting white cell-building in the blood. White blood cells are the immune system's "army". The more "soldier" cells you have, the more ability your body has to fight and prevent infections!

12. *Get plenty of Vit D – especially if you suffer from asthma or other respiratory-related illnesses!*

If you're obeying #2, and getting out in the sunshine, hopefully you'll be getting plenty of vitamin D. However, if you aren't able to get enough, you can always complement with a high-quality Vitamin D supplement.

"In a study published in the Archives of Internal Medicine, researchers analyzed information on vitamin D levels and respiratory infections from nearly 19,000 adults and adolescents who participated in the Third National Health and Nutrition Examination Survey (NHANES III) from October 1988 to October 1994. The results showed those with the lowest vitamin D levels (less than 10 nanograms per milliliter of blood) were 36% more likely to report having a recent upper respiratory tract infection than those with higher levels (30 ng/mL or higher)." (3)

"The findings of our study support an important role for vitamin D in prevention of common respiratory infections, such as colds and the flu," says researcher Adit Ginde, MD, MPH, of the University of Colorado, Denver, Division of Emergency Medicine, in a news release. "Individuals with common lung diseases, such as asthma or emphysema, may be particularly susceptible to respiratory infections from vitamin D deficiency." (3)

This association persisted during all four seasons and was even stronger among those with a history or asthma or chronic obstructive pulmonary disease (COPD). For example, people with asthma with the lowest vitamin D levels were five times more likely to have had a recent respiratory infection. Among those with COPD, recent respiratory infections were twice as common among those with lowest vitamin D levels." (3)

13. Relax and be happy!

Stress slows the healing process and weakens the immune system, which will lengthen healing time. Our bodies respond to our emotions – if you're feeling harassed and anxious, it can manifest in a

sore throat or a cold. Prayer and Bible study can relax your mind and improve your health! Giving thanks to God for the blessings and abundance in your life and of the world around you helps! Think positive thoughts!! Pay attention to warning signs of sore throat or exhaustion so you can keep them from getting worse. Remember: A merry heart doeth good like a medicine (Proverbs 17:22). When you're happy, you're far less likely to get sick!

14. *Give your body an herbal boost.*

Many herbal products exist to give the immune system the additional support it needs during the flu season (or any time your immune system is compromised). If you have followed the H1N1 virus at all, you have probably seen that most doctors will be recommending Tamiflu, antiviral medication. Countries have already begun stockpiling this drug and don't even mention natural anti-virals (But why would they? There would be no money in it for them!). But the world is full of natural anti-viral medicine! It's found in tens of thousands of different plants. Culinary herbs like thyme, sage, and rosemary are anti-viral. Garlic, ginger, and onions are anti-viral. Berries and sprouts are anti-viral. And because these anti-viral plants contain literally thousands of different medicinal compounds, they are able to attack viruses with a full spectrum of synergistic natural medicines. Thus, even mutating viruses find themselves unable to escape the all-around medicinal cocktail of antiviral plants. Here are some products that I have personally studied, taken, and highly recommend: To help prevent an infection and boost immune system overall, I like:

- C-Blast – This is a whole food Vitamin C blend (which is much stronger than commercial synthetic Vitamin C products). C-Blast will give your immune system the boost it needs to fight off infections.
- Acerola Chews – For children, or adults, who don't like to swallow pills, this is a delicious chewable form of Vitamin C. Tastes great and gives your immune system a kick!
- Mighty Immune Plus – If you don't like pills: swallowable or chewable, this product is perfect for you. Mighty Immune Plus is an amazing liquid blend of over 200 vitamins, minerals, an herbs, and nutrients that will help to boost the immune system and prevent infections.

For natural anti-viral options, try:

- Ultra Fighter – Whenever I feel something coming on, I reach for Ultra Fighter. Known as a natural antibiotic and "anti-everything." This one fights all infections, whether the cause is viral (such as flu), bacterial (such as pneumonia), or fungal.
- Anamu – Especially helpful for serious immunodeficiency disorders, Anamu helps boost the immune system to fight against foreign, harmful, and damaging organisms and particles. Also helps kill viruses and bacteria! Great for colds and the flu!
- Odorless Garlic – An extremely potent natural anti-viral, garlic is an invaluable tool against viruses such as the Swine Flu.

For congestion in the lungs:

- Congesta-Clear – This product works quickly and effectively. When the infection is deep and congestion is present, some people may experience relief in as little as 15 minutes.

Stay tuned next month for the conclusion of the Flu series, and to find out the truth about Tamiflu and Swine Flu vaccines!

A 56 year old male was referred to Auckland Hospital ICU on 1 July 2009 with total respiratory failure, for ECMO external oxygenation. The patient had contracted H1N1 Swine flu (confirmed by tests) while on holiday overseas, and had developed what is known as 'white out' pneumonia. This refers to x-rays showing no air space in the lungs.

After 20 days of life-sustaining ECMO treatment and other critical care, the patient, who was unconscious by induced coma, had not responded. The ICU team advised the family of the likely outcome and had prepared them for the possibility of the patient's death.

Family members approached Centre for Advanced Medicine Limited (CAM) for advice on the clinical use of intravenous vitamin C for such cases.

At the family's request, information was provided to ICU doctors including ISO 9001: 2008 registered protocols, safety data, dosages and access to vials of IV vitamin C under CAM's license for wholesale medicines.

The ICU team agreed to administer intravenous vitamin C according to the family's wishes. This decision acknowledged the family's rights, in compliance with the New Zealand Health and Disability Act, 1997.

The patient received intravenous vitamin C starting on the evening of 21 July, continuing until 29 July. 25 grams was provided on the first day increasing over the first three days to 50 grams twice daily which was sustained for a further six days.

By 24 July x-rays indicated increasing lung function and ECMO external oxygenation was discontinued on 26 July. After several days of assisted ventilation and critical care for ongoing secondary conditions, the patient was able to commence his recovery and rehabilitation.

The patient was discharged from hospital on Friday 18 September, and is recovering at home on the farm.

The decision by the Auckland Hospital ICU team to administer adequate dosages of IV vitamin C, and their skillful coordination of ICU procedures, were responsible for the positive medical outcome.

Permission from the patient and his family has been sought by CAM to publish these details on its website and elsewhere in the interests of accuracy. This permission was willingly provided and CAM expresses its thanks, admiration and respect.

CAM welcomes opportunities to provide similar professional support for registered medical practitioners and their patients.

FDA warns against fake online H1N1 remedy claims

Reuters, 17 October 2009, 3:44 AM GMT+8
https://www.reuters.com/article/idUSN16359915/

Washington, Oct 16 (Reuters) - The U.S. government this week warned against the online marketing of unlicensed health remedies claiming to protect against H1N1 swine flu infection, including fake "Tamiflu" pills from India.

The Food and Drug Administration reported on Thursday that it had purchased and analyzed several products represented on the Internet as Tamiflu, Roche Holding AG's brand name [ROG.VX] version of the antiviral drug oseltamivir.

One order, which arrived in an unmarked envelope from India, consisted of unlabeled white pills that contained talc and the common pain reliever acetaminophen, the FDA said. Others contained various amounts of oseltamivir but were not approved for use in the United States.

In one action, the FDA and the Federal Trade Commission ordered well-known author and doctor Andrew Weil to stop marketing his Immune Support Formula to protect against the H1N1 flu virus.

"Claims that a dietary supplement can prevent, treat or cure human infection with the H1N1 virus must be supported by well-controlled human clinical studies," the regulatory agencies said in a warning letter to Weil.

Officials at Weil's Phoenix, Arizona-based headquarters were not immediately available for comment.

"Products that are offered for sale online with claims to diagnose, prevent, mitigate, treat or cure the 2009 H1N1 influenza virus must be carefully evaluated," FDA Commissioner Dr. Margaret Hamburg said in a statement.

Swine flu, which emerged in March, spread quickly around the world, and was declared a pandemic in June, poses a serious health threat because most people lack immunity to it.

But U.S. health officials say the most effective protection against infection is vaccination and the federal government hopes to offer as many as 250 million vaccine doses to the public by the end of the year.

The government has ordered vaccine from five companies – Sanofi-Aventis SA [SASY.PA], CSL Ltd [CSL.AX], Novartis AG [NOVN.VX], GlaxoSmithKline [GSK.L] and the AstraZeneca [AZN.L] unit MedImmune.

Once someone is already infected, oseltamivir and another antiviral drug called zanamivir - an inhaled medicine produced as Relenza by GlaxoSmithKline Plc can help relieve the severity of disease.

Widespread and unnecessary use threatens to make the H1N1 virus resistant to the antivirals, which would render them ineffective as medicine for people with severe flu cases.

Health officials have already reported H1N1 resistance to Tamiflu.

U.S. Department of Health & Human Services

U.S. Food and Drug Administration — Fraudulent 2009 H1N1 Influenza Products List

Fraudulent 2009 H1N1 Influenza Products List
140 entries in list

FDA US, 27 October 2009
https://web.archive.org/web/20091028235050/http://www.accessdata.fda.gov/scripts/h1n1flu/
https://web.archive.org/web/20090615000000*/http://www.accessdata.fda.gov/scripts/h1n1flu/

Purpose of the Fraudulent Products List

This list is intended to alert consumers about Web sites that are or were illegally marketing unapproved, uncleared, or unauthorized products in relation to the 2009 H1N1 Flu Virus (sometimes referred to as the "swine flu" virus). Note that until evidence to the contrary is presented to FDA, the owner of the listed Web site is considered responsible for promoting the unapproved, uncleared, or unauthorized products. The uses related to the 2009 H1N1 Flu Virus are not necessarily being promoted by the manufacturers of the products.

Consumer Considerations about the Products List

This list does not include every Web site that is marketing products related to the 2009 H1N1 Flu Virus without FDA approval, clearance, or authorization, only those Web sites to which FDA has issued a warning letter.

Even if a Web site is not included in this list, consumers should exercise caution before purchasing over the Internet any product purporting to diagnose, mitigate, prevent, treat, or cure the 2009 H1N1 Flu Virus.

Please note that some of these products may be approved or cleared by FDA for other medical uses. The fact that a product is listed on this page indicates ONLY that the products are not cleared, approved, or authorized for the diagnosis, mitigation, prevention, treatment, or cure of the 2009 H1N1 flu virus.

THE FLU CASE

Jean Burgermeister

Natural ways to stay healthy: suggestions

The Flu Case, 7 November 2009, 10:18
https://web.archive.org/web/20100102040930/http://theflucase.com/index.php?option=com_content&view=article&id=1678%3Anatural-ways-to-stay-healthy-suggestions-&catid=1%3Alatest-news&Itemid=64&lang=en

To protect yourself against any virus, medical experts recommend a good diet and plenty of vitamins, especially C and D, routine disinfection measures such as washing your hands regularly, the use of face masks as well as of colloidal silver (used by NASA), and MMS.

Another list of suggestions on how stay health by harnessing the body's natural healing powers bas been sent in by Jean:

"Maybe you could add a list of hints, presented as links to reliable websites (with a global introductory note maybe, explaining the purpose).

As a suggestion, this list could include:

In English language :

- http://naturalhygienesociety.org/: a MASSIVE amount of informations on natural health, including historical background, up to date orientations, healthy lifestyles (vegetarianism, raw veganism, etc)
- http://www.thedoctorwithin.com/ (by Dr. Timothy O'Shea,californian chiropractor/naturopath who recently contributed with an article on your website)
- http://www.healself.org/ (website of Dr Bernarr Zowluck, Santa Monica, California)
- http://www.hippocratesinst.org/: Brian and Anna-Maria Clement are foremost promoters of living-foods diet and naturopath-way.
- http://life-enthusiast.com/index/Articles (warning: some naturopaths are also business(wo)men, but they are usually much less dangerous than allopaths)

In French:

- http://www.bickel.fr/ René Bickel is a naturopath, but he is also the author of remarkable books. He focuses on natural health /autonomy, and reveals the real nature of "big pharma" business, and the collusion of (still) a majority of health professionals.

He dedicated a book to the vaccine masquerade: "vaccination: la grande illusion".

His special way of telling the truth is very effective : he uses humor as a strategy to enlightenment/true awareness.

- http://www.santeglobale.info/: Dr Christian Tal Schaller (Switzerland) is a famous promoter of living-foods (raw-vegan), and long-time friend of Brian Clement (see up ref.).

This is just a "start/stump list", given as an example, and i could suggest you many others, for you to choose from, if you wish)

Sungazing: a master key for the restoration of human sovereignty

On a slightly different approach, SUNGAZING will play a key role in helping people to get back in connection with Nature: A few years ago, some indians exhumed this divine practise (mainly from Ayurveda, and Jainism): we humans can connect ourselves directly to the father-Sun, using our eyes as an integrated interface, and let lifeforce flow into our entire self, and dissolve all disorders (diseases, fear, selfishness, etc)

Sungazing can be practised by anyone, starting with a simple/convenient/safe protocol, as designed by Hira Ratan Manek (HRM)

The deep effectiveness of *Sungazing* will help many people get rid of all addictions, and restore their health freedom, get back into full control of their lives (motivated in escaping big pharma and conventional medicine inferno). Truly believe your website is the very right place to promote this divine practise (100% safe, and free of any cost !), as it will help people switch from fear/despair/addictive/consumerist lifestyle , back to Nature's way .

As a result, big pharma will loose all power: no more slaves/sheep -> no more master required (from Hegel principle)

=> So, *Sungazing* would deserve some introductory references (of course, it remains up to you to decide whether or not showing such references on your website !), anyway, here are a few suggestions/references on SUNGAZING (i would be very glad to further contribute, and help enrich the list, if you like):

- http://www.solarhealing.com/: Hira Ratan Manek's website, exposing a safe and simple method to practise Sungazing, and consequently improve tremendously one's life, at NO COST, with just a little bit of self discipline
- http://sungazing.vpinf.com/: Vinny Pinto is a long term sungazer, who provides exhaustive information on the practise of Sungazing (nobody ever got blind from looking at the Sun ! What a shame most of us are afraid, and this fear is culturally enforced, by our parents, ophtalmologists, the whole system/technocratic matrix !)
- http://sunlight.orgfree.com/: for those people who want to get a historical and a health-impact background on Sungazing.
- http://www.sunyoga.info/: Umasankar is the "other" indian rediscoverer of Sungazing. As far as we can infer from his website info, his way of practise differs significantly from that of Hira Ratan Manek. Since Umasankar gives no explicit/operational directives for practise, this website is best used by "advanced sungazers", ie people who have already practised Sungazing in the safe way, following HRM's protocol).

To go further (knocking down the vaccination dogma)

For people who would like to get further informations (not only operational ones, ie questioning "why" more than "how"), you may also add resources/references such as :

- http://www.soilandhealth.org/: a marvelous online library (free download of out of print or free of right natural health books).

By the way, there is specially a book there which covers the genesis of the vaccine dogma and describes also the authrntic roots of biology. This book is titled "RATIONAL BACTERIOLOGY", written by J.R. Verner, W. Veiant and R.J. Watkins in 1953 (but still deeply valuable, to lead us out of the vaccinalist maze).

This book may be downloaded by anybody from here:

http://www.soilandhealth.org/copyform.aspx?bookcode=020147 (just follow the instructions from the website)

In this web-library, there are also a profusion of valuable positive books on natural health, including those books written by famous hygienists : Herbert Shelton, Henry Lindlahr, Ross Horne, J.R.Trall, J.H. Tilden, etc...

We're on the road back to true freedom and human brotherhood, even if this seems at quite a distance from today...

We will defeat today's technical threats by positive thinking and acting (mostly upon ourselves : being healthier, stronger, determined, enlightened-intuitive, and USING our rational thinking only as a complementary tool).

Keep in mind that all the above are just suggestions, and it remains to you to decide whether or not such informations (and under which form) would fit into your website.

THE FLU CASE

Norway's police crackdown on "alternative medicine" as scare mongering over "new mutated" virus grows

The Flu Case, 21 November 2009, 13:58

https://web.archive.org/web/20100102042208/http://theflucase.com/index.php?option=com_content&view=article&id=2013%3Anorways-police-crack-down-on-qalternative-medicineq-as-scare-mongering-over-qnew-mutatedq-virus-grows&catid=1%3Alatest-news&Itemid=64&lang=en

As the hype and fear mongering grows in Norway over the emergence of a new mutated "killer" virus, the local media has reported that police have carried out coordinated raids to crack down on suppliers of alternative medicine.

It is not clear why "alternative" medicines, including vitamins and colloidal silver, which have been proven to offer safe, effective and inexpensive ways of protection against any virus, are being subjected to restrictions in Norway right now if there really is a killer virus about.

It would appear the government is trying to limit Norwegians choice for treating this "mutated virus" to a toxic and untested swine flu jab that will offer no protection against any mutated virus and that contains mercury and squalene and so will most likely cause damage.

NASA, the US space agency, recommends colloidal silver for its astronauts because it has been found to be one of the most effective ways of killing disease-creating organisms of any kind.

Boosting vitamin C and D levels will strengthen the immune system.

H1N1 Swine Flu symptoms have many people turning to natural remedies

Examiner, 4 December 2009, 4:29

https://web.archive.org/web/20091207071720/http://www.examiner.com/x-18331-Natural-Health-Examiner~y2009m12d4-H1N1-Swine-Flu-symptoms-have-many-people-turning-to-natural-remedies (this link has been corrupted)
https://web.archive.org/web/20100102052554/http://theflucase.com/index.php?option=com_content&view=article&id=2183%3Ah1n1-swine-flu-symptoms-have-many-people-turning-to-natural-remedies-reports-genevieve-kiger&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Could Garlic, Ginger, and Other Herbal Remedies Treat H1N1 Symptoms?

In the US, only two products have been approved for the treatment of H1N1 symptoms, and five vaccines to prevent swine flu symptoms in the first place; but this is not necessarily the case in other countries, nor does it keep people from using other products, such as herbal remedies; it only keeps those products from openly claiming to treat symptoms of swine flu. Two different press releases on December 3rd underscore these points.

Herbal Remedies Approved for Treatment of H1N1 Symptoms in China

Buchang USA hosted the first Buchang Health Forum in New York, whose primary goal, according to one of the press releases on December 3rd, was to "provide an integrative "East-meets-West" platform for healthcare experts and patient advocacy groups to exchange views and knowledge on the management of [pandemic H1N1] and other global pandemics."

Buchang is the producer of an herbal remedy product known as Xiangju, a formula containing 8 different herbal ingredients developed to help fight cold and flu virus symptoms. It is one of the products recently tested by the Ministry of Health in China for efficacy against H1N1, and was approved by the State FDA (China) "as an OTC product for the relief of flu and cold-like symptoms."

Another herbal formula, Lian Hua Qing Wen, is being recommended by the Chinese State Administration of Traditional Chinese Medicine (TCM) for people to take to help prevent developing H1N1 symptoms; though this same formula was warned by the US Food and Drug Administration (FDA) to remove claims that it prevents or treats H1N1 symptoms under penalty of regulatory criminal action.

Speculators say Price of Ginger may Skyrocket Due to Swine Flu Symptom Fears

Ginger, especially when combined with honey, are a well known and age-old herbal remedy for cold and flu symptoms, and H1N1 symptoms are no exception, at least in the eyes of many.

Garlic has similar preventative and virus-fighting qualities, and has seen a price increase of as much as 1500% since March, especially in China. Although ginger has not yet seen such a dramatic spike – only 85% in the same time – a press release on December 3rd claimed that "The health benefits of ginger and the current concerns over swine-flu . . . will very likely contribute to further the expected price increases." This is only made more likely as it coincides with supply shortages, as falling prices in recent years had many farmers changing to more profitable crops.

The **Idaho Observer**

1918 Flu Prevention: Baking Soda

Idaho Observer, 16 December 2009
http://www.proliberty.com/observer/20091216.htm

The proven value of Bicarbonate of Soda as a therapeutic agent (from a letter to the Church and Dwight Company):

"In 1918 and 1919 while fighting the Flu with the U.S. Public Health Service it was brought to my attention that rarely any one who had been thoroughly alkalinized with bicarbonate of soda contracted the disease, and those who did contract it, if alkalinized early, would invariably have mild attacks. I have since that time treated all cases of Cold, Influenza and LaGripe by first giving generous doses of Bicarbonate of Soda, and in many, many instances within 36 hours the symptoms would have entirely abated.

Further, within my own household, before Women's Clubs and Parent-Teachers' Association, I have advocated the use of soda as a preventative for 'Colds', with the result that now many reports are coming in stating that those who took 'Soda' were not affected, while nearly everyone around them had the 'Flu'.

…An occasional three-day course of the Bicarbonate of Soda increases the alkalinity of the blood, assists elimination and increases the resisting power of the body to all Infectious Diseases…

Whenever taking a bicarbonate solution internally, the soda should be dissolved in cold water. In the event of a threatened attack we recommend the following treatment: During the first day take six doses of half a teaspoon of Bicarbonate of Soda in a glass of cool water, at about two hour intervals."

Note: It's recommended to use aluminum-free baking soda such as Bob's Red Mill

THE FLU CASE

Cathy Margolin

Swine Flu cured using Chinese herbs

The Flu Case // Insider's Health, 18 December 2009, 19:26
https://autumnson-nwo.blogspot.com/2009/12/blog-post_6747.html
https://web.archive.org/web/20100102011409/http://theflucase.com/index.php?option=com_content&view=article&id=2344%3Aherbal-formula-for-h1n1-clinically-proven-effective&catid=1%3Alatest-news&Itemid=64&lang=en

.

Just a few days ago, a hospital in China published an article stating that a combination of four different herbs was able to successfully treat many people with swine flu (H1N1). This article describes these herbs.

An article released today from the Ditan Hospital in Beijing reported that, "88 out of 117 patients treated for (H1N1) the disease only on the herbs fully recovered and were discharged." This is a 75% success rate. What are these Chinese herbs that worked so well? The Deputy Director of the hospital said there were four herbs in the packets given to patients who drank them as a tea and used as a mouth wash. Lonicera Japonica, (honeysuckle flower), Isatis Indigodica, Mentha (mint) and Glycyrrhiza (licorice). All were dosed at 3 grams per serving. These same herbs are available in Chinese herbal medicine shops in the US.

The first herb, Lonicera, is used almost exclusively for prevention and treatment of the common cold and upper respiratory tract infections, sore throats and general flu symptoms. It can be used in a vaporizer and inhaled along with the traditional way of ingesting it after cooking (decocting) in water. In one study, 1150 patients were treated for influenza using a combination of herbs which included Lonicera and had excellent results. Using fresh Lonicera is best as it contains the most anti-inflammatory and antipyretic effects. As an antibiotic, it has "demonstrated a broad spectrum of inhibitory actions against staphylococcus aureus, E. Coli" and a host of other pathogens.

The second herb in the flu fighting formula is Isatis, otherwise known as Woad root. This herb is categorized as a toxic heat clearing herb in Chinese herbal medicine and is also commonly used for upper respiratory infections. It's pharmacological effects have been well studied and research supports its success in treating acute sore throats and influenza viruses. Like other Chinese herbs, it is often used in a formula combined with other herbs. Herbs often work more effectively when cooked together with the right combination of other synergistically compatible herbs. People allergic to sulfonamides may have an allergic reaction to this herb, and it is not recommended for those taking Coumadin or any blood thinning medication as it may potentiate this action. However, the risk of any serious interaction is slight. I mention this to emphasize that herbs are strong medicine and should be prescribed and dosed by a qualified practitioner.

The last two herbs in this very simple formula are herbs that I am certain everyone has heard of, but may not have held in high regard for treatment of flu virus such as Swine flu. I hope this article changes that perspective. Although mint and licorice are fairly common, they are not necessarily found in the neighborhood grocery store. As there are hundreds of different species, you must be certain of obtaining the correct species. Mentha has quite a history when comes to treating high

fever accompanied by flu symptoms. In fact, the original source text on mentha was written in approximately 600 A.D., while the beneficial effects of licorice were documented even earlier. Sore throats, red eyes, and headache are some of the most common symptoms mentha can treat. It is included in many famous Chinese herb formulas as is licorice. Both are considered GRAS (generally recognized as safe) by the FDA. Licorice is one of the most commonly used herbs in the Chinese Materia Medica with volumes of information and research. It is traditionally used to "harmonize" a formula in Chinese medicine, yet it has many therapeutic actions of its own. More than I can list here.

Together, these four powerful herbs are more than just the sum of their individual parts. Beijing Traditional Chinese Medicine Hospital has introduced a H1N1 prevention herbal medicine pack. If you are traveling to China, you may want to pick up a few. Better yet, consult your local Acupuncturist or Herbalist and get your very own powerhouse of herbs custom made for your constitution.

Irish Independent

John Von Radowitz

Nature provides swine flu defence

The Irish Independent, 19 December 2009, 23:00
https://www.independent.ie/regionals/herald/nature-provides-swine-flu-defence/27936614.html

A previously unknown natural defence against swine flu and other viruses has been discovered, which could lead to new treatments.

The virus-fighting proteins were identified 25 years ago but their role has been a mystery until now.

Scientists found that knocking the protein IFITM3 out of human cells allowed the H1N1 swine-flu virus to run wild, but when their levels were artificially increased, replication of the viruses was completely blocked.

Professor Stephen Elledge, from Harvard Medical School in Boston, USA, who led the research, said: "We've uncovered the first-line defence in how our bodies fight the flu virus.

"The protein is there to stop the flu. Every cell has a constitutive immune response that is ready for the virus. If we get rid of that, the virus has a heyday."

The proteins are believed to redirect the traffic of viral particles entering cells and route them to a disposal area where they can be degraded and rendered harmless.

Newsit-chuiko

The Chinese won the swine flu with medicine "Jin Hua"

News It Chuiko, 19 December 2009
https://web.archive.org/web/20091224083730/http://it-chuiko.com/others/1730-the-chinese-won-the-swine-flu-with-medicine-jin.html

"To develop the drug, which lasted six months, brought hundreds of Chinese and foreign experts, has spent about 10 million yuan (about 1,5 million dollars)", - said the director of the Beijing administration of traditional Chinese medicine, Zhao Jing.

The medicine against influenza A/H1N1, entitled "*Jin Hua*" ("*Golden Flower*") is based on prescriptions of traditional Chinese medicine, as well as with the involvement of the Western experience.
Full recovery occurs in 5-7 days. Moreover, the patient feels great relief already on the second day dosing. Drug price of 80 yuan (about $ 12).

Experts believe that the novelty will completely abandon the use of antibiotics in the treatment of swine influenza.

Natural Product Reports

Hu Ge, Yi-Fei Wang, Jun Xu, et al.

Anti-influenza agents from Traditional Chinese Medicine

Natural Product Reports, January 2010; 27 (12):1758-80. doi: 10.1039/c0np00005a.
https://pubs.rsc.org/en/content/articlelanding/2010/np/c0np00005a

After new human transmissible H1N1 (swine flu) viruses were reported in Mexico and the United States in April 2009, the World Health Organization (WHO) announced the emergence of a novel influenza A virus. Most governments in the world have been alerted and are monitoring the situation closely.

As one of the official responses to the H1N1 pandemic, the Chinese government has released three editions of a document entitled "Recommended Schemes for Pandemic Influenza A Diagnoses and Treatments".

The third edition recommended the use of not only two targeted anti-flu drugs, oseltamivir and zanamivir, but also four anti-flu TCM (Traditional Chinese Medicine) prescriptions.

Since then, TCM has played a significant role in fighting the pandemic. TCM drugs comprise multiple compounds regulating multiple targets for a given class of medical indications, and are tunable to the symptoms of the individual.

This review summarizes anti-influenza agents from TCM, including compounds, herbs, and TCM prescriptions, and suggests that, by further investigating TCM theory and mining TCM databases, a better drug discovery paradigm may arise – one that can be beneficial to both TCM and modern medicine.

Yasuyuki Wada, Hiroyuki Ida

Randomized trial of vitamin D supplementation to prevent seasonal influenza A in schoolchildren

Am J Clin Nutr, 10 March 2010; May; 91(5): 1255-60.
doi: 10.3945/ajcn.2009.29094. Epub 2010 Mar 10. PMID: 20219962
https://www.sciencedirect.com/science/article/pii/S0002916523018324?via%3Dihub

Abstract

Background: To our knowledge, no rigorously designed clinical trials have evaluated the relation between vitamin D and physician-diagnosed seasonal influenza.

Objective: We investigated the effect of vitamin D supplements on the incidence of seasonal influenza A in schoolchildren.

Design: From December 2008 through March 2009, we conducted a randomized, double-blind, placebo-controlled trial comparing vitamin D(3) supplements (1200 IU/d) with placebo in schoolchildren. The primary outcome was the incidence of influenza A, diagnosed with influenza antigen testing with a nasopharyngeal swab specimen.

Results: Influenza A occurred in 18 of 167 (10.8%) children in the vitamin D(3) group compared with 31 of 167 (18.6%) children in the placebo group [relative risk (RR), 0.58; 95% CI: 0.34, 0.99; P = 0.04]. The reduction in influenza A was more prominent in children who had not been taking other vitamin D supplements (RR: 0.36; 95% CI: 0.17, 0.79; P = 0.006) and who started nursery school after age 3 y (RR: 0.36; 95% CI: 0.17, 0.78; P = 0.005). In children with a previous diagnosis of asthma, asthma attacks as a secondary outcome occurred in 2 children receiving vitamin D(3) compared with 12 children receiving placebo (RR: 0.17; 95% CI: 0.04, 0.73; P = 0.006).

Conclusion: This study suggests that vitamin D(3) supplementation during the winter may reduce the incidence of influenza A, especially in specific subgroups of schoolchildren. This trial was registered at https://center.umin.ac.jp as UMIN000001373.

THE TIMES
THE SUNDAY TIMES

Oliver Gillie

Vitamin D better than vaccines at preventing flu, report claims

The Times, 15 March 2010
https://web.archive.org/web/20110429025038/http://www.timesonline.co.uk/tol/news/uk/scotland/article7061778.ece

The risk of children suffering from flu can be halved if they take vitamin D, doctors in Japan have found. The finding has implications for flu epidemics since vitamin D, which is naturally produced by the human body when exposed to direct sunlight, has no significant side effects, costs little and can be several times more effective than anti-viral drugs or vaccine.

Only one in ten children, aged six to 15 years, taking the sunshine vitamin in a clinical trial came down with flu compared with one in five given a dummy tablet. Mitsuyoshi Urashima, the Japanese doctor who led the trial, told *The Times* that vitamin D was more effective than vaccines in preventing flu.

Vitamin D was found to be even more effective when the comparison left out children who were already given extra vitamin D by their parents, outside the trial. Taking the sunshine vitamin was then shown to reduce the risk of flu to a third of what it would otherwise be.

Altogether 354 children took part in the trial, which took place during the winter of 2008-09, before the swine flu epidemic. Vitamin D was found to protect against influenza A, which caused last year's epidemic, but not against the less common influenza B.

The trial, which was double blind, randomised, and fully controlled scientifically, was conducted by doctors and scientists from Jikei University School of Medicine in Tokyo, Japan.

The children were given a daily dose of 1200 IUs (international units) of vitamin D over a period of three months. In the first month children in the group taking the vitamin became ill just as often as those taking the dummy tablet. But by the second month, when the vitamin level in the children's blood was higher, the advantage of the vitamin was clear.

The Japanese scientists, writing in the *American Journal of Clinical Nutrition*, say that the anti-viral drugs zanamivir and oseltamivir reduce risk of flu infection by 8 per cent in children who have been exposed to infection, compared with a 50 per cent or greater reduction with vitamin D.

Anti-virals are also too expensive, and possibly too toxic, to be given to the population as a whole whereas vitamin D has additional benefits. The sunshine vitamin not only prevents bone fractures but is also believed to reduce risks of cancer, heart disease, diabetes and other illness, including various bacterial as well as viral infections.

The Japanese finding supports a theory that low blood levels of the sunshine vitamin occurring in winter explain why flu epidemics generally peak between December and March.

Vitamin D activates the innate immune system, enabling the body to produce several proteins such as defensin and cathelicidin which trigger cell activity and disable viruses.

Dr Urashima said: "Vitamin D and vaccine work by quite different mechanisms. Vitamin D enhances innate immunity while vaccine enhances acquired immunity. So we do not have to select only one way of prevention, rather we should do both ways, I think."

Dr John Oxford, professor of virology at Queen Mary School of Medicine, London, said: "This is a timely study. It will be noticed by scientists. It fits in with the seasonal pattern of flu. There is an increasing background of solid science that makes the vitamin D story credible. But this study needs to be replicated. If it is confirmed we might think of giving vitamin D at the same time as we vaccinate."

Chinese herbs in treatment of influenza: a randomized, double-blind, placebo-controlled trial

Respir Med. 22 June 2010 // Sep;104(9):1362-9.
doi: 10.1016/j.rmed.2010.05.015. Epub 2010 Jun 22 https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7127189/

Abstract

Objective: To investigate the efficacy and safety of Antiwei, a traditional Chinese prescription, in the treatment of influenza.

Methods: In a multi-center, randomized, double-blind, placebo-controlled trial, we recruited 480 adults aged 18 to 65 years within 36 h of onset of influenza-like symptoms. There were 225 patients with confirmed influenza. Eligible patients were randomly assigned 6 g of Antiwei ($n = 360$) or placebo ($n = 120$) twice daily for three days. All patients recorded their temperature and symptoms on diary cards during treatment. Analyses were performed in both the influenza-like population and the influenza-confirmed population.

Results: Antiwei increased patients' recovery by 17% ($P < 0.001$), and reduced the severity of illness measured by the median symptom score by 50% ($P < 0.001$) in both the influenza-like and the influenza-confirmed populations, compared to placebo. The influenza-confirmed patients reported reductions in the severity of fever ($P = 0.002$), cough ($P = 0.023$) and expectoration ($P = 0.004$) after one-day of treatment with Antiwei, compared to placebo. The adverse event profiles were similar for Antiwei and placebo.

Conclusion: Antiwei was effective and well tolerated in treatment of natural influenza infection in adults. Antiwei represents a clinically valuable intervention in the management of influenza.

Wen Bing (Warm Diseases) and the 2009 H1N1 influenza

Australian Journal of Acupuncture and Chinese Medicine, November 2010, 5 (2): 23-29
https://www.ajacm.com.au/wp-content/uploads/2017/10/2010-Volume-5-Issue-1.pdf

Abstract
The epidemiological data of influenza can serve as a basis for effective use of *Wen Bing* theory in the management of the 2009 H2N1 influenza. The long history of Chinese medicine in general and of the *Wen Bing* school specifically holds much evidence on adapting and responding to changes in the climate, environment and newly emerging diseases. Uncovering and comparing these data and information from Chinese medicine with modern epidemiological ones can perhaps offer another legitimate and valid way of understanding and treating contemporary diseases. Such a methodology may also be another strategy for integrating biomedicine with Chinese medicine. This paper will examine some of the epidemiological features of the 2009 H1N1 influenza and their similarities with the main characteristics of *Wen Bing* or warm diseases in Chinese medicine. It is suggested that the 2009 H1N1 influenza can be managed from a *Wen Bing* perspective using a four-phase approach.

Wen Bing (Warm Diseases) and the 2009 H1N1 Influenza

Clinical Commentary
The 2009 H1N1 influenza is the first flu pandemic of thetwenty-first century. It has caused considerable panicand anxiety in the public and medical establishment.The aetiology and presentation of the influenza areremarkably similar to those patterns enunciated bythe *wen bing* School of traditional Chinese medicine.On that basis, TCM practitioners can use *wen bing*theory as a foundation to manage the 2009 H1N1influenza effectively. This paper examines the similarmanifestations of warm diseases and swine flu andoffers a working framework covering their preventionand treatment.

Universal treatment of acute infectious diseases

Mikhail Teppone

The phase dynamics of the COVID-19 pandemic: a systematic analysis of 213 Countries and Territories

Probl Soc Gig Zdrav Istor Med, July 2022; 30 (3): 347-355
DOI: http://dx.doi.org/10.32687/0869-866X-2022-30-3-347-355

1.2. Infectious disease is a battle between the human body's defense and viruses or bacteria

History of the battle against viruses and bacteria dates back at least several thousand years. Ancient physicians already knew about external pathogens which could cause acute febrile diseases. They also knew that an evolution of any clinical case depended on the health status of the patient before the onset of the disease, so they talked about «body defense». At the beginning of modern microbiology, the importance of body resistance was confirmed by a Prof. Max von Pettenkofer, who swallowed the entire contents of a tube filled with germs of cholera, but nothing happened to him. So, he claimed: «*The important thing is the disposition of the individual*!».[1]

Despite a variety of external pathogens, the human body has a limited number of defense mechanisms, which is accompanied by a few clinical syndromes, consisting of common symptoms, such as fatigue, chills or hot feeling, headache, cough, shortness of breath, nausea, vomiting, diarrhea, skin rashes or discoloration of the skin, etc.

In ancient times the mechanism of the onset of fever was differentiated into two main groups (*hot* & *cold*) based on the presence of thirst, sweating, chills, or feelings of heat; and the choice of individual treatment was determined by the type of fever. According to the modern view on fever, which commonly accompanies infectious diseases, one can define only two mechanisms leading to an increase in temperature: one is an increase in heat production (a ***cold*** type) and the other, a decrease in heat transfer (a ***hot*** type), or their combination.[2] Thus ancient and modern explanations of fever are quite similar, and two types of antipyretic medicines are necessary and sufficient to manage any case of excessive fever. Similarly, 2–3 mechanisms can be identified that underlie each of the remaining symptoms of any acute viral disease, so, a small group of commonly used drugs would be sufficient to manage any infectious diseases, including *old* and *new* ones.

After the discovery of bacteria and viruses as a cause of infectious diseases, the main emphasis was changed from supporting the body resistance to the fighting against pathogens. It was successful in the majority of bacterial infection cases, but it was almost useless when disease was caused by a virus.

Therefore, if there is no etiotropic treatment, then there is no need to identify a new viral disease. All pharmaceutical and non-pharmaceutical therapeutic modalities would be addressed to the well-known protective mechanisms of the human body, and treatment should be based on the leading syndromes and symptoms, using the principle called *off-label* therapy.

1.4. Treatment of patients suffering from acute infectious diseases

About 1800 years ago, Dr. Zhang Zhongjing summarized the results of research from previous generations and developed a theory of acute infectious diseases, which explained therapy based on leading clinical symptoms and syndromes.[3] According to this theory, there could be only 6 phases, and certain phases could have 2–3 variants. Thus, the whole variety of clinical syndromes related to infectious diseases was limited to 10–12 variants, each having specific treatment and prevention.

There are some examples of treatment of the initial phases of infectious diseases: in the case of initial fever with general cold feelings without sweating – *Herba Ephedrae* was recommended; if there is initial fever with general hot feelings – *Folium Mori Albae* or *Herba Menthae Haplocalycis* should be used; if there is initial fever with intensive sweating or tension in the muscles – *Ramulus Cinnamomi Cassiae* was recommended; in the case of fever with alternating cold and hot feelings – *Radix Bupleuri*, was used, etc. A change in symptoms pointed to a change in the phase of the disease and required an adjustment of therapy. If a patient has a severe fever with hemorrhagic symptoms, skin rashes, kidney and liver impairment, delirium, etc. – *Radix of Isatis tinctoria* should be applied.[4]

(a) Phases of Defense System Affection	(b) Six Phases of Acute Infectious Diseases			(c) General Adaptation Syndrome by H. Selye
Activation of defense	1.	*Tai Yang*	- Common cold symptoms	**Alarm Phase**
Unstable phase	2.	*Shao Yang*	- Unstable phase	
Highest activity of defense	3.	*Yang Ming*	- Progressive fever	(Adaptation Phase)
Exhaustion of defense	4.	*Tai Yin*	- Beginning of exhaustion	**Exhaustion Phase**
	5.	*Shao Yin*	- Hemorrhagic and other Complications	
	6.	*Jue Yin*		

Theories which describe phase evolution of acute infectious diseases:
(a) Four phases of defense in a case of disease caused by "excessive heat".[5]
(b) Six phases of diseases caused by either "cold" or "heat", or "wind".[3]
(c) Three phases according to the general adaptation syndrome theory discovered by Hans Selye.[6-8]

...

During later centuries, protocols of infectious disease treatment were updated according to the new scientific discoveries of that time. Excepting deadly epidemic diseases (plague, smallpox, or cholera), therapy of other infectious diseases was effective and successful.

Theoretically, modern medicine having a long history in the past and advanced pharmaceutical science nowadays must be able to treat any problem more effectively than our predecessors, but the helplessness of the modern medical system during the current pandemic (2019-2022) was beyond common sense, and raised questions about the quality of education of the distinguished medical leaders and their followers.

...

As far as acute infectious diseases are concerned, their pathological condition is not stable, but has several phases. Each of the phases requires the use of different medicines and patient care. It would be illogical to look for the treatment of COVID-19 in general, when each phase of the disease requires an appropriate group of medicines. Then a doctor should choose one or two medicines, taking into account the main symptoms of a certain patient.

Multiple attempts to find a unique medicine against 'COVID-19' have failed. That suggests that treatment of COVID-19 or any further new acute viral infectious diseases should be managed by means of routine drugs applied as *off-label* therapy.

Tamiflu:

Various Claims and Reports related to its Application and Efficacy

Bilderbergers, Rumsfeld Profit from Avian Flu Scam

Global News Matrix, 24 October 2005
https://www.jesus-is-savior.com/Evils%20in%20Government/birdflu_scam.htm

You can't make any real money without a boogeyman, and the new "Bird Flu" hoax is the latest scam used to generate profits for pharmaceutical company insiders.

"Finally, the pieces of the puzzle start to add up," writes Dr. Joseph Mercola, author of the "Total Health Program." "President Bush sought to instill panic in this country by telling us a minimum of 200,000 people will die from the avian flu pandemic but it could be as bad as 2 million deaths in this country alone." http://mercola.com/blog/2005/oct/19/rumsfeld_to_profit_from_avian_flu_hoax

"This hoax is then used to justify the immediate purchase of 80 million doses of Tamiflu, a worthless drug that in no way shape or form treats the avian flu, but only decreases the amount of days one is sick and can actually contribute to the virus having more lethal mutations," Mercola continues.

"So the U.S. placed an order for 20 million doses of this worthless drug at a price of $100 per dose. That comes to a staggering $2 billion.

US Defense Secretary Donald Rumsfeld, former chairman of Gilead, the manufacturer of Tamiflu, will also make big profits, since he is a major shareholder.

Better yet, Bilderberger spokesman Etienne F. Davignon (Vice-Chairman, Suez-Tractebel) and Reagan-Bush Cabal insider former Secretary of State George P. Shultz, PhD (Distinguished Fellow, Hoover Institution, Stanford University) are also on the board of directors of Gilead.

Another Bilderberger regular is Lodewijk J.R. de Vink, who sits on the board of Hoffman-La Roche, Gilead's partner. http://www.roche.com/home/company/com_gov/com_gov_dir/com_gov_dir_vink.htm
In other words, the "Bird Flu" scam will generate outrageous profits for globalist-insiders like Shultz, Rumsfeld, Davignon, and de Vink.

And where did Tamiflu come from?

According to the Gilead website, "In September 1996, Gilead and F. Hoffmann-La Roche Ltd. entered into a collaborative agreement to develop and market therapies that treat and prevent viral influenza. Under the agreement, Roche received exclusive worldwide rights to Gilead's proprietary influenza neuraminidase inhibitors, including orally administered Tamiflu (oseltamivir phosphate), formerly known as GS 4104. As part of this collaboration, Gilead and Roche jointly conducted clinical development of oseltamivir phosphate, with Roche funding all research and development costs. Roche has worldwide commercial rights to Tamiflu, and Gilead receives payments from Roche for the successful completion of program milestones and royalties on product sales.")

It should be remembered that Rumsfeld loves pharmaceutical scams. It was after all Rumsfeld, as chairman of G.D. Searle, who pressured the FDA to get Aspartame approved.

The FDA blocked its approval for ten years before Rumsfeld twisted arms and broke who knows how many legs at the FDA. Now Aspartame, an artificial sweetener as ubiquitous as it is toxic, continues to poison America and the world.
So here's an advertising tagline.

Tamiflu – It's the Bird-Flu Scam-Drug For You

The New York Times

Rumsfeld to Avoid Bird-Flu Drug Issues

The New York Times, 28 October 2005, p. A13
https://www.nytimes.com/2005/10/28/politics/rumsfeld-to-avoid-birdflu-drug-issues.html

Washington, Oct. 27 – Defense Secretary Donald H. Rumsfeld has recused himself from government decisions concerning medications to prevent or treat avian flu, rather than sell his stock holdings in the company that patented the antiviral agent Tamiflu, according to a Pentagon memorandum issued Thursday.

The memorandum, to Mr. Rumsfeld's staff from the Pentagon general counsel, said the defense secretary would not take part in decisions that may affect his financial interests in Gilead Sciences Inc.

Before becoming defense secretary in January 2001, Mr. Rumsfeld was chairman of Gilead. On each of his annual financial disclosure statements, he has listed continued stock holdings in the company.

Gilead holds the patent on Tamiflu, but contracts for it are signed with an American subsidiary of F. Hoffman-LaRoche Ltd., which holds marketing and manufacturing rights.

Mr. Rumsfeld will remain involved in matters related to the Pentagon response to an outbreak, so long as none affect Gilead.

Nelson Schwartz

Rumsfeld's Growing Stake in Tamiflu

CNN, 31 October 2005
https://money.cnn.com/2005/10/31/news/newsmakers/fortune_rumsfeld/

New York (Fortune) – The prospect of a bird flu outbreak may be panicking people around the globe, but it's proving to be very good news for Defense Secretary Donald Rumsfeld and other politically connected investors in Gilead Sciences, the California biotech company that owns the rights to Tamiflu, the influenza remedy that's now the most-sought after drug in the world.

Rumsfeld served as Gilead (Research)'s chairman from 1997 until he joined the Bush administration in 2001, and he still holds a Gilead stake valued at between $5 million and $25 million, according to federal financial disclosures filed by Rumsfeld.

The forms don't reveal the exact number of shares Rumsfeld owns, but in the past six months fears of a pandemic and the ensuing scramble for Tamiflu have sent Gilead's stock from $35 to $47. That's made the Pentagon chief, already one of the wealthiest members of the Bush cabinet, at least $1 million richer.

Rumsfeld isn't the only political heavyweight benefiting from demand for Tamiflu, which is manufactured and marketed by Swiss pharma giant Roche. (Gilead receives a royalty from Roche equaling about 10% of sales.) Former Secretary of State George Shultz, who is on Gilead's board, has sold more than $7 million worth of Gilead since the beginning of 2005.

Another board member is the wife of former California Gov. Pete Wilson.

"I don't know of any biotech company that's so politically well-connected," says analyst Andrew McDonald of Think Equity Partners in San Francisco.

What's more, the federal government is emerging as one of the world's biggest customers for Tamiflu. In July, the Pentagon ordered $58 million worth of the treatment for U.S. troops around the world, and Congress is considering a multi-billion-dollar purchase. Roche expects 2005 sales for Tamiflu to be about $1 billion, compared with $258 million in 2004.

Rumsfeld recused himself from any decisions involving Gilead when he left Gilead and became Secretary of Defense in early 2001. And late last month, notes a senior Pentagon official, Rumsfeld went even further and had the Pentagon's general counsel issue additional instructions outlining what he could and could not be involved in if there were an avian flu pandemic and the Pentagon had to respond.

As the flu issue heated up early this year, according to the Pentagon official, Rumsfeld considered unloading his entire Gilead stake and sought the advice of the Department of Justice, the SEC and the federal Office of Government Ethics.

Those agencies didn't offer an opinion so Rumsfeld consulted a private securities lawyer, who advised him that it was safer to hold on to the stock and be quite public about his recusal rather than sell and run the risk of being accused of trading on insider information, something Rumsfeld doesn't believe he possesses. So, he's keeping his shares for the time being.

OTTAWA CITIZEN

Pandemic Paranoia
Rumsfeld's connection to Tamiflu has conspiracy theorists spinning

Ottawa Citizen, 13 November 2005, p. A9.
https://www.newspapers.com/image/456099794/

One day Americans were panic-buying Tamiflu, making the influenza remedy the most sought-after drug in the world; the next day, rumours were rampant that the U.S. response to bird-flu was more about profit than public health.

What happened?

In a name: Donald Rumsfeld.

From Kandahar to Kalamazoo, the U.S. Secretary of Defense has been vilified by opponents of the Iraq war as the hawkish ideologue who took America into a battle it could not win based on information about weapons of mass destruction that was at best shoddy research and at worst an out-right lie.

In 2003, he went so far as to claim he knew "where they are; they're in the area around Tikrit and Baghdad."

Until recently, Rumsfeld's duplicity on those alleged weapons appeared to be safely constrained – at least for us non-Americans and non-Iraqis – to the arena of the war. We may not trust him, but unless you've enlisted in the marines or own a time-share in Tikrit, he's another country's problem.

Then last week's report in Fortune magazine showed Rumsfeld had brought his talents to a company making huge profits off bird flu panic.

The magazine said Rumsfeld served as chairman of Gilead Sciences the California biotech company that owns the rights to Tamiflu, the antiviral that pundits have trumpeted as the best weapon against avian flu. Rumsfeld was chairman from 1997 until he joined the Bush administration in 2001, and according to federal financial disclosures filed by Rumsfeld, he still holds a stake in Gilead valued at between $5 million and $25 million.

The documents don't specify how many shares Rumsfeld owns, but in the past six months fears of a pandemic and panic buying of Tamiflu have sent Gilead's stock to $47 from $35. According to Fortune, that has made the Pentagon chief, already one of the wealthiest members of the Bush cabinet, at least $1 million richer.

Rumsfeld reportedly recused himself from any decisions involving Gilead when he left the biotech firm and became Secretary of Defense in early 2001. He also had the Pentagon's general counsel outline what he can and cannot be involved in if there is an avian flu pandemic.

He even considered unloading his shares, but would make so much money from the deal, independent counsel told him it was better to hold on to the stock and be public about his recusal rather than risk of being accused of trading on insider information.

Rumsfeld isn't the only Republican heavyweight benefitting from demand for Tamiflu, which is manufactured by Swiss pharma giant Roche. Fortune said former Secretary of State George Shultz, who is on Gilead's board, has sold more than $7-million worth of Gilead since the beginning of 2005. (Roche gives Gilead a royalty equaling about io per cent of sales.)

But it's Rumsfeld's connection to Tamiflu that has suddenly sent the minds of conspiracy theorists spinning out of control.

If you can concoct reasons to invade another country, why not exaggerate the threat of bird flu on the other side of the globe? And it's not just his involvement in the hunt for bogus weapons of mass destruction that has raised suspicion among lefties about the sudden push to have Americans dosed with Tamiflu, it's also his involvement, more than two decades ago, in the approval of aspartame. And before that, mass vaccination of Americans against swine flu.

In 1976, a military recruit in New Jersey died from flu that experts thought could be the "swine flu" virus of 1918 fame. Rumsfeld, who was then Secretary of Defense for interim president Gerald Ford, urged him to begin a mass vaccination. The Ford administration quickly produced and distributed large numbers of doses of the vaccine. Some batches were contaminated and 52 people died while 600 fell ill. The program was stopped. Nobody got swine flu.

Then, in the early 1980s, Rumsfeld was the president and CEO of Searle, the company that originally owned the patent on aspartame.

The Food and Drug Administration had blocked its approval for io years because of objections from numerous researchers and studies that showed aspartame was dangerous, but Rumsfeld was able to use his political power to get aspartame approved by the FDA.

Afterwards, thousands of consumers filed adverse-reaction reports with the FDA blaming aspartame for migraine headaches, vision problems, epileptic seizures and other maladies – links the company says have never been clinically proven.

Now that Rumsfeld has been shown to be profiting from bird flu panic, suddenly America's response to bird flu, like weapons of mass destruction, and swine flu and aspartame before it, is not just a public health issue but a partisan one.

As *Global News Matrix*, a left-wing news website, stated last week, "You can't make any real money without a boogeyman, and the new 'Bird Flu' hoax is the latest scam used to generate profits for pharmaceutical company insiders."

Dr. Joseph Mercola, a frequent writer on health issues and author of the *Total Health Program*, wrote recently, "Finally, the pieces of the puzzle start to add up," alleging the media, U.S. President George Bush and the drug companies are orchestrating a terror campaign to make people buy Tamiflu, or at the very least, get the flu vaccine.

According to a draft of the government's plan to fight a potentially cataclysmic pandemic this new avian super-flu could kill nearly two million Americans. Best-case scenario, only 200,000 might die. But there wasn't a lot of reporting of that lesser figure.

Dr. Mercola questioned the assertion, made repeatedly by government officials and media, that the avian flu virus can jump from birds to humans and produce a fatal illness in 5o per cent of those infected.

A 50 per cent fatality rate sounds scary to anybody, he says. But how were these numbers derived? "Did they examine everyone who contracted the avian flu and use those numbers or did they examine the sickest of the sick who had come down with the avian flu and determine the mortality from there?" Of course, says Dr. Mercola, it was the latter.

"Unless you are a full-time bird handler in a Third World country that has a seriously challenged immune system, you probably have a much better chance of winning the lottery than dying from the proposed avian flu epidemic," he writes.

He says research like this would usually be dismissed if there wasn't some hidden motive. The U.S. has emerged as one of the world's biggest customers for Tamiflu. In July, the Pentagon ordered

$58-million worth of the treatment for U.S. troops around the world, and Congress is considering a multi-billion-dollar purchase. Roche expects 2005 sales for Tamiflu to be about $1 billion, compared with $258 million in 2004.

And for what? Will Tamiflu really save the world?

We're told it's the best weapon we have, but it won't prevent flu.
According to the drug company, when used within two days of contracting the flu – not bird flu, mind you – Tamiflu was shown to reduce the severity of symptoms in adult victims by 38 per cent, with a 67 per cent reduction in secondary complications such as bronchitis, pneumonia, and sinusitis in otherwise healthy patients. The drug also reduces the duration of influenza by 37 per cent.

Still, the panic-buying goes on.
The demand was so great, the drug company suspended sales in Canada, while increasing production to get it to countries like China, where an out-break is said to be imminent. Who knows if bird flu will eventually kill millions of people?

Panic-purchasing Tamiflu in the meantime, is going to make the Secretary of Defense an even wealthier man.

CNN Money

Nelson D. Schwartz

The Tamiflu Tug of War

CNN, 14 November 2005
https://money.cnn.com/magazines/fortune/fortune_archive/2005/11/14/8360685/index.htm

(*FORTUNE* Magazine) – A Year Ago Tamiflu Was Known, If at all, as an obscure remedy for influenza, which doctors typically treat with bed rest and chicken soup. Today, with panic mounting over a potential bird flu pandemic, it's the most sought-after drug in the world, as everyone from suburban soccer moms in the U.S. to health officials in London and Taipei scramble to stockpile the pill. At the moment, it seems, virtually the entire world is on sick-chicken alert.

"One dead parrot in the U.K. and four dead ducks in Romania does not mean the pandemic has arrived," says William Burns, head of the pharmaceutical division of Roche, the Swiss company that manufactures Tamiflu. But the appearance in Europe of the H5N1 strain of bird flu – which has already infected 121 people in Asia, 62 fatally – has set off a stampede for the medicine and created a contagion of stock market speculation about Roche and the California biotech firm that first developed Tamiflu, Gilead Sciences. Despite worries about Tamiflu's effectiveness, the phenomenon is a reminder of just how quickly fear can spawn greed: The potential profit windfall for the drugmakers seems to be growing daily, and shares in both Roche and Gilead are surging.

Among the beneficiaries of the run on Tamiflu is Secretary of Defense Donald Rumsfeld, who was chairman of Gilead from 1997 to 2001 and owns at least $5 million of the stock, which has jumped from $35 in April to $47. Former Secretary of State George Shultz, who is on Gilead's board, has sold more than $7 million worth of Gilead in 2005.

As the bird-flu issue heated up earlier this year, according to a senior Pentagon official, Rumsfeld considered unloading his entire Gilead stake to avoid any perceived conflict of interest. He sought the advice of the Department of Justice, the Securities and Exchange Commission, and the federal Office of Government Ethics. When those agencies didn't offer an opinion, Rumsfeld consulted a private securities lawyer, who advised him to hold on to the stock and be vocal about his earlier recusal from all matters involving Gilead, rather than sell and run the risk of being accused of insider trading. Holding on has paid off--it's made the Pentagon chief, already one of the wealthiest members of the Bush cabinet, at least $1 million richer. In late October, Rumsfeld had the Pentagon's general counsel issue instructions on what he could and could not do in the event of an epidemic.

Gilead developed Tamiflu on its own, then licensed it to Roche in 1996 to get help manufacturing and marketing it. But Gilead has complained for years that Roche wasn't aggressive on either front. In June, Gilead, which receives royalties equal to about 10% of Tamiflu sales, took the unusual step of terminating its licensing agreement with Roche and going into arbitration to win back exclusive rights to the drug.

Roche CEO Franz Humer rejects Gilead's claims that his company neglected Tamiflu. He points out that Roche has doubled Tamiflu production since last year, and will double it again next year. What's more, Humer is confident the two companies will come up with a compromise that leaves Tamiflu in Roche's hands. The most likely scenario would be that Roche simply coughs up more in

royalties to Gilead. That prospect has Wall Street very excited. Analyst Sapna Srivastava of Morgan Stanley says she's been getting calls from brokers who want to know whether to buy Tamiflu, as well as shares of Gilead. "It's suddenly become a stock everyone knows and talks about."

And interest goes well beyond Wall Street. Already drugstores are finding demand for the drug, well, contagious. "We've got doctors getting it for their families, sometimes a double treatment," says pharmacist Joseph Damin of Spencer Pharmacy in Scarsdale, N.Y. In late October, Roche halted delivery of the drug to the U.S. and Canada, to prevent hoarding and make sure there's still some Tamiflu left when the normal flu bug arrives this winter.

While the soccer moms may be going overboard, the people who really should be worrying about the threat seem remarkably blasé. Although governments in Europe are buying enough Tamiflu to cover a quarter of their population –and the Pentagon has already ordered $58 million worth of Tamiflu for U.S. troops around the world--the U.S. government has purchased only 4.3 million doses of Tamiflu and another anti-viral, Glaxo's Relenza, enough for just 1.5% of Americans. Despite months of debate about an additional multibillion-dollar purchase, Congress and the White House haven't agreed on a final plan.

Making tons of Tamiflu isn't easy. The drug is derived from the pods of Chinese star anise plants in a yearlong process that is expensive and dangerous – at one stage the stuff is highly explosive. "It's not like you press the button in the morning and in the afternoon Tamiflu falls out," says Humer. "We don't yet have a firm order from Washington ... words are not enough."

the village VOICE

James Ridgeway

Capitalizing on the Flu
Flu pandemic would spark enough fear to make it a greed pandemic

The Village Voice, 15 November 2005.
https://web.archive.org/web/20090501120739/http://www.villagevoice.com/2005-11-15/news/capitalizing-on-the-flu/http

Washington, D.C. – President Bush's vague plan for coping with a serious outbreak of bird flu is based largely on fear and greed. There is no secret about this. He seeks to get people's attention by scaring the citizenry with visions of millions of people dying from a pandemic so bad it leads to martial law, mass quarantines, restrictions on travel, and so on. He wants to encourage private business to meet the crisis by producing more of existing drugs such as Tamiflu to combat a flu plague and entice the drug companies to work harder and faster to make a vaccine by ensuring its profitability.

The answer to a bird flu pandemic is not a passive first-world population riveted to the TV, watching one person after another drop dead across the world as sickened birds fly closer and closer and finally land in our midst.

The answer lies in effective communication at all levels among different nations, through their medical establishments, scientists, and spotters, so that as soon as sick or dead birds are found, the birds in surrounding areas can be culled. This is a job for the World Health Organization, which is part of the United Nations, the organization Bush and his ambassador, John Bolton, are determined at all costs to wreck.

While developed countries race to lay in supplies of antiviral drugs, there is little interest in the animals themselves and in animal-human interaction where flu can begin and spread. The WHO and Food and Agriculture Organization have only 40 veterinarians between them.

"Reducing human exposure requires education about handling poultry and a fundamental change in cultural attitudes towards human-animal interactions and husbandry in many parts of the world," writes *The Lancet*, the British medical journal.

"In some African countries, people sleep in the same places as poultry. In southeast Asia, 'wet markets,' where live poultry are traded and slaughtered on the spot, pose a risk of human transmission. And in Central Asia and Eastern Europe, hunting of wild birds may have played a major part in the spread of avian influenza."

Changing the interplay of animals and humans may meet considerable resistance among small poultry farmers in poor countries, who face the loss of whole flocks in a mass culling. If farmers are offered too little to cull their birds, they won't do it. And if too much money is proffered, "the money will be an incentive to deliberately infect their flocks," Milan Brahmbhatt, the World Bank's lead economist for East Asia and the Pacific, told *The Lancet*.

The overall effect of a pandemic in Asia will be to drive small poultry farmers out of business and open the way for U.S.-style industrial chicken farming, with ownership concentrated in the hands of a few. Among the major exporters are China and Thailand (Southeast Asia now accounts for about a quarter of the world poultry business). Most of their chickens go to Japan. Many countries are banning imports from these two nations, and that is running up the price of chickens worldwide and promising to up exports from such places as the U.S., Brazil, and the EU.

Robber Barons

A serious effort to stave off a pandemic also means stopping the pharmaceutical companies from scaring people to make more money. It is by now well-known that the drug companies provide huge sums of cash to politicians – $133 million to federal candidates since 1998, according to the Center for Public Integrity, with upwards of $1.5 million going to Bush, the top recipient. The industry operates an elaborate lobby in Washington that in 2004 spent $123 million and employed an army of 1,291 lobbyists, more than half of whom were former federal officials. The industry's sales machine aims to bypass doctors with TV and other advertising aimed directly at the patient, appealing to his or her judgment over that of a physician.

In the case of making and marketing drugs to combat flu, the results are disastrous. The industry claims it can't make flu vaccines because there is no money in it. When asked about last year's flu vaccine shortage by CBS's Bob Schieffer, Bush said the industry was fearful of damage suits concocted by ambulance-chasing lawyers. He explained the shortage this way: "Bob, we relied upon a company out of England to provide about half of the flu vaccines for the United States citizen, and it turned out that the vaccine they were producing was contaminated. And so, we took the right action and didn't allow contaminated medicine into our country." This was not true. The American inspectors had approved flu vaccine shipments from a U.S. producer's British company. It was British inspectors who blocked shipment of the questionable vaccine from the American firm.

With no vaccine in sight, the U.S. government, along with others, is belatedly stocking up on Tamiflu, a drug that supposedly offers some defense against bird flu. But last week Japanese newspapers told how children who were administered Tamiflu went mad and tried to kill themselves by jumping out of windows. In a cautionary statement the FDA noted 12 deaths among children, and said there are reports of psychiatric disturbances, including hallucinations, along with heart and lung disorders. Roche, the manufacturer, is quoted by the BBC as stating that the rate of deaths and psychiatric problems is no higher among those taking its medication than among those with flu. The company is increasing Tamiflu production to 300 million doses a year to meet demand.

Rumsfeld's drug connections

There are other reasons people are leery of Tamiflu. Given the rip-offs in Iraq and after the hurricanes, people are understandably interested in knowing just who is going to get rich off the plague. Secretary of Defense Donald Rumsfeld, himself former CEO of drug company Searle, currently owns stock in the one company that owns Tamiflu patents – to the tune of at least $18 million. Rumsfeld says he understands why people might question his holdings, but selling them would raise even more questions. So, he is hanging on to what he's got.

A flu pandemic could mean a reduction in travel. A recent Citicorp report says likely economic losers would include airlines (such as British Airways, Lufthansa, and Air France), insurers like AXA, and luxury-goods conglomerates such as Richemont.

The report adds: "Winners could include drug makers such as Gilead Sciences, Roche, GlaxoSmithKline, and Sanofi-Aventis. Other possible winners are hospital chains such as Rhoen Klinikum, cleaning-products makers such as Henkel, Ecolab, and Clorox, as well as home entertainment companies such as Blockbuster and Nintendo."

In order for the pharmaceutical companies to profit from making flu vaccine in the administration's $7.1 billion pandemic flu plan, Bush now is proposing to ban liability suits against them except in cases of willful misconduct. As for those injured by a flu vaccine, possible lawsuits remain an open question.

With a worldwide market estimated at more than $1 billion, there's big money in a flu plague. Kimberly-Clark's Chinese subsidiary is already ramping up manufacture of new lines of medical masks, wipes, and hand-washing liquids, according to Business Week, with consulting firms Kroll and Booz Allen Hamilton selling flu preparedness advice to companies and governments. "Crisis is an opportunity as long as you see it first," Pitney Bowes's Christian Crews tells the magazine.

If all Bush wants to accomplish is to see the drug industry make more money, any fight against the flu will be uphill.

THE SUNDAY TIMES

Jonathan Carr-Brown

Doctor says bird flu drug is useless

The Sunday Times – Ireland, 4 December 2005, 12:00 AM
https://www.thetimes.co.uk/article/doctor-says-bird-flu-drug-is-useless-ftkbvjk7p05
https://web.archive.org/web/20060104003647/http://www.timesonline.co.uk/article/0,,2091-1903144,00.html
https://web.archive.org/web/20150318051721/http://www.thesundaytimes.co.uk/sto/news/uk_news/article208383.ece

A Vietnamese doctor who has treated dozens of victims of avian flu claims the drug being stockpiled around the world to combat a pandemic is “useless” against the virus.

Dr Nguyen Tuong Van runs the intensive care unit at the Centre for Tropical Diseases in Hanoi and has treated 41 victims of H5N1. Van followed World Health Organisation (WHO) guidelines and gave her patients Tamiflu, but concluded it had no effect.

“We place no importance on using this drug on our patients,” she said. “Tamiflu is really only meant for treating ordinary type A flu. It was not designed to combat H5N1 . . . (Tamiflu) is useless.”

Her verdict casts doubt on the pandemic flu policy put in place by the Irish government. Mary Harney, the minister for health, has ordered 1m doses to “protect” a quarter of the population against the flu pandemic.

=> another version:

Her verdict casts doubt on the pandemic flu policy put in place by the British government. Sir Liam Donaldson, the chief medical officer, has ordered 15 m doses to “protect” a quarter of the population against the flu pandemic he believes “is only a matter of time”.

Van, who has also treated patients with Sars, the respiratory condition linked to birds, said avian flu had a frightening effect on its victims and the only way to keep patients alive was to “support” all their vital organs, including the liver and kidneys, with modern technology such as ventilators and dialysis machines.

Van would not criticise governments for stockpiling Tamiflu but said doctors had to explain its limitations. Roche, the company that makes Tamiflu, has sold stockpiles of the drug to 40 countries and insists there is clear evidence it will protect against a future flu virus. However, it stresses the drug must be given within 48 hours to be effective.

“Laboratory studies show that Tamiflu is effective against all strains of flu,” said Bill Hall, director of the National Virus Reference Laboratory, who defended Ireland’s stockpiling of Tamiflu and other flu treatments. “The only limitation is when it is not administered within the first 24 hours of onset of symptoms.”

The WHO admitted Tamiflu had not been widely successful in humans. “However, we believe in many Asian countries it hasn’t been used until late in the illness,” a spokesman said.

INDEPENDENT

Geoffrey Lean, Jonathan Owen

Donald Rumsfeld Makes $5M Killing on Bird Flu Drug

Independent, 12 March 2006, 01:00, p. 46
https://www.independent.co.uk/news/world/americas/donald-rumsfeld-makes-5m-killing-on-bird-flu-drug-6106843.html

Donald Rumsfeld has made a killing out of bird flu. The US Defence Secretary has made more than $5m (£2.9m) in capital gains from selling shares in the biotechnology firm that discovered and developed Tamiflu, the drug being bought in massive amounts by Governments to treat a possible human pandemic of the disease.

More than 60 countries have so far ordered large stocks of the antiviral medication – the only oral medicine believed to be effective against the deadly H5N1 strain of the disease – to try to protect their people. The United Nations estimates that a pandemic could kill 150 million people worldwide.

Britain is about halfway through receiving an order of 14.6 million courses of the drug, which the Government hopes will avert some of the 700,000 deaths that might be expected. Tamiflu does not cure the disease, but if taken soon after symptoms appear it can reduce its severity.

The drug was developed by a Californian biotech company, Gilead Sciences. It is now made and sold by the giant chemical company Roche, which pays it a royalty on every tablet sold, currently about a fifth of its price.

Mr Rumsfeld was on the board of Gilead from 1988 to 2001, and was its chairman from 1997. He then left to join the Bush administration, but retained a huge shareholding.

The firm made a loss in 2003, the year before concern about bird flu started. Then revenues from Tamiflu almost quadrupled, to $44.6m, helping put the company well into the black. Sales almost quadrupled again, to $161.6m last year. During this time the share price trebled.

Mr Rumsfeld sold some of his Gilead shares in 2004 reaping - according to the financial disclosure report he is required to make each year - capital gains of more than $5m. The report showed that he still had up to $25m-worth of shares at the end of 2004, and at least one analyst believes his stake has grown well beyond that figure, as the share price has soared. Further details are not likely to become known, however, until Mr Rumsfeld makes his next disclosure in May.

The 2005 report showed that, in all, he owned shares worth up to $95.9m, from which he got an income of up to $13m, owned land worth up to $17m, and made $1m from renting it out.

He also had illiquid investments worth up to $8.1m, including in partnerships investing in biotechnology, issuing reproductions of paintings, and operating art galleries in New Mexico and Wyoming. He also has life insurance with a surrender value of up to $5m, and received up to $1m from the DHR Foundation, in which he has assets worth up to $25m, and $773,743 from the Donald H Rumsfeld Trust, in which he has assets of up to $50m.

Late last week no one at Gilead Sciences was available to comment on Mr Rumsfeld's sale of its stock. In a statement to The Independent on Sunday the Pentagon said: "Secretary Rumsfeld has no relationship with Gilead Sciences, Inc beyond his investments in the company. When he became Secretary of Defence in January 2001, divestiture of his investment in Gilead was not required by the Senate Armed Services Committee, the Office of Government Ethics or the Department of Defence Standards of Conduct Office.

"Upon taking office, he recused himself from participating in any particular matter when the matter would directly and predictably affect his financial interest in Gilead Sciences."

Tamiflu and Donald Rumsfeld
Does Secretary of Defense Donald Rumsfeld own Tamiflu stock?

Snopes, 6 May 2006
https://www.snopes.com/fact-check/tamiflu/

Claim: U.S. Secretary of Defense Donald Rumsfeld owns stock in the company that makes Tamiflu.

"Bird Flu" Do you know that 'bird flu' was discovered in Vietnam 9 years ago? Do you know that barely 100 people have died in the whole world in all that time? Do you know that it was the Americans who alerted us to the efficacy of the human antiviral *Tamiflu* as a preventative? Do you know that *Tamiflu* barely alleviates some symptoms of the common flu? Do you know that its efficacy against the common flu is questioned by a great part of the scientific community? Do you know that against a supposed mutant virus such as H5N1, *Tamiflu* barely alleviates the illness? Do you know that to date Avian Flu affects birds only? Do you know who markets *Tamiflu*? Roche Laboratories. Do you know who bought the patent for *Tamiflu* from Roche Laboratories in 1996? Gilead Sciences Inc. Do you know who was the then president of Gilead Sciences Inc. and remains a major shareholder? Donald Rumsfeld, the present Secretary of Defence of the USA. Do you know that the base of *Tamiflu* is crushed aniseed? Do you know who controls 90% of the world's production of this tree? *Roche*. Do you know that sales of *Tamiflu* were over $254 million in 2004 and more than $1000 million in 2005? Do you know how many more millions *Roche* can earn in the coming months if the business of fear continues?

So, the summary of the story is as follows: Bush's friends decide that the medicine *Tamiflu* is the solution for a pandemic that has not yet occurred and that has caused a hundred deaths worldwide in 9 years. This medicine doesn't so much as cure the common flu. In normal conditions the virus does not affect humans. Rumsfeld sells the patent for *Tamiflu* U to ROCHE for which they pay him a fortune. Roche acquires 90% of the global production of crushed aniseed, the base for the antivirus. The governments of the entire world threaten a pandemic and then buy industrial quantities of the product from Roche. So, we end up paying for medicine while Rumsfeld, Cheney and Bush do the business.

Are we crazy? Or are we idiots? At least pass this on so that it can be known!

Origins: This particular e-mail first came to us in April 2006. As to its claims, rather than take them in order, we'll examine them in two parts: whether the U.S. Secretary of Defense owns stock in the company that produces Tamiflu, and whether Tamiflu is effective against influenza.

As to the first, it is true Donald Rumsfeld does indeed have stock holdings in Gilead Sciences, Inc., the California biotech company that developed Tamiflu (a product now manufactured and sold by the pharmaceutical giant Roche), and so he benefits financially from increases in that company's stock price. (Gilead receives a royalty from Roche equal to about 10% of sales.) Rumsfeld was a member of Gilead's board of directors between 1988 and 2001, and he was its chairman from 1997 until he joined President George W. Bush's cabinet as Secretary of Defense in 2001. According to federal financial disclosures filed by Rumsfeld, he has Gilead stock holdings valued at between $5 million and $25 million.

The Secretary of Defense is not the only politically-connected person to have ties to Gilead. Former Secretary of State George Shultz, who is on Gilead's board, has sold more than $7 million worth of Gilead stock since the beginning of 2005. Another Gilead board member is the wife of former California governor Pete Wilson.

Rumsfeld is in a "damned if you do, damned if you don't" position because of his stock holdings, even though he apparently has no say in what Gilead does (he's no longer on its board) and has removed himself from being part of governmental decisions that affect it (he's recused himself). In a statement to The Independent in March 2006, the Pentagon said: "Secretary Rumsfeld has no relationship with Gilead Sciences, Inc. beyond his investments in the company. When he became Secretary of Defense in January 2001, divestiture of his investment in Gilead was not required by the Senate Armed Services Committee, the Office of Government Ethics or the Department of Defense Standards of Conduct Office. Upon taking office, he recused himself from participating in any particular matter when the matter would directly and predictably affect his financial interest in Gilead Sciences."

If Rumsfeld holds onto his stock and its share price rises (which one would expect it to do if an avian flu pandemic becomes a reality, or if concerns about such a pandemic continue to grow), he will be seen to be profiting mightily from sales of a product the U.S. government has been buying in large quantities. If he sells his stock and so divests himself of further interest in Tamiflu sales, he will be accused of locking up profits from the rise in share price that has already occurred. (In 2001, shares of Gilead Sciences, Inc. traded in a range between $6.64 and $17.93. Between January and April 2006, its price range has been $53.00 to $65.62.)

As to the second aspect of the e-mail, whether Tamiflu is effective against influenza (especially the specific H5N1 strain now referred to as avian or bird flu), the e-mail's dismissive "This medicine doesn't so much as cure the common flu" is misleading in that Tamiflu isn't meant to be a flu cure. Positioning the drug as a medicine that flopped obscures that fact.

Tamiflu does not cure the flu, but if taken soon after symptoms appear, Tamiflu can reduce the flu's severity. As to how well it's going to match up against bird flu, that is not yet known and indeed it may well not be knowable until the time comes. However, it is anticipated Tamiflu will have at least some effect against bird flu, and with that in mind, more than 60 countries (including the U.S.) have so far ordered large stocks of it. Such stockpiling is likely going to appear highly prudent if the bird flu pandemic, a worldwide medical disaster the United Nations estimates could kill 150 million people, does materialize.

Influenza is not a straightforward disease, as it is constantly mutating. While media attention has now conditioned us to regard "bird flu" as a particular entity, in truth there are many forms of "bird flu." The one now the focus of so much concern, the H5N1 strain, was first noted in Asian birds in 1997. That first year, 18 people in Hong Kong were diagnosed with the contagion, 6 of whom died. Since 1997, there have been approximately 206 known human cases bird flu (of which 114 died), but as the CDC points out: "It is possible that the only cases currently being reported are those in the most severely ill people, and that the full range of illness caused by the H5N1 virus has not yet been defined."

Viewed from one angle (114 deaths over the course of nine years), avian flu is not worth being much concerned about. But viewed from a more informed standpoint about the nature of influenza, there may indeed be great cause for alarm. Influenza can jump species and move from birds (and other animals, such as pigs) into humans. During the process of that move – and afterwards, as one person infects another – the virus changes form. What at one moment can be a containable and well-understood virus can in the space of hours or days become almost an entirely new virus. For this reason, flus are hard to combat: they change as they are passed along, staying well ahead of science's attempts to contain them.

Most strains of flu are not deadly to humans, save for members of groups especially at risk to all forms of contagion (e.g. the very young, the very old, and the infirm of all ages). Bird flu, however, is a killer, and if it jumps species and mutates on the fly into a form that humans can easily pass to each other, it could take the lives of millions in the space of weeks, ultimately making the United Nations' projected death toll of 150 million worldwide look like wishful thinking.

CIDRAP

Tamiflu may pose risk of mental side effects

CIDRAP, 14 November 2006
https://www.cidrap.umn.edu/influenza-general/tamiflu-may-pose-risk-mental-side-effects

Nov 14, 2006 (CIDRAP News) – Mainly on the basis of reports from Japan, drug manufacturer Roche and US regulators are warning that influenza patients treated with oseltamivir (Tamiflu) may have an increased risk of self-injury and delirium.

"People with the flu, particularly children, may be at increased risk of self-injury and confusion shortly after taking Tamiflu and should be closely monitored for signs of unusual behavior," says a warning that Roche has added to its official product information, according to a company letter posted on the Food and Drug Administration (FDA) Web site.

Oseltamivir, a neuraminidase inhibitor, is used both to prevent and to treat flu and is regarded as the best available drug for dealing with a potential pandemic strain of flu. The United States and many other countries are stockpiling it because of the pandemic threat.

The warning follows an FDA review of 103 reports of neuropsychiatric adverse events associated with oseltamivir use between Aug 29, 2005, and Jul 6, 2006, of which 95 came from Japan. That compares with 126 such adverse events reported between 1999 and August 2005. About two thirds of the problems were in children and youth (younger than 17 years).

A report by the FDA's Center for Drug Evaluation and Research says the adverse events included three fatal falls – one in a 14-year-old boy who apparently fell to his death from a condominium balcony and two in men. Most of the events (60 of 103) were described as delirium with disturbed behavior. Other problems included "suicidal events," panic attacks, delusions, convulsions, depressed consciousness, and loss of consciousness.

The FDA and Roche both say the contribution of the drug to the adverse events is not known. The FDA report says influenza by itself can lead to neuropsychiatric disorders, but many of the problems reported, especially delirium and suicide attempts, were not typical of those associated with flu alone.

Citing factors that seem to implicate oseltamivir in the events, the FDA said most of the problems occurred within a day after the start of treatment, and in many cases the physician suspected the drug was the cause. In addition, many of the patients recovered quickly after they stopped taking oseltamivir.

"It is still unclear whether these neuropsychiatric events are drug-related only, disease manifestations alone, or a combination" of the two, the report states.

The analysis notes that oseltamivir is used much more widely in Japan, with 24.5 million prescriptions from 2001 thorugh 2005, than in the United States, with 6.5 million prescriptions in the same period. In Japan the product information already includes a warning about possible psychoneurological problems.

The FDA report expresses concern that if oseltamivir use in the United States increases to the levels seen in Japan, the number of adverse events will increase as well. "Therefore, it would be prudent to update the U.S. labeling to be similar in scope with the current Japanese labeling," it says.

The Japanese origin of most of the adverse event reports might suggest that the problems are related to genetic characteristics common in Japan, the FDA analysis says. But given the much greater use of the drug in Japan and the possibility of different surveillance practices there, the lack of cases reported in the United States doesn't constitute good evidence for that hypothesis, it states.

The FDA analysis was prepared for the agency's Pediatric Advisory Committee, which is scheduled to meet Nov 16.

The latest developments come about a year after that committee concluded that 12 deaths in Japanese children who had been taking oseltamivir were not related to the drug. The FDA said then that the deaths seemed to be part of a wave of flu-related encephalitis and encephalopathy cases in Japanese children that began in the mid-1990s, before the drug was approved. But the committee asked the FDA to continue monitoring the situation and report again in a year.

The Sydney Morning Herald

Justin Norrie

Bird flu drug probe after 18 teenage deaths in Japan

The Sydney Morning Herald, 1 March 2007, 11.00 AM
https://www.smh.com.au/national/bird-flu-drug-probe-after-18-teenage-deaths-in-japan-20070301-gdpkln.html

Japanese health authorities are investigating a flu medicine that is also available in Australia after a teenager jumped 11 storeys to his death after taking the drug. It was the 18th juvenile fatality linked to Tamiflu in 17 months.

The Ministry of Health, Labour and Welfare has asked the Japanese importer of Tamiflu, an anti-viral drug regarded as the most important shield against bird flu in humans, to collect information about the conditions of patients who take the drug.

The 14-year-old boy's death follows a similar case two weeks ago, when a girl also 14, died after jumping from an apartment building at Gamagori, in central Japan.

It also comes after a warning by the US Food and Drug Administration late last year about the dangers of giving children Tamiflu. The drug is being stockpiled in Australia as the first line of defence against bird flu. In Australia, as in Japan, it is only available by prescription.

The Swiss manufacturer, Roche, says the rate of deaths and psychiatric disturbances among people taking its medication is no higher than for flu sufferers generally. It denies there is evidence of a direct correlation between the drug and the fatalities.

In the latest case the teenager, from Sendai in Japan's north-east, had been prescribed a five-day course of Tamiflu by his doctor. After taking two tablets on Monday, he woke during the evening and told his mother he was going to the bathroom, but went out the front door instead.

His mother followed him and called out when she saw him climbing a 1.3-metre handrail. Police said he did not respond, throwing himself off to the parking lot below. There was nothing to suggest the death was a suicide.

Hakuo Yanagisawa, the Minister of Health, Labour and Welfare, urged the public to stay calm. "There needs to be clear evidence," he said.

Drug companies reported that 54 people using Tamiflu died in Japan before November, the ministry said.

The Korea Times

Bae Ji-sook

Bird Flu Medicine Toxic for Teens

The Korean Times, 13 May 2008
http://www.koreatimes.co.kr/www/news/nation/2008/05/117_24103.html

Concerns are rising over side effect of bird flu drug Tamiflu on teenagers.

Tamiflu is Swiss-based Hoffman-La Roche's antiviral for general influenza A and B but is also used to combat bird flu. However, worries have surfaced about the possibility of the medicine causing mental disorders among teenagers.

With fear of the H5N1 virus sweeping the nation, the government has doubled the quantity of the drug in storage, as it is the most effective treatment against avian influenza.

Whether to prescribe the pills with risks of side-effects such delusions or other disorders is being widely discussed among medical experts.

Although the drug has been the only medicine accredited to be effective against the H5N1 virus strain by the World Health Organization (WHO), the Japanese and Korean governments restricted its being prescribed to teenagers last year.

The Korea Food and Drug Administration announced that the drug should not be prescribed to those between 10 to 19 years old except for emergencies.

According to Roche, there has not been a reported case of side effects here, but the Seoul Shinmun, a local daily, reported that a woman in her 30s said she had nightmares after taking the drug in 2005.

The government's decision came after Japanese health authorities banned its prescription for teenagers in March 2007.

Japan has imported the drug since 2001, long before its effect on bird flu was acknowledged.

However, since then, there have been 1,268 cases of extraordinary behavior reported, of which 85 percent were from teenagers. They reportedly committed suicide by jumping out of buildings or into cars.

Health experts admit to the dilemma and said when necessary, it should be prescribed with extra prudence.

"We will have no option but to give out the pill once someone contracts the disease. But for teenagers we need to be extra careful and make sure it is prescribed at the most appropriate time," Korean Pharmacists for a Democratic Society spokesman Shin Hyeong-geun said. "Let's hope we will never have to worry about that."

The Telegraph

Roger Highfield

Government's bird flu drugs strategy is 'flawed'
The Government's strategy to defend the nation
against a bird flu pandemic has been called into question.

The Telergraph, 15 May 2008, 1:06AM BST
https://web.archive.org/web/20090321005642/http://www.telegraph.co.uk/news/uknews/1956677/Governments-bird-flu-drugs-strategy-is-flawed.html

The Department of Health has built up millions of doses of Tamiflu, an antiviral drug, in preparation for a pandemic of the kind that killed 50 million people in 1918.

However, a team at the Medical Research Council's National Institute for Medical Research in London warned that a mutation in the H5N1 strain of the virus could make it resistant to the vaccine.

The researchers found that when mutation occurred in the H5N1 virus it became resistant to Tamiflu.

They advised against stockpiling only supplies of Tamiflu, suggesting that these should be augmented by other antiviral drugs.

Dr Steven Gamblin, who led the research, said: "It is likely a future pandemic will need to be tackled using a three or four-pronged approach, much as we tackle HIV today."

A Department of Health spokesman said: "We are considering how much of our stockpile should consist of a back-up antiviral

LIVEJOURNAL

Теракт "Калифорния-04/2009" – III

Live Journal, 2 мая 2009, 6:48 PM
https://malchish-org.livejournal.com/65581.html

Кто подложил свинью?

Я уже хотел было отойти от темы свиного гриппа до прояснения ситуации. Однако тема сама меня не отпускает. Читатели подкидывают новые факты. Дело "Калифорния-04/2009" разрастается как снежный ком и уже напоминает настоящее расследование. Выясняется, например, что препарат Тамифлю разработала американская фирма Gilead Sciences. Она продала лицензию на производство этого препарата фармацевтическому гиганту Roche, о котором я писал в прошлый раз. Согласно условиям контракта, концерн Roche продолжает выплачивать Gilead Sciences определенный процент от реализации Тамифлю в США и других странах. По некоторым данным 20%. Но самое интересное в том, что в состав совета директоров Gilead Sciences входил Дональд Рамсфельд, глава Пентагона при Буше. Он был одним из директоров Gilead Sciences с 1988 года, а с 1997 года возглавлял его.

В 2001 году, получив предложение войти в администрацию Джорджа Буша, Рамсфельд отошёл от руководства Gilead Sciences, однако продолжал оставаться одним из крупнейших акционеров компании. Только по официальным данным паника по поводу птичьего гриппа принесла ему 5 млн. долларов. Дональд Рамсфельд выгодно продал часть принадлежавших ему акций GileadSciences в 2004 году, в момент, когда цена на акции компании достигла очередного пика. Согласно финансовому отчёту министра обороны США за 2004 год, ему тогда удалось заработать только на этой сделке более $ 5 млн. Однако и после этой сделки Рамсфельд продолжает располагать 25-миллионным пакетом акций Gilead Sciences. Кроме того, после падения цены на акции, Рамсфельд мог вернуть и проданную часть, заработав на колебании курса акций как обычный биржевой спекулянт.

Известно, что в США работы по проектам "Геном человека" и "Геном ради жизни" финансируются преимущественно по линии Минобороны США. Именно этому министерству Конгресс выделяет миллиарды долларов якобы на защитные мероприятия от "птичьего гриппа". На финансирование гражданских исследований в 2004 г. было выделено 40,2 млрд. долл., из них на биологические и медицинские науки – 25,7 млрд. долл. Для сравнения: на машиностроение – 8,2; физические науки – 4,7; охрану окружающей среды – 3,5; математику и компьютерные исследования – 2,6; другие точные и естественные науки - 1,4; социальные науки – 1,4 и психологию – 0,86 млрд. долл. =>
https://web.archive.org/web/20090531174333/http://www.vpk-news.ru/print.asp?pr_sign=archive.2006.131.articles.rostrum_01

Итак, что мы обнаружили? Бывший глава Пентагона США оказывается "материально заинтересован" в пандемии гриппа! Не более и не менее. И долгое время у него в подчинении были секретные лаборатории из Института патологии Вооружённых сил США и центра по контролю за инфекционными заболеваниями, то есть те, что занимались восстановлением и изучением вируса "испанки". Есть мотив и есть оружие. Суд присяжных уже бы приговорил Рамсфельда к длительному тюремному заключению. Правда и у защиты ещё есть шансы - на оружии нет отпечатков пальцев обвиняемого. Достать мог, выстрелить мог, отпечатков нет. Однако и "отпечатки" есть!

Случай с Baxter International, в вакцине которого обнаружили настоящий птичий вирус H5N1 в комбинации с человеческим H3N2 уже можно считать таким отпечатком. Baxter пару лет назад получил штамм вируса птичьего гриппа из Индонезии с обязательством сделать для него вакцину, но "случайная ошибка" производителя вакцин могла вместо этого привести к пандемии смертельного для человека гриппа. Мало того, что Baxter International придерживается системы BSL3 (Уровень Биологической безопасности 3), по которому путаница просто невозможна, так и комбинация обнаруженных в "вакцине" вирусов имеет совершенно не случайный характер.

РИА НОВОСТИ

"Тамифлю" негативно влияет на здоровье детей и не помогает от A/H1N1

РИА Новости, 10 августа 2009, 16:05
https://ria.ru/20090810/180373589.html

Лондон, 10 августа. – РИА Новости, Елена Пахомова. Антивирусный препарат "Тамифлю", рекомендованный Всемирной организацией здравоохранения (ВОЗ) для лечения и профилактики гриппа A/H1N1, негативно влияет на здоровье детей, при этом не предотвращая распространения инфекции, говорится в докладе ученых Оксфордского университета.

Документ, опубликованный в понедельник в журнале British Medical Journal, призывает британское министерство здравоохранения изменить свою политику в отношении борьбы с распространением так называемого "свиного" гриппа.

Ученые провели исследование с участием детей до 12 лет, результаты которого показали, что негативные последствия от "Тамифлю" "значительно превышают положительный эффект".

Организм большинства детей либо не реагирует на препарат никак, либо вызывает рвоту, что, утверждают специалисты, может вызвать обезвоживание и другие осложнения.

Ранее о нежелательности применения лекарства для лечения и профилактики гриппа у детей заявляли и российские ученые. Как сообщил РИА Новости директор НИИ гриппа РАМН Олег Киселев, "Тамифлю" вызывает у детей побочные эффекты, так как их организм более чувствителен.

Темпы распространения гриппа в Соединенном Королевстве за последнее время значительно сократились. На данный момент число инфицированных превышает 300 тысяч человек, однако с каждой неделей количество вновь выявленных случаев сокращается в разы.

Всего от гриппа в стране скончался 41 человек, при этом в подавляющем большинстве случаев грипп A/H1N1 был осложнен сопутствующими заболеваниями.

Benefits of swine flu drug questioned

Financial Times, 10 August 2009
https://www.ft.com/content/697f5f68-85c6-11de-98de-00144feabdc0

The medicine now being widely handed out by the government for treating pandemic flu offers only modest benefit in children and adults in seasonal outbreaks of the virus, according to British researchers.

The findings will spark a fresh debate over the wisdom of the UK government – and many others in the developed world – to spend hundreds of millions of pounds on stockpiling Tamiflu and establishing systems for its easy prescription.

In an article in the British Medical Journal on Monday, a group led by Matthew Thompson at Oxford University said use in children under 13 of oseltamivir – branded as Tamiflu – and zanamivir (Relenza) reduced the duration of flu symptoms by an average of 12 to 36 hours with no decline in asthma or the need for antibiotics. They concluded that the drugs – a class known as neuraminidase inhibitors – "provide a small benefit by shortening the duration of illness in children with seasonal influenza and reducing household transmission". Tamiflu also caused vomiting in some cases.

The findings came after a separate article published last week in Lancet Infectious Diseases, by researchers led by Jane Burch at the University of York, concluded that otherwise healthy adults showed a reduction in symptoms of just over half a day earlier when taking the drugs.

"Recommending the use of antiviral drugs for the treatment of people presenting with symptoms is unlikely to be the most appropriate course of action," they concluded, adding that it was "reasonable" in the case of those at increased risk of suffering flu-related health complications.

The two studies were based on analyses of clinical trials on the drugs that have previously been published for seasonal flu, and do not consider the specific data related to the current swine flu pandemic virus, for which information so far remains scant.

Sir Liam Donaldson, the chief medical officer, said the study on drugs in children was limited in its scope, tentative in its conclusions and not directly comparable to the current situation.

"Antivirals are the only available weapon, albeit imperfect, against the virus until a vaccine is developed and ready for use," he said. "Like all drugs, they can have side-effects in some people."

Roche, which sells Tamiflu, said in a statement: "Tamiflu has been shown to prevent influenza infection, to reduce the duration and severity of influenza illness, its complications and associated hospitalisations."

The reviews came as an Australian company, Biota, which originally developed Relenza – since licensed to GlaxoSmithKline – raised the prospects of the introduction of a third and longer-lasting neuraminidase inhibitor to treat flu by 2011.

It said its drug, called laninamivir, developed with its partner Daiichi Sankyo, would be filed with regulators as soon as March 2010 for approval in Japan. In common with Relenza, it is inhaled, while Tamiflu is swallowed as a pill.

BioCryst of the US and its partner Shionogi of Japan said last month they planned to file with regulators later this year for Peramivir, a fourth antiviral drug, which is injected.

Don't give Tamiflu to children'

The Independent, Press Association, 10 August 2009, 15:23 BST
https://www.independent.co.uk/life-style/health-and-families/health-news/don-t-give-tamiflu-to-children-1770154.html

Children should not be given the anti-viral drug Tamiflu to combat swine flu, Oxford University researchers said today. They urged the Department of Health to urgently rethink its policy on giving the drugs to youngsters affected by the current flu pandemic.

Some 300,000 people in England, including children and adults, have received courses of Tamiflu through the Government's National Pandemic Flu Service for England.

Today's study, published in the British Medical Journal (BMJ), warned that Tamiflu can cause vomiting in some children, which can lead to dehydration and the need for hospital treatment. The researchers said children should not be given the drug if they have a mild form of the illness although they urged parents and GPs to remain vigilant for signs of complications.

Parents of children with a compromised immune system or a condition like cystic fibrosis should discuss the harms and benefits with their GP, they said. But overall, the researchers said, children who were otherwise healthy could suffer more harm than benefit from taking Tamiflu or another anti-viral, Relenza.

They found the drugs had little or no effect on asthma flare-ups, ear infections or the likelihood of a youngster needing antibiotics.The researchers also found that using anti-virals preventatively had little effect - reducing transmission of flu by 8 per cent. This means 13 children would have to be treated to prevent one additional case of the flu. However, anti-virals could reduce symptoms by between half a day and one day.

Dr Carl Heneghan, a GP and clinical lecturer at Oxford University, said the current policy of giving Tamiflu for mild illness was an "inappropriate strategy". He added: "The downside of the harms outweigh the one-day reduction in symptomatic benefits." He and Dr Matthew Thompson, a GP and senior clinical scientist at Oxford University, analysed four studies involving children aged one to 12.

The children were being treated for normal seasonal flu but Dr Thompson said the findings would extend to the current swine flu pandemic. "I don't think we have got any reason to think our results would be any different," he said. "The current swine flu is generally a mild flu illness...it does not seem that different from current seasonal flu. "We would be happy to say our results apply to the current swine flu strain." He said children with mild symptoms should be treated in the same way as if they had any other mild flu - with drinks to cool high temperatures and rest.

Dr Heneghan said the only benefit found in the study was that children were back to normal half a day to one day earlier if taking Tamiflu or Relenza. He said his advice to GPs was "not to rely on Tamiflu as a treatment to reduce complications" or to think of it as a "magic bullet". And he warned that widespread use of Tamiflu could result in the flu becoming resistant to the drug. "What is a problem going forward - like with antibiotics - is you run into a resistance issue. "Going forward we have a treatment which is ineffective because we've given it to everybody."

Both researchers called on the Department of Health to review its current policy. Dr Thompson said: "It's possible a more conservative strategy (such as) reserving these anti-viral drugs for people, for children who are more likely to have complications of the illness might be a more sensible strategy." Dr Heneghan added: "I think the Government should be looking at this urgently, this week."

The experts said the studies had been publicly available to the Government before it formulated its current strategy with regard to Tamiflu. And they said the Government should have demanded more data from the pharmaceutical companies which manufacture the drugs - Roche, which makes Tamiflu, and GlaxoSmithKline, which makes Relenza.

Today's research was published in the British Medical Journal (BMJ) and follows two recent studies which found that more than half of children taking Tamiflu suffered side-effects such as nausea, insomnia and nightmares. Experts from the Health Protection Agency (HPA) found a high proportion of British schoolchildren reporting problems after taking the anti-viral preventatively.

The experts behind one of the studies said that although children may have attributed symptoms which were due to other illnesses to the use of Tamiflu, that was "unlikely to account for all the symptoms experienced". That study was carried out in April and May - before the Government decided to stop using Tamiflu preventatively.

Only those with suspected or confirmed swine flu are now getting the drug and are being urged to get access to Tamiflu through the Pandemic Flu Service, which is accessed online or via a telephone helpline. Children are known to be at high risk of catching the flu, with more than 40% of pre-school children getting the virus and 30% of school-age children doing so, the researchers said.

A Department of Health spokesman dismissed the researchers' claims that their findings would also apply to swine flu. "The BMJ review is based on seasonal flu and not swine flu," he said.

"As the authors note, the extent to which the findings can be applied to the current pandemic is questionable - after all, we already know that swine flu behaves differently to seasonal flu, and past pandemics have hit younger people hardest.

"Whilst there is doubt about how swine flu affects children, we believe a safety-first approach of offering anti-virals to everyone remains a sensible and responsible way forward."

He said the policy would be kept under review and people with mild symptoms "may find bed rest and over-the-counter flu remedies work for them.

"But for those who experience severe symptoms, the best scientific advice tells us that Tamiflu should still be taken as soon as possible - and to suggest otherwise is potentially dangerous.

"If people are in any doubt about whether to take Tamiflu, they should contact their GP."

Liberal Democrat health spokesman Norman Lamb said: "This analysis needs to be taken extremely seriously and demands an immediate response from the Government. "An urgent review must be carried out into whether the benefits of prescribing certain anti-viral drugs are worth the risks when it comes to our children's health."

A total of 36 people in England have died after getting swine flu.

Daily News

WHO: Save Tamiflu for the young, old and pregnant

Daily News, 21 August 2009, at 12:00 a.m.
https://www.dailynews.com/2009/08/21/who-save-tamiflu-for-the-young-old-and-pregnant/amp/

LONDON – The World Health Organization said Friday that Tamiflu should only be given to particularly vulnerable people – a warning to countries like Britain where the swine flu drug is being handed out freely.

WHO previously said it was up to doctors to decide who should get Tamiflu. On Friday, the U.N. agency said healthy people who catch mild to moderate cases of swine flu don't need the drug, but the young, old, pregnant, and those with underlying health problems surely do.

WHO said people thought to be at risk for complications from swine flu – children less than 5 years old, pregnant women, people over age 65 and those with other health problems like heart disease, HIV or diabetes – should definitely get the drug.

The agency also recommended all patients, including children, who have severe cases of swine flu, with breathing difficulties, chest pain or severe weakness, should get Tamiflu immediately, perhaps in higher doses than now used.

"The WHO guidance is quite different from what has been done in England," said Hugh Pennington, a flu expert at the University of Aberdeen. "England's approach is out of step with the rest of the world on this."

In Britain, the government's response to the swine flu outbreak has come under fire for allowing Tamiflu to be handed out by call center workers who have as little as three hours of training.

Since the British set up a national flu service in July to deal with the surge of swine flu cases, Tamiflu has been available to anyone suspected of having the disease.

At its summer peak, British authorities guessed there were about 110,000 new cases of swine flu, also known as H1N1, every week. The number of new cases dropped last week to about 11,000, but the fall/winter flu season has not yet begun.

Boasting that Britain had the world's largest supply of Tamiflu, enough to cover 80 percent of its nearly 61 million people, Health Minister Andy Burnham promised the drug would be available to anyone who needed it.

Britons who call the national flu line can get Tamiflu without ever seeing a doctor – it is given out by call center workers who have no medical training. The operators' training lasts from three hours to a day. There are no health workers present at the call centers. Scotland, Northern Ireland and Wales decided not to participate in the swine flu phone line.

On its swine flu Web site, the Department of Health says "the government has decided to offer the antivirals Tamiflu or Relenza to everyone confirmed with swine flu."

To stop people fraudulently getting Tamiflu, the web site says "the government is relying on the public to use the system responsibly." In its first two weeks of operation, the call center workers handed out more than 511,000 courses of Tamiflu.

Some experts have criticized that approach, warning that blanketing the population with Tamiflu increases the chances of resistant strains emerging.

Pennington called the strategy "a very big experiment" that could render Tamiflu useless. The U.S. Centers for Disease Control and Prevention says antivirals must be prescribed by a health care professional. Canada's Public Health Agency does not recommend Tamiflu for people with mild illness.

Pennington said Britain's national flu line should be dismantled so that Tamiflu would only be used sparingly.

"This approach increases the likelihood of a resistant strain and that is not a risk worth running," Pennington said.

Officials have already found widespread drug resistance in seasonal strains of H1N1 flu and worry that might also crop up with swine flu. So far, only a handful of Tamiflu-resistant swine flu strains have been found.

Charles Penn, a WHO antivirals expert, said it was up to countries to decide how they used their Tamiflu stocks. He said in most cases, the drug should be prescribed by a doctor or nurse, and that resistance could emerge if Tamiflu was overused.

WHO said most patients infected with swine flu worldwide recover within a week without any medical treatment. Still, about 40 percent of the severe swine flu cases are occurring in previously healthy children and adults, usually under 50 years of age.

WHO has estimated that as many as 2 billion people could become infected over the next two years with swine flu – nearly one-third of the world's population. At a swine flu conference in Beijing, a top WHO official predicted there would be "an explosion" of cases in the future.

Lewis Smith

Government's Tamiflu advice is wrong, says WHO

The Independent, 22 August 2009, 00:00
https://www.independent.co.uk/life-style/health-and-families/health-news/government-s-tamiflu-advice-is-wrong-says-who-1775807.html

Only seriously ill and vulnerable patients should be prescribed antiviral drugs to help them to get over swine flu, the World Health Organisation said yesterday, in advice which conflicts with the decision taken by the British Government to prescribe Tamiflu to everyone with swine flu.

Most people will recover from swine flu within a week, just as they would from seasonal forms of influenza, the WHO said.

"Healthy patients with uncomplicated illness need not be treated with antivirals," the WHO concluded in guidance issued on the internet. "*Worldwide, most patients infected with the pandemic virus continue to experience typical influenza symptoms and fully recover within a week, even without any form of medical treatment*."

Swine flu, now present in 177 countries, has been blamed for 1,799 deaths, and it is feared that over-use of Tamiflu will lead to the virus becoming resistant to it. The WHO has been formally notified of 12 cases where the H1N1 virus has already been found to have developed resistance after mutating.

The WHO issued its advice after a panel of international experts reviewed the effectiveness and safety of antivirals in tackling the pandemic.

It agreed, however, that antivirals are appropriate in cases where patients suffer a severe bout of swine flu or have an underlying medical condition. In these cases the drugs have proved effective at reducing the risk of pneumonia setting in.

The Department of Health responded to the WHO guidance by saying that the decision to offer Tamiflu remained right and sensible.

"We believe a safety-first approach of offering antivirals, when required, to everyone remains a sensible and responsible way forward. However, we will keep this policy under review as we learn more about the virus and its effects," a spokesman said.

Andrew Lansley, the shadow Health Secretary, has backed the Government's approach, especially in the early stages of the outbreak when the severity of the disease was unclear.

He added: "In the light of this latest expert advice, it may be appropriate for GPs and the fluline to make clear to otherwise healthy patients that there may be little benefit in taking anti-virals. But I do not think it would be appropriate for us to not offer treatment to those who request it."

The number of courses of antivirals issued in England by the National Pandemic Flu Service has almost halved since the beginning of the month. In the seven days up to 18 August there were 45,986 courses prescribed, compared to 90,363 the previous week. Last week there were 11,000 new cases of swine flu reported, down from 25,000 the week before.

In its advice the WHO included pregnant women as one of the at-risk groups that should continue to receive antivirals.

"As pregnant women are included among groups at increased risk, WHO recommends that pregnant women receive antiviral treatment as soon as possible after symptom onset," it said.

The WHO recommended that children under five be regarded as being a high-risk group and should therefore be treated with antivirals as soon as possible once symptoms began.

Children over five years, however, should only be given the drugs if their condition becomes serious or if they have an underlying health problem.

Earlier this month a team of researchers from Oxford University said children with mild symptoms should not be given the antiviral to combat swine flu and urged the Department of Health to urgently rethink its policy.

Мистер грипп

Бизнес-журнал, Август 2009, № 8 (163): 60-64.
https://www.klerk.ru/boss/ articles/158863/
https://books.google.com.my/books?id=IHnrAwAAQBAJ&source=gbs_navlinks_s

...

Поводом к изучению биографии Дональда Рамсфелда послужил очередной всплеск дорогой моему сердцу конспирологии: сценарий главной страшилки 2009 года расписали браво и уверенно – обнаружили на ровном месте свиной грипп, посовещались во Всемирной организации здравоохранения, постановили считать эпидемией, раздули истерию и тут же подсунули пилюлю-панацею, препарат Tamiflu – тот же самый, что эксклюзивно использовался для «лечения» птичьего гриппа в 2005 году.

И что с того? Как же, как же: ведь Tamiflu изготавливает и продает швейцарская фирма Hoffmann-La Roche, но патент на препарат принадлежит калифорнийской Gilead Sciences, в которой министр обороны в кабинете Джорджа Буша-младшего хозяйничал практически со дня основания в 1987 году! В 2005 году «Дабья»,* адекватно оценив цифры урона, нанесенного человечеству птичьим гриппом, – за девять лет «жуткой эпидемии» во всем мире умер 121 человек, застращал Конгресс мрачными пророчествами: не сегодня-завтра в одних только Соединенных Штатах скончаются в лучшем случае 200 тысяч человек, а при неудачном развитии событий – целых 2 миллиона. Спасение, тем не менее, есть – это Tamiflu, о котором в отчете одного провинциального Центра по контролю и предотвращению эпидемий (Center for Disease Control and Prevention) сказано, что он точно помогает!

Перепуганный Конгресс поспешно выделяет «Дабья» 7,1 млрд долларов на борьбу со смертельной угрозой «птичьего гриппа», из которых 2 млрд идут прямиком на закупку 20 млн доз Tamiflu по 100 долларов за штуку! Продажи Hoffmann-La Roche молниеносно вырастают с 254 млн (в 2004-м) до миллиарда (в 2005-м), после того как истерические закупки США поддержали правительства Великобритании, Японии и Израиля.

Читатели помнят, что эпидемия птичьего гриппа канула в никуда так же неожиданно, как и появилась на свет – едва ли не на следующий день после удачного распила выделенных на борьбу средств. Все то время, что «Дабья» стращал человечество апокалипсическими перспективами, за его спиной находился Дональд Рамсфелд, который, скромно потупив очи, подсчитывал прибыль от мажоритарного пакета акций Gilead Sciences, находящихся в его распоряжении (по прикидке журналистов – на сумму от 5 до 25 млн долларов). Не удивительно, что стоило в 2009 году сценарию практически дословно повториться со «свиным гриппом», как общественность, раздраженная дежавю, тут же припомнила Рамсфелда, тем более что и панацея оказалась знакомой – Tamiflu.

Рамсфелда сразу же обвинили во всех смертных биохимических грехах: и в том, что он якобы раскрутил вреднейший для здоровья аспартам в конце 70-х годов, и то, что выпустил из секретных лабораторий Пентагона «чуму XX века» СПИД, а заодно синтезировал птичий грипп, а теперь – еще и свиной. Именно это последнее обвинение, точь-в-точь повторяющее предыдущие, наполнило меня скепсисом и подвигло на более глубокое изучение биографии Дональда Рамсфелда.

Дело в том, что ситуация с рукотворными эпидемиями, лекарствами и политиками в 2009 году коренным образом отличается от той, что была в 2005-м. Когда население планеты спасали по первому кругу от птичьего гриппа посредством миллиардодолларовых закупок Tamiflu (сделанные тогда запасы поныне пылятся невостребованными на стратегических складах), Рамсфелд работал министром обороны, был правой рукой Буша и патроном-покровителем Gilead Sciences, а Hoffmann-La Roche эксклюзивно грузила мировые правительства волшебными пилюлями по заоблачным ценам.

В 2009-м все по-другому: Рамсфелд пишет мемуары, заседая в почетных фондах в статусе пенсионера, Gilead Sciences вяло и тщетно переругивается с Hoffmann-La Roche на предмет отзыва лицензии на эксклюзивное производство Tamiflu, а сами швейцарцы давно потеряли контроль над рынком: дженерики волшебного лекарства производят Вьетнам, Таиланд, Китай и Индия. Последний случай особенно показателен: фармацевтическая компания Cipla обвинила в индийском суде Hoffmann-La Roche в преступном укрывательстве от человечества противогриппозной панацеи и потребовала разрешения производить собственный дженерик вообще без всякой лицензии. В декабре 2008 года Cipla дело выиграла, а в мае 2009-го Всемирная организация здравоохранения официально признала, что ее дженерик «Antiflu» не уступает Tamiflu по эффективности, и включила индийский препарат в рекомендательный список.

Ну и где же во всей этой истории конспирология? Тем паче – в контексте Дональда Рамсфелда как отца всех современных биохимических надругательств? Да, подсобил родному предприятию, будучи министром обороны. Случалось такое и ранее. Даже так: подсоблял при малейшей оказии всегда, когда только мог. Так ведь это ж естественно! Взгляните на то, что вытворял в Ираке Дик Чейни со своим Halliburton'ом, не говоря уж о Goldman Sachs, щупальца которого, кажется, торчат из каждого правительства Западной Европы (об Америке вообще речи нет – там у «Сакса» все схвачено сверху донизу). Так что подобными подвигами сегодня никого не удивишь.

Между тем фигура Дональда Рамсфелда – не проходная во всех отношениях. Скажу больше: трудно назвать второго деятеля современной истории, который добился бы столь уникальных результатов одновременно в политике, идеологии и бизнесе. Дональд Рамсфелд, оставаясь всю жизнь на вторых ролях в тени харизматичных своих товарищей, достигал результатов, которые харизматичным товарищам даже не снились. Постараюсь продемонстрировать свою гипотезу на биографическом материале.

* * *

____

* - «Дабья» - полагаю, читатели не забыли культового прозвища самого оригинального президента Америки – Dubja, основанное на том, как он сам произносит свое среднее имя – W. (George W. Bush): «дабья» вместо грамотного «дабл ю».

Health Gem

Dr. Olson

Influenza Part 4:
The Facts on Tamiflu and Swine Flu Vaccine

Our Firm Foundation, September 2009, 24(9): 23-25
https://dn720001.ca.archive.org/0/items/2009-olson-influenza-part-1-4/2009_Olson_Influenza_Part%201-4.pdf

***Dr. Olson** comes from a long line of health professionals including MDs, naturopaths, and osteopaths. Having early wanted to help people, especially in the area of health, she was a missionary to Belize and Korea. A national speaker, an RN for years, a certified herbologist, and a naturopathic doctor, Dr. Olson is utilizing this experience and wealth of knowledge for the benefit of people all over the world*

Last month I mentioned several natural ways you can boost your immune system to get ready for this coming flu season (and possibly the Swine Flu), but you're still concerned. You say, all of that is wonderful, but why not at least try Tamiflu? What about a swine flu vaccine? If one is offered, should I take it? Ok, let's take a better look at this "wonder" drug, Tamiflu:

"Unusual" Behavior

"First approved by the FDA in 1999, Tamiflu was touted as a drug that could significantly reduce the length and severity of influenza. These claims even prompted the U.S. government to purchase 20 million doses of Tamiflu – at a cost of $2 billion – in the event that a bird flu pandemic occurred. The Pentagon followed, paying a whopping $58 million in July, 2005, for treatments of U.S. troops around the world. However, problems with Tamiflu began to surface in 2004. It was thought that the drug... was causing some of its users to manifest very unusual behavior. For example, during the 2004 and 2005 flu seasons, two teenage boys committed suicide within hours of taking Tamiflu. The 17-year-old jumped in front of a large truck on a busy road after walking outside his house barefoot and in pajamas during a snowstorm. The 14-year-old jumped to his death from the balcony of a ninth-floor flat. Later, a teenage girl was narrowly prevented from jumping to her death from a window within days of starting a course of the flu drug. By November, 2005, it had been reported that 12 Japanese children had died while on the drug and that others had experienced hallucinations, encephalitis, and other symptoms."(1)

No Warning From the FDA

"Despite these alarming reports, the FDA voted not to issue a warning about the drug's potential for causing abnormal behavior. Instead, the FDA chose to warn of Tamiflu's potential for producing skin rashes. It wasn't until reports surfaced of more than 100 new cases of delirium, hallucinations, and other abnormal psychiatric behavior in children treated with Tamiflu that the FDA changed course and added a warning label in November 2006." (1)

Read this part carefully: "Over the years, the FDA has been accused of causing high drug prices, keeping life-saving drugs off the market, allowing unsafe drugs on the market because of pressure from pharmaceutical companies and censoring health information about nutritional supplements and foods. One such critic is Dr. David Graham, Associate Director for Science and Medicine and a senior drug safety researcher at the U.S. Food and Drug Administration (the FDA). In his estimation, the FDA is "responsible for 140,000 heart attacks and 60,000 dead Americans. That's as many people as were killed in the Vietnam War." His words offer an insider's perspective on the fatal role he believes the FDA played in thousands of heart attacks and deaths caused by the pain medication

Vioxx – a medication the FDA approved and initially failed to warn of its potential effects. Indeed, the Vioxx debacle was brought to America's attention when Congress was presented with evidence showing that among the estimated 20 million users of Vioxx, hundreds of thousands had died or suffered heart attacks as a result of taking the drug… Yet as Graham has pointed out, "Rarely will they keep a drug from being marketed or pull a drug off the market."…The pharmaceutical companies also bear the responsibility – and the blame – for unsafe drugs being approved and put out on the market. "The FDA assumes the drug is safe and now it's up to the company to prove that the drug isn't safe," remarked Graham.

"Well, that's a no-brainer. What company on earth is going to try to prove that [their] drug isn't safe?" It should come as no surprise that the pharmaceutical companies have the federal government in their hip pocket.

Americans and Congress should be Screaming Bloody Murder

According to a 2005 report from the Center for Public Integrity, "The pharmaceutical and health products industry has spent more than $800 million in federal lobbying and campaign donations at the federal and state levels in the past seven years." In fact, no other industry has pent more money to sway public policy during that period… With an estimated 200,000-plus people dying every year from prescription drugs, Graham believes "Americans and Congress should be screaming bloody murder. They should be beating on the doors of the FDA demanding change." (1)

With the deaths of the children in Japan, it should come as no surprise that there are physicians beginning to stand up in protest. "The anti-Tamiflu forces in Japan are led by Dr. Rokuro Hama, an epidemiologist and internal medicine specialist who heads the Japan Institute of Pharmacovigilance, a medical industry watchdog. Hama believes that Tamiflu can directly cause temporary neurological disorders in a small percentage of users – especially young people. That can ead to abnormal behavior, such as a seemingly happy, healthy teenager suddenly deciding to leap off a high-rise apartment building. 'There is no possibility whatsoever" that there could be another cause behind the Tamiflu deaths, says Hama. "Ultimately it should be taken off the market'." (2)

What does Tamiflu Actually do?

If it wasn't bad enough that Tamiflu causes deadly side effects and it is still on the market, 3 cases of swine flu have now proven resistant to Tamiflu (3) (4) – with more cases suspected resistant, yet it is still being recommended for almost everyone as a preventative or in case of actual swine flu infection. And for the people it does "work" for, what does it actually do? According to Roche's (the manufacturer of Tamiflu) own website it says if the Tamiflu is taken within 48 hours of the onset of symptoms: it may be able to reduce the length of illness by about a day. Keep in mind, along with the "normal" potential side effects like nausea, fever, vomiting (sounds kind of like the flu, doesn't it?), Tamiflu carries a couple serious/life-threatening potential side effects as well: hepatitis and Stevens-Johnson syndrome (a life-threatening condition in which the skin blisters and sloughs off – has been called a type of "flesh eating" disease).

So if you're asking me… I would rather have one extra day of the flu than to suffer potentially life-threatening side effects. Plus, whenever I'm considering taking a drug, the questions I like to ask are: 1. Who is saying that the drug (Tamiflu, swine flu vaccine, or fill-in-the-blank) works? And, 2. Can you trust that person/establishment?

FDA approves emergency use of intravenous peramivir against Swine Flu

Los Angeles Times, 24 October 2009, 9:20 AM PT
https://www.latimes.com/archives/blogs/booster-shots/story/2009-10-24/fda-approves-emergency-use-of-intravenous-peramivir-against-swine-flu

Responding to a request from the Centers for Disease Control and Prevention, the Food and Drug Administration on Friday approved emergency use of the experimental intravenous antiviral drug peramivir to treat hospitalized patients with pandemic H1N1 influenza.

Tamiflu, the primary drug used to treat swine flu, is given orally, and Relenza, also used, is given as a nasal spray. Some experiments have been conducted with an intravenous form of Relenza and it has been credited with saving at least one swine flu patient's life, but it is considered more experimental than peramivir.

The problem with existing drugs is that some people have difficulties tolerating the oral Tamiflu and that the nasal spray Relenza may not get deep enough into the lungs to reach the swine flu virus when it causes viral pneumonia. The emergency use authorization says peramivir can be used when other drugs have failed or when delivery by a route other than intravenous is not expected to be feasible.

Peramivir, manufactured by BioCryst Pharmaceuticals Inc., is still in Phase 3 clinical trials. Known side effects include diarrhea, nausea, vomiting and decreases in white blood cell count, all of which stop when its use is halted. It has not been tested in pregnant women.

Oseltamivir boosts 2009 H1N1 virus infectivity *in vitro*

Biochem Biophys Res Commun. 29 October 2009 (Epub),
Dec 25; 390(4):1305-8. doi: 10.1016/j.bbrc.2009.10.142
https://www.academia.edu/17981681/Oseltamivir_boosts_2009_H1N1_virus_infectivity_in_vitro

Abstract

The neuraminidase inhibitor oseltamivir has been identified to have significant anti-influenza activity in clinical practice. However, its efficacy has not been verified in enough subtypes of influenza A virus, particularly, the current pandemic virus, H1N1. In vitro, using our influenza pseudotyped particle system, oseltamivir displayed significant inhibitory effects on viral NA activity and pp release. Conversely, a boosting effect on viral infection was observed, particularly with the 2009 H1N1 pp at oseltamivir concentrations above 0.025 μM. Further testing on two wild 2009 H1N1 virus strains, A/California/07/09 and A/Sichuan/1/09, as well as a seasonal flu virus, A/Baoan/51/2008, confirmed these findings.

Introduction

The surface proteins of influenza viruses, HA and NA, play important roles in virulence, host specificity, and human immune response. Influenza A viruses are believed to enter host cells via HA binding to sialic acid receptors on the cell surface [1]. Human viruses known to be capable of tropism bind preferentially to sialic acid linked to galactose via a-2,6 linkages, while avian viruses of this type tend to bind to a-2,3 linkages [2,3]. In particular, the 2009 H1N1 virus prefers both a-2,6 and a-2,3 linked sialic acids [4]. NA is believed to remove sialic acid from sialyloligosaccharides to aid viral release and spread [1,5,6], NA inhibitor oseltamivir is designed to inhibit this function and has been lead to the expected effects with some influenza viruses [7-9].

While, as a NA inhibitor, oseltamivir could play contradictory roles in the influenza virus life cycle; that is, when NA is inhibited by oseltamivir, viral release is inhibited, but more receptors in target cells may be provided to the HA of the viruses already released. In this study, we evaluated the role of oseltamivir in both the early infection stage and release event using our newly established influenza virus pseudotyped particle system (pp) and wild virus strains. Our study advances our knowledge of oseltamivir and urges us to consider the possible consequences related to its effect on viral infection in clinical practice.

...

Discussion

Accumulating clinical evidence indicates that some severely ill patients might even deteriorate if treated with oseltamivir [13,14] and drug-resistant variants were thought to be responsible for this [13]. In this study, none of the strains represented by pps and the wild viruses possessed H274Y or other mutations [15]. If we recheck current clinical cases, deterioration after oseltamivir treatment may possibly be partially due to this viral infection enhancement effect in individuals with high viral load, thus, it is urgent to evaluate this possibility and distinguish resistance from the enhancement effect of oseltamivir.

Our study advised us the anti-viral profile of oseltamivir with different subtypes of influenza viruses should be evaluated comprehensively prior to its administration to treat a certain virus strain and it is important to evaluate the anti-viral effect in all processes of the viral life cycle especially for drugs like NA inhibitors.

Conclusion

This study has advanced our knowledge of oseltamivir and urges consideration of the possible consequences related to its effect on virus infection during the use of oseltamivir in clinical practice.

151 young flu patients have exhibited abnormal behavior

The Japan Times, 2 December 2009
https://www.japantimes.co.jp/news/2009/12/02/national/151-young-flu-patients-have-exhibited-abnormal-behavior/

The health ministry has reported that 151 flu patients up to age 17 demonstrated abnormal behavior between late September and mid-November, including acting violently or uttering gibberish.

Most of the cases are believed to have involved patients with swine flu, and the strange behavior is thought to have occurred regardless of whether they were given the drug Tamiflu, according to a report submitted to a research group at the Health, Labor and Welfare Ministry.

The number of cases, coming in a period of less than two months, is already close to the total of 179 seen in all of last year's flu season.

A ministry official said cases this year have been on the rise in line with the spread of the new H1N1 flu and young patients should be watched carefully for at least two days after developing a fever.

Of the 151 patients, it is known that Tamiflu was used in 26 cases, Relenza in 36 and neither of them in 16.

Tamiflu has been banned for use among teenagers out of fear it may cause abnormal behavior, though it can still be used in some cases.

Neuraminidase inhibitors for preventing and treating influenza in healthy adults: systematic review and meta-analysis

BMJ, 8 December 2009, 339: b5106; doi: 10.1136/bmj.b5106
www.bmj.com/cgi/content/abstract/339/dec07_2/b5106

Abstract

Objectives To update a 2005 Cochrane review that assessed the effects of neuraminidase inhibitors in preventing or ameliorating the symptoms of influenza, the transmission of influenza, and complications from influenza in healthy adults, and to estimate the frequency of adverse effects.

Search strategy An updated search of the Cochrane central register of controlled trials (*Cochrane Library* 2009, issue 2), which contains the Acute Respiratory Infections Group's specialised register, Medline (1950-Aug 2009), Embase (1980-Aug 2009), and post-marketing pharmacovigilance data and comparative safety cohorts.

Selection criteria Randomised placebo controlled studies of neuraminidase inhibitors in otherwise healthy adults exposed to naturally occurring influenza.

Main outcome measures Duration and incidence of symptoms; incidence of lower respiratory tract infections, or their proxies; and adverse events.

Data extraction Two reviewers applied inclusion criteria, assessed trial quality, and extracted data.

Data analysis Comparisons were structured into prophylaxis, treatment, and adverse events, with further subdivision by outcome and dose.

Results 20 trials were included: four on prophylaxis, 12 on treatment, and four on postexposure prophylaxis. For prophylaxis, neuraminidase inhibitors had no effect against influenza-like illness or asymptomatic influenza. The efficacy of oral oseltamivir against symptomatic laboratory confirmed influenza was 61% (risk ratio 0.39, 95% confidence interval 0.18 to 0.85) at 75 mg daily and 73% (0.27, 0.11 to 0.67) at 150 mg daily. Inhaled zanamivir 10 mg daily was 62% efficacious (0.38, 0.17 to 0.85). Oseltamivir for postexposure prophylaxis had an efficacy of 58% (95% confidence interval 15% to 79%) and 84% (49% to 95%) in two trials of households. Zanamivir performed similarly. The hazard ratios for time to alleviation of influenza-like illness symptoms were in favour of treatment: 1.20 (95% confidence interval 1.06 to 1.35) for oseltamivir and 1.24 (1.13 to 1.36) for zanamivir. Eight unpublished studies on complications were ineligible and therefore excluded. The remaining evidence suggests oseltamivir did not reduce influenza related lower respiratory tract complications (risk ratio 0.55, 95% confidence interval 0.22 to 1.35). From trial evidence, oseltamivir induced nausea (odds ratio 1.79, 95% confidence interval 1.10 to 2.93). Evidence of rarer adverse events from pharmacovigilance was of poor quality or possibly under-reported.

Conclusion Neuraminidase inhibitors have modest effectiveness against the symptoms of influenza in otherwise healthy adults. The drugs are effective postexposure against laboratory confirmed influenza, but this is a small component of influenza-like illness, so for this outcome neuraminidase inhibitors are not effective. Neuraminidase inhibitors might be regarded as optional for reducing the symptoms of seasonal influenza. Paucity of good data has undermined previous findings for oseltamivir's prevention of complications from influenza. Independent randomised trials to resolve these uncertainties are needed.

Peter Doshi

Neuraminidase inhibitors – the story behind the Cochrane review

BMJ, 8 December 2009, 339: b5164; doi: 10.1136/bmj.b5164
https://www.bmj.com/content/339/bmj.b5164.long

Although billions have been spent on oseltamivir in the face of pandemic influenza, the team updating the Cochrane review of neuraminidase inhibitors in healthy adults found that the public evidence base for this global public health drug was fragmented and inconsistent. Peter Doshi tells the story

Since August 2009, our Cochrane review team has tried to obtain the data needed to verify claims that oseltamivir (Tamiflu) lowers serious complications of influenza such as pneumonia. We failed, but in failing discovered that the public evidence base for this global public health drug is fragmented, inconsistent, and contradictory. We are no longer sure that oseltamivir offers a therapeutic and public health policy advantage over cheap, over the counter drugs such as aspirin. If the public is to trust in public health policies, the scientific basis informing knowledge of the harms and effects of those interventions must be public and open to independent analysis.

How a Cochrane review update turned controversial

Systematic reviews are designed to synthesise the most reliable evidence on the effects of interventions. Following the outbreak of influenza A/H1N1 in April 2009, the UK NHS National Institute of Health Research commissioned an update of the Cochrane systematic review of neuraminidase inhibitors in healthy adults. In retrospect, our review began on a naive note. Although the review had last been updated in 2008, our new task was to include a safety assessment component. Tom Jefferson, who led the review, wrote to the group then just being formed, "Dear Friends…although it is always dangerous to pre-judge the issue, I expect no new effectiveness data but a lot of pharmacovigilance data." Two days later, a paediatrician from Japan, Keiji Hayashi, submitted a comment to the Cochrane Collaboration that would ultimately leave us doubtful about the ability of systematic reviews to deal with the challenges of contemporary pharmaceutical evaluation ...

Nick Freemantle and Mel Calvert

What can we learn from observational studies of oseltamivir to treat influenza in healthy adults?

BMJ, 8 December 2009, 339: b5248; doi: 10.1136/bmj.b5248
https://www.bmj.com/content/339/bmj.b5248.long

Post-marketing studies can provide important information about safety and efficacy in real practice. However, Nick Freemantle and Mel Calvert found studies of oseltamivir identified by Roche were of limited value

The treatment effects of drugs are conventionally estimated in randomised controlled trials. Random allocation of patients ensures that any difference in outcome observed between the experimental groups must be attributable either to chance or to the randomised treatments. Although a remarkably durable approach, randomisation does have limitations. Randomised trials conducted for regulatory purposes rarely include people with comorbidities, since adverse events observed as a result of these comorbidities may undermine the attempts to establish the safety of the new drug. Furthermore, randomised trials are costly and time consuming and may not be conducted by industry sponsors when a "positive" outcome seems unlikely. Thus health policy makers often have to make important decisions about new drugs when not all relevant trials have been undertaken. This is the situation currently regarding the use of antiviral therapy in H1N1 influenza. It may be argued that at such times we should be informed by all available evidence and not constrained by randomised trials alone.

The authors of the Cochrane Collaboration systematic review of neuraminidase inhibitors for preventing and treating influenza in healthy adults1 approached Roche, the manufacturer of oseltamivir, for unpublished data. Among the incomplete data that Roche provided was a list of observational studies that it considered to describe the "real life" value of antiviral treatment. The BMJ invited us to provide a rapid review of these studies and the extent to which they support the use of oseltamivir to treat influenza in healthy adults.

Problems of non-randomised trials

In non-interventional study designs the difference in outcomes between those receiving and not receiving the treatment of interest may be due to the play of chance, to …

Fiona Godlee and Mike Clarke

Why don't we have all the evidence on oseltamivir?

BMJ, 8 December 2009, 339: b5351; doi: 10.1136/bmj.b5351
https://www.bmj.com/content/339/bmj.b5351

The full data from drug trials must be available for scrutiny by the scientific community

This week the *BMJ* publishes an updated Cochrane review on neuraminidase inhibitors in adults with influenza.1 The review and a linked investigation undertaken jointly by the *BMJ* and Channel 4 News[2] cast doubt not only on the effectiveness and safety of oseltamivir (Tamiflu) but on the system by which drugs are evaluated, regulated, and promoted.

In the process of updating their review, Jefferson et al found several important inconsistencies. Prompted by a reader of their previous update,[3] they attempted to reconstruct the evidence from a much cited analysis on which they had based their previous conclusions. The analysis, by Kaiser et al,[4] looked specifically at the effects of oseltamivir on the risk of hospital admission and complications (pneumonia and other lower respiratory tract infections) in people with influenza. Jefferson et al noted that the Kaiser analysis was funded by the drug's manufacturer Roche and was based entirely on 10 trials funded by Roche, only two of which had been published as articles in peer reviewed journals. All 10 included trials were authored by Roche employees and paid academic consultants. The Cochrane reviewers could find no independently funded trials of oseltamivir in healthy adults.

Other questions also arose, as outlined by one of the Cochrane reviewers Peter Doshi[5] and by Deborah Cohen in our feature.[2] Which authors of the trials had seen the raw data? Why were key authors of the published papers and abstracts not named in company documents submitted for drug approval, while people named in these documents were not included in the published papers? Were ghost writers involved in some of the manuscripts, as alleged by former employees of the medical communication company hired by Roche? Why …

James Smith

Roche replies to the authors of the Cochrane Review on oseltamivir

BMJ, 8 December 2009, 339: b5364; doi: 10.1136/bmj.b5364
https://www.bmj.com/content/339/bmj.b5364

We would like to respond to some of the issues raised with regard to the Cochrane Review on oseltamivir published in this issue of the BMJ.[1]

We were not provided with this article in advance to allow detailed comment, but we understand from correspondence with Dr T Jefferson of the review team that it may omit from its assessment data that show the efficacy and safety of this drug – namely, a meta-analysis of 10 studies published in 2003.[2] This review indicated that oseltamivir treatment reduces lower respiratory tract infections and hospitalisations in both healthy and "at risk" adults with flu illness. The publication is one of numerous data sources supporting the efficacy and safety of the drug, including a pooled analysis by Singh et al.[3] studies from Hong Kong[4] and Canada[5] showing a reduction in mortality, evidence of efficacy from claims database studies,[6,7,8] a brief review of evidence of efficacy in cases of pandemic 2009 H1N1 flu infection, 9 and the European summary of product characteristics.[10]

Over the past weeks we and investigators involved in certain publications evaluating the utility of Tamiflu in reducing flu related complications have been approached separately or jointly by the BMJ and Channel 4 News, requesting answers to wide ranging questions on access to study data, interpretation of data, procedures for writing publications, authorship, and other matters. Responses to all questions have been provided in full to the BMJ and Channel 4, and should leave no doubt about the high integrity of the data, publications, and interactions between ...

James Smith

On behalf of Roche
Point-by-point response from Roche to *BMJ* questions

BMJ, 8 December 2009, 339: b5374; doi: 10.1136/bmj.b5374
https://www.bmj.com/content/339/bmj.b5374.abstract

James Smith responds on behalf of Roche to some of the issues raised with regard to the Cochrane Review on oseltamivir published in the BMJ (doi:10.1136/bmj.b5106)

Below is a point-by-point response to the questions and allegations raised by the BMJ [questions from the BMJ are in italics].

1. The Cochrane Review
We have been closely following the efforts of the Cochrane Collaboration to update its review on: 'Neuraminidase inhibitors for preventing and treating influenza in healthy adults. A systematic review and meta-analysis'. This update will be published in the BMJ on 8th December 2009.

As part of its investigations, the Cochrane Review sought to examine in detail Professor Laurent Kaiser's paper, 'Kaiser L, Wat C, Mills T, Mahoney P, Ward P, Hayden F. Impact of oseltamivir treatment on influenza-related lower respiratory tract complications and hospitalizations. Arch. Intern. Med. 2003 Jul 28; 163(14): 1667-1672.' - which has been extensively cited, by Roche and public health authorities, as evidence for the effectiveness of Tamiflu in reducing hospitalisations. As publishers of the review, the BMJ has been in close contact with the Cochrane Review team. In a linked feature, we intend to report on the following matters: a. that the Cochrane Review team was unable to obtain access to the complete data sets of the 10 RCTs which the Kaiser 2003 paper meta-analysed (8 of which have not been fully published in peer-reviewed journals).

Response: In addressing the issue of access to data, we note that, according to our records, Roche was initially approached with a request for data on 9 September 2009 by Philip Carter from ITN regarding a Channel 4 news request, and not the Cochrane review team itself. We believe this is in conflict with accepted standard practice: the merits of scientific studies, and debate relating to them, are of course to …

Los Angeles Times

Thomas H. Maugh II

British medical journal questions efficacy of Tamiflu for swine flu – or any flu

Los Angeles Times, 8 December 2009, 11:40 am
https://web.archive.org/web/20091213043911/http://latimesblogs.latimes.com/booster_shots/2009/12/british-medical-journal-questions-efficacy-of-tamiflu-for-swine-flu-or-any-flu.html

A major controversy about the efficacy of the antiviral agent Tamiflu in treating influenza has erupted in the online version of BMJ, formerly known as the British Medical Journal.

A team from the prestigious Cochrane Review says that its analysis of published data about clinical trials of the drug, known generically as oseltamivir, shows that the drug is able to reduce the course of an influenza infection by a day but that they are unable to conclude that the drug is effective at reducing complications and hospitalizations caused by flu because they do not have access to key data from eight clinical trials sponsored by the drug's manufacturer, Roche Laboratories Inc.

=> Jefferson T, Jones M, Doshi P, Mar CD. Neuraminidase inhibitors for preventing and treating influenza in healthy adults: systematic review and meta-analysis. – BMJ, 8 December 2009, 339: b5106; doi:10.1136/bmj.b5106
https://web.archive.org/web/20091214095112/http://www.bmj.com/cgi/content/abstract/339/dec07_2/b5106

In a commentary accompanying the report, BMJ editor Fiona Godlee said, "Governments around the world have spent billions of pounds on a drug that the scientific community now finds itself unable to judge."

=> Godlee F. Mike Clarke. Why don't we have all the evidence on oseltamivir? – BMJ, doi: 10.1136/bmj.b5106
https://web.archive.org/web/20091222053207/http://press.psprings.co.uk/bmj/december/Godlee.doc

In a response, Roche officials said that the data from the eight trials simply duplicated the results from published trials and did not provide enough new information to justify publication. => Response: Roche replies to the authors of the Cochrane Review on oseltamivir. – BMJ, 8 December 2009, doi:10.1136/bmj.b5364;
https://web.archive.org/web/20091214234425/http://www.bmj.com/cgi/content/extract/339/dec08_3/b5364

The company also said that all of the data were submitted to the Food and Drug Administration and other regulatory agencies when the company sought approval to market the drug and that those agencies found it convincing. Roche also said it would post the eight disputed trials on a password-protected website so that researchers would have access to it – although that has not occurred yet.

Although the controversy involves trials of the drug against seasonal influenza, the debate has particular significance now because Tamiflu is the primary tool used in combating pandemic H1N1 influenza in the face of poor availability of the swine flu vaccine. In response to the new findings, both the World Heatlh Organizaton and the Centers for Disease Control and Prevention said they would continue to stand by their guidelines for use of the drug, arguing that it is not a good tool for prophylaxis against the swine flu virus but that it does provide benefit in reducing complications.

The Cochrane Review is a nonprofit British organizaton that specializes in independently reviewing published trials on drug efficacy to determine whether the medications are effective. In a 2005 review of Tamiflu and a 2008 update, a group headed by Tom Jefferson of the Cochrane Collaboration's Acute Respiratory Infections Group in Rome concluded that the drug was effective in reducing influenza complications. But a letter from Japanese pediatrician Keiji Hayashi this

summer questioned its conclusion, arguing that the team had not actually seen much of the data on which they were basing its conclusion. Hayashi was concerned about the side effects of the drug, which include insomnia, nausea, bad dreams, abdominal pain, headache and a rare neuropsychiatric disease that caused some users to attempt to harm themselves. Such side effects might be tolerated if the drug was effective, but not otherwise. Hayashi was particularly concerned because Japan consumes more than 60% of the world production of the drug. => Deborah Cohen, Complications: tracking down the data on oseltamivir. - BMJ, 8 December 2009, 339:b5387 doi:10.1136/bmj.b5387
https://web.archive.org/web/20091214233716/http://www.bmj.com/cgi/content/extract/339/dec08_3/b5387

Under Cochrane rules, the team had six months to respond to Hayashi.

Jefferson attempted to obtain data from the trials, but the situation took a strange turn when the request was made through England's Channel 4 News, which was also investigating the efficacy of Tamiflu. Eventually, Roche agreed to provide the data, providing Jefferson would sign a confidentiality agreement preventing its publication. He refused, and negotiations reached an impasse. Meanwhile, the six-month deadline was nearing its expiration, and Jefferson's team decided to publish its findings without considering the data from the eight studies. And without those studies, they could not reach any conclusions about the effectiveness of the drug.

Roche also provided BMJ with some data about observational studies of Tamiflu, which the group forwarded to Dr. Nick Freemantle and Dr. Melanie Calvert of the University of Birmingham. Reviewing the data, they concluded that "oseltamivir may reduce the risk of pneumonia in otherwise healthy people who contract flu. However, the absolute benefit is small, and side effects and safety should also be considered." => Freemantle N, Calvert M. What can we learn from observational studies of oseltamivir to treat influenza in healthy adults? – BMJ 8 December 2009; 339: b5248 doi:10.1136/bmj.b5248
https://web.archive.org/web/20091214062207/http://www.bmj.com/cgi/content/extract/339/dec07_2/b5248

Jefferson's team and BMJ had other concerns about the clinical studies, including original documents that cited Roche employees whose names did not appear on the final papers and the use of professional writers to help produce published papers. Roche made a point-by-point response to their concerns in an online statement. The company also noted that it was standard industry practice 10 years ago, when the studies appeared, not to publish all results from clinical trials and to employ professional writers whose names did not appear on published reports. The company said that its policies have since changed and that it now publishes all new data online and acknowledges all contributions to written reports.

James Smith responds on behalf of Roche to some of the issues raised with regard to the Cochrane Review on oseltamivir published in the BMJ (doi:10.1136/bmj.b5106)
=> Letters; Response: Roche; Point-by-point response from Roche to BMJ questions. – BMJ, 8 December 2009, doi:10.1136/bmj.b5374; https://www.bmj.com/content/339/bmj.b5374.abstract

The final conclusions from the brouhaha: It probably doesn't hurt to treat patients with severe flu complications with Tamiflu, and it may help. But the drug should not be used in an effort to prevent infection among people who have been exposed to the virus or in those who have only very mild infections.

New review questions benefit of Roche drug Tamiflu

Reuters, 9 December 2009, 3:10 AM
http://www.reuters.com/article/idUSTRE5B74GA20091208

London (Reuters) – There is no clear evidence that Roche's widely used drug Tamiflu prevents complications such as pneumonia in people with flu, a group of medical experts said on Tuesday.

Governments around the world have mobilized Tamiflu stockpiles to fight swine flu but an updated review of past clinical trial results found there was insufficient data to know if the medicine cut complications in otherwise healthy people.

Roche contested the finding and said it stood behind the robustness and integrity of previous data showing a benefit.

Sales of the antiviral drug, also known by the generic name oseltamivir, have soared since the start of the current H1N1 flu pandemic in April due to massive government orders.

That has provided a windfall for the Swiss drugmaker, which said in October it expected Tamiflu revenue to reach 2.7 billion Swiss francs ($2.65 billion) this year.

The latest analysis, which updates an earlier 2006 review, was published online by the British Medical Journal, whose editor-in-chief, Fiona Godlee, said it left important questions about Tamiflu's effectiveness unresolved.

"Governments around the world have spent billions of pounds on a drug that the scientific community now finds itself unable to judge," she said.

The BMJ report was also the subject of a Channel 4 News story on British television.

At issue is whether or not certain previously published trials on Tamiflu should be included or excluded when analyzing the drug's effectiveness.

For the latest review, a team led by Chris Del Mar from Bond University in Australia looked at 20 trials – but they decided to drop eight that were included in the earlier review because they were unable to independently verify the results.

As a result they concluded that while Tamiflu reduced flu symptoms by about a day they had no confidence in previous claims that it cut the risk of flu complications.

David Reddy, Roche's pandemic taskforce leader, said the expert group was wrong to exclude the data from the eight studies.

He told reporters that Roche would have supplied full data on the contested studies if the investigators had signed confidentiality agreements, which were drawn up to protect patients.

"We fully stand behind the robustness of the data and the integrity of that data, particularly the efficacy and safety of Tamiflu, the conduct of our clinical studies and the publication process," Reddy said.

Tamiflu, which Roche manufactures under license from Gilead Sciences, has been commercially available for 10 years as a treatment for seasonal flu and used by around 68 million people worldwide.

The pill competes with another less widely used flu medicine from GlaxoSmithKline, called Relenza, which must be inhaled.

Just one in five people given Tamiflu by NHS hotline was actually suffering from swine flu (and 800,000 wrongly told to stay home)

Daily Mail, 9 December 2009, 08:09 BST
https://www.dailymail.co.uk/news/article-1234135/Just-diagnosed-swine-flu-hotline-actually-disease.html#ixzz0ZC3eWQK9

Hundreds of thousands of people were wrongly diagnosed with swine flu after calling the Government's emergency helpline, it was revealed yesterday.

Around 800,000 people were incorrectly told to stop work and take the Tamiflu drug, costing employers hundreds of millions of pounds and adding to the NHS drug bill.

In fact just one in every five people diagnosed by the controversial call centres actually had the illness.

And at the height of the scare during the summer the rate fell to as low as one in 20, the Health Protection Agency disclosed.

The revelation came as a survey concluded there was no clear evidence that Tamiflu reduced the risk of life-threatening complications.

The Government's pledge to vaccinate all under-fives against swine flu this month was also mired in chaos as GPs pulled out of the scheme in a row over cash.

Just 20 per cent of all cases diagnosed by the National Pandemic Flu Service were actually cases of swine flu, HPA scientists found. Everyone diagnosed by the service was given vouchers to get Tamiflu.

It means that more than 800,000 of the 1million packets of Tamiflu - which cost around £15 each - were given out needlessly.

In the busiest week 40,000 doses of Tamiflu were dished out - yet now it would appear that 95 per cent - 36,000 packets - should not have been.

It could also mean that millions of working days were lost by people taking time off claiming to have been hit by the pandemic.

Businesses say the mistakes have lost them more than £500million after thousands took the opportunity to take swine flu 'sickies'.

This will also raise concerns that the system could have encouraged the virus to become resistant to Tamiflu.

Critics have attacked ministers for handing out the drug in such huge quantities at the beginning of the outbreak, when it was feared that up to 65,000 may die.

Now the expected death toll has been revised to less than 1,000 - with 270 having died so far, of whom 80 per cent had other illnesses or underlying conditions.

Scientists warned in the summer that handing out the antiviral to healthy people could be a bad move, because a more resistant form of the virus could be dangerous in those with underlying health problems which makes them more likely to die from the disease.

Two weeks ago it emerged that the first case of Tamiflu-resistant swine flu being passed from person to person had occurred in Wales.

The Government's swine flu call centres, staffed by unqualified students and temps, were set up to take the strain off GPs' surgeries.

People with suspected swine flu were told to ring the helpline or a related internet site to get the antiviral rather than visit their doctors. The requirement to get a sick note from the GP was waived.

Similar tests of patients diagnosed by GPs found half of their patients were also misdiagnosed.

Liberal Democrat health spokesman Norman Lamb said the potential danger to misdiagnosed patients is 'seriously concerning'.

'Ministers had years to prepare for such an outbreak but completely failed to put in place an effective flu-line service,' he added.

And Mark Wallace, of the TaxPayers' Alliance, said: 'If call centres were so inaccurate, then it suggests this was more about PR than medical treatment. In effect, this was a very expensive press release.'

A Department of Health spokesman insisted the 'best scientific advice' states Tamiflu should still be taken as soon as possible. 'To suggest otherwise is potentially dangerous,' he added.

Roche's Tamiflu not Proven to cut Flu complications, Study says

Bloomberg, 9 December 2009
https://web.archive.org/web/20100107164229/http://www.bloomberg.com/apps/news?pid=20601100&sid=a9acc7qIJFdU

Dec. 9 (Bloomberg) – Roche Holding AG's antiviral drug Tamiflu may not prevent complications from influenza in healthy adults, according to a review by an independent research group that reversed its previous findings that the medicine warded off pneumonia and other deadly conditions linked to the disease.

The pill has been the mainstay of treatment for pandemic swine flu, which has killed nearly 9,000 people since it emerged in April, according to the World Health Organization. Roche, based in Basel, Switzerland, defended the benefits of the drug, which it expects to generate 2.7 billion francs ($2.64 billion) in sales this year.

An analysis of 20 studies by the Cochrane Collaboration showed Tamiflu offered mild benefits for healthy adults and found no clear evidence it prevented lower respiratory tract infections or complications of influenza, according to the group. The review, published in the British Medical Journal and broadcast yesterday on the U.K.'s Channel 4 News, showed the drug eased and shortened symptoms if taken quickly. => https://www.bmj.com/content/339/bmj.b5106

The report, an update of a 2005 analysis by Cochrane, excluded eight studies funded by Roche that haven't been published and whose full data wasn't given to the researchers. The exclusion reversed the nonprofit group's earlier finding that Tamiflu protects against complications.

Insufficient Evidence

"We now conclude there is insufficient evidence to describe the effects of Tamiflu on complications of influenza or the drug's toxicity," Tom Jefferson, the lead researcher from the Cochrane Collaboration in Rome, said in a telephone interview. "We have multibillion-dollar public health policies in place that rely on evidence not available for independent analysis."

The group, which reviews medical evidence, excluded the eight studies, involving 2,500 patients, because it couldn't get satisfactory access to the data involving the healthy adults in the study, he said.

The report raises questions about how drugs are reviewed, approved and distributed, Fiona Godlee, the British journal's editor in chief, wrote in an editorial. The studies originally used to establish the benefits of Tamiflu were written by Roche employees and paid consultants, under-reported serious side effects and failed to clearly identify all the authors, she wrote. In at least one case, a study was attributed to a researcher who disavowed any involvement to the journal, Godlee wrote.

Godlee F, Clarke M. Why don't we have all the evidence on oseltamivir? BMJ, 8 Decmber 2009; 339:b5351; DOI: 10.1136/bmj.b5351; https://pubmed.ncbi.nlm.nih.gov/19995815/

'Taken on Trust'

Governments relied on the studies to justify the widespread use of Tamiflu, known chemically as oseltamivir, she said. The reviewers were unable to find any independent studies of the drug in healthy adults, she said.

"This case exposes how much of the evidence on drug safety and effectiveness is taken on trust," Godlee wrote. "Governments around the world have spent billions of pounds on a drug that the scientific community has found itself unable to judge." She called for more independent research, greater access to raw data used to license and sell drugs and stricter regulations on the conduct, review and publication of medical research.

Roche defended the drug's benefits and its research, saying confidentiality agreements with patients enrolled in the trials kept the company from giving the investigators unreserved access to the findings.

"We fully stand behind the robustness of the data and the integrity of that data, particularly the efficacy and safety of Tamiflu, the conduct of our studies and publication policies," David Reddy, head of the company's global pandemic task force, said on a conference call with reporters. "We believe this drug is playing a pivotal role in the management of the current pandemic."

Data From Pandemic

Two published trials show Tamiflu reduces complications in patients with seasonal influenza, while an observational study suggests it may lower death rates, Reddy said. Data emerging from the swine flu pandemic shows giving the drug within two days of symptoms appearing is the only effective way to help patients, he said.

More than 8,768 people worldwide have died from swine flu since it was first identified in Mexico and the U.S. in April, according to the Geneva-based WHO. More than 68 million people have taken Tamiflu since it was approved a decade ago. Influenza kills as many as 500,000 people worldwide each year.

The WHO recommends giving Tamiflu to infected people with a high risk of developing complications, including pregnant women and people with underlying medical conditions. The researchers said there is little evidence now available to show that otherwise healthy people should be routinely given Tamiflu.

In the U.K., patients can get a Tamiflu prescription by calling a national hotline or filling out an online questionnaire about their symptoms.

"The evidence shows that if taken within 24 hours, Tamiflu reduces symptoms of influenza by about a day," Jefferson said. "It may reduce transmission. But we could not verify the claims that Tamiflu reduces complications. Once you took out the eight unpublished studies, the data relating to healthy adults that weren't published, what remained showed no effect."

WHO backs findings on Tamiflu for seasonal flu

Reuters, 11 December 2009

http://www.reuters.com/article/idUSGEE5BA0UY20091211?type=marketsNews (deleted)
https://web.archive.org/web/20091215062127/http://www.reuters.com/article/idUSGEE5BA0UY20091211?type=marketsNews

GENEVA, Dec 11 (Reuters) - The World Health Organisation on Friday endorsed findings that there is no clear evidence the antiviral Tamiflu prevents complications such as pneumonia in otherwise healthy people with seasonal flu.

But the WHO continues to recommend that Tamiflu, made by Swiss drugmaker Roche (ROG.VX), be used immediately in people infected with the separate H1N1 virus who are at high risk of complications or whose symptoms persist for three days or worsen.

The WHO also said pandemic influenza has peaked in North America, most of Western Europe except France, and possibly in Russia as well, the WHO said in a weekly statement.

In a weekly update, it said swine flu outbreaks are still on the rise in Japan, as well as in Hong Kong and Taiwan, where peaks had previously been recorded. The virus is also circulating across most of Africa.

An updated review of past clinical trial results for Tamiflu by researchers from the Cochrane Review, published by the British Medical Journal on Tuesday, found there was insufficient data to know if the drug cut complications from flu in otherwise healthy patients. [ID:nGEE5B71WW]

"We would not take issue with the Cochrane conclusions concerning seasonal influenza," WHO spokesman Gregory Hartl said.

Hartl told Reuters: "That is entirely consistent with our views and guidelines. For otherwise healthy people presenting with uncomplicated seasonal influenza, they do not need to be treated with the drugs."

Roche has contested the finding and said it stood behind the previous data showing a benefit.

At issue is whether or not certain previously published trials on Tamiflu should be included or excluded when analysing the drug's effectiveness.

Governments around the world have stockpiled Tamiflu, known generically as oseltamivir, to fight swine flu. H1N1 virus emerged in April and started an influenza pandemic which has killed at least 9,596 people, according to WHO's latest update.

"We need to make very clear that what Cochrane was looking at was seasonal influenza, it was not H1N1," Hartl said.

In the course of the H1N1 pandemic, "a substantial body of evidence has been building up to indicate oseltamivir is effective at reducing and/or preventing severe illness and even death," he added.

This was mainly in people who are at higher risk from H1N1 due to underlying medical conditions such as asthma or in patients who develop severe illness, he said.

"So our recommendations have been and continue to be that concerning infections with H1N1, if you are in a high risk group you should start oseltamivir treatment immediately.

"If you are not in a high risk group but if you have symptoms which persist over 3 days and or get worse, you should begin oseltamivir treatment."

Otherwise healthy individuals do not need to be treated with Tamiflu, as the great majority of H1N1 patients recover without any kind of medical care, the WHO spokesman said.

The pill competes with another less widely used flu medicine from GlaxoSmithKline (GSK.L), called Relenza and known generically as zanamivir, which must be inhaled.

WHO still recommends Tamiflu for H1N1 despite the proof it's useless

Prevent Disease, 14 December 2009
https://web.archive.org/web/20100102174942/http://preventdisease.com/news/09/121409_WHO_still_recommends_tamiflu_despite_proof_its_useless.shtml

Ironically, the World Health Organization (WHO), the agency responsible for the H1N1 flu, vaccine and antiviral hype, is now endorsing findings that there is no clear evidence the antiviral Tamiflu prevents complications such as pneumonia in otherwise healthy people with seasonal flu.

Despite this evidence, and to coincide with the WHO's junk science and contradictions which have dominated their pandemic statements and policies, they continue to recommend that Tamiflu be used in people infected with the H1N1 virus.

The WHO also said pandemic influenza has peaked in North America, most of Western Europe except France, and possibly in Russia as well, the WHO said in a weekly statement.

An updated review in the Cochrane Review published by the British Medical Journal, researchers found there was insufficient data to know if the drug cut complications from flu.

Roche, the manufacturer of Tamiflu, has made it impossible for scientists to assess how well the anti-flu drug stockpiled around the globe works by withholding the evidence the company has gained from trials, doctors alleged.

"We would not take issue with the Cochrane conclusions concerning seasonal influenza," WHO spokesman Gregory Hartl said.

Hartl told Reuters: "That is entirely consistent with our views and guidelines. For otherwise healthy people presenting with uncomplicated seasonal influenza, they do not need to be treated with the drugs."

Roche has contested the finding and said it stood behind the previous data showing a benefit.

At issue is whether or not certain previously published trials on Tamiflu should be included or excluded when analysing the drug's effectiveness.

In direct contradiction to his previous statements, Hartl then said that in the course of the H1N1 pandemic, "a substantial body of evidence has been building up to indicate oseltamivir is effective at reducing and/or preventing severe illness and even death."

This was mainly in people who are at higher risk from H1N1 due to underlying medical conditions such as asthma or in patients who develop severe illness, he said.

"So our recommendations have been and continue to be that concerning infections with H1N1, if you are in a high risk group you should start oseltamivir treatment immediately."

Other experts have noted that evidence also suggests that Tamiflu and other antivirals lower body temperatures. They make people (who can still transmit the virus) asymptomatic for longer periods and can therefore be expected to facilitate and contribute to the spread of the pandemic. If populations begin taking Tamiflu as a preventive measure, it could potentially cause the reverse of the intended effect, causing an explosion of viral transmission.

"If you are not in a high risk group but if you have symptoms which persist over 3 days and or get worse, you should begin oseltamivir treatment," the WHO said.

In early 2008, the WHO began stating on their own website that they had reported a high rate of resistance to Tamiflu. A total of 30 countries from all WHO regions reported Tamiflu (oseltamivir) resistance for H1N1. Since then, the WHO has been suspiciously downplaying the rapid growth of mutations and antiviral resistance. Some experts suggest that the number of actual cases of antiviral resistance are far higher than those being reported by the WHO.

Despite the adverse reactions of antivirals such as Tamiflu, and their use consistently reporting pneumonia and respiratory failure, the WHO's recommendation is to administer these drugs antivirals to people who have already developed pneumonia, an endorsement that could potentially promote millions of fatalities.

The World Health Organization also said last month that H1N1 vaccine had been cleared of blame for 41 deaths which health authorities worldwide had investigated after suspicions they might have been caused by the inoculation. The agency reaffirmed that the pandemic vaccine is as safe as the seasonal flu vaccine.

"No new safety issue has been identified from reports issued to date ... Reporting so far reconfirms that the pandemic flu vaccine is as safe as the seasonal flu vaccine," Marie-Paule Kieny, WHO's top vaccine expert, told a telephone conference.

Perhaps the 2300 reports of adverse reactions from the pandemrix vaccine in Sweden, the plethora of miscarriages, paralyses and other reactions from around the world, and the 200 deaths in Canada in addition to the 170,000 doses recalled due to safety issues all went unnoticed by the WHO.

Tamiflu anti-viral drug revealed as complete hoax; Roche studies based on scientific fraud

Natural News, 14 December 2009
https://web.archive.org/web/20100104234830/http://www.naturalnews.com/027734_Tamiflu_Roche.html

When it comes to selling chemicals that claim to treat H1N1 swine flu, the pharmaceutical industry's options are limited to two: Vaccines and anti-virals. The most popular anti-viral, by far, is Tamiflu, a drug that's actually derived from a Traditional Chinese Medicine herb called *star anise*.

But Tamiflu is no herb. It's a potentially fatal concentration of isolated chemical components that have essentially been bio-pirated from Chinese medicine. And when you isolate and concentrate specific chemicals in these herbs, you lose the value (and safety) of full-spectrum herbal medicine.

That didn't stop Tamiflu's maker, Roche, from trying to find a multi-billion-dollar market for its drug. In order to tap into that market, however, Roche needed to drum up some evidence that Tamiflu was both safe and effective.

Roche engages in science fraud

Roche claims there are ten studies providing Tamiflu is both safe and effective. According to the company, Tamiflu has all sorts of benefits, including a 61% reduction in hospital admissions by people who catch the flu and then get put on Tamiflu.

The problem with these claims is that **they aren't true**. They were simply invented by Roche.

A groundbreaking article recently published in the *British Medical Journal* accuses Roche of misleading governments and physicians over the benefits of Tamiflu. Out of the ten studies cited by Roche, it turns out, only two were ever published in science journals. And where is the original data from those two studies? *Lost.*

The data has disappeared. Files were discarded. The researcher of one study says he never even saw the data. Roche took care of all that, he explains.

So the *Cochrane Collaboration*, tasked with reviewing the data behind Tamiflu, decided to investigate. After repeated requests to Roche for the original study data, they remained stonewalled. The only complete data set they received was from an unpublished study of 1,447 adults which showed that Tamiflu was no better than placebo. Data from the studies that claimed Tamiflu was effective was apparently lost forever.

As *The Atlantic* reports, that's when former employees of Adis International (essentially a Big Pharma P.R. company) shocked the medical world by announcing *they had been hired to ghost-write the studies for Roche*.

It gets even better: **These researchers were told what to write by Roche!**

As one of these ghostwriters told the *British Medical Journal*:

"The Tamiflu accounts had a list of key messages that you had to get in. It was run by the [Roche] marketing department and you were answerable to them. In the introduction ...I had to say what a big problem influenza is. I'd also have to come to the conclusion that Tamiflu was the answer."

In other words, **the Roche marketing department ran the science** and told researchers what conclusions to draw from the clinical trials. Researchers hired to conduct the science were controlled by the marketing puppeteers. No matter what they found in the science, they had already been directed to reach to conclusion that "Tamiflu was the answer."

H1N1: la prescription du Tamiflu fait débat

Le Figaro, 14 December 2009, 21:46
https://sante.lefigaro.fr/actualite/2009/12/15/9945-h1n1-prescription-tamiflu-fait-debat

Des représentants des médecins généralistes critiquent les nouvelles recommandationsdes autorités sanitaires.

La prescription systématique de Tamiflu aux patients grippés, préconisée depuis la semaine dernière par la Direction générale de la santé (DGS), est loin de faire l'unanimité dans le monde médical. Le 10 décembre, la DGS a annoncé que les traitements antiviraux, jusque-là recommandés uniquement dans les formes sévères et chez les personnes à risque, étaient désormais justifiés chez tous les patients avec une grippe clinique. Les antiviraux, Tamiflu mais aussi Relenza, issus du stock constitué par le gouvernement, seront délivrés gratuitement sur ordonnance dans les pharmacies, au plus tard le 21 décembre.

Mais cette stratégie, rendue publique à peu près en même temps qu'une publication très critique sur le Tamiflu dans le British Medical Journal (BMJ), est de plus en plus mise en cause. Pour des représentants des médecins généralistes comme le Collège national des généralistes enseignants (CNGE), les nouvelles recommandations ne sont pas justifiées d'un point de vue médical. Tandis que des spécialistes de maladies infectieuses ou de pneumologie regrettent qu'elles interviennent trop tard dans l'évolution de l'épidémie.

Le CNGE, qui représente les médecins généralistes chargés d'enseignement dans les facultés de médecine et revendique 1 500 adhérents, est monté au créneau lundi. Dans un communiqué, il a fait savoir qu'il «ne recommande pas l'utilisation systématique de médicaments antiviraux en cas de suspicion de grippe A (H1N1)». Soulignant que, pour cette grippe, «les données actuelles sont trop fragmentaires et de très faible niveau de preuve», le CNGE demande carrément à la DGS «d'indiquer les arguments scientifiques et les niveaux de preuve sur lesquels s'appuie ce changement soudain de recommandation». Une attitude contestatrice plutôt inhabituelle de la part de cette instance. «Selon les données dont nous disposons, la balance bénéfice-risque du Tamiflu est défavorable, explique le Dr Vincent Renard vice-président du CNGE. Les bénéfices ne sont pas établis, contrairement aux effets secondaires : nausées et vomissements qui sont fréquents chez les adultes, troubles du sommeil chez les enfants. Or, si des millions de patients sont traités, ce sont les généralistes qui auront à gérer les effets indésirables.»

Plusieurs spécialistes interrogés par LeFigaro se montrent également sceptiques sur l'intérêt du Tamiflu et l'extension des indications. «L'argumentation n'est pas solide sur le plan scientifique. Je ne comprends pas que la décision ait été prise sans discussion avec les sociétés savantes», réagit le Pr Bruno Housset, chef du service de pneumologie de l'hôpital intercommunal de Créteil et, par ailleurs, président de la Fédération française de pneumologie. Selon lui, la prescription systématique d'antiviraux aurait pu être logique il y a trois semaines, quand la circulation du virus H1N1 était prédominante par rapport aux autres virus respiratoires, mais elle ne l'est plus à ce stade de l'épidémie. «Mon opinion personnelle est que si le Tamiflu a une efficacité en termes de santé publique, c'est lorsqu'il y a une circulation virale très importante. Aujourd'hui, ce moment est passé», renchérit le Pr Jean-Paul Stahl, chef du service de maladies infectieuses du CHU de Grenoble, et président de la société de pathologie infectieuse de langue française. «La décision a été tardive», juge aussi le Dr Jean-Marie Cohen, coordonnateur des groupements régionaux d'observation de la grippe (GROG), qui note que des experts du comité de lutte contre la grippe avaient recommandé l'élargissement des prescriptions dès début novembre.

Mais au-delà de ce problème de calendrier, qu'en est-il de l'efficacité du Tamiflu ? L'article du BMJ, qui repose sur l'analyse de vingt études, conclut que cet antiviral réduit d'environ une journée la durée des symptômes cliniques. Mais ses bénéfices sur les complications de l'infection sont jugés peu convaincants. «Cette revue de la littérature avait déjà été faite en 2003, mais il n'y a pas plus de données aujourd'hui, observe le Pr Stahl. Cela ne signifie pas que le Tamiflu n'est pas efficace, mais qu'il n'en a pas fait la démonstration.» Le Pr Alain Chantepie, président de la Société française de pédiatrie est moins sévère. «Nous n'avons pas de certitude sur l'efficacité, mais c'est un traitement plutôt bien supporté. Les recommandations actuelles ne me choquent pas, dans le cadre du principe de précaution», dit-il. Pour le laboratoire Roche, fabricant du Tamiflu, la publication du BMJ est tronquée. «Cette métanalyse n'a porté que sur des sujets sains, qui ne sont pas les groupes qui font le plus de complications» , souligne un représentant de Roche, qui s'étonne aussi de la non-prise en compte d'une étude démonstrative portant sur 3 500 personnes pourtant publiée dans une revue de haut niveau. En outre, selon le laboratoire, «des études incluses dans les dossiers d'autorisation de mise sur le marché attestent d'une diminution statistique des complications respiratoires sous Tamiflu.»

French GP's Union criticises decision to distribute Tamiflu for free

The Flu Case, 18 December 2009

https://web.archive.org/web/20100102020806/http://theflucase.com/index.php?option=com_content&view=article&id=2336%3Afrench-gps-union-criticises-decision-to-distribute-tamiflu-for-free&catid=1%3Alatest-news&Itemid=64&lang=en

A key medical union for GPs in France has criticised the government for recommending Tamiflu for treating the swine flu after studies casting doubt on the efficacy of antivirals were published in the BMJ and Lancet.

On December 10th, the French health authorities said they planned to make antivirals available for free to any patient with swine flu symptoms, however mild. Government stocks of Tamiflu and Relenza are to be delivered to pharmacies by December 21st, reports Le Figaro. The French army medical corps – also supplying 100-150 vaccination teams to work in the especially established vaccine centers – significantly increased its production of Tamiflu licenced by Roche from this summer.

The CNGE union for teachers and researchers focussing on general practice, representing 35 regional colleges in medical schools, 150 associated professors and lecturers, 900 teachers, 4000 trainers and involving more than 4000 GP’s, said in a press release on Monday that they are "not in favour" of the systematic prescription of antivirals.

Dr Vincent Renard, vice president of CNGE, told the newspaper Le Figaro: "According to the facts at our disposal, the benefit-risk balance of Tamilfu is not favourable. The benefits are not established, contrary to the secondary effects: nausea, vomitting are frequent among adults and difficulties in sleeping among children. However, if millions of patients are treated, the GPs will be the ones who have to cure the undesirable side effects," he said.

Collège National des Généralistes Enseignants

Stéphane Solanille

Argumentaire du CNGE sur l'utilisation systématique des antiviraux dans la grippe H1N1

SNGE, 15 Décembre 2009
https://web.archive.org/web/20091226021058/http://www.cnge.fr/article.php3?id_article=1276

Le Collège National des Généralistes Enseignants ne recommande pas l'utilisation systématique de médicaments antiviraux en cas de suspicion de grippe A/H1N1 2009

Efficacité des inhibiteurs de la neuraminidase

Les données disponibles relatives au traitement de la grippe saisonnière **ne sont pas** en faveur de la prescription systématique des inhibiteurs de la neuraminidase (IN) pour les patients ayant des signes cliniques de grippe. Les dernières publications confirment et précisent les données antérieures:

Selon les données disponibles, il n'y a pas de preuve que les IN préviennent les décès et les formes graves dus à la grippe chez les patients avec ou sans facteur de risque.

L'administration précoce d'IN (avant 48 heures d'évolution et de préférence dans les premières heures suivant l'apparition des symptômes) permet de réduire la durée des symptômes de moins d'une journée.

Les avis de la commission de transparence ont été régulièrement mis à jour et notamment pour l'oseltamivir recommandé par la DGS en première intention en traitement curatif. Dans cette indication et dans les 5 avis publiés entre le 11/02/2004 et le 21/10/2009, la Commission a toujours conclu à un service médical rendu insuffisant impliquant l'absence de remboursement, pour les personnes sans comorbidité et pour les patients âgés de 1 à 65 ans avec comorbidité. D'après la Commission, les études prospectives et rétrospectives [1,2] concernant le lien éventuel entre traitement par oseltamivir et hospitalisation, ou mortalité, ne permettaient pas de conclure à une efficacité de ce médicament.

Les deux dernières et récentes publications sont une revue systématique avec méta-analyse dans le BMJ [3], incluant 7 essais pour le zanamivir et 5 essais pour l'oseltamivir, et une méta-analyse du Lancet [4] incluant 6 essais pour le zanamivir et 4 pour l'oseltamivir (essais concernant l'indication curative). La publication du BMJ a confirmé le bénéfice sur la durée des symptômes pour les deux IN, à condition d'être administrés moins de 48 heures après le début des symptômes ; ce gain est qualifié de modeste (< à 24h). Dans celle du Lancet, le bénéfice était évalué à 0,55 jours en moins pour l'oseltamivir chez les patients en bonne santé et 0,74 chez les patients à risque. La pertinence clinique de ce bénéfice était considérée comme discutable par rapport à une durée habituelle d'environ 7 jours.

Après évaluation de l'ensemble de la littérature, aucune de ces deux publications, n'a fait état d'une quelconque efficacité des IN en termes de prévention des complications, des hospitalisations et de la mortalité.

Tolérance des IN

La tolérance des IN est globalement acceptable, mais ils provoquent un nombre significatif d'effets indésirables, notamment des nausées/vomissements, avec l'oseltamivir.

La revue du BMJ montre un taux significatif de nausées sous oseltamivir 75 (mg) versus placebo (odds-ratio = 1,79 : IC 95% = 1,10-2,93), et une incidence de 0,5% d'effets indésirables neuropsychiatriques. La compilation des publications montre une fréquence des nausées et/ou des vomissements de 15 à 30%, des douleurs abdominales de 12 à 20%, ainsi que des troubles du sommeil et du comportement pour 20% des enfants [3, 5, 6]. Le BMJ pointe le manque de connaissances sur la toxicité éventuelle des IN et sollicite des études complémentaires.

Les revues systématiques et méta-analyses ne se sont pas spécifiquement attachées à évaluer les effets secondaires des IN. Un article récent [7] résumait ainsi la situation : « Aucune information n'est disponible concernant la tolérance et l'efficacité d'oseltamivir chez les patients présentant un état clinique suffisamment sévère ou instable pour nécessiter une hospitalisation ».

Pour la pandémie A/H1N1

Pour la grippe A/H1N1, les données actuelles sont trop fragmentaires et de très faible niveau de preuve. Il n'y a pas de donnée plaidant en faveur de l'efficacité supplémentaire des IN sur le virus A/H1N1 2009. Par ailleurs, l'impact d'une diffusion massive des IN sur la souche virale pandémique est inconnu. La méta analyse du Lancet [5] posait le problème de l'émergence des résistances sans argument solide en faveur d'un lien entre l'apparition des résistances et l'importance de la diffusion des IN. Cependant, l'effet d'une diffusion massive n'a pas été évalué, notamment dans le cas d'une deuxième vague épidémique.

La publication du BMJ [3] considère que les IN ne sont pas un moyen optimal susceptible de freiner la diffusion virale puisqu'ils ne préviennent pas l'infection et ne suppriment pas l'excrétion virale par voie nasale. La revue Prescrire [7]) souligne que les effets des antiviraux sur la contagiosité, son ampleur et son délai d'action sont inconnus.

Directive de la DGS

La nouvelle directive de la Direction Générale de la Santé recommandant l'utilisation systématique des IN pour tous les cas de grippe sans autre précision ni arguments est pour le moins contradictoire avec les données scientifiques publiées et les avis de la Commission de la Transparence. Le CNGE demande à la DGS de dévoiler les arguments scientifiques et les niveaux de preuve sur lesquels s'appuie ce changement soudain de recommandation.

Il semblerait que cette recommandation s'appuie sur des opinions sans preuve à l'appui. La comparaison entre la mortalité en Argentine qui a peu utilisé d'IN et au Chili qui les a utilisés massivement l'été dernier n'a aucune valeur scientifique. En effet, la mortalité dépend du dénominateur, c'est-à-dire du nombre total de cas identifiés dans la population. La mortalité élevée en Argentine (>4%) traduit l'absence de recensement ou d'évaluation de l'ensemble des cas et ôte toute fiabilité à la comparaison. Dans sa note du 05/08, l'INVS appelait déjà à une très grande prudence dans l'interprétation de ces données. Par ailleurs, la survenue de cas graves et notamment de syndromes de détresse respiratoire aiguë sévère chez des sujets jeunes est une autre opinion avancée pour promouvoir la prescription des IN.

Il n'existe actuellement aucun argument scientifique pour affirmer que les IN préviennent un seul cas de grippe sévère alors que ces médicaments sont commercialisés depuis une dizaine d'années.

Rapport bénéfices/risques

Comme pour toute intervention préventive ou curative, il convient de réfléchir en termes de bénéfices/risques aux conséquences d'une éventuelle prescription massive des IN comme le recommande la DGS.

Dans l'esprit du communiqué de la DGS, cette utilisation large aurait pour objectif de prévenir les complications graves chez les patients sans facteur de risque, les patients à risque étant déjà mis sous oseltamivir selon les recommandations.

Au 08/12 selon l'INVS, il y avait 4,6 millions de cas de grippe A estimés, mais beaucoup plus de syndromes grippaux puisque la proportion de ces derniers effectivement dus au virus de la grippe A/H1N1 ont varié de 4% à 9% en septembre jusqu'à 65% lors du pic de l'épidémie (données GROG). Dans les semaines à venir, compte tenu de l'évolution et de l'émergence notamment du VRS, le virus A/H1N1 va repasser en dessous de 50% des étiologies de syndromes grippaux. Depuis le début de l'épidémie en France métropolitaine, il y a eu 20 décès et environ 10% des 630 cas sévères chez des patients sans facteur de risque, soit 1 décès/230 000 et 1 cas grave/73 000 liés au virus A/H1N1.

Alors qu'il n'y a pas de preuve d'efficacité des antiviraux en termes de mortalité et d'hospitalisations, prévenir ces 20 décès et 60 cas sévères aurait nécessité d'exposer aux IN tous les patients atteints d'un syndrome grippal clinique. En prenant comme hypothèse très élevée une fréquence moyenne de 50% de virus A/H1N1 dans les syndromes grippaux, il aurait fallu traiter 9,2 millions de personnes par IN.

Chez les patients atteints d'un syndrome grippal, cette stratégie aurait provoqué 15 à 30% de nausées ou vomissements (1,35 à 2,7 millions de patients), 12 à 20% de syndromes douloureux abdominaux (1,1 à 1,8 millions de patients) et 20% de troubles du sommeil et du comportement chez les enfants atteints. En cas d'incidence de 0,5%, les effets neuropsychiatriques graves auraient concerné 46 000 patients.

Autrement dit, compte tenu de la prévalence des syndromes grippaux, appliquer les recommandations de la DGS conduirait les prescripteurs à provoquer plusieurs millions d'effets indésirables dont certains graves, sans preuve scientifique de la capacité des antiviraux à prévenir le moindre décès ni la moindre hospitalisation liés à la grippe.

Cette fréquence d'effets indésirables aurait pour première conséquence des difficultés importantes d'évaluation de la sévérité du tableau clinique par les médecins généralistes et conduirait à un nombre non évaluable d'hospitalisations, probablement élevé et sans rapport avec le nombre de cas réellement graves.

Compte tenu de ces éléments, le rapport bénéfices/risques d'une prescription large des IN est clairement défavorable, y compris d'un point de vue de santé publique. Par ailleurs, ce rapport devrait être de plus en plus défavorable car les indicateurs montrent que le pic épidémique est atteint, et que la proportion du virus A/H1N1 diminuera dans les semaines à venir, notamment avec l'émergence actuelle du VRS [8].

D'un point de vue médico-économique, les coûts induits par la recommandation de la DGS seraient considérables. Aux coûts directs des IN s'ajouteraient les coûts indirects générés par les conséquences des effets indésirables.

Recommandation du CNGE

Dans l'immédiat, compte tenu du risque très faible de complication pour les sujets en bonne santé, de l'absence de preuve du bénéfice clinique des IN dans cette situation, du risque tangible de mauvaise tolérance notamment digestive, *le CNGE recommande de ne pas prescrire systématiquement les IN en cas de suspicion clinique de grippe*.

Compte tenu des informations scientifiques disponibles, *le CNGE considère qu'il n'y a aucun argument scientifique pour modifier les recommandations existantes.* Même si aucune donnée solide ne permet de recommander l'utilisation des IN chez les patients à risque, les réserver aux situations à risque, aux femmes enceintes et aux sujets à risque est recevable. Dans ces cas, les IN doivent être prescrits le plus précocement possible, de préférence dans les 24 heures après le début des symptômes. Ils peuvent aussi être prescrits dans les formes graves en l'absence d'alternative thérapeutique.

Ces recommandations du CNGE relèvent du principe de précaution sans qu'il soit possible d'affirmer leur réelle pertinence puisque les données de la littérature ne permettent pas d'en escompter un bénéfice clinique.

Le CNGE rappelle que la vaccination anti A/H1N1 reste le meilleur moyen pour éviter la grippe et donc les formes graves, en particulier chez les sujets à risque. Les tests d'immunogénicité

montrent une réponse de bonne qualité au vaccin non adjuvé (Panenza®) et aux deux vaccins adjuvés (Pamdemrix® et Focetria®) utilisés dans la vaccination en France. Dans la grippe saisonnière, lorsque le vaccin protège contre la souche responsable de l'épidémie, la vaccination antigrippale réduit l'incidence de la grippe, la mortalité et les hospitalisations [9].

Conclusion

Les médecins généralistes sont confrontés à la difficulté de gérer l'épidémie grippale, les patients malades, leur entourage, les patients en bonne santé inquiets ou interrogatifs, la prévention et le traitement.

Les recommandations des autorités sanitaires ont des conséquences dont elles n'ont parfois pas conscience. La prise en compte du rapport bénéfices/risques dans toutes ses dimensions, celle des données de la science, du contexte et de l'environnement, mais aussi du patient et de ses préférences, sont indissociables d'une démarche de soins de qualité en médecine générale.

Le CNGE demande que les recommandations qui sont élaborées à l'intention des médecins généralistes le soient en concertation étroite avec les sociétés scientifiques de leur discipline. C'est le minimum que les médecins généralistes sont en droit d'attendre.

First Case of Tamiflu-Resistant H1N1 Flu Death

The Chosunlbo, 18 December 2009, 11:40
http://english.chosun.com/site/data/html_dir/2009/12/18/2009121800633.html

Health officials said an infant with the H1N1 virus died of pneumonia and respiratory failure on Dec. 1 after showing no response to the anti-viral drug Tamiflu.

The one-year-old girl who was suffering from nervous-system disorders was hospitalized with a high fever and coughing last month but her condition continued to worsen despite taking the drug.

Health authorities have confirmed that they discovered a strain of the H1N1 virus resistant to Tamiflu in her body.

The health ministry is in consultations with the WHO to see if the country's first case of such a fatality is also the world's first case

Lettre ouverte - pétition à Didier Houssin,
Directeur Général de la Santé

Unisfaceauvaccin, 19 December 2009

https://web.archive.org/web/20100220010925/http://www.theflucase.com/index.php?option=com_content&view=article&id=2355%3A600-french-doctors-launch-petition-against-tamiflu-prescription-&catid=1%3Alatest-news&Itemid=64&lang=en
http://www.fmcdinan.org/article-lettre-ouverte-petition-a-didier-houssin-directeur-general-de-la-sante-41196553.html

Devant la nouvelle demande des autorités sanitaires faite aux médecins de prescrire systématiquement de l'oseltamivir (Tamiflu®) pour les syndromes grippaux, le Formindep demande à la Direction Générale de la Santé des données fiables et transparentes pour justifier cette mesure, avant de la mettre en œuvre.

See: Nouvelles recommandations sur la prise en charge des patients grippés. – Sante-Sports, 10 Décembre 2009. https://web.archive.org/web/20091213220135/http:/www.sante-sports.gouv.fr/nouvelles-recommandations-sur-la-prise-en-charge-des-patients-grippes-10-decembre-2009.html

Chaque médecin peut s'associer à cette demande en signant cette lettre (voir ci-dessous).

Le 15 décembre 2009
Le Formindep à:
Monsieur le Professeur Didier Houssin, Directeur Général de la Santé
Direction Générale de la Santé 14, avenue Duquesne 75350 Paris 07 SP

Monsieur le Directeur,

Les médecins par l'intermédiaire de leurs URML [1], viennent de recevoir votre courrier en date du 9 décembre 2009 leur enjoignant de se conformer à de nouvelles recommandations les incitant à prescrire systématiquement de l'oseltamivir (alias Tamiflu®) en traitement curatif des syndromes grippaux. Cette molécule serait d'ailleurs dispensée gratuitement en pharmacie sur prescription médicale.

Vous motivez ces recommandations par une extension de l'épidémie, une circulation active et prépondérante du virus A (H1N1), et l'augmentation des hospitalisations et des formes graves. Vous précisez que ces recommandations nous sont faites « sur proposition des experts».

Or ces recommandations sont en contradiction avec les données scientifiques fiables actuellement portées à notre connaissance.

Les règles de prescriptions des médicaments doivent se conformer au résumé des caractéristiques des produits (RCP). Une modification d'autorisation de mise sur le marché du Tamiflu® est intervenue le 23/10/2009, elle repose cependant toujours sur le RCP [2].

Le chapitre 5.1 du RCP décrit l'efficacité de l'oseltamivir. Il précise que l'effet attendu en traitement curatif est une diminution de la durée de l'épisode grippal évaluée à 24 heures, qu'en traitement post exposition l'oseltamivir diminue le risque de contamination secondaire de 6 %, selon ces données, il faudrait ainsi traiter plus de 16 personnes-contacts pour éviter une grippe classique. Il est par ailleurs indiqué que les études auxquelles se réfèrent le RCP ne mettent en évidence aucune efficacité du médicament dans le traitement des personnes âgées de 65 ans atteintes d'insuffisance cardiaque et respiratoire, ni chez les enfants asthmatiques.

L'oseltamivir n'a jamais démontré aucun effet sur la diminution de la mortalité ni le taux d'hospitalisation des personnes atteintes d'un syndrome grippal à l'exception d'une méta-analyse entièrement contrôlée par le laboratoire Roche commercialisant le Tamiflu®, dont les données brutes sont inaccessibles, et dont les résultats qui font polémique sont largement remis en cause par le British Medical Journal du 12 décembre et les membres de la Collaboration Cochrane [3].

A notre connaissance l'oseltamivir n'a jamais fait l'objet d'une étude randomisée dans la grippe A (H1N1v) et, toujours dans le British Medical Journal, des membres de la Collaboration Cochrane indépendants de l'industrie ont demandé la mise en place de telles études [4].

Concernant le fait que des experts puissent être à l'origine de ces recommandations, nous vous rappelons que l'avis d'expert est reconnu par l'ensemble de la communauté médicale internationale comme le plus faible niveau de preuve pour apprécier la validité d'une information médicale.

En conséquence, nous vous demandons de bien vouloir nous communiquer dans les meilleurs délais l'ensemble du texte de la recommandation, son argumentaire, et les éléments et niveaux de preuve sur lesquels elle se fonde. Nous vous remercions également de bien vouloir nous adresser l'analyse exhaustive du rapport bénéfice risque de l'usage extensif de l'oseltamivir en population générale, en particulier sur la grippe A (H1N1v).

Enfin les experts auxquels vous faites référence n'étant pas identifiés, nous vous demandons communication de leur identité et de leurs déclarations publiques d'intérêts ainsi que l'exige la loi [5] pour tout collaborateur de la Direction Générale de la Santé.

Nous vous remercions de la diligence avec laquelle vous nous ferez parvenir ces informations indispensables, car nous regretterions de devoir priver nos patients d'une éventuelle chance supplémentaire si, après leur étude attentive, nous estimions qu'elles devraient être mises en œuvre.

Vous comprendrez bien évidemment, qu'en tant que professionnels de santé soucieux de l'unique intérêt des patients, les signataires du présent courrier, et les médecins membres du Formindep, ne pourront déférer à votre injonction sans avoir en mains tous les éléments scientifiques d'un niveau de preuve suffisant, pour pouvoir déterminer en toute responsabilité et conscience leur attitude vis-à-vis de leurs patients.

L'urgence sanitaire d'une situation, qui reste largement à démontrer, ne peut en aucun cas exonérer les médecins de la responsabilité professionnelle de soins rigoureux et rationnels, comme pour vous de diffuser une information fondée sur des données fiables, transparentes et indépendantes.

Dans l'attente de votre réponse rapide, nous vous assurons, Monsieur le Directeur, de notre ferme vigilance pour continuer à travailler en toute indépendance dans l'unique intérêt des patients, à l'abri de toutes pressions.

Pour le Formindep,
Dr Philippe Foucras, Président
Docteur Philippe Masquelier, Vice-Président

600 French Doctors Launch Petition Against Tamiflu Prescription

The Flu Case, 21 December 2009 12:49
https://web.archive.org/web/20100220010925/http://www.theflucase.com/index.php?option=com_content&view=article&id=2355%3A600-french-doctors-launch-petition-against-tamiflu-prescription-&catid=1%3Alatest-news&Itemid=64&lang=en

600 French doctors have signed an open letter to Didier Houssin, Director Gernal of Health, criticising the government for recommending the use of Tamiflu for treatment for the swine flu.

the Atlantic

Shannon Brownlee and Jeanne Lenzer

The Truth about Tamiflu:
Has the U.S. wasted $1.5 billion on an ineffective drug?

The Atlantic Magazine, December 2009
https://www.theatlantic.com/magazine/archive/2009/12/the-truth-about-tamiflu/307801/
https://web.archive.org/web/20110905055204/http://www.theatlantic.com/magazine/archive/2009/12/the-truth-about-tamiflu/7801/

Two months ago, we pointed out in our story on flu in *The Atlantic* that the antiviral drug Tamiflu might not be as effective or safe as many patients, doctors, and governments think.
https://www.theatlantic.com/magazine/archive/2009/11/does-the-vaccine-matter/307723/
The drug has been widely prescribed since the first cases of H1N1 flu surfaced last spring, and the U.S. government has spent more than $1.5 billion stockpiling it since 2005 as part of the nation's pandemic preparedness plan.

Now it looks as if our concerns were correct, and the nation may have put more than a billion dollars into the medical equivalent of a mirage. This week, the British medical journal *BMJ* published a multi-part investigation that confirms that the scientific evidence just isn't there to show that Tamiflu prevents serious complications, hospitalization, or death in people that have the flu.
https://web.archive.org/web/20110905055204mp_/http://www.bmj.com/cgi/content/full/339/dec07_2/b5106
The *BMJ* goes further to suggest that Roche, the Swiss company that manufactures and markets Tamiflu, may have misled governments and physicians. In its defense, Roche stated that the company "has never concealed (or had the intention to conceal) any pertinent data."
https://www.bmj.com/content/339/bmj.b5374.full

The *BMJ*'s investigation began innocently enough, with an update of a review by the Cochrane Collaboration, a widely-respected international consortium of researchers who periodically examine the medical literature to assess the safety and effectiveness of various treatments. Roche has claimed that its drug reduces hospital admissions by 61% in patients who were otherwise healthy before they got the flu. http://www.bmj.com/cgi/content/full/339/dec08_3/b5387
It has also said that Tamiflu reduces such complications as bronchitis, pneumonia, and sinusitis by 67%, and lower respiratory tract infections requiring antibiotics by 55%. A 2006 Cochrane review of Tamiflu came to similar conclusions – based largely on a paper that looked at ten studies, all of them funded by the company.

The dog ate my homework

But when the Cochrane team, led by Chris Del Mar, from Bond University in Australia, re-examined the studies they had previously used in 2006, they found some discrepancies. It turned out that only two of the ten studies had ever been published in medical journals, and those two showed the drug had very little effect on complications compared to a dummy pill, or placebo. So the Cochrane reviewers decided to look at the data for themselves.

First they went to the lead authors of the published studies – the researchers who were supposed to have access to all of the data. One author said he had lost track of the data when he moved offices

and the files appeared to have been discarded. The other said he'd never actually seen the data himself, and directed the Cochrane team to go directly to the company.

Four months and multiple requests later, the Cochrane researchers had a hodgepodge of data from the company, including two studies that showed the drug was ineffective, but which the company had never published. Roche also provided data from a third study, which involved 1,447 adults and adolescents aged 13-80, the largest study of the drug ever conducted. Yet the company never published that one either. (A summary of this and other studies is available at www.roche-trials.com).

https://web.archive.org/web/20110905055204mp_/http://www.roche-trials.com/patient/trialresults/stur10633.html

But with only partial data, the Cochrane team couldn't even figure out what the study had been intended to measure.

In the meantime, two former employees of Adis International, a large communications company, came forward with documents showing they had ghostwritten some of the published studies of Tamiflu. One of the ghostwriters told the *BMJ*, "The Tamiflu accounts had a list of key messages that you had to get in. It was run by the [Roche] marketing department and you were answerable to them. In the introduction . . . I had to say what a big problem influenza is. I'd also have to come to the conclusion that Tamiflu was the answer."

Stockpiling

The Cochrane team eventually concluded that the evidence that Tamiflu reduces complications, hospitalizations, or deaths is weak at best, and if the drug does offer any benefit, it is slight indeed. This is precisely the conclusion of the U.S. Food and Drug Administration (FDA), and the UK's National Institute for Health and Clinical Excellence (NICE). As we reported in our story in *The Atlantic*, the FDA directed Roche to state on the drug's label the following caveat: "Tamiflu has not been proven to have a positive impact on the potential consequences (such as hospitalizations, mortality, or economic impact) of seasonal, avian, or pandemic influenza."

http://www.theatlantic.com/doc/200911/brownlee-h1n1

An FDA spokesperson told the *BMJ*, "The clinical trials . . . failed to demonstrate any significant difference in rates of hospitalization, complications, or mortality in patients receiving either Tamiflu or placebo." Yet in the wake of the H1N1 pandemic, the FDA gave temporary approval for the drug to be given to hospitalized flu patients, who are at risk of dying.

Another big unknown is just how safe – or dangerous – Tamiflu may be. According to an FDA spokesperson, side effects may include potentially fatal heart problems. If the drug is going to be used to prevent death, it seems reasonable to ask whether or not its potentially deadly side effects are outweighed by potential benefits. We asked the FDA whether it had required Roche to conduct an additional trial or trials looking at whether or not, on balance, the drug reduces more serious complications than it causes. This week, a spokesperson reported back that there has been no such request made to Roche.

All of which leaves open the question of why governments around the world have invested so much – on the order of $3 billion since the emergence of H1N1 last spring, according to investment bank, JP Morgan – in a drug that appears to do so little.

The answer may lie in the politics of disease. Far from a commercial success when it was initially approved by the FDA in 1999, Tamiflu's fortunes began to look up in 2003, after the SARS outbreak and the emergence of bird flu. Then Hurricane Katrina hit. In the wake of criticism over its handling of the disaster in New Orleans, the Bush Administration announced a multi-billion-dollar pandemic and bioterrorism preparedness strategy, which included stockpiling millions of doses of Tamiflu.

As the nation's lead public health agency, the Centers for Disease Control and Prevention appears to be operating in some alternative universe, where valid science no longer matters to public policy. The agency's flu recommendations are in lockstep with Roche's claims that the drug can be life-saving – despite the FDA's findings and despite the lack of studies to prove such a claim. What's more,

neither the CDC nor the FDA has demanded the types of scientific studies that could definitively determine whether or not the company's claims are true: that Tamiflu reduces the risk of serious complications and saves lives. Nancy Cox, who heads the CDC's flu program, told us earlier this year she opposes a placebo-controlled study (in which one half of patients would be given Tamiflu and the other half would be given placebo), because the drug's benefits are already proven.

There are a couple of take-home messages here. One is pretty obvious: Tamiflu may not be doing much good for patients with the flu who take it, and it might be causing harm. The more important issue, however, involves the need for trust in science and medicine. Governments, public health agencies, and international bodies such as the World Health Organization, have all based their decisions to recommend and stockpile Tamiflu on studies that had seemed independent, but had in fact been funded by the company and were authored almost entirely by Roche employees or paid academic consultants. So did the Cochrane Collaboration, at least in its earlier assessments of Tamiflu. Millions of flu patients have taken the drug as a result.

That trust appears to have been misplaced, and a drug touted as beneficial on the basis of flimsy evidence has by now become so entrenched that no one appears willing to conduct the sort of study needed to prove whether or not it can, in fact, save lives.

Stuff

Mass buy-up of flu medication raises questions

Stuff, 19 June 2010, 15:54
https://www.stuff.co.nz/national/3815985/Mass-buy-up-of-flu-medication-raises-questions

New Zealand's purchase of millions of doses of flu medication and swine flu vaccines has been called into question by European reports suggesting pandemic advice was driven by drug company interests.

A British Medical Journal (BMJ) investigation has found key scientists advising the World Health Organisation (WHO) on planning for a flu pandemic had done work for drug companies who ultimately benefited from the guidance the scientists gave.

WHO's advice led to governments worldwide stockpiling billions of dollars of antiviral drugs such as Tamiflu before and during the recent swine flu pandemic. However, WHO has strongly denied that commercial interests played any part in its advice.

In 2005, the New Zealand government started stockpiling about 1.2 million doses of Tamiflu for use in a global influenza pandemic.

Only 20,000 courses have been used and 60,000 distributed to district health boards.

Shortly after the swine flu H1N1 virus reached New Zealand in early 2009, the Government bought 235,000 courses of Relenza, another antiviral.

The Government also bought 300,000 doses of a monovalent (single strain) swine flu vaccine.

As of last month, more than 900,000 doses of the seasonal flu vaccine – which includes the H1N1 strain – had been distributed nationwide, nearly as many doses as were distributed in the entire 2009 influenza season.

The Ministry of Health said it could not reveal the amount paid for these pharmaceuticals because it was "commercially sensitive".

It usually spent about $9 million a year on flu vaccinations.

Otago University, Christchurch, professor Les Toop said there was no question that drug companies had undue influence over governments and medical professionals.

The efficacy of antivirals such as Tamiflu was "well overplayed" by the companies as their effect turned out to be "very underwhelming".

Toop questioned why, despite there being no signs of a second wave and the H1N1 strain being included in the regular seasonal flu vaccine, the monovalent was still given to thousands of Kiwi health workers and pregnant women.

"Once you've bought it you want to use it," he said.

The Government's initial response to swine flu was right in that it was based on advice given at the time that the virus was easily spread and potentially deadly, he said.

However, this should have been reviewed once it became obvious that for most people it caused just a mild illness.

The BMJ investigation found that WHO advisers who wrote 2004 guidelines recommending stockpiling drugs in a pandemic had received payment from Roche (manufacturers of Tamiflu) and GSK (manufacturers of Relenza) for lecturing and consultancy work.

WHO director general Margaret Chan has strongly denied the organisation's advice was affected by connections to drug companies.

"At no time, not for one second, did commercial interests enter my decision-making," she said.

A Council of Europe report released this month said the handling of the swine flu pandemic, "led to a waste of large sums of public money, and unjustified scares and fears about the health risks faced by the European public".

Chapter 17

Million doses of H1N1 vaccine were Destroyed, Discarded or Donated

World Health Organization

Pandemic vaccine donations for the developing world

Geneva, WHO, 18 September 2009

https://web.archive.org/web/20090922171635/http://www.who.int/mediacentre/news/statements/2009/pandemic_vaccine_donations_20090918/en/index.html

WHO applauds and welcomes the announcement of donations of pandemic vaccine made today by the United States of America, in concert with Australia, Brazil, France, Italy, New Zealand, Norway, Switzerland, and the United Kingdom.

The announcement demonstrates the commitment of these countries to fairness in sharing of scarce resources as the 2009 H1N1 influenza pandemic continues to evolve.

Current supplies of pandemic vaccine are inadequate for a world population in which virtually everyone is susceptible to infection by a new and readily contagious virus.

Given that current demand outstrips supply, these donations, together with the doses pledged by manufacturers, will help increase supplies of pandemic vaccines to populations that would otherwise not have access.

WHO continues to support developing countries to ensure donated vaccines are distributed where they are most needed.

THE FLU CASE

Unwanted vaccine piles up in Sweden

The Flu Case, 14 October 2009, 08:57
https://web.archive.org/web/20091018051450/http://www.theflucase.com/index.php?option=com_content&view=article&id=1024%3Avaccine-mountain-in-sweden&catid=1%3Alatest-news&Itemid=64&lang=en

Mass vaccinations against the highly questioned so-called "swine flu" have started in Sweden and the hard reality of this mistake is now confronting everyone involved. One big issue for politicians seem to be that they have signed a contract which forced them to purchase a certain amount of vaccine as soon as the WHO declared pandemic level 6. Now, with a mild so-called "swine flu" and a vaccine-hesitant popuation, the amount of vaccine ordered will pile up and soon become a political scandal. Especially since less than half of the population intend to get the shot.

Swedish news paper Aftonbladet writes:

Vaccine mountain in Sweden

Sweden has bought two vaccine shots for every citizen. Only one is needed. Now the local authorities are trying to get rid of the unnecessary vaccine mountain.

18 million doses for over one billion SEK (144 million dollars). That is how much swine flu vaccine Sweden is bound to purchase since it was calculated that two doses would be needed per citizen. But yesterday that all changed reports Sveriges Radio (Swedish state radio).

Only one dose

Now, both manufacturers of the vaccine and experts from World Health Organization, WHO, claim that one dose per person will be enough. For Sweden this means unused medication for half a billion SEK (70 million dollars). But Göran Stjernstedt from Sveriges Kommuner och Landsting, SKL, hopes that the vaccine manufacturers will take back some of all the medication.

"- I presume that we can renegotiate with the company since the conditions have changed. The product delivered is another from the one promised when we signed the agreement" he says to Ekot.

So far, 600 000 doses have arrived to Sweden and are being distributed.

BILL & MELINDA GATES *foundation*

Gates Foundation Statement on Global Agreement to Supply H1N1 Vaccine to Developing Countries

Bill & Melinda Gates Foundation, 18 September 2009.
https://web.archive.org/web/20090923192518/http://www.gatesfoundation.org/press-releases/Pages/gates-foundation-statement-on-global-agreement-h1n1-vaccine-090918.aspx

Seattle – Dr. Tachi Yamada, president of the Global Health Program of the Bill & Melinda Gates Foundation, released the following statement on the announcement by several nations regarding access to H1N1 vaccine by developing countries:

"We heartily applaud the commitment by nine nations to donate a portion of their H1N1 vaccine supply on a rolling basis to the World Health Organization for distribution to countries that would otherwise not have direct access.

Australia, Brazil, France, Italy, New Zealand, Norway, Switzerland, the United Kingdom, and the United States have all shown tremendous leadership. Wealthier countries have an obligation to ensure more equitable access to vaccines in this global pandemic. This issue is surely one of the most pressing moral challenges of our time.

This announcement underscores the interdependency of all people when it comes to matters of health. As important as the announced generosity is, we must keep in mind that the needs are great, and more must be done to ensure that all nations have access to vaccines and other tools.

We understand that these are hard decisions to make right now. We hope and expect that more nations will join this effort."

Bill & Melinda Gates Foundation

Guided by the belief that every life has equal value, the Bill & Melinda Gates Foundation works to help all people lead healthy, productive lives. In developing countries, it focuses on improving people's health and giving them the chance to lift themselves out of hunger and extreme poverty. In the United States, it seeks to ensure that all people – especially those with the fewest resources – have access to the opportunities they need to succeed in school and life. Based in Seattle, Washington, the foundation is led by CEO Jeff Raikes and Co-chair William H. Gates Sr., under the direction of Bill and Melinda Gates and Warren Buffett.

THE FLU CASE

170,000 doses of Pandemrix destroyed by GSK in Belgium

The Flu Case, 4 November 2009, 11:29
https://web.archive.org/web/20091107021136/http://www.theflucase.com/index.php?option=com_content&view=article&id=1588:170000-doses-of-pandemrix-destroyed-by-gsk-in-belgium&catid=41:highlighted-news&Itemid=105&lang=en

GlaxoSmithKline (GSK) has had to destroy 170,000 doses of its swine flu vaccine Pandemrix at its production facilities in Belgium, it has emerged.

The reason why the company had to destroy 170,000 doses of Pandemrix is not clear.

It appears that the adjuvant AS03 squalene for the Pandemrix vaccine is largely manufactured in Belgium. GSK Biologicals, the division responsible for vaccine production, is headquartered in Rixensart/Wavre.

The incident only came to light when the Norwegian Health Minister Anne-Grete Strøm-Erichsen sent a letter to the CEO of GlaxoSmithKline asking for additional doses, as reported in the Swedish newspaper Aftonbladet.

This is the report in Aftonbladet:

WHO slår larm efter norska dödsfall

Bloggat om artikeln

Från bloggen:

04 nov 11:33

Världshälsoorganisationen, WHO, är oroliga över att svininfluensan skördat så många dödsfall i Norge och vill nu skicka en expert.

Men Norge säger nej. Det skriver VG i dag.

Det var i måndags som norska hälsoministern Anne-Grete Strøm-Erichsen (Ap) skrev ett brev till VD:n för läkemedelsföretaget GlaxoSmithKline.

”Influensapandemin sprider sig snabbt i hela landet och tätbefolkade områden har nu drabbats hårdast. Jämfört med andra europeiska länder har vi en högre dödlighet, vilket lett till att WHO uttryckt oro och kontaktat vår hälsomyndighet för att hjälpa till”, skriver hälsoministern i brevet.

Bad om ytterligare doser

Hälsoministern skrev brevet efter att 170.000 doser av influensavaccin Pandemrix gått förlorade vid en olycka i en fabrik i Belgien. I brevet bad hon därför läkemedelsjätten att få ytterligare doser så snart som möjligt.

Nej till hjälp

Hälsoministern Anne-Grete Strøm-Erichsen bekräftar att man sagt nej till hjälpen från WHO.

– Vi har fortlöpande dialog med WHO, men avvaktar erbjudande om hjälp. De vet att vi har vaccin och gör vad vi kan, säger hälsoministern.

Sammanlagt har Norge beställt 9,4 millioner doser av vaccinet, vilket beräknas räcka till alla norrmän.

Sammanlagt ska 13 personer avlidit till följd av svininfluensan i Norge, enligt de senaste uppgifterna.

HSE has ordered too many swine flu vaccines

Irish Independent, 17 November 2009, 13:00.
https://www.independent.ie/life/health-wellbeing/hse-has-ordered-too-many-swine-flu-vaccines/26587318.html

THE Health Service Executive (HSE) is now expected to have surplus stocks of the swine flu vaccine next year after it entered into an €80m contract with drug companies.

Ireland was one of the countries which placed early orders for pandemic vaccines and is promised 7.7 million doses.

Although several hundred thousand doses have now been delivered here, the supply is expected to accelerate from next month onwards.

But with the announcement that just one dose, instead of two doses, of the vaccine Pandemrix is needed for everyone over 13 years of age, there will be excess stocks here next year. Two doses of the vaccine Celvapan, made by Baxter and delivered in HSE clinics, will still have to be administered.

The Department of Health said that it was in talks with the drug companies again but it was unclear if it could extricate itself from the contract for 7.7 million doses. The vaccine is now being administered to at-risk groups as well as healthcare workers and the first group of healthy under-fives.

Meanwhile, Beaumont Hospital in Dublin yesterday reiterated its appeal to visitors to heed restrictions to reduce the risk of swine flu spreading.

Hospitals haveimposed various restrictions in response to the threat. However, a Beaumont Hospital spokesman said "that the failure of the public to heed visiting restrictions could force it to take further action".

Asked what further action could entail, he said the most extreme measure was to ban all visitors with a few exceptions, but the situation had not reached that point.

Bremen will bestellten Schweinegrippe-Impfstoff stornieren

Impfkritik // Deutsches Ärzteblatt, 9 Dezember 2009, 18:45
https://web.archive.org/web/20200314231823/https://impfkritik.de/pressespiegel/2010010404.html

Bremen (ddp). Das Land Bremen will sich für eine Stornierung bereits bestellter Impfstoffe gegen die Schweinegrippe beim Hersteller einsetzen. Wie eine Sprecherin der Gesundheitsbehörde auf ddp-Anfrage sagte, ist am Mittwoch ein entsprechendes Schreiben an die anderen Bundesländer gegangen. «Wir wollen möglichst ein gemeinsames Vorgehen aller Länder noch vor Weihnachten erreichen», sagte sie.

Bislang hätten sich in Bremen nur etwa vier Prozent der Bevölkerung impfen lassen. Hinzu komme nun, dass nur noch eine Impfdosis gebraucht werde statt zwei, wie ursprünglich angenommen. Der bestellte Impfstoff, der für 30 Prozent der Bevölkerung ausreichen sollte, sei also nun genug für 60 Prozent der Bevölkerung, sagte die Sprecherin. «Das brauchen wir auf keinen Fall.»

Das Problem ist, dass die Krankenkassen nur die Kosten für die tatsächlich verbrauchten Impfdosen übernehmen. Niedersachsen etwa könnte deshalb am Ende auf rund 30 Millionen Euro Kosten sitzen bleiben. In Bremen rechnet man damit, dass das Land durch das Stornieren des noch nicht ausgelieferten Impfstoffes etwa eine Million Euro sparen könnte.

THE FLU CASE

German State wants to Cancel Contract over unwanted Swine Flu Jabs

The Flu Case, 9 December 2009, 11:55
https://web.archive.org/web/20100102034836/http://theflucase.com/index.php?option=com_content&view=article&id=2220%3Agerman-state-wants-to-cancel-contract-over-unwanted-swine-flu-jabs&catid=1%3Alatest-news&Itemid=64&lang=en

The federal state of Bremen in Germany has said that it wants to cancel its existing contract with pharmaceutical companies for swine flu vaccine in view of the low interest in the shot.

Only about 4 % of the people in Bremen have had the swine flu shot, according to the local authorities estimates, leaving the state sitting on millions of doses and needing to foot the bill of 30 million euros for the unused jabs.

Germany and Spain seek to cut H1N1 vaccine orders

Reuters, 17 December 2009, 10:31 PM GMT+8
https://www.reuters.com/article/idUSTRE5BG2PD/

London (Reuters) – Germany and Spain want to reduce deliveries of swine flu vaccine and potentially return excess supplies to manufacturers, due to low uptake of the shots, in a move that could hit drugmakers' profits.

Germany's health ministry said on Thursday some German states had been in talks with Britain's GlaxoSmithKline about reducing deliveries of H1N1 vaccine, but the talks had as yet yielded no results.
The German federal government will also start negotiations in January with other countries that might be interested in taking some of its excess supplies, he added.

Germany said earlier this month it wanted to sell on more than 2 million H1N1 vaccine doses because of weak demand at home.

Spain's health minister Trinidad Jimenez said her country was "speaking with the pharmaceutical companies" about returning unused vaccine, according to a report on the specialist news service APM Health Europe.

A health ministry official in Madrid said Spain expected to either return surplus vaccines to suppliers so they could be sold at pharmacies, or send them to other European Union countries to help with their vaccination programmes.

"The health ministry introduced clauses in contracts signed with GSK, Novartis and Sanofi-Pasteur which foresaw the possibility of returning surplus vaccines in case they were not necessary," the official told Reuters.

"Vaccination forecasts at the time were made on the basis that two doses per person would be needed, but this has not turned out to be the case."

A single dose of vaccine is now deemed sufficient for immunizing adults by health authorities around the world.

Countries Have "Number of Options"

Germany ordered 50 million doses of H1N1 vaccine from Glaxo, while Spain bought 22 million doses from Novartis, 14.7 million from Glaxo and 400,000 from Sanofi-Aventis.

Analysts at Morgan Stanley said revenues generated from swine flu were expected to total $600 million for Novartis, 2.2 billion pounds ($3.6 billion) for Glaxo and 750 million euros ($1.1 billion) for Sanofi, to be booked in the last quarter of 2009 and first three months of 2010. – "The return of excess quantities by Germany and Spain creates downside risk of up to 15 percent of total swine flu revenues for these companies," they said.

The World Health Organization's (WHO) flu expert Keiji Fukuda said countries with surplus vaccine had "a number of options" including donating it to those who have none, or keeping it in reserve for a later date.

"This is a virus that we don't expect to just suddenly disappear," he told a briefing.

The Geneva-based WHO is coordinating efforts to encourage rich countries to share vaccines with poorer nations who had little or no access to supplies. Fukuda said six manufacturers and 12 countries had so far pledged some 180 million doses of vaccines to be distributed to around 95 countries.

Officials at the drug companies had no immediate comments on the German and Spanish government moves

Grippe-Berlin, Madrid veulent réduire leurs commandes de vaccins

Reuters, 17 December 2009, 9:02 PM GMT+8
https://www.reuters.com/article/idUSLDE5BG1CS/

Londres, 17 décembre (Reuters) - L'Allemagne et l'Espagne souhaitent réduire leurs commandes de vaccins contre le virus H1N1 de la grippe A et éventuellement renvoyer leur excès de stocks aux fabricants, signe d'un tassement de l'épidémie.

Le ministère allemand de la Santé a fait savoir jeudi que certains Länder étaient en pourparlers avec le laboratoire britannique GlaxoSmithKline en vue de réduire ses livraisons.

Le gouvernement fédéral entamera pour sa part en janvier des négociations avec les autorités de pays qui pourraient être intéressés par la reprise de ses surplus de vaccins - plus de deux millions de doses -, a précisé le ministère de la Santé.

La ministre de la Santé espagnole, Trinidad Jimenez, a annoncé, de son côté, que Madrid négociait avec les fournisseurs de vaccins la reprise de ses surplus, là encore faute d'une demande soutenue, afin qu'il puissent être redistribués dans d'autres pays.

L'Allemagne avait commandé 50 millions de doses à Glaxo. L'Espagne en avait acquis 22 millions de Novartis , 14,7 millions de Glaxo et 400.000 de Sanofi-Aventis .

AstraZeneca recalls 4.7 million flu vaccine doses

The Philadelphia Inquirer, 23 December 2009, 3:01 a.m. ET
https://www.inquirer.com/philly/health/20091223_AstraZeneca_recalls_4_7_million_flu_vaccine_doses.html

AstraZeneca P.L.C.'s MedImmune unit announced a recall of 4.7 million doses of its nasal spray version of the swine flu vaccine because tests showed a decline in potency, U.S. regulators said yesterday.

There are no questions about the safety of the doses, and people who have already been inoculated don't need to get vaccinated again, said Norman Baylor, director of vaccines research and review for the Food and Drug Administration. About 3,000 of the doses remain in warehouses, and AstraZeneca will contact clinics that may still have unused vials, he said. The company has its U.S. headquarters near Wilmington.

The recall follows a similar move on Dec. 15 by Sanofi-Aventis SA, which recalled 800,000 doses of swine flu vaccine. After vaccines are shipped from the manufacturers, companies keep samples from each lot and continue to test them for potency declines, Baylor said. Both swine flu vaccine recalls were voluntary after potency dropped below pre-specified thresholds.

"There are no safety concerns with these lots," Baylor said in a conference call with reporters yesterday. "We do see a decline in potency every now and then."

WHO donerer mio. af doser overskudsmedicin til u-lande

Information, 23 december 2009
https://www.information.dk/indland/2009/12/who-donerer-mio-doser-overskudsmedicin-u-lande?lst_cntrb

180 millioner doser af vestens overskydende H1N1-vacciner gives lige nu til WHO, der deler dem ud i 95 lande, som er 'sårbare over for pandemien'. Afghanistan, Aserbajdsjan og Mongoliet er blandt de 35 lande, der har bedt om de gratis vacciner og skrevet under på, at de udvikler en national pandemiplan.

De gratis vacciner møder dog kritik fra flere eksperter. Når WHO skaffer sig af med de kæmpe lagre af vacciner, gør de sig samtidig fri af en politisk dårlig sag, lyder det bl.a. fra Tom Jefferson, epidemiolog ved det uafhængige forskningsinstitut, Cochrane Centre.

»Hvorfor giver de overhovedet vaccinerne til udviklingslandene? Pandemien er afblæst i store dele af verden. Den største trussel i de fattige lande lige nu er hjerte-kar-sygdomme, mens virus kommer meget langt nede på listen. Hvad er den lægelige begrundelse for at donere 180 millioner doser væk?«

Influenza en lille trussel

Medlemslande ligger inde med millioner af doser H1N1-vaccine på grund af kontrakter med vaccineproducenterne, der blev indgået før pandemien brød ud, og dermed før man kendte til pandemiens omfang. Frankrig købte 94 millioner doser og har til dato kun brugt tre millioner doser, mens Storbritannien købte 60 millioner doser. Af dem har de brugt godt fem millioner. Norge og Tyskland har besluttet at donere vaccinerne til lande, der ikke selv har mulighed for at købe vaccinerne.

Professor i virussygdomme på Rigshospitalet, Jens Lundgren, siger: »Umiddelbart vil jeg mene, at u-landene har betydeligt større ting at slås med end den her influenza. Hvis man gerne vil gøre noget for u-landene, så skal man nok gøre noget andet,« siger Jens Lundgren.

Speciallæge i almen medicin Claus Hancke undrer sig også: »For mig at se har u-landene ikke en pind at bruge H1N1-vaccine til. Influenza er ikke et særligt stort problem i de lande, hvor der er meget sol. Dertil kommer, at svineinfluenzaen har vist sig ikke at være særlig farlig,« siger Claus Hancke og tilføjer:

»Det virker som om, at vi gerne vil løse et affaldsproblem, og gør det ved at sende den overskydende vaccine til u-landene. I den logik er det åbenbart bedre at sprøjte affaldet ind i mennesker end at destruere det. Det er grotesk,« siger Claus Hancke, som tidligere har frarådet folk at lade sig vaccinere, fordi H1N1-vaccinen er dårligt testet og muligvis kan have ukendte bivirkninger.

Hvem holder øje?

WHO har gennemført ni workshops i alle regioner, der skal hjælpe landene med at udfærdige nationale pandemiplaner og forberede vaccinernes ankomst. Pandemiplanerne indeholder instruktioner

i, hvem vaccinen gives til, hvordan den skal administreres og anbefalinger om først at vaccinere sundhedspersonale.

Alligevel er administrationen af vaccinen den største udfordring, mener Tom Jefferson fra Cochrane Centeret: »Det er enormt vigtigt, at man er i stand til at overvåge ny medicin, når man dumper millioner af doser ned i et samfund. Man skal overvåge både effekt og bivirkninger, og hvordan har man tænkt sig at gøre det i Afghanistan?« siger han og uddyber:

»Den bedste forklaring, jeg kan komme på, er, at WHO forsøger at formindske de enorme H1N1-lagre. Den største taber i den her pandemihistorie er troværdigheden hos de offentlige sundhedssystemer og WHO. Vi kommer til at betale en enorm pris for det, når vi engang står med en rigtig folkesund-hedskrise, og ingen længere stoler på sundhedssystemet. Troværdigheden er det sande offer«.

WHO Donates millions of doses of surplus medical supplies to Developing Countries

Information // The Flu Case, 28 December 2009
https://web.archive.org/web/20100117114421/http://theflucase.com/index.php?option=com_content&view=article&id=2419:whos-swine-flu-jab-donations-to-developing-countries-demarks-information-reports&catid=41:highlighted-news&Itemid=105&lang=en

180 millions of doses of surplus H1N1 vaccines are in the process of being donated to WHO, which will distribute them to 95 countries that are "vulnerable to the pandemic."

Afghanistan, Aserbajdsjan and Mongolia are among the 35 countries which have asked for free vaccines and signed an agreement to develop national plans for a pandemic.

However, several experts have criticised the free vaccines.

By getting rid of the enormous stocks of vaccines, WHO at the same time frees itself of political problem, says, among others, Tom Jefferson, an epidemiologist at the Cochrane independent research center.

"Why do they give the vaccines to the developing countries at all? The pandemic has been called off in most parts of the world. The greatest threat in poor countries right now is heart and circulatory diseases while the virus figures at the bottom of the list. What is the medical reason for donating 180 million doses?"

Flu is a Small Threat

The member countries have millions of doses of H1N1 in stock because of the contracts with the vaccine producers, which were signed before the pandemic broke out, and so before the scope of the pandemic was known.

France bought 94 million doses but has so far used only used three millions, while Great Britain bought 60 million doses. Of these, a little over five millions have been used. Norway and Germany have decided to donate the vaccines to countries, which cannot afford to buy the vaccines.

Professor for virological diseases at the central Danish hospital, Rigshospitalet, Jens Lundgren, says: “My first thought is that the developing countries have greater problems to fight than this flu. If you really want to do something for the developing countries, you should probably do something else,” says Jens Lundgren.

Claus Hancke, a medical doctor who is specialized in ordinary medicine, is also wondering:

“From my point of view the developing countries have no need whatsoever for H1N1 vaccine. Flu is a minor problem in countries where there is a lot of sunshine. Furthermore it has turned out, that the swine flu is not particularly dangerous,” says Claus Hancke, adding:

“It seems we would like to find a solution to the problem of waste, and are doing so by sending the surplus vaccine to the developing countries. Following this logic it seems to be better to inject the waste into people instead of destroying it. It is grotesque,” says Claus Hancke, who early on has advised people not to take the vaccine as the H1N1 jab is not properly tested and possibly may have unknown sideeffects.

WHO Survey?

WHO has conducted workshops in all regions to help the countries to establish plans for pandemics and prepare for the arrival of the vaccines. The plans for the pandemic contains instructions concerning who is going to receive the vaccine, how it is going to be administered and the recommendations to inoculate health staff first of all.

Still the administration of the vaccine is the greatest challenge, believes Tom Jefferson from the Cochrane Center.

“It is extremely important to be able to monitor new medicine when you dump millions of doses on a society. You have to survey both for effect and side effects, and how is that supposed to be done in Afghanistan?” he says and elaborates:

“The best explanation I can imagine is that WHO is trying to reduce the enormous stocks of H1N1. The greatest loser in this story about the pandemic is the credibility of the public health systems and the WHO. We are going to pay an enormous price for this when we one day have a real crisis in public health, and nobody trusts the health system any longer.

Credibility is the true victim”.

More swine flu vaccine recalled: FDA

Reuters, 24 December 2009, 1:39 AM
https://www.reuters.com/article/us-recall-idINTRE5BM30U20091223

Chicago (Reuters) – The U.S. Food and Drug Administration said on Tuesday AstraZeneca’s MedImmune unit is voluntarily recalling some of its H1N1 swine flu vaccine because it was not as potent as it should be.

Norman Baylor, director of the office of vaccines research and review at the FDA, said the recall involves a total of 4.7 million doses of the company’s nasal spray vaccine, but only about 3,000 of those doses are left in warehouses.

The rest of the doses were given out in October and November, when the vaccine was still at full potency, Baylor told reporters on a conference call.

The FDA said people who had already received the vaccine do not need another dose.

The company is the second to recall H1N1 swine flu vaccine in the past month. Sanofi-Aventis SA on December 15 recalled 800,000 doses of its pediatric H1N1 swine flu vaccine because it is not as potent as it should be.

MedImmune said in a statement the recall involves unused doses of 13 specific lots of 2009 H1N1 nasal spray vaccine, because of a slight decrease in potency that was detected during regular checks.

"The doses were well within potency specifications at the time of distribution,” said Tor Constantino, a spokesman for the unit of AstraZeneca.

He said the recall was not for safety issues, but was intended to notify any healthcare providers who may still have some of the recalled vaccine in their refrigerators.

"The cause of the loss of potency is being investigated,” Constantino said by telephone, adding that this has not been an issue in the past with the company’s seasonal flu vaccine.

MedImmune is recommending that all lots marked with an expiration date of between January 19 and January 26, 2010 not be used.

Constantino said the company has delivered 23 million of the total 40 million doses on its contract with the U.S. government. He said the recalled doses were some of the earliest the company made, and most have already been given to people.

The U.S. Health and Human Services Department has contracts with five companies to make 251 million doses of H1N1 vaccine as well as seasonal flu vaccine – Sanofi Aventis, CSL of Australia, AstraZeneca unit MedImmune and GlaxoSmithKline.

The CDC’s Dr. Anne Schuchat said on Tuesday 111 million doses of H1N1 vaccine have been made available so far.

Would Want a Vaccine Pulled Off the Shelves (But Still ...)

News Week, 24 Dec 2009, 10:39 AM EST
https://www.newsweek.com/more-h1n1-vaccine-recalled-best-reason-one-would-want-vaccine-pulled-shelves-still-222092

Another batch of H1N1 vaccine has been recalled, this time the nasal-spray version made by AstraZeneca. According to the FDA, 4.7 million doses of MedImmune were recalled yesterday. Last week, the vaccine made headlines when it was revealed that 800,000 vials of the children's vaccine, made by Sanofi-Aventis SA, were also being recalled. Luckily, neither company's products are being recalled due to any serious safety concerns─in fact, the only safety concern is that the vaccine might not protect against H1N1. However, it does present a troubling problem that health officials will need to address sooner rather than later.

In both cases, the vaccine was recalled due to the lower-than-usual potency of the doses. H1N1 vaccines are made with the H1N1 virus, to which the body reacts and produced antibodies. In the case of the pediatric vaccine, the virus was de-activated. The nasal vaccine used a live virus. But both vaccines tested less powerful than needed to fight H1N1 infection.

When determining the efficacy of the vaccine, researchers decide how much of the deactivated virus is necessary to ensure that enough antibodies are created. After vaccines are produced, they are regularly tested to ensure that the level of antibody-creating virus remains above the baseline needed to remain effective, says to Lance Rodewald, M.D., director of the Division of Immunization Services in the National Center for Immunization and Respiratory Diseases at the Center for Disease Control and Prevention. He spoke to reporters last week as part of a training session for the Association of Health Care Journalists. Most vaccines lose some potency over time, which is why they come with expiration dates. But potency levels H1N1 vaccines, he said, are degrading much faster than usual. So when these drug companies test for efficacy, the saw that the vaccine was about to become or had just become too weak to be effective. Those who have received the vaccine already don't need to worry – they most likely received the vaccine at a proper potency.

But WHY is the H1N1 vaccine losing power so quickly? Scientists don't know, says Rodewald, but they speculate that the viruses in the serum is especially sticky – clinging to the walls or being absorbed into the syringes in which they're housed. How to make less absorbent syringes, or a less sticky vaccine have yet to be determined.

Currently, the recalled vaccines are not an issue of life and death. But if, as predicted, there's a second wave of influenza outbreak, or if swine flu returns as the dominant flu strain next season, it's a problem that needs to be resolved as quickly as possible.

HSE cuts swine flu vaccine order

Business Post, 26 December 2009
https://www.businesspost.ie/legacy/hse-cuts-swine-flu-vaccine-order/

The Health Service Executive has renegotiated orders for one of the swine flu vaccines, resulting in a saving of up to €35 million.

The HSE told pharmaceutical firm Baxter it was cancelling orders for its Celvapan vaccine after December 21. That move means that the HSE will not be taking 3.7million doses of the Celvapan vaccine that it had originally ordered from Baxter.

The HSE had scaled back orders for Celvapan because two doses of the vaccine are required for full protection. Recent studies have shown that most people require a single dose of the Pandemrix vaccine, which is manufactured by GlaxoSmithKline (GSK). The HSE had originally placed orders for 7.7 million vaccines from Baxter and GSK, with a projected cost of about €88 million. It said the move would result in savings of between €25 and €35 million.

Other countries are attempting to renegotiate their contracts with vaccine suppliers.

While contracts between governments and suppliers vary widely, most did not anticipate re-negotiations in the event of lower demand, as they were agreed at a time when forecasts suggested demand for vaccines would outstrip supply.

In a research note, investment bank Morgan Stanley said the efforts to return vaccines could hit earnings per share at the pharmaceutical companies.

More than 550,000 people have been vaccinated in Ireland and the overall incidence of swine flu is continuing to decline, according to the HSE. However, there have been 22 deaths in Ireland so far, and Dr Darina O’Flanagan of the Health Protection and Surveillance Centre said there were still high infection rates among young people.

Berliner Morgenpost

Berlin will weniger Impfstoff kaufen

Berliner Morgenpost, 30 December 2009, 12:40
https://www.morgenpost.de/berlin/article104978374/Berlin-will-weniger-Impfstoff-kaufen.html

Die Berliner sind impfmüde - und das Land kann dies teuer zu stehen kommen. Um nicht Millionen für nicht verwendete Schweinegrippe-Impfdosen zahlen zu müssen, wollen die Bundesländer nun Serum abbestellen. Die Weltgesundheitsorganisation warnte allerdings davor, die Schweinegrippe als besiegt anzusehen.

Berlin und die anderen Bundesländer bestellen weniger Schweinegrippe-Impfstoff. Die Berliner sind bislang sehr impfmüde, so dass weniger Dosen gebraucht werden als bei Vertragsschluss mit dem Pharmakonzern Glaxo-Smith-Kline abzusehen war, sagte eine Sprecherin der Berliner Senatsverwaltung für Gesundheit. Außerdem sei zunächst von einer Zweifach-Impfung ausgegangen worden. "Es ist aber in fast allen Fällen nur eine Impfung nötig", sagte die Sprecherin. Trotz der geplanten reduzierten Bestellung von Impfstoff gegen die Schweinegrippe will Berlin aber genug Dosen für den Gesundheitschutz der Bevölkerung bereit halten.

Durch den Beschluss der Gesundheitsministerkonferenz der Länder, statt 50 Millionen nur 25 Millionen Dosen Impfstoff zu bestellen, könnte Berlin viel Geld sparen. Die Krankenkassen bezahlen die Impfung nur, wenn Ärzte das Serum Patienten auch tatsächlich spritzen.

Bislang haben sich aber nur schätzungsweise 120.000 bis 130.000 Berliner zur Impfung entschlossen, hatte Berlins Infektionsschutzbeauftragte Marlen Suckau zuvor gesagt. Bleibt es bei dieser Impfmüdigkeit, muss das Land die Rechnung für seine Impfvorräte selbst begleichen. Auf Berlin könnten nach Suckau dann Kosten von bis zu 13 Millionen Euro zukommen. Wie viel Geld das Land durch die reduzierte Bestellung des Impfstoffs einsparen kann, ist laut Gesundheitsverwaltung allerdings noch nicht absehbar.

Auch in Brandenburg ist eine Impfmüdigkeit zu bemerken, sagte Brandenburgs Infektionsschutzreferent Ulrich Widders. Über die Reduzierungspläne sagte er nur: "Wir warten erstmals die Verhandlungen ab."

Das Robert Koch-Institut in Berlin wollte sich am Mittwoch zu dem Beschluss der Länder nicht äußern. "Das ist eine Entscheidung der Politik, das kommentieren wir nicht", sagte eine Institutssprecherin. Die Chefin der Weltgesundheitsorganistation (WHO) Margaret Chan sagte der Schweizer Zeitung "Le Temps", auch in den kommenden sechs bis zwölf Monaten müsse die Verbreitung des Virus A (H1N1) weiterhin wachsam verfolgt werden, bevor von einem Sieg über den Erreger gesprochen werden könne, sagte . Auch wenn der Höhepunkt der Schweinegrippe in einigen Ländern der nördlichen Erdhalbkugel überschritten sei, darunter die USA und Kanada, steckten andere Länder noch mitten in der Epidemie. "Der Winter ist noch lang", sagte die WHO-Generaldirektorin mit Blick auf die Influenza-Hochsaison.

Wie das Bielefelder "Westfalen-Blatt" berichtet, wollen die Länder am 7. Januar mit dem Hersteller über die verminderten Liefermengen des Impfstoffs Pandemrix verhandeln. Der Pharmakonzern Glaxo-Smith-Kline sei bereits informiert, dass die Landesgesundheitsminister 25 Millionen Impfdosen für ausreichend halten. Bei der Bestellung von 50 Millionen Impfdosen sei noch von einer Zweifach-Impfung ausgegangen worden, führte Schubert aus. Somit habe sich die Vertragsgrundlage für die Abnahme der 50 Millionen Dosen geändert. Schubert geht dem Bericht zufolge davon aus, dass bis Ende Dezember wie geplant 20 Millionen Dosen an die Bundesländer ausgeliefert würden. Anfang 2010 sollten die Lieferungen auslaufen, heißt in dem Zeitungsbericht. Ein Verkauf von Impfstoff an bedürftige ausländische Staaten sei bisher nicht zustande gekommen, sagte Schubert. Es sei lediglich bekannt, dass die Ukraine, der Kosovo und die Türkei Impfstoff in Deutschland angefragt hätten. Konkrete Verhandlungen habe es aber bisher nicht gegeben.

France sells off surplus swine flu vaccine

BBC News, 3 January 2010, 17:30 GMT
http://news.bbc.co.uk/2/hi/health/8438663.stm

France is selling off millions of surplus swine flu vaccine doses to other countries, officials say.

They say the move was decided after health authorities found they had more than enough to deal with the outbreak.

Germany and The Netherlands announced similar sales late last year. The H1N1 virus appears to have peaked in North America and parts of Europe.

However it remains active elsewhere. More than 11,500 people worldwide are believed to have died from swine flu.

A French health ministry official told AFP on Sunday: "We started with a plan for two-dose vaccinations but since one dose is sufficient we can start to resell part of the stock."

The government bought 94 million swine flu vaccine doses - more than one for every French person - and started vaccinating in October.

Only about five million people are recorded as having been vaccinated in France so far, AFP reports.

Le Parisien newspaper quotes officials as saying Qatar had bought 300,000 doses and Egypt was negotiating to buy two million.

Last week the head of the World Health Organization Margaret Chan said it was "premature" to say that the H1N1 pandemic was over.

Bachelot résilie la moitié des commandes de vaccins contre la grippe

Les Echos.fr, 4 Janvier 2010, 22H17
https://web.archive.org/web/20100322233732/http://www.theflucase.com/index.php?option=com_content&view=article&id=2465%3Afrench-health-minister-cancels-consignment-of-50-million-swine-flu-jabs&catid=41%3Ahighlighted-news&Itemid=105&lang=en#

En pleine polémique sur la campagne de vaccination contre le virus pandémique H1N1, la ministre de la Santé Roselyne Bachelot a annoncé avoir résilié les commandes de 50 millions de doses de vaccin, soit "une économie de plus de la moitié" du total engagé.

"Ces commandes n'avaient été ni livrées, ni payées, elles sont donc résiliées", a précisé la ministre, dans un entretien lundi sur TF1.

"Les vaccins représentaient 712 millions d'euros, cela fait une économie de plus de la moitié", a dit Mme Bachelot.

Ce chiffre diffère du montant de 869 millions d'euros précédemment annoncé par le ministère de la Santé pour les commandes de vaccin, du fait d'un changement de TVA (de 19,6% à 5,5%) lié à l'autorisation de mise sur le marché, explique-t-on au cabinet de Mme Bachelot.

L'entourage de la ministre n'a pu préciser lundi soir si des clauses de résiliation prévoyaient le versement d'indemnités aux laboratoires.

Dans la perspective d'une pandémie mondiale redoutée par l'Organisation mondiale de la santé (OMS), la France avait commandé 94 millions de doses de vaccin auprès de GlaxoSmithKline (GSK, 50 millions de doses), Sanofi Pasteur (28 millions), Novartis (16 millions) et Baxter (50.000), pour un montant total de 869 millions d'euros, selon le ministère de la Santé.

GlaxoSmithKline France et Sanofi Pasteur se sont déclarés prêts à examiner une éventuelle demande de renégociation du contrat avec le gouvernement.

La ministre de la Santé a déclaré lundi à propos des doses commandées, "avoir négocié directement avec les laboratoires".

Les critiques à l'encontre du gouvernement, qui a confirmé dimanche avoir commencé à revendre des surplus de vaccins à des pays tiers, se sont multipliées lundi.

Premier à porter le fer, le socialiste Jean-Marie Le Guen a réclamé dimanche une "mission d'information parlementaire". A droite, le député UMP Bernard Debré a vilipendé le "principe absurde, poussé à l'extrême, de précaution".

Les laboratoires ont également été jugés "grands vainqueurs de cette affaire" par le porte-parole du PS Benoît Hamon.

Pour sa part, la ministre s'est défendue d'en faire "trop ou pas assez". "Je le dis clairement, il faut pratiquer le principe de précaution", a-t-elle martelé lundi soir, évoquant la crise sanitaire du sang contaminé.

"Cette grippe a tué 18 personnes ce week-end, en trois jours, en particulier des personnes qui n'avaient aucun facteur de risque", a souligné Mme Bachelot.

Selon elle, la vente des vaccins aux autres pays sera "marginale" au regard de la résiliation des commandes annoncée ce lundi.

Sur le total de 94 millions de doses, en plus des 50 millions résiliés, 9,4 millions ont été promises à l'Organisation mondiale de la santé (OMS) et 2 à 3 millions seront vendues, selon le ministère. Quelque 25 millions de doses resteraient ainsi disponibles pour la vaccination en France, selon le ministère.

"Je serai attentif à ce qui va se passer", a déclaré M. Le Guen lundi soir à l'AFP après l'annonce de la résiliation de commandes. "J'ai tendance à penser que c'est un artifice", a-t-il ajouté.

Mme Bachelot a appelé à ne "pas relâcher la garde sur la vaccination", précisant que "la semaine prochaine les médecins généralistes volontaires pourront vacciner dans leur cabinet".

La vaccination va également se poursuivre dans les centres de vaccination et doit "continuer jusqu'à septembre prochain", a déclaré la ministre.

Mme Bachelot a souligné qu'avec 5 millions de vaccinés, la France avait "des chiffres parmi les meilleurs d'Europe".

THE FLU CASE

The French Health Minister Roselyne Bachelot yesterday evening announced that existing contracts for the delivery of 50 million swine flu vaccines would be cancelled

The Flu Case, 5 January 2010 12:32

https://web.archive.org/web/20100322233732/http://www.theflucase.com/index.php?option=com_content&view=article&id=2465%3Afrench-health-minister-cancels-consignment-of-50-million-swine-flu-jabs&catid=41%3Ahighlighted-news&Itemid=105&lang=en

She told TF1 TV news that a consignment for 50 million swine flu jabs had not been "delivered or paid for and so was retracted."

The announcement comes amid a growing protest in France over the costs and dangers surrounding the unprecedented mass vaccination campaign with an untested substance.

Only about 5 million people have taken the jab in France according to Bachelot, leaving the country sitting on about 90 million doses of swine flu vaccine.

France ordered 94 million doses of the jab from GlaxoSmithKline (GSK, 50 million), Sanofi Pasteur (28 million), Novartis (16 million) et Baxter (50.000).

LE TEMPS

Paris résilie la commande de 50 millions de vaccins

Le Temps, 5 janvier 2010 à 08:59
https://www.letemps.ch/monde/paris-resilie-commande-50-millions-vaccins?srsltid=AfmBOoroZZ1vKNcRoGvFGkixGeIWQhNcxd31_MuBgd-MaS7VxAHL10Yj

En pleine polémique suscitée par l'organisation des vaccinations et la découverte de gros surplus de vaccins, la ministre de la Santé française Roselyne Bachelot a annoncé résilier plus de la moitié des commandes prévues.

«Ces commandes n'avaient été ni livrées, ni payées, elles sont donc résiliées», a précisé la ministre, dans un entretien lundi sur TF1. «Les vaccins représentaient 712 millions d'euros, cela fait une économie de plus de la moitié», a dit Mme Bachelot.

Ce chiffre diffère du montant de 869 millions d'euros précédemment annoncé par le ministère de la Santé pour les commandes de vaccin, du fait d'un changement de TVA (de 19,6% à 5,5%) lié à l'autorisation de mise sur le marché, explique-t-on au cabinet de Mme Bachelot.

Un communiqué du ministère a précisé lundi soir que cette résiliation «unilatérale» avait un «motif d'intérêt général»: «il s'agit de tirer les conséquences» de la recommandation des autorités sanitaires internationales d'une vaccination en une seule dose au lieu de deux, intervenue en novembre.

Cette résiliation concerne GSK à hauteur de 32 millions de doses, Sanofi-Pasteur à hauteur de 11 millions de doses et Novartis à hauteur de 7 millions de doses. Des discussions sont menées «avec les industriels pour dénouer juridiquement les éléments résiliés des contrats passés sous le régime du code des marchés publics», ajoute le ministère de la santé.

Dans la perspective d'une pandémie mondiale redoutée par l'Organisation mondiale de la santé (OMS), la France avait commandé 94 millions de doses de vaccin auprès de GlaxoSmithKline (GSK, 50 millions de doses), Sanofi Pasteur (28 millions), Novartis (16 millions) et Baxter (50.000).

GlaxoSmithKline France et Sanofi Pasteur s'étaient déclarés prêts à examiner une éventuelle demande de renégociation du contrat avec le gouvernement.

Tollé à gauche et à droite

Les critiques à l'encontre du gouvernement, qui a confirmé dimanche avoir commencé à revendre des surplus de vaccins à des pays tiers, se sont multipliées lundi. Premier à porter le fer, le socialiste Jean-Marie Le Guen a réclamé dimanche une «mission d'information parlementaire». A droite, le député UMP Bernard Debré a vilipendé le «principe absurde, poussé à l'extrême, de précaution».

Pour sa part, la ministre s'est défendue d'en faire «trop ou pas assez». «Je le dis clairement, il faut pratiquer le principe de précaution», a-t-elle martelé lundi soir, évoquant la crise sanitaire du sang contaminé. «Cette grippe a tué 18 personnes ce week-end, en trois jours, en particulier des personnes qui n'avaient aucun facteur de risque», a souligné Mme Bachelot.

Selon elle, la vente des vaccins aux autres pays sera «marginale» au regard de la résiliation des commandes annoncée ce lundi.

Sur le total de 94 millions de doses, en plus des 50 millions résiliées, 9,4 millions ont été promises à l'OMS et 2 à 3 millions seront vendues, selon le ministère. Quelque 25 millions de doses resteraient ainsi disponibles pour la vaccination en France, selon le ministère.

Mme Bachelot a appelé à ne «pas relâcher la garde sur la vaccination», précisant que «la semaine prochaine les médecins généralistes volontaires pourront vacciner dans leur cabinet». La vaccination va également se poursuivre dans les centres de vaccination et doit «continuer jusqu'à septembre prochain», a déclaré la ministre. Mme Bachelot a souligné qu'avec 5 millions de vaccinés, la France avait «des chiffres parmi les meilleurs d'Europe».

French move fuels fears for flu vaccine sales

Reuters, 5 January 2010, 7:27 PM GMT+8
https://www.reuters.com/article/breakingviews/french-move-fuels-fears-for-flu-vaccine-sales-idUSLDE6040M7/

London/Paris, January 5 (Reuters) - France's decision to cancel over half the swine flu vaccines it ordered has increased concerns that manufacturers' revenues from the H1N1 pandemic will be lower than forecast.

Experts had initially anticipated that everyone would need two shots of vaccine for immunity against the H1N1 virus, but a single dose of vaccine is now deemed sufficient for adults.

That, combined with scepticism about the need for immunisation among the general population, has resulted in reduced demand for vaccines across Europe.

The French government said on Monday it aimed to cancel 50 million of the 94 million doses ordered from Sanofi-Aventis (SASY.PA), GlaxoSmithKline (GSK.L), Novartis (NOVN.VX) and Baxter International (BAX.N) because of over-supply. [ID:nnLDE6031W2]

A government spokesman said on Tuesday it had already cancelled 9 million doses from Sanofi Pasteur, the vaccines unit of Sanofi-Aventis, and was in talks about cancelling the remaining excess supply from other companies.

The decision follows similar moves last month by Germany, Spain and Switzerland to try and cut deliveries, return unwanted stocks to suppliers or sell them on to other countries, due to a low uptake at home. [ID:nLDE5BG1CU] [ID:nLDE5BH0X3]

Morgan Stanley analysts said the latest French cutbacks highlighted declining demand for H1N1 vaccines and translated into a modest near-term risk to earnings at Glaxo, Sanofi and Novartis.

"Longer term, the evident overcapacity with H1N1 should limit any multiple expansion related to income associated with pandemic flu," they added.

Shares in Glaxo were down 2.2 percent at 1310 pence while Sanofi's were down 1.6 percent at 55.82 euros by 1118 GMT. Novartis was down 1.7 percent at 54.10 Swiss francs, also hit by concerns over dilution following its offer to buy out minorities in eye care group Alcon (ACL.N) via a share swap.

Sales of H1N1 vaccines have been a windfall for drugmakers since mid-2009 as governments have built up stockpiles, with Glaxo expected to be the single biggest beneficiary with anticipated sales of some $3.5 billion by the end of the first quarter of 2010, according to industry analysts.

Sanofi and Novartis have been forecast to book around $1 billion and $600 million apiece.
The latest cancellations in Europe could trim those numbers, although there is still outstanding demand from other parts of the world.

A spokesman for Sanofi Pasteur said his company expected to replace the lost sales in France with other orders.

"We see additional orders from countries we were not in position to supply before," he said.

"We still see virus circulation going in many regions of the world. As it goes away from the north there will be strong reasons for governments in the south to have H1N1 vaccinations," the Sanofi Pasteur spokesman said. He declined to disclose the countries interested in Sanofi's vaccine.

Glaxo declined to comment on the commercial impact of the latest developments but a spokeswoman said the British group was in discussions with governments about orders. (Editing by Greg Mahlich)

GlaxoSmithKline slips after France cuts back on swine flu vaccine

The Guardian, 5 January 2010, 11:43 GMT
https://www.theguardian.com/business/marketforceslive/2010/jan/05/glaxosmithkline

The FTSE 100 may be on the rise again - up nearly 30 points at the moment - but GlaxoSmithKline is missing out on the rally.

Shares in the pharmaceutical group are down 28p at 1311.5p on concerns about the revenue prospects for its swine flu vaccine. This has been prompted by news yesterday that France has cancelled 50m doses of H1N1 vaccine from Glaxo and other suppliers, around half of the shots it had ordered. Traders said that the initial thought was that two shots per person would be needed, but now one may be sufficient.

The French move followed decisions by Spain, Germany and Switzerland last month to cut deliveries. Analysts are therefore becoming increasingly pessimistic about revenue and earnings prospects for the vaccine.

Schweinegrippe-Impfung in Frankreich: Bestellt und nicht abgeholt

Taz, 5 January 2010, 2:00 Uhr
https://taz.de/Schweinegrippe-Impfung-in-Frankreich/!5149995/

Die französische Gesundheitsministerin Bachelot möchte 50 von 94 Millionen Impfstoffen abbestellen. Kritiker werfen ihr massive Fehlplanung vor, die 2,2 Milliarden Euro gekostet hat.

PARIS taz | Gegen Polemik gibt es in Frankreich keinen Impfschutz. Gesundheitsministerin Roselyne Bachelot ist wegen ihrer Strategie zur Bekämpfung der Schweinegrippe massiv unter Beschuss geraten. Die weitgehend erfolglosen Versuche, die riesigen Überschüsse an unbenötigten Impfstoffen im Ausland zu verkaufen oder sonst an interessierte Staaten zu verschenken, sind für die Opposition der schlagende Beweis für das "Scheitern" der Gesundheitspolitik.

Die Sozialisten, aber auch die zur Regierungskoalition gehörende Zentrumspartei "Nouveau Centre", verlangen eine parlamentarische Untersuchungskommission, damit die Lehren aus dem "Fiasko" gezogen würden. Bereits jetzt kritisiert beispielsweise der sozialistische Abgeordnete Pierre Moscovici eine "maßlose Überreaktion": "Frankreich hat viel zu viel Impfstoffe gekauft, wovon in geradezu unverschämter Weise die Pharmaindustrie profitiert. Das hat mit mehr als zwei Milliarden Euro einen Preis für die öffentlichen Finanzen, die bereits in einer extrem schwierigen Lage sind."

Frankreich wollte die gesamte Bevölkerung von 65 Millionen Menschen impfen und dies, gemäß ursprünglicher Empfehlung der WHO, lieber zwei statt ein Mal. Nicht vorgesehen war, dass die Franzosen und Französinnen überhaupt wollten. Zudem klappte die zentralistische Organisation der Impfkampagne in speziellen Zentren sehr schlecht. Die meisten haben ihr amtliches "Aufgebot" bis heute nicht erhalten. Nur knapp fünf Millionen Personen wurden überhaupt geimpft.

Auch renommierte Mediziner, die meist von Beginn weg die Kampagne der Regierung in Frage gestellt hatten, machen jetzt Vorwürfe. Der frühere Minister und Klinikchef Bernard Debré sagte, Frankreich habe zehn Prozent der weltweit produzierten Impfstoffe und einen Drittel der Tamiflu-Antivirenmittel gehortet. Das sei "absurd" gewesen. Und schlimmer: Die Katastrophe mit enormen Überschüssen wäre vorzusehen gewesen.

Professor Marc Gentilini, Ex-Präsident des Roten Kreuzes Frankreich und Spezialist für Infektionskrankheiten, hatte ebenfalls die übertriebene Angstmacherei und die Impfung der ganzen Bevölkerung als "disproportioniert" kritisiert. Er rechnet vor, dass Frankreich mit geschätzten Ausgaben von 2,2 Milliarden Euro für die Schweinegrippe drei Mal mehr ausgebe als für das Fünfjahresprogramm der staatlichen Krebsbekämpfung. Für ihn handelt es sich darum um einen krassen Fall falsch gesetzter Prioritäten.

Dominique Paillé von der Regierungspartei UMP nimmt dagegen die Gesundheitsministerin Roselyne Bachelot in Schutz: "Was hätte man im gegenteiligen Fall gesagt, wenn die Regierung nicht genügend vorsichtig gewesen wäre?" Frühere Regierungen mussten sich wegen Skandalen mit

HIV-verseuchten Blutkonserven und krankheitserregenden Wachstumshormonen verantworten. Auch bei der Hitzewelle von 2003, der in Frankreich 15.000 Menschen zum Opfer fielen, waren die Behörden der mangelnden Vorbereitung beschuldigt worden.

Solche Vorwürfe wollte sich Ministerin Bachelot nicht gefallen lassen. Sie kann auch darauf verweisen, dass andere Länder wie Deutschland, Niederlande und die Schweiz vergleichbare Probleme haben und ihre überzähligen Impfungen zu verkaufen suchen. Um wenigstens Geld zu sparen, hat Bachelot angekündigt, sie mache kurzerhand die Bestellung von 50 Millionen "noch nicht gelieferten und nicht bezahlten" Dosen rückgängig.

Das französische Unternehmen Sanofi-Pasteur hatte sich bereit erklärt, über die noch ausstehenden Bestellungen zu "verhandeln". Einen einseitigen Vertragsbruch des französischen Staates werden die Impfstoffproduzenten aber kaum ohne finanzielle Kompensation hinnehmen.

EU governments seek to offload flu vaccines

EurActiv // Reuters, 5 January 2010.
https://web.archive.org/web/20100108102310/http://www.euractiv.com/en/health/eu-governments-seek-offload-flu-vaccines/article-188534

Governments in Western Europe are selling off surplus stocks of the H1N1 flu vaccine and cancelling orders for additional supplies amid low public demand. But the World Health Organisation is warning that flu transmission is still on the rise in Central and Eastern Europe.

Background:

Last June, the World Health Organisation (WHO) raised its flu pandemic alert level to phase six, marking the first full-scale global pandemic in 41 years. European governments put forward national response plans and prepared for an anticipated surge in cases as winter approached.

The European Health Agency Directorate predicted that 30% of Europeans would be infected with the H1N1 virus. Most people infected with the virus - which is sometimes referred to as swine flu or Mexican flu - make a full recovery, but deaths have been recorded on all continents.

Around 1,700 people have died in Europe as a result of being infected with H1N1. An estimated 28 million people have been vaccinated in Europe to date, using one of the three vaccines authorised by the European Medicines Agency (EMEA).

Initially, two doses of each vaccine were thought to be necessary, but it became clear during the autumn that a single dose would be sufficient.

EU health ministers agreed last October to work closely on sharing information and medical resources should the threat of the virus continue to grow.

France is looking to sell large volumes of surplus vaccine after ordering millions more doses than it needed. Germany hopes to row back on a large order of drugs placed during the early phase of the pandemic, while Spain wants drug companies to buy back its excess vaccine stocks.

A similar picture is emerging in the Netherlands and the UK, where demand has fallen well short of expectations, partly due to the relatively mild impact of the virus and partly due to public unease over mass vaccination.

Switzerland and Canada have also acknowledged that they have more vaccine available than necessary.

Experts say the winter peak has not brought the much-feared wave of infections and the response to national vaccination programmes has been sluggish.

Critics say authorities 'overreacted'

News that health ministers had vastly overestimated the demand for vaccines has prompted accusations that governments overreacted to the threat posed by the novel flu virus.

The French Health Ministry said it had originally bought 94 million individual vaccinations against the H1N1 virus from Sanofi-Pasteur, GlaxoSmithKline (GSK), Novartis and Baxter International at a cost of €870 million, on the basis that it would need to provide two doses of the vaccine for most of its population.

However, it emerged during the autumn that a single jab would be sufficient to provide immunity, leaving France with a massive oversupply of vaccines.

Some five million people in France have so far been vaccinated against H1N1, health officials say. The flu virus has killed an estimated 198 people on mainland France, according to data released on 29 December, but doctors have said new infections have fallen sharply in recent weeks.

Around 300,000 shots have already been sold by France to Qatar, while a further two million could be sold to Egypt later this month.

"We are in contact with other countries, notably Ukraine and Mexico," the health ministry in Paris said in a statement, without providing any financial details of the deal.

Vaccine oversupply creates buyer's market

When the first batch of vaccines arrived in Germany in November, news media reported that patients had to be turned away from clinics due to limited supplies.

The position had changed dramatically by the end of last month, however, when Germany announced that it wanted to sell millions of doses of vaccine, even though its order of 50 million vaccines will not be delivered in full until March.

Afghanistan and Central European countries are among those interested in snapping up the excess supplies – if the price is right.

Last week Bloomberg reported that Germany hoped to cancel 50% of the swine flu shots it ordered from GSK. The order of 50 million doses was based on the expectation that two shots per person would be required, which proved excessive, Deputy Health Minister Hartmut Schubert said. Germany will start negotiations with suppliers this week.

Spain is seeking to return unused vaccines to the manufacturers due to slow uptake. The Spanish government says its contracts with GSK, Novartis and Sanofi-Pasteur include clauses that allow it to return surplus vaccines if they prove to be unnecessary.

Ireland too has renegotiated a deal with Baxter pharmaceuticals in a bid to save up to €35 million. The Irish government had originally ordered 7.7 million doses of vaccine - enough to give double doses to each of the population. This order was split between GSK and Baxter at a total cos t of €88 million.

This means Ireland will not take delivery of 3.7 million doses of Baxter's Celvapan vaccine under a new deal which came into effect at the end of 2009.

The Netherlands has also announced plans to sell 19 million of the 34 million doses that it ordered now that single doses are considered to be sufficient. In Britain, a health ministry spokesman told press agency AFP on Sunday (3 January) that sales of the vaccine were also being considered.

Switzerland, whose total population is 7.7 million, ordered 13 million doses of the vaccine from GlaxoSmithKline and Novartis, while Canada is currently debating whether to sell excess stocks or to keep millions of doses in reserve. Canada expects to have around 20 million unused doses in April unless demand picks up significantly.

Virus spreading in parts of Europe

While the number of new cases of flu appears to have peaked in several Western European countries, neighbouring nations in Central and Eastern Europe are still grappling with the worst of the pandemic.

The most active areas of flu transmission include Greece, Poland, Bulgaria, Serbia, Ukraine and the Urals region of the Russian Federation, the WHO said in its weekly pandemic update.

According to the European Centre for Disease Prevention and Control (ECDC), just over 1,700 fatal cases of H1N1 influenza had been recorded in the EU and European Free Trade Association (EFTA) countries to date.

The European Medicines Agency (EMEA) said that while most deaths have been in Western Europe, there are increasing numbers of deaths being reported from Central and Eastern Europe.

"However, because of lack of laboratory confirmation and underreporting, among other factors, this is likely to be a gross underestimation of the true number of fatalities associated with the pandemic," it said.

At least 28 million people - including at least 218,000 pregnant women - have been vaccinated to date in Europe with one of the three centrally-authorised vaccines. The most frequent adverse reactions that have been reported are not serious, according to the EMEA.

THE IRISH TIMES

Order for swine flu vaccines cancelled

Irish Times, 6 January 2010, 00:00

https://web.archive.org/web/20160702072652/http://www.irishtimes.com/news/order-for-swine-flu-vaccines-cancelled-1.1265629

An order placed by the State for some 3.7 million doses of swine flu vaccine from the Baxter pharmaceutical company has been cancelled, the Health Service Executive has confirmed, writes.

It said the vaccines were no longer required now that experts agreed most people would only require one dose. It was originally envisaged two jabs would be required.

A spokeswoman said this would result in a saving of €25 million to €35 million.

Swine Flu Vaccine Closeout

Gazeta Wyborcza, 6 January 2010

http://wyborcza.pl/1,75248,7419254,Wyprzedaz_szczepionek_na_swinska_grype.html?utm_source=Nlt&utm_medium=Nlt&utm_campaign=2015058 (deleted)
https://web.archive.org/web/20100220012125/http://www.theflucase.com/index.php?option=com_content&view=article&id=2486%3Agermany-holland-switzerland-france-desperately-getting-rid-of-h1n1-vaccine-excess&catid=1%3Alatest-news&Itemid=64&lang=en

Germany, the Netherlands, Switzerland, France – European governments increasingly trying to sell influenza A/H1N1 vaccine, of which they bought too much.

The case evokes heated controversy among others on the Seine River. Disproportion between the number of vaccines purchased and consumed there is huge - 94 million doses purchased, 5 million used.

Did the government panicked? Wanted to quietly support the pharmaceutical companies? Or it only showed a caution against the danger, which seemed huge?

In autumn, when Polish authorities decided not to buy vaccines, media in Western Europe counted patients, predicted a huge number of cases, recommended not to kiss.

Authorities – not only because of public pressure, but under the influence of WHO recommendations – ordered a large quantity of vaccines. Queues formed, but the epidemic has proved weaker than expected, France, Germany, Britain ceased to turn up for the vaccine.

It also turned out that one dose will do, and not – as initially thought – two doses of vaccine. The governments are left with large amount of unused doses.

The authorities of the Netherlands, Germany and Switzerland already in autumn stated they would be willing to sell part of the vaccine. Considering it are also the British and Italians. After the New Year it turned out that a large number of vaccines is also to be sold in France, which spent 870 million euros for them. "The Ministry of Health turned for two months in a warehouse in which the A/H1N1 vaccines were overdosed.

Disproportion between the number ordered and used in vaccines must cause controversy" - writes "La Nouvelle Republique". "Sud-Ouest" strikes even harder, noting that Health Minister Roselyn Bachelot has worked in the pharmaceutical industry. "870 million hurriedly transferred to four big pharmaceutical companies can no longer be called carefulness, it is a plan to revive this branch of industry" - says this regional newspaper.

However according to the leftist "Libération" it was impossible not to make a maximum confronting an unknown virus A/H1N1. Newspaper criticizes rather chaotic way of distribution and that the French went for it.

One of the companies, Sanofi Pasteur, which accepted the order of half of the 94 million vaccines, ststed it is willing to rethink the contract, if the government so requests. Part of the vaccines has not yet been delivered.

Paris defends itself, saying authorities of Qatar and Egypt want to buy the vaccine, but this is a very small part of them. In France 200 people died of the swine flu, many times less than that every year die of ordinary flu. Worldwide virus killed more than 11.5 thousand people, mainly in the U.S. and Brazil.

Poland won't buy. Our government is not equipped himself for the vaccine because - as explained to the minister of health - no producer wanted to take responsibility for any possible side effects of the vaccine and its introduction into the pharmacy. So it can not be considered a safety product - said Min. Kopacz.

Now, when Western Europe is left with millions of vaccines, officials triumph. - Clogging of the vaccine is problem of their governments. You can see now that it is common sense and merit approach, which we presented in the Pandemic Committee. Swine flu virus is several times less virulent than the seasonal influenza virus and the infections wave dropped. I do not know why it led to a situation where everyone felt very vulnerable - v-ce Health Minister Adam Fronczak told us yesterday.

In early December, Citizen Rights Spokesman issued to the National Prosecutor to initiate a national inquiry into the lack of vaccine. Minister Ewa Kopacz was blamed to bring the epidemiological risks.

According to data of the Chief Sanitary Inspector, in the week of 16-22 December 2009 in Poland, there were nearly 39 thousand incidences of flu that is about 38 percent less than in the previous week. In Poland, there were 116 deaths among people infected with A/H1N1.

Government of Canada Gouvernement du Canada

Canada to Bridge Mexico's H1N1 Flu Vaccine Requirements

Gov. Canada, 6 January 2010

https://www.canada.ca/en/news/archive/2010/01/canada-bridge-mexico-h1n1-flu-vaccine-requirements.html

(Ottawa) – The Honourable Leona Aglukkaq, Minister of Health, on behalf of the Government of Canada, has announced it will be providing five million doses of H1N1 flu vaccine to Mexico to help bridge that country's immediate pandemic vaccine requirements. This is not a donation. Mexico will replenish Canada's H1N1 vaccine supply by March 31, 2010.

"We are privileged that we are in a position to support Mexico's pandemic response efforts," said Minister Aglukkaq. "The immediate response to Mexico's request by Canada's federal, provincial and territorial governments serves as testimony to the special relationship that exists between Canada and Mexico."

The Government of Mexico has placed orders for H1N1 flu vaccine with several manufacturers; however, the bulk of Mexico's order will only be available at the end of January 2010. Accordingly, the Mexican government has requested Canada provide five million doses of H1N1 flu vaccine GSK Canada is currently holding for provinces and territories. Initial shipments of the H1N1 flu vaccine to Mexico from Canada will begin during the first week of January.

Provincial and territorial governments unanimously agreed to the request. Canada already has distributed and has stockpiled enough vaccine in Canada to meet its immediate and ongoing needs, as well as to accommodate Mexico's request.

"The Public Health Agency of Canada has worked with Mexico since the beginning of the H1N1 outbreak, when our National Microbiology Laboratory in Winnipeg played a key role in identifying the novel H1N1 flu virus," said Dr. David Butler-Jones, Canada's Chief Public Health Officer. "Canada's provinces and territories have been instrumental in facilitating a quick response to Mexico's request. Canada's commitment to support global efforts to respond to H1N1 pandemic is possible through our ongoing collaboration with our provincial partners."

Canada lending H1N1 vaccine to Mexico

Globe and Mail, 6 January 2010, 11:45AM EST
https://web.archive.org/web/20100220012220/http://www.theglobeandmail.com/news/national/canada-lending-h1n1-vaccine-to-mexico/article1420935/?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed%3A+TheGlobeAndMail-HYPolitics+%28The+Globe+and+Mail+-+Politics+News%29

Canada is lending, not donating, five million doses of the H1N1 vaccine to Mexico – and the federal government remains mum on what it will do with its expected surplus of the pandemic drug.

As demand for the H1N1 shot drops and flu activity slows down, the country will be left with tens of millions of unclaimed doses. But even as other countries, such as Germany and Spain, look to sell their excess vaccine or scale back their orders, the federal government has kept a tight lid on its plans.

“We are reviewing our options to deal with any potential remaining H1N1 vaccine,” said Tim Vail, spokesman for Health Minister Leona Aglukkaq, adding that the government hopes to announce its decision shortly.

In the meantime, the government said yesterday that it will ship five million doses this week to Mexico, where the pandemic first surfaced. Manufacturers will only deliver the bulk of that country's order at the end of this month. Mexico will replenish Canada's supply by the end of March.

“Canada currently has enough H1N1 vaccine on hand to meet the needs of every Canadian who may need or want to be immunized and can accommodate this request,” Mr. Vail said in an e-mail.

The federal government ordered 50.4 million doses from pharmaceutical company GlaxoSmithKline when it was believed that each person needed two shots to be protected. But subsequent clinical trials determined only one dose would be needed to provide immunity.

About 24 million doses of vaccine have so far been shipped to provinces and territories, and, with the second wave over, demand has been waning. Roughly 45 per cent of Canadians have been vaccinated.

The federal government could choose to donate excess vaccine to the World Heath Organization, which is helping developing countries that can't afford to buy it. It can also keep some of the remaining vaccine in reserve in case the virus returns in the winter and a high-profile death, such as that of 13-year-old Evan Frustaglio, acts as a wake-up call for Canadians to get the shot. The vaccine has a shelf life of 18 months.

REUTERS

Canada sends 5 mln H1N1 vaccine doses to Mexico

Reuters, 7 January 2010, 3:06 AM GMT+8
https://www.reuters.com/article/economy/canada-sends-5-mln-h1n1-vaccine-doses-to-mexico-idUSN06148239/

Ottawa, Jan 6 (Reuters) - Canada is sending five million doses of the H1N1 vaccine to Mexico this week to help that country meet its immediate pandemic needs, Health Minister Leona Aglukkaq said on Wednesday.

Mexico will replenish Canada's supply by the end of March. By that time, its own orders for the vaccine from several manufacturers are expected to have been delivered.

"This is not a donation," the Public Health Agency of Canada said in a release.

"Canada already has distributed and has stockpiled enough vaccine in Canada to meet its immediate and ongoing needs, as well as to accommodate Mexico's request."

Canada, which has ordered 50.4 million doses from GlaxoSmithKline <GSK.L> for a population of 33.7 million, has immunized about a third of its population.

Last month, health officials said the number of deaths and hospitalizations in Canada from the flu were dropping, and provincial governments, which are responsible for immunization, have been closing down flu clinics.

At least 12,220 deaths from H1N1 flu had been formally confirmed around the globe as of Dec. 27, the World Health Organisation (WHO) has said.

It said that in North America -- the United States, Canada and Mexico -- transmission has been widespread but has declined substantially in all three countries. (Reporting by Louise Egan; editing by Peter Galloway)

Canada lends Mexico five million swine flu vaccine doses

Terra Daily, 6 January 2010
https://www.terradaily.com/reports/Canada_lends_Mexico_five_million_swine_flu_vaccine_doses_999.html

Ottawa (AFP) – Canada will provide Mexico with five million doses of the H1N1 flu vaccine to meet its immediate pandemic vaccine needs, Health Minister Leona Aglukkaq announced on Wednesday.

Mexico placed orders for the swine flu vaccine with several manufacturers, but most orders will be ready only at month's end, the Canadian minister said in a statement.

In the meantime, Ottawa is allowing Mexico to have five million doses of the medication, which had been reserved by pharmaceutical giant GlaxoSmithKline for Canada.

Mexico is expected to replenish the borrowed Canadian stock by the end of March, Aglukkaq said.

As of mid-December, nearly half of Canada's 33 million people had been vaccinated against the swine flu, in the largest immunization program in the country's history.

More than 400 Canadians died from the swine flu.

Länder hoffen auf Kulanz des Herstellers

Stern, 7 Januar 2010, 08:07 Uhr

https://www.google.com/search?client=firefox-b-e&q=%22L%C3%A4nder+als+auch+das+Unternehmen+seien+zum+Zeitpunkt+der%22

Dieses Geschäft hatte sich GlaxoSmithKline sicherlich ganz anders vorgestellt. Statt eines Runs auf den Schweinegrippe-Impfstoff sind die Länder auf dem Mittel sitzen geblieben. Nun hoffen sie auf eine kulante Haltung des Pharmakonzerns. Von heute an wird verhandelt.

Vor den Beratungen von Länder-Gesundheitsministerien zum überschüssigen Schweinegrippe-Impfstoff Pandemrix setzt das Land Niedersachsen auf Kulanz des Pharmakonzerns GlaxoSmithKline (GSK). Sowohl die Länder als auch das Unternehmen seien zum Zeitpunkt der Bestellung von einer zweimaligen Impfung ausgegangen, sagte die Vorsitzende der Gesundheitsministerkonferenz, Niedersachsens Ressortchefin Mechthild Ross-Luttmann (CDU), am Donnerstag dem Sender NDR Info. In Berlin kommen am Nachmittag auf Beamtenebene Vertreter der Länder-Gesundheitsministerien zusammen, um über das Problem der überschüssigen Schweinegrippe-Impfdosen zu beraten.

Niedersachsen setze auf eine Doppelstrategie, sagte Ross-Luttmann. Zum einen verhandele man darüber, nicht alle Dosen abnehmen zu müssen. Zum anderen sollen schon erhaltene Dosen an Länder verkauft werden, in denen noch Bedarf bestehe, zum Beispiel an den Iran oder das Kosovo. Nach Informationen von "Zeit online" gab es bereits erste Anfragen - etwa aus dem Iran, dem Kosovo, der Ukraine und der Türkei.

Länder wollen Bund in die Pflicht nehmen

Auch der Bund sei in der Verantwortung und müsse gemeinsam mit den Ländern diese Doppelstrategie verfolgen, forderte die niedersächsische Ministerin. Denn Pandemie-Vorsorge sei eine gesamtgesellschaftliche Aufgabe von Bund und Ländern. Ross-Luttmann: "Man darf auch nicht übersehen, dass der Bund uns immer sehr gedrängt hat, noch mehr Impfstoff zu bestellen, als wir tatsächlich bestellt haben."

Ziel der Länder sei es, am Ende nur die Kosten für Impfdosen für 30 Prozent der Bevölkerung übernehmen zu müssen, so Ross-Luttmann. "Wir haben jetzt Impfdosen für 60 Prozent der Bevölkerung - 60 Prozent werden sich niemals impfen lassen. Für mich ist ganz wichtig, dass wir zumindest schon mal zehn Prozent runter gehen können." Dies sei zwingend. Für die verbleibenden 20 Prozent forderte sie ein finanzielles Entgegenkommen des Pharmakonzerns: "Da erwarte ich ein Angebot von GSK." Der Pandemrix-Hersteller hat bisher Gesprächsbereitschaft signalisiert, aber auch darauf hingewiesen, dass die Produktion nicht sofort gestoppt werden könne und es gültige Verträge gebe.

Die Länder hatten 50 Millionen Dosen des Impfstoffes Pandemrix für 416,5 Millionen Euro geordert. Dies geschah jedoch noch in der Annahme, dass eine zweifache Impfung notwendig sei. Anfang Dezember hatte das Robert-Koch-Institut aber darauf hingewiesen, dass schon eine einmalige Impfung den nötigen Schutz sicherstelle. Nun könnten sogar 60 Prozent aller Menschen geimpft werden. Aufgrund der Impfmüdigkeit der Deutschen bleiben die Ländern aber auf einem Großteil ihrer Dosen sitzen.

THE FLU CASE

German Federal States Attempt to Wring Concessions from GSK over Unwanted Swine Flu Vaccines

The Flu Case, 7 January 2010, 13:21
https://web.archive.org/web/20100322233938/http://www.theflucase.com/index.php?option=com_content&view=article&id=2498%3Agerman-federal-states-attempt-to-wring-concessions-from-gsk-over-unwanted-swine-flu-vaccines&catid=1%3Alatest-news&Itemid=64&lang=en

Will 25 million surplus swine flu jabs in Germany end up on the rubbish dump? Asks Bild Zeitung as Germany's federal states meet GlaxoSmithKline representatives to renegotiate existing vaccine orders – ignoring the fact that these jabs are considered to be a biohazard material and cannot be disposed of so easily.

Bild details the feeble attempts by Germany federal state governments to extract minimal concessions from the pharmaceutical company GSK so that the German tax payer does not have to pay hundreds of millions of euros for the untested and useless jabs.

INDEPENDENT

Germany cancels part of GSK swine flu vaccine order

Independent, 8 January 2010
https://www.independent.co.uk/news/business/news/germany-cancels-part-of-gsk-swine-flu-vaccine-order-1861830.html

German health officials have cancelled part of its order of GlaxoSmithKline's swine flu vaccine, just three days after France indicated that it would also be paring back the number of doses it would be ordering.

Originally GSK's vaccine was designed as a two-dose treatment, although European regulators have since advised that one dose of the treatment is likely to be sufficient to guard against the effects of the virus. Other governments are also thought to be scaling back stocks after the number of expected cases of the illness has fallen well below expectations. A spokesperson for GSK confirmed that the group was in talks with other administrations seeking to renegotiate deals.

GSK has disclosed that it is charging clients based on a sliding scale, from €7 a dose for developed countries, down to providing the World Health Organisation with 50m free doses. It has refused however, to give details of individual agreements.

German officials praised GSK , saying that renegotiations had been conducted on friendly terms: "From the drugs group GSK, we have had signals of goodwill on cancelling a large part of the excess vaccine supply," said Mechthild Ross-Luttmann, who chaired a meeting of German state and federal government officials on the issue. GSK said that the German authorities had not given it permission to disclose the number of cancelled doses.

The company, Europe's biggest drug maker, also denied reports from earlier in the week that France had also cancelled orders. Health minister Roselyne Bachelot told French television on Monday that, "I have cancelled 50 million doses. These orders had not been paid for or delivered so they are cancelled".

GSK insisted that talks with French officials were ongoing. France, which originally said it would need some 94 million doses of the vaccine, ordered the treatment from GSK, Sanofi-Pasteur, Novartis and Baxter.

Separately, the chairman of the influential health committee of the Parliamentary Assembly of the Council of Europe, Wolfgang Wodarg has called on the organisation to debate the role of the major drugs companies in the WHO's swine flue campaign.

The WHO's "false pandemic" flu campaign is, "one of the greatest medicine scandals of the century," Dr Wodarg has said. The WHO has recently reaffirmed its stance that the pandemic is not over, and is still dangerous for those that contract the virus. Nonetheless, the number of swine flu deaths is dramatically lower than initially anticipated.

The Telegraph

Swine flu: Ministers 'preparing to offload millions of unwanted vaccines'

The Telegraph.UK, 9 January 2010, 8:00 AM GMT
https://web.archive.org/web/20100112081816/http://www.telegraph.co.uk/health/swine-flu/6952793/Swine-flu-Ministers-preparing-to-offload-millions-of-unwanted-vaccines.html

Ministers are preparing to offload millions of unwanted swine flu vaccines, it has emerged, as officials predicted that there will be no third wave of the pandemic this winter.

Millions of pounds could be wasted if the Government is unable to get out of orders for the vaccine it has placed with GlaxoSmithKline (GSK), the pharmaceutical giant.

Officials confirmed that they are considering a number of options, including attempting to sell or give away millions of the vaccines.

They also considering whether to stand down the National Pandemic Flu Service, the network of call centres which diagnose swine flu and hand out antiviral medications.

Fewer than 5,000 people in Britain are thought to have contracted swine flu in the last week, and the numbers in intensive care are falling, although there has been a rise in those aged over 65.

In May, even before a pandemic had been declared, ministers had signed contracts thought to be worth around £100 million to deliver 90 million vaccines to Britain.

Britain has now received almost 29 million doses of the H1N1 vaccine, but only just over 3.7 million have been given out and in total the Government has announced plans to inoculate only 14 million people.

The Government is considering exercising a break clause in its contract with Baxter, the pharmaceutical company, which supplies one of two vaccines used in the NHS.

There is no such clause in the GSK contract but ministers are currently in discussions with the company about future supplies.

But Prof David Salisbury, the Department of Health's director of immunisation, admitted that that still left the problem of vaccines which had already been delivered.

"There are a number of options open to us," he said. "These include selling vaccines or giving them away.”

Officials are also considering keeping one part of the vaccine, to form the basis of a future pandemic virus jab.

But Prof Salisbury insisted that the Government would keep a stock of the H1N1 vaccines in case the virus returned.

"If there were a UK resurgence during 2010 we would look very foolish if we had disposed of a valuable stockpile," he said.

He refused to give further details of discussions with manufacturers or of how much money might have been wasted, insisting that that was a matter of "commercial confidentiality".

Prof Sir Liam Donaldson, the Chief Medical Officer, who at one point predicted that up to 64,000 people could die from swine flu this winter, insisted that when the contracts were signed much of the news surrounding the pandemic suggested it was extremely dangerous.

"The information coming out at the time that the contracts had to be signed was from Mexico and was very alarming," he said.

He added that predictions now suggested there would be no third wave of the swine flu virus this winter.

He said: "At the moment the modellers in this country … don't think there will be a third wave following Christmas."

A number of other countries including France have already announced plans to sell off their surplus vaccines.

Angus Nicoll, a flu specialist at the European Centre for Disease Prevention and Control (ECDC), said: "All of the vaccination programmes were built on two shots and the good news is that ... we only need one shot to get us protected. So, there is a natural excess there.

"I would not say any country over-ordered because they were ordering on a basis of being cautious to a pandemic that could have been considerably worse."

Newly revised figures show that 360 people across Britain have died after contracting swine flu since April.

Europa brændt inde med H1N1-vacciner for milliarder
Europe is Left with Billions worth of Swine Flu Jabs

9 Januar 2010, 19:25
http://www.berlingske.dk/verden/europa-braendt-inde-med-h1n1-vacciner-milliarder
https://web.archive.org/web/20100111225500/http://www.berlingske.dk/verden/europa-braendt-inde-med-h1n1-vacciner-milliarder

En af århundredets største medicinskandaler, siger formandenfor Europarådets sundshedsudvalg.

PARIS: Der bliver aldrig brug for langt størstedelen af de vacciner mod svineinfluenza, som europæiske lande har brugt milliarder på at indkøbe og oplagre. Det erkendte Frankrig, Tyskland og Storbritannien i denne uge og går dermed i Spaniens fodspor, der allerede har forsøgt at afbestille - eller endda tilbagelevere - millioner af vaccinedoser.

Det var den franske sundhedsminister, Roselyne Bachelot, der åbnede ballet mandag aften, hvor hun i et interview på landets største TV-kanal TF1 erklærede, at hun har afbestilt 50 ud af 94 millioner doser.

Torsdag fulgte tyske delstater trop og erklærede, at man kun ønsker halvdelen af de bestilte 50 millioner doser, hvorefter chefen for det britiske immunisationsprogram David Salisbury fredag annoncerede, at man »lige nu« genforhandler leverancen.

»Absurd at købe to doser«

Der er dog kun i de færreste kontrakter nedfældet afbestillingsklausuler, og europæiske skatteydere risikerer derfor at skulle betale alligevel - også for det store flertal af doser, der ikke er leveret. »Sanofi-Pasteur har fortalt os, at ordren på ni millioner doser simpelthen var annulleret uden nogen erstatningsbetaling,« præciserede Bachelot dog. Det vides ikke hvordan de øvrige producenter stiller sig, men avisen Le Figaro hæfter sig ved, at selv om den franske stat ikke juridisk har ret til kvit og frit at annullere ordrerne, kan man indirekte presse selskaberne, da det er myndighederne der godkender og prisfastsætter deres produkter.

Navnlig i Frankrig, hvor man stort set købte vacciner nok til at give alle to doser, står myndighederne for skud fra uafhængige eksperter, ligesom oppositionen taler om en »ekstravagant fiasko«.

»At købe to doser af vaccinen per person er absurd,« lød det sågar fra et folkevalgt medlem af det borgerlige regeringsparti, lægen Bernard Débre, på radioen.

»Udgifterne er højere end underskuddet for alle franske hospitaler. Det er tre gange udgiften til statens anti-cancer-plan.«

Kun knap fem millioner franskmænd har ladet sig vaccinere, og alligevel har svineinfluenzaen blot kostet 224 franskmænd livet, mens sæsoninfluenzaen årligt kræver 2.000-6.000 dødsofre.

Hemmelige eksperter

Kritikken er ikke blevet mindre af, at kliniske undersøgelser godkendt af europæiske sundhedsmyndigheder i november konkluderede, at der reelt ikke var behov for mere end ét skud per person. Alligevel beretter medicinalselskaberne, at eksempelvis Frankrig først denne uge bad dem regulere leverancen.

Mistanken om inkompetence eller urent trav retter sig dog i høj grad også mod verdenssundhedsorganisationen WHO, der i juni erklærede pandemi og dermed mangedoblede efterspørgslen efter vacciner. Samtidig neddroslede man kriterierne for, hvad der kan kaldes en pandemi.

Formanden for Europarådets sundhedsudvalg, Wolfgang Wodarg, kalder håndteringen af sagen for »en af århundredets største medicinalskandaler« og hæfter sig ved, at WHO ikke vil oplyse hvem der sidder i det ekspertudvalg, der traf beslutningen.

Men andre WHO-udvalg er spækket med eksperter, der direkte eller indirekte arbejder for medicinalindustrien, ligesom eksempelvis den franske sundhedsminister ifølge ugeavisen »Den Lænkede And« rådgives af eksperter med arbejde hos selskaberne.

Vaccins résiliés:
la contrepartie de l'Etat vis-à-vis des labos

TFI News, 9 janvier 2010, 15h22
https://web.archive.org/web/20100110203813/http://lci.tf1.fr/science/sante/2010-01/vaccins-resilies-la-contrepartie-de-l-etat-vis-a-vis-des-labos-5630658.html

Plutôt que de verser des compensations aux laboratoires pour les annulations de commandes de vaccins anti-grippe A, l'Etat s'engagerait, selon le JDD, à leur acheter des vaccins lors de futures épidémies "en versant dès aujourd'hui des arrhes".

Sept Français sur dix estiment que le gouvernement a surestimé la dangerosité du virus et commandé trop de vaccins contre la grippe A (H1N1), selon un sondage Ifop pour Sud-Ouest Dimanche. Ils sont 31% à estimer au contraire "qu'en vertu du principe de précaution, il a eu raison d'en commander une aussi grande quantité". Ceci étant, l'heure n'est quasiment plus à cette polémique, mais à la question de comment dédommager les laboratoires. Selon le Journal du dimanche de samedi, l'Etat aurait choisi de s'engager à acheter des vaccins aux laboratoires lors de futures épidémies, en échange d'un renoncement de ces derniers à des compensations pour les annulations de commandes de vaccins contre la grippe A.

French Government keeps Vaccine option for "Future" Pandemics

The Flu Case, 11 January 2010, 16:51
https://web.archive.org/web/20100220012323/http://www.theflucase.com/index.php?option=com_content&view=article&id=2523%3Afrench-government-keeps-vaccine-option-for-qfutureq-pandemics&catid=1%3Alatest-news&Itemid=64&lang=en

The French Government has agreed to put down a "deposit" for vaccines for future pandemics rather than pay compensation to pharma companies for cancelling vaccine orders, according to TF1.

It is not clear what this deal consists of. However, it appears the French government is holding on to its existing contract with vaccine manufacturers to produce pandemic vaccines in the future.

OZARKS FIRST.com

U.S. Considers Cancelling H1N1 Vaccine Orders

Ozarks First, 10 January 2010, 18:18
http://ozarksfirst.com/content/fulltext/?cid=223541 (deleted)
https://web.archive.org/web/20100220012247/http://www.theflucase.com/index.php?option=com_content&view=article&id=2513%3Aus-considers-cancelling-h1n1-vaccine-orders&catid=1%3Alatest-news&Itemid=64&lang=en

(Washington, DC) - No decision has been by U.S. health officials on whether to cancel or sell its orders for the H1N1 flu vaccine.

An official with the Centers for Disease Control and Prevention says demand for the vaccine is steady and the focus remains on mass immunizations.

The U.S. currently has contracts for 251-million doses of bulk vaccine from five pharmaceutical companies.

As the U.S. mulls over its decision to cancel orders, Germany has arrived at the decision to do so.

Officials there are planning to cancel half of the 50-million orders for the H1N1 vaccine from GlaxoSmithKline.

Doctors in Germany had initially thought two doses of the vaccine would be needed to stave off flu.

Meantime, France has already placed a stop on over half it orders.

Länder ein Drittel weniger Schweinegrippe-Impfstoff abnehmen

Bild, 11 Januar 2010, 19:23 Uhr
https://www.bild.de/politik/2010/laender-muessen-ein-drittel-weniger-impfstoff-bezahlen-11077894.bild.html?t_ref=https%3A%2F%2Fwww.google.com%2F

Die Bundesländer müssen der Pharmaindustrie nur rund 34 Millionen Impfdosen gegen die Schweinegrippe abnehmen. Das ist rund ein Drittel weniger, als ursprünglich vereinbart.

Dadurch sparen die Länder nach BILD-Informationen rund 133 Millionen Euro. Bund und Länder hatten sich am vergangenen Donnerstag mit dem Pharmakonzern Glaxo Smith Kline (GSK) auf eine Reduzierung der Schweinegrippe-Impfdosen geeinigt.

Das niedersächsische Gesundheitsministerium, das den Vorsitz der Gesundheitskonferenz hat, wollte die Zahlen zunächst nicht bestätigen. Ein Ministeriumssprecher verwies in Hannover darauf, dass die Länderkabinette dem Verhandlungsergebnis noch zustimmen müssten.

Die offiziellen Zahlen zu den Impfdosen und dem Impfstoff-Verbrauch sollten am Dienstagnachmittag auf einer Pressekonferenz in Hannover vorgelegt werden.

Die Länder hatten bei dem Pharmaunternehmen ursprünglich 50 Millionen Impfdosen gegen die Schweinegrippe bestellt. Sie wollten diese Menge aber nicht mehr abnehmen, weil – anders als zunächst angenommen – eine einmalige Impfung reicht.

Bei der Bestellung der 50 Millionen Impfdosen im Herbst waren Experten noch davon ausgegangen, dass eine Zweifach-Impfung nötig sei.

Zudem ließen sich bislang weniger Menschen als erwartet impfen. Die Länder fürchten deshalb, auf Impfdosen und damit auf hohen Kosten sitzen zu bleiben. Sie drängen daher auch auf den Verkauf überschüssiger Impfdosen ins Ausland.

German States to keep 34 Million Swine Flu Jabs

The Flu Case, 11 January 2010, 16:47
https://web.archive.org/web/20100220012318/http://www.theflucase.com/index.php?option=com_content&view=article&id=2522%3Agerman-states-to-keep-34-million-swine-flu-jabs&catid=1%3Alatest-news&Itemid=64&lang=en

The German federal states will have to keep 34 million jabs of the untested and toxic swine flu vaccine under a deal reached on Thursday with GlaxoSmithKline according to Bild newspaper.

Isn't it time for the police to start to investigate these extraordinary contracts and the officials who are agree to hand over 100s of millions of taxpayers money to pharma companies for unwanted jabs that should never have been purchased in the first place?

Sanofi says no change in its H1N1 U.S. contracts

Reuters, 12 January 2010, 12:39 am EST
http://www.reuters.com/article/idUSLDE60A20320100111

London, Jan 11 (Reuters) – Sanofi-Aventis (SASY.PA) is meeting all its U.S. contracts for sales of swine flu vaccine, despite Washington's decision to cut supplies from rival drugmaker CSL (CSL.AX), a company spokesman said on Monday.

"We are fulfilling all our contracts with the U.S. government, so there is no change," said Pascal Barollier at the French group's vaccine unit Sanofi Pasteur.

Sanofi is the leading supplier of flu vaccine to the U.S. market.

Earlier, Australian company CSL said its order for vaccine from the United States had been cut in half in the latest example of governments around the world cancelling orders in the face of low demand. [ID:nSGE60A0DK]

Different manufacturers have different contracts with governments. Some contain break clauses allowing customers to reduce the size of orders. (Reporting by Ben Hirschler; Editing by Dan Lalor)

GSK says it will cut Germany's swine flu vaccines order

Terra Daily, 12 January 2010.
https://www.terradaily.com/reports/Swine_Flu_Vaccine_Cut_As_WHO_Faces_Questions_999.html

London (AFP) Jan 12, 2010 - British drug maker GlaxoSmithKline said Tuesday it had agreed to cut the amount of swine flu vaccines that had been ordered by Germany. "Today, GSK confirmed that it has reached an agreement with the German Ministry of Health to amend its existing contract to receive approximately 70 percent of the ordered vaccine, equivalent to 34 million doses," the group said in a statement to the London Stock Exchange. The pharmaceuticals giant added that it was in ongoing discussions with other nations regarding its pandemic H1N1 vaccine. "Following declaration of the pandemic by the World Health Organization in June 2009, GSK has been working closely with governments to respond to their changing needs as understanding of the H1N1 pandemic has increased," it said.

"The company is currently in ongoing discussions with a number of governments regarding their specific pandemic planning needs, including governments who are changing their planned immunisation programmes." GSK added that many countries were amending their vaccine orders because one dose appeared to be sufficient to give a strong immune response. "At the start of the pandemic and based on previous experience, immunisation programmes were expected to consist of two doses of vaccine," the firm said. "However, data from subsequent clinical trials demonstrating a strong immune response from one dose of the vaccine, have resulted in some public health authorities adapting their recommendations for immunisation. It added: "The clinical trial programme for H1N1 vaccines is ongoing and data continues to be made available."

Serbia puts swine flu vaccine purchase on hold

Terra Daily, 12 January 2010.
https://www.terradaily.com/reports/Swine_Flu_Vaccine_Cut_As_WHO_Faces_Questions_999.html

Belgrade (AFP) Jan 12, 2010 – Serbia decided on Tuesday to put on hold further purchases of swine flu vaccines from Swiss Novartis due to low interest among the people to the government's vaccination programme, a minister said. "Upon expertise by health authorities, the government has recommended the further purchase of vaccines to be put on hold," Health Minister Tomica Milosavljevic told Serbian state television RTS. Serbia has already purchased more than 850,000 doses of A(H1N1) vaccines, with plans to buy a total of three million doses. But so far, only about 130,000 people have been inoculated since the start of the campaign on December 17, Milosavljevic said.

However, he insisted that the mass vaccination would continue in the country where 68 people have so far died of the flu. "We hope that the response (among people) will be higher and there are enough doses of vaccines in stock until mid-February," when health authorities will again reconsider further purchases, Milosavljevic said. Health officials said they had confirmed 671 cases of the A(H1N1) virus so far, but added the true number could be far higher as not all patients were tested for the disease. Some 384 people are hospitalised with severe flu-like symptoms. Serbia, which has a population of 7.5 million, declared a swine flu epidemic on November 11.

European Governments Cancel Vaccine Orders

The Wall Street Journal, 13 January 2010, 5:48 am ET
https://www.wsj.com/articles/SB126335633266727463
https://web.archive.org/web/20210124230315/https://www.wsj.com/articles/SB126335633266727463

Just months after rushing to order enough swine-flu vaccine to protect their citizens, European governments are cancelling orders and trying to sell or give away extra doses as they sit on a glut of the vaccine.

The main reason: European health officials decided that only one shot per person was needed, instead of the two originally planned. Low demand is also to blame. Many Europeans believe the pandemic has turned out to be fairly mild, and don't see a reason to get vaccinated. Some are also concerned that they will suffer side effects from the shots, despite assurances otherwise from global health officials.

French Health Minister Roselyne Bachelot gets an H1N1 flu shot in Paris in November.
Amid a glut of the vaccine, France, which had ordered 94 million doses,
is seeking to cancel 50 million of them. European Pressphoto Agency

"The population is not running to get the vaccination," says Roland Jopp, a spokesman for Germany's health ministry.

Declining interest in the shots could be bad news for vaccine makers, particularly if countries demand their money back for supplies already delivered. Companies may be able to sell the shots elsewhere, however. Most vaccine makers, including GlaxoSmithKline PLC, Sanofi-Aventis SA, Novartis AG and Baxter International Inc. BAX -0.62% , have been expecting a large sales bump from H1N1 vaccine.

In October, analysts estimated that Glaxo would ring up an extra £1 billion ($1.62 billion) of fourth-quarter sales thanks to the vaccine. Novartis has forecast H1N1 sales of $400 million to $700 million for that period.

But some countries are now canceling orders. Germany on Tuesday said it canceled 30% of the 50 million doses it had ordered from Glaxo, which it said would save the country €133.3 million ($194 million). Mr. Jopp of the German health ministry said the main reason for the cancellation is that only one shot is needed per person.

France, which had ordered 94 million doses from four companies, is seeking to cancel 50 million of those doses, according to its health ministry. The U.K., Switzerland, the Netherlands and Spain also say they are seeking to trim their orders, or to sell already delivered doses to other countries.

In the U.S., where vaccine supplies are now ample after an earlier shortage, a top health official last week said the country is focused on vaccinating as many people as possible, and has made no decision about canceling vaccine orders or selling supplies.

Mr. Jopp said Germany still aims to vaccinate one-third of its population, which would cover all groups who are at greater risk for suffering bad infections—including pregnant women, young children and people with asthma. So far, though, only about 10% of the population has stepped forward to be vaccinated, he said.

Some health officials say the public's lack of interest reflects the thought that the outbreak is milder than many people expected. Last week, the World Health Organization said that rates of "influenza-like illness" have declined substantially in Western Europe in recent weeks, though it added that there was still "intense virus circulation" in parts of Central, Eastern and Southeastern Europe.

When France began vaccinating people in November, the government opened makeshift vaccination centers in basketball arenas and meeting halls. People at first rushed to get vaccinated, even lining up in the cold. After a few weeks, however, the public's concern ebbed, leaving most vaccination centers idle and the government facing criticism that it overreacted to the threat.

French President Nicolas Sarkozy on Tuesday defended the government's planning. "I will always prefer to be too prudent when it comes to people's health than not enough," he said in a speech to doctors and nurses.

France initially focused on vaccinating high-risk groups, but has since made vaccine available to the entire population. Still, as of Jan. 10, only about 8% of France's population of 65 million had been vaccinated, according to health officials.

Swiss authorities have run television and Internet ads to promote vaccination, helping convince about 15% to 20% of the population to get vaccinated— about the same number that would during the regular flu season most years, a spokesman for the Swiss health ministry said.

In an emailed reply to questions, a WHO spokeswoman declined to comment on countries' attempts to cancel their vaccine orders. She said: "It is premature to consider the pandemic as completed, and there is still immense value in the H1N1 immunization."

Glaxo said it is "working closely with governments to respond to their changing needs." Novartis said it "will evaluate government requests on a case-by-case basis within the framework of the contractual agreements, which are considered binding."

A Baxter spokeswoman said its "have always included provisions allowing the contract holder to adjust its vaccine supply requirements based on its evolving pandemic needs." All three companies declined to comment on how cancellations might affect sales.

A Sanofi spokesman said the company doesn't yet anticipate any significant changes in revenue due to vaccine cancellations.

Nations scrap orders for GSK swine flu jab
British drugs company renegotiates H1N1 deals with 'many governments'

Independent, 16 January 2010, 01:00 GMT
https://www.independent.co.uk/news/business/news/nations-scrap-orders-for-gsk-swine-flu-jab-1869653.html

The British pharmaceuticals giant GlaxoSmithKline has confirmed it is in talks with several countries keen to reduce their orders of its swine flu vaccine Pandemrix. The Belgian government yesterday became the latest to tell the company that it was paring back its requirement.

The health ministry in Brussels said it would be cutting its order by about €33m (£29m) after initially asking for 12.6 million doses of Pandemrix. The cancellation comes after a host of countries in the northern hemisphere told the pharmaceuticals industry that there was insufficient demand for the treatment. Britain, France, Germany, Spain and the US have all indicated in the past two weeks that they will be renegotiating their deals.

Demand for vaccines to combat H1N1 influenza has fizzled out because the pandemic has proven to be less aggressive than was first feared. Regulators who initially indicated that two vaccinations would be needed by each swine flu patient now say that one dose is sufficient. Analysts predict that European governments could return or cancel up to 50 per cent of what they ordered, which could reduce GSK's income from Pandemrix by £300m.

Andrew Witty, the chief executive of GSK, said in October that forecasts for about £1bn in sales of Pandemrix in the fourth quarter were "pretty close to being right". However, since he made his remarks a number of analysts have lowered the estimates. Credit Suisse, for example, cut its forecasts for GSK's 2009 and 2010 sales by $800m.

GSK issued a statement yesterday, saying it shipped 130 million doses of Pandemrix, worth £835m, in the final three months of last year. "Shipments of the vaccine continue to be delivered in the first half of 2010 and GSK is in ongoing discussions with many governments as their needs evolve," the company added. "This includes renegotiation of contracts with governments who have announced changes to their planned immunisation programmes, and with governments who have placed new orders for the pandemic vaccine. It is therefore too early to say what the final number of doses supplied and the value of these orders will be."

GSK pointed out that while sales in the northern hemisphere would be hit, countries in the southern hemisphere had yet to reach peak swine flu season. Drugs that were originally earmarked for countries such as Britain and Germany this winter could be re-routed elsewhere in the coming months.

Yet this could still be costly for GSK. Countries south of the equator are generally thought to be paying less for the vaccine. The company has disclosed that it charges clients on a sliding scale, from €7 a dose for developed countries, to providing the World Health Organisation with 60 million vaccines for free.

Earlier this week, GSK confirmed that German health officials had cancelled 30 per cent of its Pandemrix order, trimming it to 34 million doses. Meanwhile, the French health minister, Roselyne Bachelot, told French television last week: "I have cancelled 50 million doses. These orders had not been paid for or delivered so they are cancelled."

GSK insists that talks with France are ongoing. Ms Bachelot's ministry originally said it would need 94 million vaccines and ordered them from GSK, Sanofi-Pasteur, Baxter and Novartis. Baxter, along with GSK, has a contract to supply swine flu vaccine in the UK.

News of more cancelled vaccine orders came as the WHO hit back at claims that its H1N1 forecasts had been unduly influenced by the big drugs companies. Keiji Fukuda, the WHO director-general's special adviser on pandemic influenza, said yesterday: "The world is going through a real pandemic ... the description of it as a fake is both wrong and irresponsible".

His comments followed a claim by Wolfgang Wodarg, the chairman of the Council of Europe's health committee, that global drugs companies had influenced the WHO's assessment of the dangers of the H1N1 virus, calling the outbreak a "false pandemic"

Mr Wodarg said the WHO's campaign was "one of the greatest medicine scandals of the century".

GSK also issued a robust rebuttal of Mr Wodarg's comments yesterday, saying: "Allegations of undue influence are misguided and unfounded. The WHO declared that H1N1 swine flu met the criteria for a pandemic.

"Responding to it has required unprecedented collaboration. As WHO have stated, legal regulations and numerous safeguards are in place to manage possible conflicts of interest."

RIANOVOSTI

Greece cancels order for swine flu vaccine

RIA Novosti, Athens, 19 January 2010, 02:35

https://web.archive.org/web/20100122123538/http://en.rian.ru/world/20100119/157606062.html

Greece has canceled the remaining order for about 8 million batches of the vaccine against the deadly swine flu, local media said citing the government sources.

Greece has previously ordered over 11 mln batches to vaccinate its entire population, and has received 3.6 mln batches, worth 25 mln euro ($36 mln) from that order.

"The state will pay only for vaccines which have been received so far," local TV quoted Health Minister Mariliza Xenogiannakopoulou as saying on Monday.

The minister said the vaccination against the A/H1N1 virus had not been popular among the Greek citizens. Only about 360,000 Greeks have voluntarily received the vaccination up till now, and it is questionable if all the received vaccines would be used until their expiration in 2011.

According to official data, up to 96 people have died so far in Greece from the swine flu and its complications.

The World Health Organization (WHO) reported late in December 2009 that the death toll from the swine flu outbreak had reached 11,516 worldwide.

The number of infections continues to rise in some areas of central and eastern Europe, as well as in western, southern and central Asia, which were hit by the virus outbreak later than other parts of the world, the organization said.

WHO had earlier suspended publishing weekly reports on the spread of swine flu after some countries refused to report each infection.

Greece halts purchases of H1N1 flu vaccines

Reuters, 19 January 2010, 7:56 PM GMT+8
http://www.reuters.com/article/idUSLDE60I0RI20100119
https://web.archive.org/web/20100123031951/https://www.reuters.com/article/idUSLDE60I0RI20100119/

ATHENS, Jan 19 (Reuters) - Greece cancelled orders for more than 12 million doses of swine flu vaccine to reduce costs, as it struggles with soaring budget deficits, the country's health minister said.

Greece is well stocked for its 11-million population after receiving 3.7 million doses, Health Minister Marilisa Xenogiannakopoulou said late on Monday.

The Mediterranean country, which sees about 15 million tourists every year, has attributed nearly 100 deaths to the virus. About 360,000 people have been vaccinated so far, according to government figures.

"At a time of financial hardship and efforts to economise, it is important to save up funds," Xenogiannakopoulou said.

Cutting health and hospital costs are key in the Greek government's drive to tidy up public finances after the budget deficit soared to 12.7 percent of GDP last year.

Greece's previous conservative government had earmarked 40 million euros ($57.59 million) to buy 16 million doses of vaccine from Novartis (NOVN.VX), Glaxo (GSK.L) and Sanofi (SASY.PA).

Several governments have started cutting orders for the vaccine because the pandemic has not turned out to be as deadly as originally feared and most people need only one dose, not two, to be fully protected [LDE6070ML]. (Reporting by Harry Papachristou; Editing by Rupert Winchester)

Contract with 'Novartis' for purchase of vaccines cancelled

Blic, 27 January 2010, 08:30 h

https://web.archive.org/web/20100129101729/http://english.blic.rs/Society/5920/Contract-with-Novartis-for-purchase-of-vaccines-cancelled

Serbia has officially cancelled contract for purchase of vaccines against the new flu with the Swiss manufacturer 'Novartis', 'Blic' learns unofficially. On the other hand 'Novartis' yesterday warned governments not to cancel already placed orders since next time when some other pandemic occurs 'the reliable countries shall have priority'.

According to Svetlana Vukajlovic, Director of the Republican institute for healthcare (RZZO) the contract was cancelled as early as on December 12 after decision by Serbia Government. However, it is not clear if we shall have to pay penalties for cancellation of the contract.

The importer 'Jugohemija' claims, however that the contract is still in force but that they shall support every agreement reached in negotiations between the Government and the supplier.

NZZ

900'000 Dosen Schweinegrippe-Impfstoff nach Iran

NZZ, 28 January 2010, 16:47
https://web.archive.org/web/20110319184633/http://www.nzz.ch/nachrichten/politik/schweiz/900000_dosen_impfstoff_von_der_schweiz_nach_iran_1.4676520.html?printview=true

Schweiz lagert Teil der ursprünglich 13 Millionen gekauften Impfungen ein
Der Iran erhält von der Schweiz 900'000 Dosen des Schweinegrippe-Impfstoffes Celtura. 750'000 Dosen werden verkauft. Weitere 150'000 Portionen erhält das Land als Spende geschenkt, wie das Bundesamt für Gesundheit mitteilte. ...

Der Iran erhält von der Schweiz 900'000 Dosen des Schweinegrippe-Impfstoffes Celtura. 750'000 Dosen werden verkauft. Weitere 150'000 Portionen erhält das Land als Spende geschenkt, wie das Bundesamt für Gesundheit am Donnerstag mitteilte.

(sda) Nachdem sich herausgestellt hatte, dass es für den Schutz vor H1N1 nicht bei allen Menschen zwei Impfdosen braucht, beschloss der Bundesrat, bis zu 4,5 Mio. Dosen ins Ausland abzugeben. Ob weitere Impfdosen das Land verlassen, hängt laut dem BAG-Sprecher davon ab, ob die Haltbarkeit verlängert werden kann.

Der Iran erhält vorläufig insgesamt 360'000 Dosen Celtura. Der Impfstoff ist vorläufig sechs Monate lang haltbar. Novartis als Herstellerin strebt eine Verlängerung um zwei Mal drei Monaten an. Davon hängt es ab, ob auch die übrigen 540'000 Dosen in den Iran geliefert werden können.

Impfstoff geschenkt erhält auch die Weltgesundheitsorganisation (WHO), nämlich rund 1,3 Mio. Dosen Pandemrix von GlaxoSmithKline. Das Unternehmen wird den zwei Jahre haltbaren Impfstoff direkt der WHO zur Verfügung stellen.

Impfstoff wird auch eingelagert
Die Schweiz wird auch Impfstoff einlagern. Dieser soll der Bevölkerung in der Schweiz für den Fall zur Verfügung stehen, dass eine nächste Pandemiewelle anrollen sollte. Insgesamt hatte die Schweiz 13 Millionen Impfdosen für 84 Millionen Franken gekauft.

H1N1 auf dem Rückzug
Derzeit ist in der Schweiz das H1N1-Virus, das die Schweinegrippe verursacht, weiter auf dem Rückzug. Für die vergangene Woche meldete das BAG noch 54 Arztbesuche pro 100'000 Einwohner wegen Grippeverdachts oder 5,6 Verdachtsfälle auf 1000 Arztbesuche. Das sind etwas mehr als der nationale epidemische Schwellenwert.
Total wurden bis Mittwoch 13'433 Fälle bestätigt. 561 Personen mussten wegen Schweinegrippe ins Spital; von ihnen brauchten 105 Intensivpflege. 18 Personen starben wegen des H1N1-Virus.

Switzerland to send 900,000 swine flu jabs to Iran
Novartis applies to use jabs after expiration date

The Flu Case, 28 January 2010 15:36
https://web.archive.org/web/20100220013202/http://www.theflucase.com/index.php?option=com_content&view=article&id=2655%3Aswitzerland-to-send-900000-swine-flu-jabs-to-iran-novartis-applies-to-use-jabs-after-expiration-date&catid=1%3Alatest-news&Itemid=64&lang=en

Switzerland is to send 900,000 doses of Novartis's Celtura to Iran; 750,00 doses of which were sold and the rest donated.
Celtura can be used for six months but Novartis is applying for the swine flu jab to be used for two to three months after its expiration date, reports the Neue Zürcher Zeitung.

Canada donates 5 million doses of excess H1N1 vaccine to WHO redistribution effort

The Flu Case, 28 January 2010, 15:28
https://web.archive.org/web/20100220013147/http://www.theflucase.com/index.php?option=com_content&view=article&id=2652%3Acanada-donates-5-million-doses-of-excess-h1n1-vaccine-to-who-redistribution-effort&catid=1%3Alatest-news&Itemid=64&lang=en

Canada donates 5 million doses of excess H1N1 vaccine to WHO redistribution effort

Toronto – The federal government is donating five million doses of H1N1 vaccine to the World Health Organization.

The doses will be added to a pool of donated vaccine that the WHO is redistributing to countries that could not afford to secure their own pandemic vaccine contracts.

As well, Canada will donate $6 million to the WHO to support the agency's ongoing pandemic relief efforts.

Health Minister Leona Aglukkaq announced the donation in a news release, saying Canada can take this step now because the country's own immediate needs have been met.

Demand for the vaccine here has plummeted since late December, as flu activity has tailed off.

Canada bought 50.6 million doses of vaccine and likely faces a surplus of several tens of millions of doses, even after making the donation to the WHO.

Quad-City Times

Vaccine recall prompts RI County flu clinic changes

Quad City Times, 1 February 2010, 4:55 pm
https://web.archive.org/web/20100209001942/http://www.qctimes.com/news/local/article_6beb2bbc-0f85-11df-a556-001cc4c002e0.html

A weakened batch of the H1N1 flu vaccine in the inventory of the Rock Island County Health Department has been recalled by the manufacturer, Sanofi Pasteur.

That means the injectable H1N1 vaccine will not be available this week for children 6-35 months old. Public health officials are seeking other sources of the injectable version and plan to resume that type of vaccination next week, beginning Monday, Feb. 8.

There are adequate amounts of the injectable vaccine for those older than 36 months, including adults. In addition, vaccine in a nasal mist form is available for most people who are 2 to 49 years old.

Sanofi Pasteur recalled the children's vaccine because it was not potent enough, officials said. The vaccine is not harmful, but it may not be fully effective as it creates protection for the patient. Children who recently received the vaccine do not have to be revaccinated, the health department announced.

Scheduled Rock Island County Health Department clinics this week are: 8 a.m. to noon and 1-4:30 p.m. Tuesday at the health department, 2112 25th Ave., Rock Island; and 2-5:30 p.m. Wednesday at Our Lady of Guadalupe Church, 800 17th St., Silvis, Ill.

Centers for Disease Control and Prevention

CDC Health Update:
Sanofi Pasteur H1N1 Influenza Vaccine Expiration Date Change

CDC Health Update, 2 February 2010, 18:45 ET (6:45 PM EST)
CDCHAN-0309-2010-02-02-UPD-N
https://www.cms.gov/Outreach-and-Education/Outreach/FFSProvPartProg/downloads/CDC_Health_Update_Sanofi_Pasteur_H1N1_Influenza.pdf

Sanofi Pasteur Monovalent 2009 (H1N1) Influenza Vaccine in Pre-Filled Syringes – Shortened Shelf Life of Certain Lots

Summary
Sanofi Pasteur has notified CDC and FDA that some lots of monovalent 2009 (H1N1) influenza vaccine in prefilled syringes will have a shorter expiration period than indicated on the label. The lots of Sanofi Pasteur monovalent 2009 H1N1 influenza vaccine in prefilled syringes should be used by February 15, 2010, as indicated in the table below regardless of the expiration imprinted on the package. This is to ensure that the vaccine is used while it remains within its potency specification. There are no safety concerns with these lots of 2009 H1N1 vaccine. People who received vaccine from the lots listed below with shortened shelf life do not need to take any action.

Background
As part of its quality assurance program, Sanofi Pasteur performs routine, ongoing stability testing of the vaccine after it has been shipped to providers. Stability testing means measuring the strength of a vaccine over time. The 50 lots subject to this change in expiration date include approximately 12 million doses. These lots were shipped to providers between November 2009 and January 2010. Although these lots remain potent, they are losing their potency more rapidly than expected, and therefore the shelf life is being shortened. While most of the doses from these lots are believed to have already been administered, there are almost certainly some doses that have not yet been used.
The change in expiration date described here is specific to the 50 lots of Sanofi Pasteur 2009 H1N1 influenza vaccine in pre-filled syringes listed below. However, a related recall was conducted recently, which involved lots from Sanofi Pasteur's 2009 H1N1 vaccine in 0.25 mL and 0.5 mL pre-filled syringes. These actions do not affect Sanofi Pasteur's 2009 H1N1 vaccine in multi-dose vials. =>

Non-Safety-Related Voluntary Recall of Unused Doses
from Certain Lots of Sanofi Pasteur H1N1 Vaccine in Pre-Filled Syringes
CDC Health Update – 29 January 2010, 19:15 EST (7:15 PM EST)

Summary: As part of its quality assurance program, Sanofi Pasteur, Inc., performs routine, ongoing testing of influenza vaccines after the vaccine has been distributed to health care providers to ensure that the vaccine continues to meet required specifications. In recent testing of its influenza A (H1N1) monovalent vaccine, Sanofi Pasteur found five distributed lots of single-dose, pre-filled syringe pediatric (0.25 mL) vaccine and one distributed lot of single-dose pre-filled syringe for older children and adults (0.5 mL) vaccine had potency below pre-specified limits. The manufacturer is conducting a non-safety related voluntary recall of any unused doses of these affected lots of vaccine. Information will be sent by Sanofi Pasteur to providers who received vaccine from the affected lots. ... => see this link below
https://web.archive.org/web/20100223124207/http://www2a.cdc.gov/HAN/ArchiveSys/ViewMsgV.asp?AlertNum=00306

CDC 24/7: Saving Lives. Protecting People.™

Non-Safety-Related Voluntary Recall of Sanofi Pasteur 2009 H1N1 Flu Vaccine in Pre-filled Syringes (February 2010)

CDC, 3 February 2010, 6:00 PM ET
https://www.cdc.gov/h1n1flu/vaccination/qa_recall.htm

1. Why are some of the doses of H1N1 vaccine manufactured in pre-filled syringes being recalled from the market?

As part of its ongoing quality assurance program, Sanofi Pasteur performs routine stability testing of its 2009 H1N1 influenza vaccine after the vaccine has been shipped to health care providers. Stability testing means measuring the strength (also called potency) of a vaccine over time. It is performed because sometimes the strength of a vaccine can decrease over time.

Sanofi Pasteur (the manufacturer) notified the FDA that the potency of some of its pediatric and adult syringes that had been distributed between November 2009 and January 2010 were found to have dropped below a pre-specified potency after they were shipped. On February 2, 2010, Sanofi Pasteur sent health care providers instructions to return unused vaccine from the affected lots.

These actions apply only to the lots of 2009 H1N1 vaccine in pre-filled syringes manufactured by Sanofi Pasteur.

2. What does "potency" mean for the H1N1 vaccine?

Potency (or strength) is determined by measuring the concentration of the active ingredient (also called antigen) in the vaccine.

3. Are there any concerns about the safety of 2009 H1N1 vaccines being recalled?

No. There are no safety concerns with the recalled lots of H1N1 vaccine and no re-administration of the vaccine is required. All of the H1N1 vaccine lots successfully passed pre-release testing and additional post-release testing supports the conclusion that there is no cause for concern over safety.

4. What are the lot numbers affected by this recall?

The vaccines in pre-filled syringes affected by this recall include the following lot numbers:
- UT023AA, UT023BA, UT023CA, UT023EA, UT023FA (NDC # 49281-650-25, which also may be recorded as # 49281-0650-25), 0.25 mL syringes in 10-packs
- UT037AA (NDC # 49281-650-90, which also may be recorded as # 49281-0650-90), 0.5 mL syringes in 25-packs

5. How many doses are in these lots?

There are approximately 1.3 million doses in the lots that were distributed to health care providers. The manufacturer is recalling any doses from these lots that may still be unused.

Prague (Dow Jones) – Czech Healthcare Minister Dana Juraskova will hold talks with Glaxo-SmithKline PLC (GSK) on possibly canceling vaccination shots for swine flu, or A/H1N1, ordered earlier, ministry spokesman Vlastmil Srsen said Thursday.

The ministry had ordered a total of 1 million shots of the vaccine from GSK and planned to use them all. "The minister has been asked by the government security council to initiate such talks with GSK so that there's such a possibility of not receiving all ordered vaccines," Srsen said.

GSK has so far delivered 238,000 swine flu vaccination shots and "over 60,000 have been used up so far," Srsen said.

Sanofi Speeds Swine Flu Shot Expiration after Recall

Bloomberg, 5 February 2010, 04:43 PM EST
https://web.archive.org/web/20100220013557/http://www.theflucase.com/index.php?option=com_content&view=article&id=2721%3Aexpiry-date-of-sanofi-swine-flu-jabs-shortened-by-16-months-shots-must-be-used-by-end-of-week-says-us-government-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Feb. 5 (Bloomberg) – Sanofi-Aventis SA shortened the expiration of its 12 million pre-filled swine flu shots by as much as 16 months to ensure the potency of the vaccine doesn't decline.

The shots should be administered by Feb. 15, according to a Web site run by the U.S. Department of Health and Human Services. The vaccines previously had expiration dates that varied from March to June 2011. Paris-based Sanofi in December recalled 800,000 doses of the shot for H1N1 influenza, known as swine flu, and AstraZeneca Plc withdrew 4.7 million spray vaccines, after tests showed the potency was too low.

Flu rates in the U.S. have declined since peaking in late October, and the H1N1 virus is no longer widespread in any state, the U.S. Centers for Disease Control and Prevention reported today. More than 70 million people have received a swine flu vaccine, the Atlanta-based CDC said. The December recalls were made after routine tests showed declining potency in some batches.

"The FDA and the manufacturers are really looking into this," Anne Schuchat, head of the National Center for Immunization and Respiratory Diseases at the CDC, said today during a conference call. The declining potency of pre-filled syringes is "a special focus of attention to understand mechanically what may have been going on and to learn from that.

U.S. Vaccines

The shortened expiration date only affects shots in the U.S., said Len Lavenda, a spokesman for Sanofi in Swiftwater, Pennsylvania, in a telephone interview. The shots don't affect vaccine the company is donating to the Geneva-based World Health Organization because the donated shots are in multidose vials, not pre-filled syringes, he said.

Most of the shots were shipped early in the season, and the number of unused doses that are affected by the shortened shelf life is low, said Richard Quartarone, a spokesman for the CDC, in an e-mail.

All pre-filled syringes "should now be administered by Feb. 15, 2010, regardless of the expiration imprinted on the package," according to the U.S. Web site.

Sanofi's decreased vaccine potency may have been due to the key ingredient, antigen, clinging to the wall of the syringe over time, Schuchat said after the December recall.

Different Doses

Multidose vials, the most common form of the vaccine, aren't affected by the expiration change. The single-dose syringes are sometimes used for convenience and because they don't require thimerosal, a preservative that has been shown to be safe in studies though remains controversial.

Sanofi shares declined 1.74 Euros, or 3.3 percent, to close at 51.68 in Paris trading.

Swine flu continues to circulate in the U.S., though at rates below average for seasonal flu in previous years, the CDC's Schuchat said. Pneumonia and flu deaths remain at an epidemic level, above average for the season, she said.

"We aren't seeing signs of a major increase in H1N1, but we are seeing persistent transmission," Schuchat said today. "It's really easy to be vaccinated now, and we hope that people will take advantage of that."

The U.S. government ordered 229 million doses of antigen. About 155 million doses have been made available in the U.S., and 124 million doses have shipped throughout the country, Schuchat said.

Berliner Morgenpost

Berlin wirft Schweinegrippe-Impfstoff auf den Müll

Berrliner Morgenpost, 5 Februar 2010, 11:33
https://www.morgenpost.de/berlin-aktuell/article103957957/Berlin-wirft-Schweinegrippe-Impfstoff-auf-den-Muell.html

In Berlin landen viele ungebrauchte Packungen des Schweinegrippe-Impfstoffs Pandemrix im Müll. Dies hat die Gesundheitsverwaltung bestätigt. Für die bislang weggeworfenen Impfdosen muss das Land bereits einen hohen fünfstelligen Betrag zahlen.

In Berlin sind Impfdosen des Schweinegrippe-Mittels Pandemrix im Wert von 90.000 Euro abgelaufen. Das geht aus der Antwort der Senatsgesundheitsverwaltung auf eine Parlamentsanfrage des CDU-Abgeordneten Mario Czaja hervor. Rund 10.700 Impfdosen seien bisher im Müll gelandet, da die Haltbarkeit des Wirkstoffs abgelaufen war. Nach Öffnen eines Zehnerpacks Pandemrix muss das Serum binnen 24 Stunden gespritzt werden, sonst wird es unbrauchbar. Ungeöffnet ist der Impfstoff zwei Jahre haltbar. Für die weggeworfenen Dosen bezahlt das Land Berlin.

Seit dem Start der Massen-Immunisierung im November 2009 haben sich nur 128.000 Berliner gegen das H1N1-Virus impfen lassen. Ausgeliefert wurden rund 245.000 Dosen. "Die Anzahl der verbrauchten Impfdosen und die Auslieferungen sind stark abnehmend", sagt Benjamin-Immanuel Hoff, Staatssekretär der Gesundheitsverwaltung.

Ursprünglich sollte Berlin zwei Millionen Impfdosen bekommen. Das Land verhandelte erneut mit dem Hersteller und soll nun nur die Hälfte der gelieferten Dosen abnehmen. Dennoch bleibt Berlin auf einem Großteil des bestellten Vorrats sitzen. Wird das Serum nicht gespritzt, entstehen dem Land Kosten in Höhe von etwa 13 Millionen Euro.

THE FLU CASE

Berlin throws away swine flu jabs

The Flu Case, 7 February 2010, 13:33
https://web.archive.org/web/20100220013436/http://www.theflucase.com/index.php?option=com_content&view=article&id=2704%3Aberlin-throws-away-swine-flu-jabs&catid=1%3Alatest-news&Itemid=64&lang=en

Berlin in Germany has already thrown away 10,700 doses of GlaxoSmithKline's Pandemrix swine flu jab because they have passed their expiry date, it has emerged.

Berlin Senate health officials said in answers to MP Mario Czaja that Pandemrix jabs worth 90,000 euros have passed their expiry date.

Only 128,000 people in Berlin took the swine flu jab in a city of about 3.4 million people leaving the city with a gigantic surplus of pre ordered swine flu jabs.

L'Algérie réduit ses importations du vaccin contre la grippe porcine

Algerie-Dz, 8 février 2010

https://web.archive.org/web/20101204073434/http://www.algerie-dz.com/article18225.html

L'Algérie n'importera que cinq millions de doses du vaccin contre la grippe porcine contre vingt millions prévues initialement.

Le déclin de la propagation de virus H1N1 à travers le monde et la non-adhésion de la population à la campagne de vaccination ont poussé le ministère de la Santé à revoir à la baisse l'importation du vaccin contre la grippe porcine. L'Algérie n'importera finalement que 5 millions de doses du vaccin contre la grippe A/H1N1 au lieu de 20 millions de doses prévues initialement, selon M. Faouzi Derrar, le directeur du centre de référence de la grippe porcine au ministère de la Santé, invité hier matin de la radio nationale. Après une campagne hystérique qui a accompagné l'urgence de ramener des millions de lots de vaccin H1N1, le ministère de la Santé a finalement décidé de revoir à la baisse les besoins en matière de ce vaccin.

Au lieu de 20 millions de doses, l'Algérie n'en importera finalement que 5 millions, dont 2,5 millions de doses sont déjà réceptionnées et le reste suivra, selon ce responsable au ministère de la Santé. «L'Algérie a entamé des négociations avec le laboratoire britannique GlaxoSmithKline (GSK) pour ramener de 20 à 5 millions de doses sa commande de vaccins contre la grippe H1N1», a souligné l'invité de la radio nationale. Et d'ajouter : « Nous avons transmis nos préoccupations au fournisseur qui les a comprises et nous sommes actuellement en discussion sur les clauses du contrat pour que soient livrées 5 millions de doses et pas 20 millions.» Le directeur du centre de référence a affirmé que l'Algérie avait commandé au départ vingt millions de doses, mais la population, particulièrement les personnels de santé, «n'a pas adhéré» à la campagne de vaccination qui a débuté à la fin de décembre dernier. Il a également mis en avant les «données épidémiologiques» relevées dans le pays faisant état d'un déclin de la maladie, pour justifier la révision à la baisse de la commande.

THE FLU CASE

Algeria cuts swine flu vaccine order by three quarters

The Flu Case, 8 February 2010, 15:11

https://web.archive.org/web/20100220013502/http://www.theflucase.com/index.php?option=com_content&view=article&id=2709%3Aalgeria-cuts-swine-flu-vaccine-order-by-three-quarters&catid=1%3Alatest-news&Itemid=64&lang=en

The Algerian government has cut back its order of GlaxoSmithKline swine flu jabs from 20 million to 5 million doses following the decline in swine flu cases across the world and the refusal of people to take the vaccine, according to the local media.

NEWS BBC

Two-thirds of swine flu vaccines remain unused in NI

BBC News, 10 February 2010, 10:40 GMT, 2010
http://news.bbc.co.uk/2/hi/uk_news/northern_ireland/8507274.stm

The Department of Health in Northern Ireland still has half a million swine flu vaccines which remain unused.

In mid-January, there were more than 60% of the vaccines left. The health minister had estimated he would need £61m to combat the virus in NI. But a member of the British Medical Association said it was better to have too many than too few vaccines.

Dr Tom Black said swine flu no longer posed a threat - therefore, lives have been saved.
"I think it is better to have vaccine left over than to be left short," he said.
"If we had needed to vaccinate the whole population then we would have needed a lot more vaccine.
"This was the fourth pandemic influenza outbreak in the last century. The previous three killed millions of people. I think we did very well with this one."

There have been 18 deaths related to swine flu in Northern Ireland.
There are still about 500,000 doses of the vaccine which have not been used. The majority of those are still held centrally and not distributed to surgeries. To date 751,200 vaccines have been received by the health service in Northern Ireland and 252,182 have been administered. There are currently 334,600 vaccines held centrally with the balance being held by health trusts and GPs.

The health minister has insisted that all decisions related to the virus were taken after scientific advice. Michael McGimpsey agreed with fellow executive ministers in December that he would need £61m to combat the threat of the virus. It is understood that figure is being re-evaluated and an updated bid will be supplied to the Department of Finance in February.

Review
The evaluation comes as health chiefs around the world assess their reaction to the global outbreak. The death rate from those suffering from the virus in the UK was low, at 0.026%. In addition, hundreds of thousands of people are thought to have been infected but not displayed any symptoms.

The World Health Organisation (WHO) has already announced it will review its handling of the pandemic. Council of Europe Health Committee Chairman Dr Wolfgang Wodarg has been one of the most vocal critics. He has said experts have been unduly influenced by the pharmaceutical industry, and questioned whether a virus that proved to be so mild could really be classed as a pandemic.

However Mr McGimpsey pointed to the fact that the WHO had called Dr Wodarg's comments "irresponsible" as well as "scientifically wrong and historically inaccurate" and said his department's response was guided by the "best scientific advice available in the UK". He added that his department is unable to divulge how much it paid for the vaccines as it would "violate confidentiality clauses in the contracts with the manufacturers."

GUELPH Mercury Tribune

Czechs reduce swine fu vaccine order by 300,000 due to lack of interest

Guelph Mercury Tribune, 19 February 2010
https://www.guelphmercury.com/news/czechs-reduce-swine-fu-vaccine-order-by-300-000-due-to-lack-of-interest/article_e1c92a4b-168d-51a1-90c9-4e2a146faee9.html

Prague, Czech Republic – The Czech Republic's health minister says authorities are reducing an order for swine flu vaccine shots by 300,000 due to a lack of interest among people to get vaccinated.

The country had planned to vaccinate about 1 million people in high-risk groups, including people with chronic diseases, health workers, soldiers and pregnant women.

The Health Ministry says only about 64,000 people have agreed to get the shot.

Minister Dana Juraskova said Friday that as a result the state reduced its order to 700,000 doses from the British pharmaceutical company GlaxoSmithKline PLC.

The ministry said 100 had died of swine flu in the Czech Republic.

Georgia has glut of swine flu vaccine

The Atlanta Journal-Constitution, 26,February 2010, 6:11 p.m.
https://web.archive.org/web/20100301095513/https://www.ajc.com/health/georgia-has-glut-of-332591.html

Georgia has a glut of more than 2 1/2 million doses of swine flu vaccine, and some local health departments are working hard to administer them before they expire.

Less than a third of Georgia's total allocation of 3 1/2 million doses – 978,092 doses – have been administered, according to the state Department of Community Health.

With only weeks left in a flu season that traditionally ends around late March, state and county health officials are faced with distributing a large amount of vaccine to a public that has largely lost interest in swine flu. Some local health officials say some of their vaccine will start to expire at the end of March.

"There's just not much interest in it right now," said Lisa Crossman, director of clinical and prevention services at Cobb and Douglas Public Health.

The Cobb/Douglas health agency has administered less than half of the doses intended for its own clinics and mass vaccination events -- a total of 17,000 of 37,000 doses. Some 8,300 doses there will expire at the end of March, Crossman said.

Georgia has experienced 860 hospitalizations and 53 deaths due to swine flu, DCH said. The virus, which has diminished in activity, has largely displaced the common flu this season, officials said.

The Georgia problem reflects a national excess of the vaccine. The federal government has produced about 155 million doses for public distribution. About 50 million doses are still unused, said Tom Skinner, spokesman for the Atlanta-based Centers for Disease Control and Prevention.

It remains unclear what will happen to leftover vaccine, but federal health officials said some might go to waste, a potential loss of millions of taxpayer dollars. The federal government took on the full cost of the swine flu vaccination program.

Skinner said the federal government will make an announcement shortly on a plan regarding the unused vaccine. For now, concern remains that the flu season is not over and another uptick in activity could occur.

The injectable vaccine has a shelf life of a year to 18 months, he said. The mist vaccine has a shelf life of about 18 weeks once it is shipped to a provider.

According to the CDC, 23 percent of Americans have received swine flu vaccinations. About 37 percent of children and teens up to the age of 18 years have been vaccinated.

Health officials are concerned that many people remain unprotected while the virus is still circulating and people are still getting sick and dying. They are particularly worried about children. Two swine flu vaccination doses are required for children 9 years and younger, and only 37 percent of children in this age group received their second dose, according to the CDC.

The problem has been one of timing, Skinner said. Essentially, by the time the vaccine was widely available to the public, the flu activity – and the public interest – had peaked.

Swine flu, also known as H1N1, first appeared last April, but it was December before the vaccine was widely available. In addition, concern over the virus, which initially raised worries of a major health disaster, diminished as it became apparent the effects for most people mirrored the seasonal flu.

While federal health officials say that producing a new vaccine in months was monumental, the effort had problems with delays, shortages and the recall of over 5 million doses that lost potency.

"We wanted to make sure there was enough vaccine for everyone who might want one," Skinner said.

The federal Department of Health and Human Services spent $1.6 billion on 229 million doses of H1N1 vaccine bulk antigen and associated supplies, according to the CDC. About 155 million doses have been placed into syringes, vials and sprayers. The CDC is hopeful that the raw antigen, which lasts longer, can be used in future flu vaccines. Some extra vaccine may be made available to the World Health Organization for donation to countries that otherwise would not have access to the vaccine.

To move more vaccine, Cobb health officials set up several H1N1 mass vaccination clinics in the evenings, on weekends and at large community events such as those held at the Galleria.

Gwinnett and DeKalb health officials offered vaccinations this month at the Vietnamese New Year's Celebration in Norcross. DeKalb has been working hard for months to vaccinate people, at one point presenting the benefits in a puppet show that featured a big dancing needle and "Captain Healthy" showing kids to use hand sanitizer.

The excess stands in stark contrast to the situation in the fall, when people stood on long lines to receive swine flu vaccine, which, because of shortages and production delays, was being administered only to high priority groups.

Free vaccine clinic

The Fulton County Department of Health and Wellness is holding a swine flu vaccination clinic noon to 4 p.m. Saturday at North Springs High School in Sandy Springs. The vaccine is free.

Excess of Vaccines, the Biggest Challenge

Top News, 6 March 2010, 09:45
http://topnews.us/content/212545-excess-vaccines-biggest-challenge

All the top U. S. public health leaders at the conference saw the eye to eye on Friday, regarding the fact that that people have stopped being vaccinated and now how the surplus vaccines of H1N1 swine flu to be used, is the one of the biggest challenges. Earlier people were bawling for H1N1 vaccines, but only a few came for vaccination.

"The truth is for this pandemic we had about the longest warning we might ever have for a potential bio-threat. And yet we all lament how long it took for vaccine to be made", said Dr. Nicole Lurie, who heads preparedness at the Health and Human Services Department.

About 12,000 Americans have been killed by the H1N1 virus and nearly 250,000 patients have been hospitalized, according to the U. S. Centers for Disease Control and Prevention. According to CDC about more than half the U. S. population should have been vaccinated and 250 million vaccines had been ordered but the scheduled didn't happen.

"We told people to prepare to be vaccinated in October and then we didn't show up with vaccine", said Texas State Health Commissioner David Lakey.

To make available free H1N1 vaccinations to students upto age 9 and to those who require their second dose, the Lexington-Fayette County Health Department will to three public schools.

Dutch Health Ministry intends to sell back Swine Flu vaccine doses

TopNews, 7 March 2010, 13:50
https://web.archive.org/web/20100309112132/http://topnews.co.uk/22907-dutch-health-ministry-intends-sell-back-swine-flu-vaccine-doses

The Dutch Health Ministry has intended to sell back its 21 million unexploited H1N1 flu vaccine doses, as the Government doesn't find its requirement anymore.

The Health Ministry has been advancing to GlaxoSmithKline and Novartis for the selling back those doses.

However, the Ministry has refused to provide the exact details of the cost of these doses, as of now.

When the Swine Flu Pandemic was at its peak, the Dutch Government had ordered more than 34 million doses of the tamiflu.

During that period, around 11 million doses were put to use and 2.2 million were preserved for the crisis.

INDEPENDENT

Alistair Dawber

Government cuts H1N1 vaccine order by two-thirds

Independent, 7 April 2010, 00:00 BST
https://www.independent.co.uk/news/business/news/government-cuts-h1n1-vaccine-order-by-twothirds-1937544.html

The Department of Health and GlaxoSmithKline yesterday agreed to cut the number of doses of swine flu vaccine the Government will buy from the group by about two-thirds, after the H1N1 virus proved to be far less devastating than first feared.

Last year, when concerns about the the virus were high, the Government ordered enough vaccine for everyone in Britain from GSK and the US pharmaceutical group Baxter. Health officials yesterday said that they would now take just 34.8 million doses of GSK's treatment, after initially ordering 90 million batches. The company had recommended at the start of the pandemic that each patient take two doses of the drug. The Government terminated its contract with Baxter in February.

"This deal means that the UK will save approximately one third of the original value of the orders with GSK," said the Health Secretary, Andy Burnham. "I am pleased we have reached an agreement that is good value for the taxpayer and means the department has retained a strategic stockpile to protect the UK population without incurring a cancellation fee."

While the Government is not paying a cancellation fee, it is paying substantially more per dose for the vaccine. GSK said that the Government would receive other treatments, such as H5N1 *bird flu* vaccine and courses of the anti-viral Relenza, to balance the deal.

The Department of Health said that the UK now has a stockpile of 23.6 million doses and confirmed that those deemed vulnerable to the virus, such as pregnant women and health workers, would continue to get the drug. The Government said it would donate 3.8 million batches of swine flu vaccine to the World Health Organisation.

Both the Government and GSK have refused to say how much the UK has paid for swine flu vaccine. A Freedom of Information request submitted by The Independent to force the Government to disclose how much it was paying per dose was rejected on the grounds that the details would "prejudice the commercial interests" of GSK and the Government's ability to negotiate with its commercial partners.

GSK has charged governments on a sliding scale, from €7 for the most developed economies, to 50 million free doses submitted for distribution by the World Health Organisation. The UK was offered a discount, but the size of the cut has not been made public.

Yesterday's deal is the result of lengthy negotiations between the Government and GSK and follows similar action from the German authorities, who agreed to take and pay for 70 per cent of its original order in January.

GSK is in talks with a number of other administrations over plans to par back vaccine orders. A host of northern hemisphere countries are known to want to slash orders after the initial spike in incidents of swine flu cases quickly tailed off. Among them, France, Belgium and Spain are thought to be in talks with GSK.

The company said that it would not be altering its earnings estimates for 2010, saying that it expects to see swine flu vaccine sales of about £880m this year, a similar amount to 2009.

The Washington Post

Millions of H1N1 vaccine doses may have to be discarded

The Washington Post, 1 April 2010
https://web.archive.org/web/20100408172009/http://www.washingtonpost.com/wp-dyn/content/article/2010/03/31/AR2010033104201.html
https://web.archive.org/web/20100408172009/http://www.washingtonpost.com/wp-dyn/content/article/2010/03/31/AR2010033104201_2.html

Despite months of dire warnings and millions in taxpayer dollars, less than half of the 229 million doses of H1N1 vaccine the government bought to fight the pandemic have been administered - leaving an estimated 71.5 million doses that must be discarded if they are not used before they expire.

Between 81 million and 91 million doses of swine flu vaccine were injected into peoples' arms or squirted up their noses through the end of February, according to federal officials, leaving about 138 million doses unused. An estimated 60 million of those will be donated to poor countries or saved for possible future use. But doses already in vials and syringes will be thrown away if not used before their expiration dates pass.

The prospect of millions of doses of the once-precious vaccine being discarded is the latest twist in the $1.6 billion program - the most ambitious immunization campaign in U.S. history. The government-led effort produced a vaccine in record time, but unexpected production problems delayed delivery of the bulk of supplies until after the second wave of infections had peaked, leaving millions anxious and frustrated as they scrambled for the shots and nasal sprays.

Nevertheless, officials said they were largely satisfied with the effort, which blunted the impact of the first flu pandemic in decades. Between 72 million and 81 million people are estimated to have been immunized.

"Did we do as well as we would have liked to? No, not at all," said Anne Schuchat of the federall Centers for Disease Control and Prevention (CDC). "But the country did an extraordinary job of responding. It's pretty incredible to think about how much uncertainty we had at the beginning of this."

Given the potential seriousness of the threat and the uncertainties of vaccine production, Schuchat said, it was unavoidable that some doses would go to waste.

"We were dealing with a very unusual situation. We had a pandemic. We had young people being killed," she said. "We wanted to make sure we had enough. We didn't want to be short. It was important to us to be able to protect the American people."

Noting that the virus still poses a threat, Schuchat and other experts stressed that they hope millions more in the country will still get vaccinated.

"It's too early to write the final chapter on this vaccine," said Michael T. Osterholm of the University of Minnesota. "If we're at the beginning of a third wave, I just bet you a lot of that vaccine that is sitting there will not be unused."

But officials acknowledge that it becomes more difficult in spring to persuade a skeptical public to get vaccinated, especially because the threat appears to be fading.

"We still don't know what the future is. We need to be nimble enough in case there is an uptick in disease," said Bruce Gellin, head of the National Vaccine Program Office.

The immunization program was designed to provide enough vaccine to protect every U.S. resident if needed. But antiquated technology dependent on growing the virus in chicken eggs delayed arrival of most of the doses. Fears about the pandemic fostered wide-scale anxiety and spawned long lines as the first doses trickled in amid the second wave of infections last fall. By the time the vaccine was plentiful, demand had dissipated.

Of the 229 million doses bought by the federal government, about 162.5 million were put into vials and syringes, which starts the clock ticking on an expiration date. About 25 million are being donated to poor countries, and about 35 million remain in bulk form, which lasts longer and could be used if the virus flares up again later this year or as part of next year's seasonal flu vaccine. The Defense Department received about 3 million doses.

Overall, about one-third of people considered at the highest risk from the virus, including nearly 37 percent of children ages 6 months to 17 years, were vaccinated through January. But the proportion of people immunized varied widely nationwide, with some states reporting vaccination rates three times as high as others.

"The message we should take away from this experience is that we need to continue to explore technologies to improve the stability of the flu vaccine supply and, equally as important, we need to invest in public health infrastructure to make sure that there are strong health departments to communicate with the public and administer vaccine once it is produced," said Rep. Henry A. Waxman (D-Calif.).

The World Health Organization, meanwhile, faces mounting charges that it overreacted to the pandemic. The Council of Europe's Parliamentary Assembly is investigating allegations that the Geneva-based arm of the United Nations was influenced by pharmaceutical companies to exaggerate the risk, thereby helping in vaccine sales.

WHO officials have strongly disputed the charges, saying the response was vital given the uncertainty about the new virus and its potential threat. Many independent public health experts have defended the agency.

Nevertheless, the WHO has launched an internal review of its response and announced Monday that a committee of 29 outside experts would conduct an independent assessment. The critique will include whether WHO's pandemic alert system should consider the severity of a new virus, not just whether it is novel and spreading globally.

"Could we have made decisions better? Could we have considered things in a different way at the time?" said Keiji Fukuda, WHO's top flu official, told reporters Monday. "We, along with many others, are asking the same kinds of questions of ourselves and each other."

The CDC estimates that more than 60 million people in the United States were sickened by the virus, at least 265,000 were hospitalized and more than 12,000 died. Although about 36,000 residents succumb in a typical flu season, officials said H1N1 tended to kill pregnant women, children and otherwise healthy young adults, making the impact far more serious than the numbers alone indicate.

Infections have dropped sharply in most of the country, but the CDC reported Monday that the virus was still spreading in several southeastern states, including Georgia, where hospitalizations have increased in recent weeks.

Internationally, officials are concerned because the virus has started spreading widely for the first time in some parts of the Southern Hemisphere, especially in poor African countries with limited resources to stem the spread and treat cases.

Millions of H1N1 Vaccine doses to be Discarded in the US

Top News, 1 April 2010, 11:49
https://web.archive.org/web/20171027025018/http://topnews.us/content/214923-millions-h1n1-vaccine-doses-be-discarded

It is reported that less than half of the 229 million doses of H1N1 vaccine the Government purchased to combat against the pandemic have been administered, thereby rendering an estimated 71.5 million doses in a position to be discarded if they are kept unused before they expire, despite months of dire warnings and millions spent in taxpayer Dollars.

The federal officials claim that nearly 81 million to 91 million doses of swine flu vaccine were used through the end of February, leaving nearly 138 million doses unused.

They post that nearly 60 million of those will be donated to poor countries or saved keeping in mind the future possibility of requirement. However, doses already in vials and syringes will be discarded if not used before their expiration dates pass.

The prospect of millions of doses of the vaccine being thrown away has emerged as a twist in the $1.6 billion program, revealed as the most ambitious immunization campaign in U. S. history.

However, officials uncover that they were highly gratified with the effort. Between 72 million and 81 million people are estimated to have been immunized.

Keeping in mind the potential seriousness of the disease and the uncertainties linked to the vaccine production, Schuchat posted that there was no other way than to witness some doses go to waste.

Америка спешит избавиться от вакцин против свиного гриппа
Text & Video

ВЕСТИ.RU, 2 апреля 2010, 12:49
https://www.vesti.ru/article/2085314

Америка избавляется от излишков вакцины против свиного гриппа. 138 миллионов доз оказались неиспользованными. Часть из них собираются подарить бедным странам. Американские эксперты уже называют панику по поводу свиного гриппа одной из самых широкомасштабных медицинских афер. С подробностями – собственный корреспондент радио "Вести ФМ" в Вашингтоне Елена Соколова.

Соколова: Америка готова избавиться от излишков вакцины против свиного гриппа.
США закупили 229 миллионов доз, но, несмотря на потраченные деньги налогоплательщиков и активную рекламу прививок, в США на сегодняшний день использовали меньше половины закупленной вакцины.

138 миллионов доз оказались невостребованными. И теперь американское правительство в срочном порядке ломает голову – как же избавляться от лишней вакцины до истечения срока её годности. Согласно статье-расследованию в газете "Вашингтон пост", 25 миллионов доз вакцины собираются подарить бедным странам, 35 миллионов оставить в США про запас, на всякий случай, 3 миллиона доз вакцин – отправить в армию, а остальные 71 с половиной миллионов доз, скорее всего, будут просто списаны, так как использовать их просто некуда.

История с вакцинацией от свиного гриппа была самой широкомасштабной и агрессивной в истории американского здравоохранения – общий счёт этой широкомасштабной программы, по оценкам "Вашингтон пост", составил более полутора миллиардов долларов.

Многие американские эксперты называют кампанию по иммунизации против свиного гриппа одной из самых успешных и самых раздутых медицинских афер при непосредственном участии Всемирной организации здравоохранения. Сейчас комиссия Европарламента проводит независимое расследование – насколько фармакологические корпорации могут быть причастны к раздуванию паники и объявлению пандемии свиного гриппа.

Американцы же больше не желают прививаться от мнимой угрозы – в прошедший сезон, согласно статистике, свиным гриппом заболели примерно 60 тысяч американцев, некоторые умерли от осложнений. Эта цифра гораздо меньше, чем количество смертей от осложнений во время эпидемии обычного гриппа в Америке. Поэтому вопрос – как избавиться от лишних 138 миллионов доз ненужной вакцины – в Америке по-прежнему открыт.

THE FLU CASE

Frank Wiley

H1N1 Vaccine going to Waste.
$100 million of swine flu vaccines past or close to expiration date, says CDC

The Flu Case, 2 April 2010, 9:20 pm
https://web.archive.org/web/20100613224639/http://www.theflucase.com/index.php?option=com_content&view=article&id=3204%3A100-million-of-swine-flu-vaccines-past-or-close-to-expiration-date-says-cdc&catid=41%3Ahighlighted-news&Itemid=105&lang=en

It may be spring, but its still flu season. Especially since many people didn't get vaccinated.

Over stocked, and under used. Global panic, millions hospitalized, and millions of deaths – not enough to scare many Oklahomans into getting vaccinated for the h-1-n-1 swine flu virus.

"I don't think you need shots, per se," said parent, Shawn Johnson.

"I think that's kind of crazy, everyone should get vaccinated," said parent, Becky Gentes.

In a year's time, more than 1,100 hospitalized, in Oklahoma, and 44 have died form the virus. Since September, causing panic among parents like Gentes.

"I don't want to be sick, I don't want my child to be sick and I certainly don't want anybody else's child to be sick," said Gentes.

The chances of that happening, increased. Only 20 percent of Oklahomans have gotten the shot.

The Centers for Disease Control says more than $100 million doses of the vaccine were wasted. Expiration dates have either passed, or are looming, leaving the CDC calling for change, next flu season.

"Definitely the recommendation is let's put it in this year's seasonal flu vaccine because we want to get people protected early on," said a CDC Spokesman.

Officials hope the effort isn't wasted next time.

GSK agrees to one-third cut in UK H1N1 vaccine order

Reuters, 6 April 2010, 7:45 PM GMT+8

https://www.reuters.com/article/economy/gsk-agrees-to-one-third-cut-in-uk-h1n1-vaccine-order-idUSLDE6350RB/

London, April 6 (Reuters) - GlaxoSmithKline (GSK) <GSK.L> has agreed the British government can cut its order of H1N1 swine flu vaccines by about a third.

The government and GSK said separately on Tuesday they had agreed to cap the number of Pandemrix shots to 34.8 million doses, including those already delivered, and there would be no cancellation fee.

"The final settlement was mutually agreed as representing fair value for the UK government and the manufacturer," the health department said in a statement. The government also said the agreement meant it would now receive other GSK products, including H5N1 "bird flu" vaccines and courses of the antiviral drug Relenza to replace the amount used during the peak of the swine flu outbreak.

The government did not give further details of the deal, saying they were commercially confidential, but said the agreement was in line with GSK's settlements with other countries. The government's statement was repeated in GSK's statement on the deal.

About 17,000 people have died from laboratory-confirmed cases of H1N1 but the World Health Organisation, which declared the H1N1 flu a pandemic last June, has said the real death toll is likely to be many times higher. However, initial fears that the pandemic would kill many millions have turned out to be unfounded so far and governments around the world that ordered vast supplies of vaccines have been seeking to renegotiate their deals with suppliers like GSK.

The British company, which is the biggest supplier of H1N1 vaccines, has already reached agreements to cut vaccine orders for Germany and Belgium.

Other H1N1 flu vaccine manufacturers such as Novartis <NOVN.VX> and Sanofi-Aventis <SASY.PA> also faced order cancellations from France.

Simon Jose, general manager of GSK UK, said the firm was keen to work with governments when public health needs changed.

"Understanding of the H1N1 pandemic has significantly evolved since the declaration by the WHO last June and we recognise that governments' needs and public health priorities are changing," he said in a statement.

"We are committed to working with them to respond to their needs as the pandemic evolves and find appropriate and fair solutions."

GSK shares were 0.7 percent lower by 1025 GMT.

British health minister Andy Burnham said the deal represented "good value for the taxpayer" and meant the government would be able to keep a strategic stockpile of vaccine.

"This both protects the public purse and ensures the UK remains at the forefront of pandemic preparedness worldwide," he said in a statement. (Additional reporting by Paul Sandle, editing by Karen Foster)

U.S. has 71 million unused flu vaccine doses

Reuters, 4 May 2010, 11:06 PM GMT+8Updated 14 years ago
https://www.reuters.com/article/idUSTRE6425HW20100504/

Washington (Reuters) - The United States still has 71 million doses of H1N1 swine flu vaccine that have not been used, but it is not yet time to throw them out, the federal government said on Monday.

States and other providers should hang on to the vaccine and continue to offer them to people until drug companies can start distributing seasonal vaccine for the coming influenza season in the autumn, said Health and Human Services Department spokesman Bill Hall.

Senator Chuck Grassley, the ranking Republican on the Senate Finance committee, released a letter on Monday that he sent to HHS secretary Kathleen Sebelius asking her how much vaccine was left over and when it would expire.

H1N1 swine flu is still technically causing a pandemic and health officials say anyone who has not been vaccinated should still try, in case it causes a third wave of serious disease.

Health experts consider swine flu likely to join the mix of seasonal flu viruses and it will be included in the seasonal flu vaccine for 2010-2011, which will also contain two other flu strains.

When the H1N1 virus started spreading in April, HHS and its agencies, along with commercial flu vaccine makers, rushed to formulate and make a vaccine.

Influenza vaccines are made using old and unwieldy methods that require incubating the virus in chicken eggs, and the process always takes months.

Vaccine started rolling out in October and the U.S. eventually ordered 229 million doses from its five licensed makers -- Novartis, AstraZeneca unit MedImmune, Sanofi Aventis, GlaxoSmithKline and Australian vaccine maker CSL.

Sebelius said last month that 162 million doses were produced and distributed, but only 90 million actually got into people's arms or noses.

Varying Shelf Life

"Depending on the vaccine manufacturer, the shelf life of the H1N1 vaccines range from 18 weeks to 18 months, with some due to expire on June 30, 2010," Grassley wrote in his letter to Sebelius

Scott Hensley

Sen. Grassley Wonders What Will Happen To Swine Flu Vaccine

NPR, 4 May 2010, 3:25 PM ET
https://www.npr.org/sections/health-shots/2010/05/sen_grassley_wonder_what_will.html

A lot of the swine flu vaccine produced in such a hurry is about to expire.

Republican Sen. Charles Grassley of Iowa wants to know what will happen to it. The federal government ordered 229 million doses of the stuff last year and some doses of unused vaccine started expiring in February.

After Americans' pretty so-so response to the government's push for immunization the clock is ticking on vaccine sitting around – more than 70 million doses by some reports. =>
https://www.npr.org/sections/health-shots/2010/02/flu_vaccine_in_america_epidemi.html/

So Grassley fired off a letter to Health and Human Services Secretary Kathleen Sebelius to figure out what her department has in mind.
https://web.archive.org/web/20100506014547/http://grassley.senate.gov/news/Article.cfm?customel_dataPageID_1502=26437

The short answer, according to an HHS spokesman quoted by Reuters, is that states and health care providers should hold onto the vaccine and keep offering it to people until the new seasonal flu vaccine becomes available. The agency will send a fuller response directly to Grassley.
=> https://www.reuters.com/article/idUSTRE6425HW20100504/

We're eager to learn how Sebelius answers some of Grassley's questions about the billions of dollars the government devoted to the new H1N1. "To date, how much of the appropriated dollars from Congress has been obligated and expended?" Grassley asks. "Please provide a breakdown of the spending by HHS and its agencies."

BBC NEWS

Billions wasted over swine flu, says Paul Flynn MP

BBC, 24 June 2010
https://www.bbc.com/news/10396382

Billions of pounds in public money were wasted worldwide on buying drugs to combat a swine flu "pandemic that never was", says Newport West MP Paul Flynn.

He has compiled a report on the H1N1 virus for the Council of Europe.
He told BBC Wales' Dragon's Eye the World Health Organisation (WHO) made a "terrible mistake" in causing panic.

WHO said it reminded the public in its pandemic assessments that most people had mild symptoms and made a full recovery without medical treatment.

Dr Tony Jewell, chief medical officer for Wales, said: "It is easy with hindsight to say things should have been done differently."

Mr Flynn, one of the 47 parliamentarians from across Europe who sits on the human rights-focused Council of Europe, said: "They [WHO] frightened the whole world with the possibility that a major plague was on the way."

He added: "The result of that was that the world spent billions and billions of pounds on vaccines and anti-virals that will never be used. It is huge waste of money."

Mr Flynn's report will be debated by the Council of Europe later.

He claimed that the decision by WHO, a body of the United Nations, to declare a pandemic had been influenced by pharmaceutical companies.

He said: "The firewall that should exist between the commercial interests, the pharmaceutical bodies, and the scientists has been breached.

"We know the only people who benefited were pharmaceutical companies. They had a huge influence in defining what a pandemic is."

Mr Flynn said WHO was not being transparent in not explaining who had sat on the emergency committee that had declared H1N1 a pandemic.

'Resources distorted'

He said as a result "resources and priorities in health services in dozens of countries were distorted".

Globally, more than 15,000 people died as a result of the H1N1 virus compared to the two to four million deaths that had been predicted by WHO, he said.

"The mistake was to say this was the most dangerous form of flu. It created vast over-buying that wasn't necessary," said Mr Flynn.

WHO has rejected Mr Flynn's conclusions, saying they had not exaggerated the dangers.

In a statement, it said: "In every assessment of the pandemic, WHO consistently reminded the public that the overwhelming majority of patients experienced mild symptoms and made a rapid and full recovery, even without medical treatment."

Mr Flynn said governments, while "damned if they acted, and damned if they didn't," did have a choice in how they responded to the warning from WHO.

While the UK spent £500m on anti-viral drugs that will now never be used, Poland spent nothing, explained Mr Flynn.

The UK ordered 90 million doses of H1N1 vaccine and 4.63 million doses were used in England.

Vaccines and public awareness campaigns cost Wales £35m, according to official figures.

'Clear response'

Dr Jewell said: "Our response to the pandemic has been clear.

"When the infection first arrived, we didn't know how severe it would be and the potential impact. Therefore the only prudent course of action was to plan for a worst-case scenario - based on scientific advice. To do otherwise would have been irresponsible."

A spokesperson for the Department for Health, in England, said that pandemic decisions had been based on advice from independent experts.

"The response was the result of careful preparation and thoughtful consideration, this continues to be the case.

"It is important that we learn lessons. A review into the WHO's handling of the pandemic is currently underway and this is happening in the UK too. This will ensure we remain one of the best prepared countries in the world for any future pandemics."

Mr Flynn said that while WHO had done incredible work, including eliminating smallpox, it had "cried wolf four times".

He said: "With Sars, CJD, avian flu and swine flu, none of them justified the billing as mass killers.

"WHO can't go on crying wolf and expect to have its views respected."

WHO convened a panel earlier this year to conduct a "credible and independent review" of how it and national authorities handled the outbreak.

Two experts on the panel resigned recently because of their close ties to the UN health body and concerns over conflict of interest.

What pandemic?
$260 million worth of H1N1 vaccine to go up in smoke

Local Tech Wire, 1 July 2010, 8:35
https://web.archive.org/web/20101125032138/http://localtechwire.com/business/local_tech_wire/news/blogpost/7887392/

"Only a small number of influenza viruses are being reported, most of which are 2009 H1N1. Flu is unpredictable, but sporadic cases of flu, caused by either 2009 H1N1 or seasonal flu viruses, will likely continue to occur throughout the summer in the United States. Internationally, 2009 H1N1 viruses are still circulating, including in the Southern Hemisphere, which is entering its flu season." – Latest CDC H1N1 update

AP, LTW; Atlanta – What happened to the pandemic?

About a quarter of the H1N1 vaccine produced for the U.S. public has expired - meaning that a whopping 40 million doses worth about $260 million is being written off as trash.

"It's a lot, by historical standards," said Jerry Weir, who oversees vaccine research and review for the U.S. Food and Drug Administration.

The outdated vaccine, some of which expired Wednesday, will be incinerated. The amount, more than twice the usual leftovers, likely sets a record. And that's not even all of it.

GlaxoSmithKline (NYSE: GSK), which maintains its U.S. headquarters in Research Triangle Park, N.C., was one of the firms that won contracts with the federal government and other countries worldwide to produce H1N1 vaccine.

GSK has struck a number of deals with countries on deals through which less vaccine was required.

Novartis, which is building a massive vaccine production plant in Holy Springs, N.C., also produced H1N1 vaccine.

About 30 million more doses will expire later and may go unused, according to one government estimate. If all that vaccine expires, more than 43 percent of the supply for the U.S. public will have gone to waste.

Federal officials defended the huge purchase as a necessary risk in the face of a never-before-seen virus. Many health experts had feared the new flu could be the deadly global epidemic they had long warned about, but it ended up killing fewer people than seasonal flu.

"Although there were many doses of vaccine that went unused, it was much more appropriate to have been prepared for the worst case scenario than to have had too few doses," said Bill Hall, spokesman for U.S. Department of Health and Human Services.

Most leading health experts generally agree with that.

Millions of doses of flu vaccine generally go unused every year and are marked for burning, but in recent years the leftovers amounted to closer to 10 percent of the supply, rather than the 25 percent expiring now. Government flu experts couldn't recall throwing away anything close to 40 million doses before.

The new H1N1 swine flu emerged in April last year, hitting children and young adults particularly hard. It was difficult to predict how deadly it might be or how easily it might spread. Federal health officials pushed five vaccine manufacturers to produce a vaccine as quickly as possible. What's more, they wanted a lot of it - many experts thought most people would need two doses for it to work.

The government placed three orders last year for a combined total of nearly 200 million doses - an unprecedented amount and almost double the amount of vaccine produced in recent years for seasonal flu.

About 162 million doses were meant for the general public. Another 36 million included doses for the military and other countries. But demand never took off, for several reasons:

- Tests of the vaccine soon showed only one dose was enough to protect most people.
- Much of the vaccine was not ready until late 2009, after the largest wave of swine flu illnesses passed.
- Swine flu turned out not to be as deadly as was first feared.

About 12,000 deaths have been attributed to it - or roughly a third of the estimated annual deaths from seasonal flu.

So while people were waiting hours for swine flu vaccinations in some cities in October and November, by January local health departments were trying gimmicks to get anyone at all to come in for a shot.

Government officials have known for months that they were looking at a huge surplus. According to an Associated Press calculation based on federal purchasing information, the dollar value of the 40 million expired doses is about $261 million. The government didn't release an official figure, but Hall said the AP estimate was approximately correct.

In Europe, where nations also found themselves with millions of unused doses, some commentators have attacked the World Health Organization, which declared swine flu a global epidemic, or pandemic.

The critics have questioned the motivation of some WHO advisers who had links to the pharmaceutical industry.

Some critics have simply lamented that a lot of anxiety was raised and money wasted, not just during the swine flu scare but also in government responses to bird flu and SARS, a respiratory virus that swept parts of Asia in 2003.

"Each time the so-called experts told us that millions of people would be killed worldwide by the respective viruses. We have learned that the experts were utterly wrong," said Dr. Ulrich Keil, a professor at Germany's prestigious University of Muenster and a WHO adviser.

"This behavior is irresponsible because the angst campaigns ... confuse the priority setting in public health," he said. The death toll from influenza epidemics is much smaller than the number killed annually by chronic illnesses like heart disease, cancer, stroke and diabetes, he added, in an e-mail.

Unused flu vaccine is a common problem. The June 30 expiration date is set by the FDA and has less to do with the vaccine's shelf life than the desire to tweak the recipe each year to protect against the three flu strains expected to cause the most illness.

"It's not necessarily because it's degraded or not potent," said Dr. Mark Mulligan, an Emory University vaccine researcher.

In the past year, about 114 million doses of seasonal flu vaccine were distributed. The government thinks most of that was used - demand was unusually high because of fears about swine flu.

In the flu vaccination campaign for this coming fall, swine flu vaccine is being combined with two seasonal strains in single doses. Manufacturers have told the government they expect to make about 170 million doses.

An influential government advisory panel this year recommended that virtually all Americans get flu shots each year. Still, that doesn't mean it will all get used.

"No doubt there will be unused doses. This happens every time," said Dr. John Treanor, an immunology specialist at the University of Rochester Medical Center.

Jennifer Evans

Happy Trails, Swine Flu Vaccine

NPR, 1 July 2010, 5:24 PM ET
https://www.npr.org/sections/health-shots/2010/07/01/128248906/happy-trails-swine-flu-vaccine

After a crash project to develop swine flu vaccine last year, some 40 million unused doses of the stuff made to protect Americans have officially expired.

The expired vaccines – roughly a quarter of the amount produced for the U.S. – are about to get incinerated, the Associated Press' Mike Stobbe reports. That's the equivalent of $260 million going up in smoke, according to some number crunching by the AP.

Americans raced to receive the vaccine last October. But by January, when it became apparent the swine flu wasn't as deadly as initially feared, the public started losing interest. So, Sen. Charles Grassley (R-IA) asked to Health and Human Services Secretary Kathleen Sebelius what was to become of the millions of leftover and expiring doses?

Leftover flu vaccines is an annual occurrence. Every spring, manufacturers and purchasers engage in a kind of a guessing game, estimating just how many people will turn out for their annual seasonal flu shots in the fall. Some years they're way off, other years, it's spot on. Back in May CDC spokesman Tom Skinner said that close to all of the 114 million doses of seasonal flu vaccine produced this year were administered.

When there are leftovers, there are simple procedures for disposal – burn them up or bury in a landfill, according to the state requirements.

What's different in the case of the swine flu vaccine is the sheer volume of vaccine slated for disposal. "Government flu experts couldn't recall throwing away anything close to 40 million doses before," the AP found. And there's more. In total, roughly 30 million doses of viable swine flu vaccine remain unused, the AP reports.

"Our decisions regarding vaccine production were in line with the existing threat at the time such decisions were made," HHS spokesman Bill Hall told Shots by e-mail. "Although there were many doses of vaccine that went unused, it was much more appropriate to have been prepared for the worst case scenario than to have had too few doses. As we have said repeatedly, the risk of influenza disease is far greater than the risk of vaccination either for seasonal or pandemic influenza."

But millions of doses into the air? What kind of threat could that be? The Environmental Protection Agency says no worries: "If the H1N1 vaccine is managed in accordance with applicable state rules and regulations, EPA does not foresee any environmental risks. The volume of the vaccine to be destroyed does not present any environmental issues," the agency told Shots last month by e-mail.

That won't be the end of the story. Sebelius tells Grassley that while this year's seasonal flu vaccine "will contain protection against 2009 H1N1," they're encouraging states to keep a supply of this year's vaccine on hand, in case there's a rerun of the panic of 2009.

FIERCE Pharma

John Carroll

Up to 70M doses of unused H1N1 vax to be destroyed

Fierce Pharma, 1 July 2010, 9:33
https://www.fiercepharma.com/vaccines/up-to-70m-doses-of-unused-h1n1-vax-to-be-destroyed

With the great swine flu pandemic of 2009 largely forgotten by the U.S. public, health officials say they are preparing to burn 40 million doses of expired H1N1 vaccine they bought to guard the population--and another 30 million doses may soon find their way into the flames.

The 40 million doses bound for the incinerator represent about a quarter of the massive stockpile the U.S. contracted to buy from manufacturers as fears of a lethal wave of infections made headlines around the world. And if the other 30 million doses follow the path to the dumpster the U.S. will have disposed of almost half of its entire shipment, a record level of waste after tens of millions of Americans ended up shrugging off a virus that proved far more mild than was originally feared. But U.S. officials aren't apologizing for any miscalculations.

"Although there were many doses of vaccine that went unused, it was much more appropriate to have been prepared for the worst case scenario than to have had too few doses," Bill Hall, an HHS spokesman, told *Local Tech Wire*.

Japan and a long lineup of countries around the world have been able to cancel portions of their vaccine shipments. And officials at the WHO have been forced to defend itself against angry accusations that they colluded to whip up a frenzy over the swine flu virus to help the manufacturers sell their supplies. The pandemic did leave one positive lasting legacy: putting a spotlight on the old technology used to develop and manufacture vaccines. A host of vaccine developers have been at working proving the potential of new technologies that will be able to deliver bulk quantities of new vaccines at a much faster pace.

NBC NEWS Expired swine flu shots amount to $260 million loss

Mike Stobbe

Expired swine flu shots amount to $260 million loss

NBC News, 2 July 2010, 5:59 AM + 08
https://www.nbcnews.com/health/health-news/expired-swine-flu-shots-amount-260-million-loss-flna1c9457544

About a quarter of the swine flu vaccine produced for the U.S. public has expired – meaning that a whopping 40 million doses worth about $260 million are being written off as trash.

"It's a lot, by historical standards," said Jerry Weir, who oversees vaccine research and review for the U.S. Food and Drug Administration.

The outdated vaccine, some of which expired Wednesday, will be incinerated. The amount, as much as four times the usual leftover seasonal flu vaccine, likely sets a record. And that's not even all of it.

About 30 million more doses will expire later and may go unused, according to one government estimate. If all that vaccine expires, more than 43 percent of the supply for the U.S. public will have gone to waste.

Federal officials defended the huge purchase as a necessary risk in the face of a never-before-seen virus. Many health experts had feared the new flu could be the deadly global epidemic they had long warned about, but it ended up killing fewer people than seasonal flu.

"Although there were many doses of vaccine that went unused, it was much more appropriate to have been prepared for the worst-case scenario than to have had too few doses," said Bill Hall, spokesman for U.S. Department of Health and Human Services.

Most leading health experts generally agree with that.

"We were faced with the first pandemic we'd had in 40 years. We had to ensure there would be enough vaccine for our nation," said Dr. Mark Mulligan, an Emory University researcher who was involved in testing the vaccine.

Many average Americans also agreed earlier this year, said Robert Blendon, a Harvard University professor who conducts polls on public health. He said a Harvard poll in January found that 59 percent of Americans would prefer the flu vaccine be over-ordered to ensure enough was available, even if it meant doses went unused.

Millions of doses of flu vaccine typically go unused every year and are marked for burning, but in recent years the leftovers amounted to closer to 10 percent of the supply, rather than the 25 percent expiring now. Government flu experts couldn't recall throwing away anything close to 40 million doses before.

The new H1N1 swine flu emerged in April last year, hitting children and young adults particularly hard. It was difficult to predict how deadly it might be or how easily it might spread. Federal health officials pushed five vaccine manufacturers to quickly produce a vaccine. What's more, they wanted a lot of it – many experts thought most people would need two doses for it to work.

The government placed three orders last year for a combined total of nearly 200 million doses – an unprecedented amount and almost double the amount of vaccine made in recent years for seasonal flu.

About 162 million doses were meant for the general public. Another 36 million included doses for the military and other countries.

But demand never took off, for several reasons:

– Tests of the vaccine soon showed only one dose was enough to protect most people.
– Much of the vaccine was not ready until late 2009, after the largest wave of swine flu illnesses passed.
– Swine flu turned out not to be as deadly as was first feared. About 12,000 deaths have been attributed to it – or roughly a third of the estimated annual deaths from seasonal flu.

So while people were waiting hours for swine flu vaccinations in some cities in October and November, by January local health departments were trying gimmicks to get anyone at all to come in for a shot.

Government officials have known for months that they were looking at a huge surplus. Unused flu vaccine is a common problem. The June 30 expiration date is set by the FDA and has less to do with the vaccine's shelf life than the desire to tweak the recipe each year to protect against the three flu strains expected to cause the most illness.

"It's not necessarily because it's degraded or not potent," Mulligan said.

In the past year, about 114 million doses of seasonal flu vaccine were distributed. The government thinks most of that was used — demand was unusually high because of fears about swine flu.

In the flu vaccination campaign for this coming fall, swine flu vaccine is being combined with two seasonal strains in single doses. Manufacturers have told the government they expect to make about 170 million doses.

An influential government advisory panel this year recommended that virtually all Americans get flu shots each year. Still, that doesn't mean it will all get used.

"No doubt there will be unused doses. This happens every time," said Dr. John Treanor, an immunology specialist at the University of Rochester Medical Center.

After the federal government rushed H1N1 flu vaccine to all 50 states, including Oklahoma, last year, about 40 million doses expired unused and will wind up being destroyed.

INDEPENDENT

Netherlands destroying 17 million swine flu vaccine doses

Independent, 29 July 2010, 00:00
https://www.independent.co.uk/life-style/health-and-families/netherlands-destroying-17-million-swine-flu-vaccine-doses-2038287.html

The Netherlands is destroying more than 17 million unused doses of swine flu vaccine that were nearing their expiry date and that it could not resell, the health ministry said Tuesday.

"We have started destroying" the vaccines, health ministry spokeswoman Inge Freriksen told AFP. "In the coming months, 17.8 million doses will be destroyed because the expiry date is approaching."

The Dutch government bought 31 million doses of vaccine against the A(H1N1) virus at the height of the global swine flu outbreak last year. About 11 million were used.

Some 2,156 people infected with swine flu were hospitalised in the Netherlands between April and December last year and 53 died.

In November the Dutch goverment said it was putting 19 million doses on sale to other countries, but managed to offload only 257,000.

The government will keep 2.2 million doses with a later expiry date "in case the virus returns in one form or another", Freriksen said.

The World Health Organisation declared a swine flu pandemic on June 11, 2009, and says it has since claimed some 18,311 lives worldwide.

The Council of Europe recently called for a probe into the WHO's handling of the outbreak, which it said caused unjustified scares and waste of public money.

THE LOCAL de

Swine flu vaccine worth €250 mln to be destroyed

The Local de, 17 Aug 2011 11:13 CEST
https://www.thelocal.de/20110817/37007

German health authorities are making arrangements to burn around 15 tonnes of swine flu vaccine worth around €250 million which people refused to take, and is now past its use-by date.

A report in the *Frankfurter Allgemeine Zeitung* on Wednesday totted up the amount of Pandemrix vaccine, which state health authorities were scrambling to obtain at the height of the pandemic, but are now disposing.

The issue has created bad blood between the state health ministries and their federal counterpart. The state authorities have the responsibility to fund and organise the purchase and administration of vaccines, but they have to follow the recommendations of federal authorities.

The guidelines were for the provision of vaccine for a third of the population - this is the minimum considered necessary to keep everything running and protect a population in general.

Yet the Germans proved less willing than expected, to have the vaccine – after a widely publicized argument between various medics about the safety of GlaxoSmithKline's product. It was said that Pandemrix had not been sufficiently tested to be administered to the public, after it was licensed in an accelerated process.

GlaxoSmithKline's initially slow production led to panicky efforts by authorities to secure the supplies they needed while the number of cases increased and the H1N1 virus spread across the world. In the end it turned out that not two, but only one dose was necessary to provoke the desired immune system response – and that for most of those infected, the disease was much milder than expected.

In the end only around seven percent of Germans took the shot, leaving the authorities sitting on stockpiles of the vaccine. Efforts to sell or even give the Pandemrix to other countries have largely failed, the *FAZ* reported.

Germany's largest state North Rhine-Westphalia bought up 7.1 million doses of Pandemrix when the pandemic was officially declared. Around a million of these were used, and a small number is likely to still be stored by doctors and pharmacists, leaving more than six million in decentralized state storage. Now that their use-by date has been reached, these doses will have to be disposed of.

Although the controlled burning of vaccine stocks is not expected to be terribly expensive – the *FAZ* said it costs around €100 a ton – the waste of money cannot be denied.

North Rhine-Westphalia had followed federal guidelines and bought in enough vaccine to inoculate a third of its nearly 18-million population – at a cost of €62 million. This leaves the authorities having to destroy around €46.9 million worth of vaccine – its purchase price plus two years of storage costs.

"We reckon at the end with costs of nearly €47 million costs," said Serap Celen, the state's Health Ministry spokesman.

Efforts made by the state authorities to get the federal government to shoulder some of the costs have repeatedly failed.

In total the states spent €303.2 million on Pandemrix, and are estimated to be left with around €250 million worth of soon to be out-of-date vaccine. Although there different batches have different use-by dates, the last one will be reached at the end of this November. Since the WHO declared the pandemic over, the vaccine is, "not much more than expensive waste," the *FAZ* wrote.

Richard Connor

Surplus to Requirements

Deutsche Welle, (AFP), 17 August 2011
https://www.dw.com/en/germany-to-destroy-expensive-unwanted-swine-flu-vaccine/a-15324186

Out-of-date swine flu immunizations that were bought by Germany amid fears of a pandemic two years ago are to be destroyed. The number of people who wanted the vaccine at the time was lower than expected.

Swine flu vaccine that German states bought amid fears over a pandemic two years ago, but which few people wanted, is to be destroyed.

The news was confirmed by a spokesman for the Health Ministry of the state of Saxony Anhalt on Wednesday, as stocks of the vaccine reach the end of their shelf life.

Officials from Saxony Anhalt, which currently chairs a working group on the issue, are inviting tenders from disposal firms to get rid of as many as 16 million vials of the material.

The vaccine - which is to be burnt at high temperatures - was bought to meet demand across all German states at the time of the swine flu outbreak in 2009, and had been stored centrally. In addition, said the spokesman, many states had bought their own supplies - some of which have already been destroyed.

In total it is believed that there was an excess of up to 30 million containers of vaccine, costing as much as 250 million euros ($360 million).

Widespread skepticism

States were left with the excess vaccine because fewer people than expected had taken up the opportunity to have the immunization, amid widespread skepticism about the true threat posed by the flu.

Swine flu became a concern across the world in 2001, after it appeared to have originated in Mexico.

The outbreak was declared a pandemic in June that year. The classification came to an end in August last year as the threat posed was considered to have diminished.

The World Health Organization had come in for harsh criticism at the Council of Europe in Strasbourg early last year for its handling of the H1N1 flu pandemic.

Accusations were made that the organization had exaggerated claims of the risk in order to benefit drug companies keen to sell the vaccine.

Germany to Destroy 30 Million Glaxo Pandemrix Doses, FAZ Says

Bloomberg, 17 August 2011, 2:18 PM GMT+8
https://www.bloomberg.com/news/articles/2011-08-17/germany-to-destroy-30-million-glaxo-pandemrix-doses-faz-says?leadSource=uverify%20wall

Germany will destroy as many as 30 million doses of GlaxoSmithKline Plc's Pandemrix swine flu vaccine valued at 250 million euros ($360 million) that remain unused a year after the World Health Organization declared the pandemic over, Frankfurter Allgemeine Zeitung said today.

While Pandemrix was ordered to vaccinate some 30 percent of Germans, less than 10 percent of the population elected to be vaccinated, the German newspaper reported today, without saying where it got the information. The vaccine will expire in the coming weeks and must therefore be destroyed by burning in an incinerator, Frankfurter Allgemeine Zeitung reported.

Encephalophathies Following Prophylactic Pertussis Vaccine

Pediatrics, 1948, April, 1(4): 437-457
https://archive.org/details/pediatrics-1948/ https://doi.org/10.1542/peds.1.4.437

Introduction

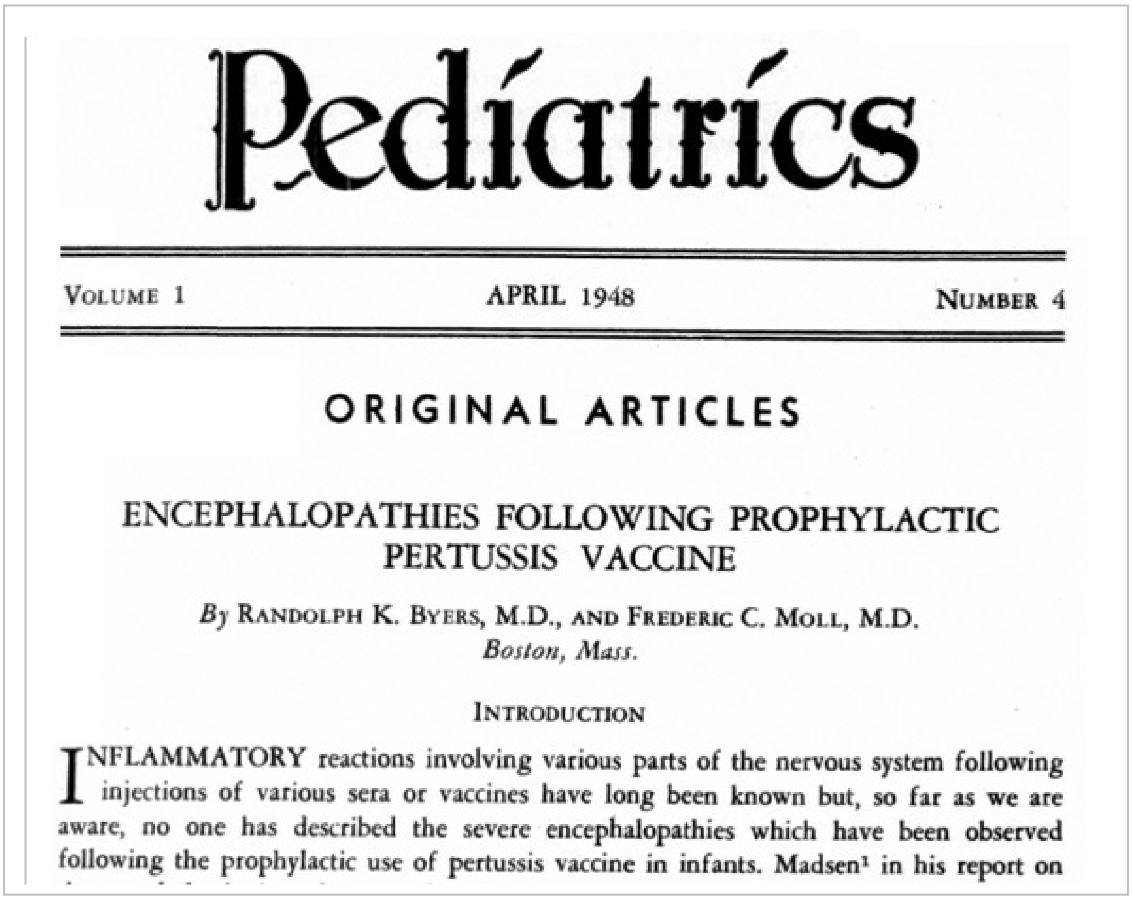
Inflammatory reactions involving various parts of the nervous system following injections of various sera or vaccines *have long been known* but, so far as we are aware, no one has described the severe encephalopathies which have been observed following the prophylactic use of pertussis vaccine in infants.

Madsen[1] in his report on the prophylactic inoculations of 1,832 Faroe Islanders mentioned the death of two small infants in convulsions beginning one or two hours after injections of fluid pertussis vaccine. He reported that autopsies failed to disclose any adequate cause of death. Werne and Garrow[2] reported the death in shock of a pair of identical twins 16 and 24 hours respectively after the second injection of alum-precipitated diphtheria toxoid and pertussis antigen. Careful post mortem examination showed widespread vascular injury. Convulsions, said to be ephemeral in character, have been reported by a number of observers, Doull, Shibley, and McClelland[3] reported three children with convulsions among 496 children immunized with fluid vaccine. Taylor[4] reported a reaction to the vaccine of a ten-month-old boy characterized by subnormal temperature, limpness, and convulsions coming on a few hours after the injection. Recovery was stated to be complete in a few hours. Kendrick and Eldering[5] reported the immunization of 1,815 children, 6 to 15 months of age, by 9,075 injections, with one reaction characterized by convulsions. Sako[6] and his co-workers reported two instances of convulsions following 6,600 injections of H. pertussis alum-precipitated vaccine, and in a personal communication Sako states that in approximately 105,000 children immunized to pertussis, there have been four transient convulsions. Many large series, such as the early ones of Sauer[7] involving 3,974 children and the later one of Cravitz and Cauley[8] including 5,000 chil-dren, have been reported without reference to such accidents.

...

Summary

Inspection of the records of the Children's Hospital for the past ten years has disclosed 15 instances in which children developed acute cerebral symptoms within a period of hours after the administration of pertussis vaccine. The children varied between 5 and 18 months in age and, in so far as it is possible to judge children of this age range, were developing normally according to histories supplied by their parents. None had had convulsions previously. Many different lots of vaccine, made by eight different manufacturers over a period of eight years, were implicated. The inoculations were given throughout the usual geographic range of children coming to this hospital. All but one, at the time of follow-up or death, showed evidence of impairment of the nervous system, which might still have been in the healing stage in three or four.



During the same period about half as many children were seen in the hospital suffering from the encephalopathy secondary to smallpox vaccination, and about twice as many from the encephalopathy complicating pertussis itself.

A variety of etiologic considerations were suggested by consideration of the reported cases and references to the literature. That constitutional factors may have been involved was suggested by both the preponderance of males as opposed to females, and by the high incidence of abnormalities of the nervous system in the family histories. The clinical course and cytologic abnormalities of spinal fluids found in acute cases indicated an encephalopathy. The literature suggested that this process might have resulted from either the activity of a specific toxin or from an antigen-antibody response. Against the former of these hypotheses was the unstable nature of the heretofore recognized toxins which could hardly survive in properly aged vaccines. The rapid onset of symptoms, occasionally within minutes of the first injection, seemed strong evidence against the second. The present study has left these etiologic considerations unanswered, but it has called attention to a risk of the prophylactic use of pertussis vaccine not hitherto recognized.

In view of the impressive evidence of the effectiveness of prophylactic pertussis vaccine now accumulating, it seems likely that babies are safer vaccinated than not. Further studies should be made to prove this point definitely, for the encephalopathy following pertussis vaccine seems more devastating than the vast majority of the nervous lesions following the use of smallpox vaccine.

Conclusion

In common with many other biologic materials used parenterally, an important risk of encephalopathy attends the use of prophylactic pertussis vaccine. The mechanism whereby the encephalopathy is produced is not elucidated by the present study. The universal use of such vaccine is warranted only if it can be shown to be effective in preventing encephalopathy or death from pertussis itself in large groups of children. If avoidance of the inconvenience of the average attack of pertussis is all that is expected, the risk seems considerable. Efforts to diminish the hazard by modification of the vaccine or new methods of administration seem indicated.

This progressive and ultimately fatal disease of children and adolescents had been suspected to be of viral origin since its initial description by Dawson in 1932. Measles virus or a virus very closely related to measles virus has been recovered from the brains of patients with the disease. The disorder may be considered to be a slow form of measles encephalitis (see Chap. 200).

giform virus encephalopathies. Although these diseases have been shown to be of infectious etiology by the transmission of neurological illness to higher primates, their causative agents remain incompletely characterized. They are classified as the slow virus infections due to unconventional agents.

SUBACUTE SCLEROSING PANENCEPHALITIS (INCLUSION-BODY ENCEPHALITIS) This progressive and ultimately fatal disease of children and adolescents had been suspected to be of viral origin since its initial description by Dawson in 1932. Measles virus or a virus very closely related to measles virus has been recovered from the brains of patients with the disease. The disorder may be considered to be a slow form of measles encephalitis (see Chap. 200).

SSPE occurs in patients between the ages of 4 and 20; 80 percent are under 11. The disease affects boys 3 to 10 times as frequently as girls. The incidence has fallen recently. Most patients are from rural areas or small towns. Characteristically, they are entirely well until the disease begins. The onset of usually insidious mental deterioration, often expressed by a decline in the patient's schoolwork, is the presenting symptom. Incoordination, ataxia, and myoclonic jerks develop within a few months along with abnormalities of the pyramidal and extrapyramidal motor systems. Cortical blindness, papilledema, and optic atrophy may be present; focal chorioretinitis has been described. A few cases have occurred in association with infectious mononucleosis.

The patient becomes bedridden within 6 to 9 months. Death results from superimposed pulmonary or urinary tract infections or from decubiti. Signs of meningeal irritation are absent.

The CSF gamma-globulin level, as determined by electrophoresis, quantitative immunochemical assay, or colloidal gold curve, is elevated, but the fluid is otherwise normal. The EEG typically shows a "burst suppression" pattern characterized by synchronous and symmetrical spike and high-voltage slow wave activity followed by electrical inactivity. Elevated levels of measles antibody are found in the serum and CSF.

Pathologic findings include lymphocyte and mononuclear infiltrations about small cerebral arteries and veins, intranuclear and intracytoplasmic inclusions in neurons and glial cells, and varying degrees of destruction of medullated nerve fibers. The lesions occur in the cerebral gray and white matter, brainstem and cerebellum.

Measles virus is the etiologic agent. Electron-microscopic studies show that the intranuclear inclusions in brain cells are composed of hollow tubular filaments resembling the internal nucleocapsid component of a paramyxovirus. Staining of brain tissue from patients with the disease demonstrates measles virus antigen in the inclusions. An agent serologically identical with measles virus and having the properties of measles virus has been recovered from brain by cocultivating cell cultures originating from brain tissue with established laboratory cell lines.

Attempts to transmit the disease to animals have met with variable results. Ferrets inoculated with suspensions of brain from patients with the disease develop a nonfatal neurological disorder with EEG changes.

There is evidence that SSPE patients have clinical measles at an unusually early age, but SSPE appears many years after the patient's initial rubeola infection. A few reported cases may have been related to measles vaccination. The risk of SSPE following measles vaccination is far less, however, than the risk of encephalitis or SSPE following natural measles.

SSPE patients lack antibody to one of the measles virus proteins (the M or matrix protein) despite high titers of antibodies to the other viral proteins. The M protein is a nonglycosylated protein localized to the inner surface of the viral membrane; it is important in the assembly of the virus particle at the cell surface. SSPE brain cells do not appear capable of synthesizing the M protein even in normal amounts. The reason for this selective defect in a single viral protein has not been ascertained.

Isoprinosine[1] has been reported by some to affect the course of the disease favorably in an open therapeutic trial, but there is controversy about the drug's effectiveness.

PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY This rare neurological condition, first described in 1958, usually occurs in patients who have leukemia, malignant lymphoma, carcinomatosis, immunosuppressive therapy, or a variety of other chronic disease processes. The disease is consistently associated with disorders of cell-mediated immunity with which deficits in humoral antibody response may or may not coexist.

The disease affects adults of both sexes, and its duration from onset of symptoms to death is 1 to 6 or more months. The neurological signs and symptoms reflect a diffuse, asymmetric involvement of the cerebral hemispheres. Hemiplegia, hemianopsia, aphasia or dysarthria, and organic mental changes are frequent; visual field abnormalities and complete or incomplete transverse myelitis may develop. Headache and convulsive seizures are rare, but EEG abnormalities consisting of diffuse or focal abnormalities are often present. Lesions in the white matter may be recognized on CT scans. CSF is normal.

The pathologic changes consist of multiple areas of demyelination with little or no perivascular infiltration and abnormal mitotic figures in astrocytes. The presence of distinctive intranuclear inclusions in oligodendrocytes first suggested that the disease was of a viral etiology. Electron-microscopic observations show the intranuclear inclusion bodies to be composed of closely packed spheres, which have the physical dimensions and properties of the polyomavirus genus of the papovaviruses.

By employing tissue cultures derived from human fetal brain it has been possible to recover a new human polyomavirus serotype (JC virus) from the brains of PML patients. Abundant virus particles are present in brain. Rapid identification of the virus in brain is possible using fluorescent antibody staining or electron-microscopic agglutination with monospecific hyperimmune rabbit serum. Serologic diagnosis using the patient's serum is unreliable. The virus has not been demonstrated in tissues other than brain; the disease has not been transmitted to animals.

There are isolated reports of clinical remission with cytosine arabinoside, but no cures. Death usually occurs within 6 months of onset.

PML may result from the activation of a polyomavirus which has been latent in brain or other tissues since childhood infection. Alternatively, there may be certain individuals who fail to acquire immunity in childhood and have their first encounter with the virus when a disease which interferes with cell-mediated immunity develops. The demyelination which

Ileal-lymphoid-nodular hyperplasia, non-specific colitis, and pervasive developmental disorder in children

A J Wakefield, S H Murch, A Anthony, J Linnell, D M Casson, M Malik, M Berelowitz, A P Dhillon, M A Thomson, P Harvey, A Valentine, S E Davies, J A Walker-Smith

Summary

Background We investigated a consecutive series of children with chronic enterocolitis and regressive developmental disorder.

Methods 12 children (mean age 6 years [range 3–10], 11 boys) were referred to a paediatric gastroenterology unit with a history of normal development followed by loss of acquired skills, including language, together with diarrhoea and abdominal pain. Children underwent gastroenterological, neurological, and developmental assessment and review of developmental records. Ileocolonoscopy and biopsy sampling, magnetic-resonance imaging (MRI), electroencephalography (EEG), and lumbar puncture were done under sedation. Barium follow-through radiography was done where possible. Biochemical, haematological, and immunological profiles were examined.

Findings Onset of behavioural symptoms was associated, by the parents, with measles, mumps, and rubella vaccination in eight of the 12 children, with measles infection in one child, and otitis media in another. All 12 children had intestinal abnormalities, ranging from lymphoid nodular hyperplasia to aphthoid ulceration. Histology showed patchy chronic inflammation in the colon in 11 children and reactive ileal lymphoid hyperplasia in seven, but no granulomas. Behavioural disorders included autism (nine), disintegrative psychosis (one), and possible postviral or vaccinal encephalitis (two). There were no focal neurological abnormalities and MRI and EEG tests were normal. Abnormal laboratory results were significantly raised urinary methylmalonic acid compared with age-matched controls (p=0·003), low haemoglobin in four children, and a low serum IgA in four children.

Interpretation We identified associated gastrointestinal disease and developmental regression in a group of previously normal children, which was generally associated in time with possible environmental triggers.

Introduction

We saw several children who, after a period of apparent normality, lost acquired skills, including communication. They all had gastrointestinal symptoms, including abdominal pain, diarrhoea, and bloating and, in some cases, food intolerance. We describe the clinical findings, and gastrointestinal features of these children.

Patients and methods

12 children, consecutively referred to the department of paediatric gastroenterology with a history of a pervasive developmental disorder with loss of acquired skills and intestinal symptoms (diarrhoea, abdominal pain, bloating and food intolerance), were investigated. All children were admitted to the ward for 1 week, accompanied by their parents.

Clinical investigations

We took histories, including details of immunisations and exposure to infectious diseases, and assessed the children. In 11 cases the history was obtained by the senior clinician (JW-S). Neurological and psychiatric assessments were done by consultant staff (PH, MB) with HMS-4 criteria.[1] Developmental histories included a review of prospective developmental records from parents, health visitors, and general practitioners. Four children did not undergo psychiatric assessment in hospital; all had been assessed professionally elsewhere, so these assessments were used as the basis for their behavioural diagnosis.

After bowel preparation, ileocolonoscopy was performed by SHM or MAT under sedation with midazolam and pethidine. Paired frozen and formalin-fixed mucosal biopsy samples were taken from the terminal ileum; ascending, transverse, descending, and sigmoid colons, and from the rectum. The procedure was recorded by video or still images, and were compared with images of the previous seven consecutive paediatric colonoscopies (four normal colonoscopies and three on children with ulcerative colitis), in which the physician reported normal appearances in the terminal ileum. Barium follow-through radiography was possible in some cases.

Also under sedation, cerebral magnetic-resonance imaging (MRI), electroencephalography (EEG) including visual, brain stem auditory, and sensory evoked potentials (where compliance made these possible), and lumbar puncture were done.

Laboratory investigations

Thyroid function, serum long-chain fatty acids, and cerebrospinal-fluid lactate were measured to exclude known causes of childhood neurodegenerative disease. Urinary methylmalonic acid was measured in random urine samples from eight of the 12 children and 14 age-matched and sex-matched normal controls, by a modification of a technique described previously.[2] Chromatograms were scanned digitally on computer, to analyse the methylmalonic-acid zones from cases and controls. Urinary methylmalonic-acid concentrations in patients and controls were compared by a two-sample *t* test. Urinary creatinine was estimated by routine spectrophotometric assay.

Children were screened for antiendomyseal antibodies and boys were screened for fragile-X if this had not been done

UNITED STATES HOUSE of REPRESENTATIVES

Hon. Dan Burton, of Indiana

Mercury in Medicine Report

The House of Representatives, 20 May 2003
Congressional Record, 2003, May 21, 149(9): 12720-12739
https://www.govinfo.gov/content/pkg/CREC-2003-05-21/html/CREC-2003-05-21-pt1-PgE1011-3.htm
https://archive.org/details/burton-mercury-medicine_202408

Mr. Burton of Indiana. *Mr. Speaker, I submit the following report prepared by the staff of the Subcommittee on Human Rights and Wellness, Committee on Government Reform. This report is the result of a three-year investigation initiated in the Committee on Government Reform.*

Mercury in medicine – taking unnecessary risks

I. Executive summary

Vaccines are the only medicines that American citizens are mandated to receive as a condition for school and day care attendance, and in some instances, employment. Additionally, families who receive federal assistance are also required to show proof that their children have been fully immunized. While the mandate for which vaccines must be administered is a state mandate, it is the Federal Government, through the Centers for Disease Control and Prevention (CDC) and its Advisory Committee for Immunization Practices that make the Universal Immunization Recommendations to which the majority of states defer when determining mandates. Since the early to mid 1990s, Congress has been concerned about the danger posed by mercury in medical applications, and in 1997, directed the Food and Drug Administration (FDA) to evaluate the human exposure to mercury through foods and drugs.

In 1999, following up on the FDA evaluation and pursuant to its authority, the House Committee on Government Reform initiated an investigation into the dangers of exposure to mercury through vaccination. The investigation later expanded to examine the potential danger posed through exposure to mercury in dental amalgams. This full committee investigation complemented and built upon the investigations initiated by two of its subcommittees. In January 2003, the investigation continued in the newly formed Subcommittee on Human Rights and Wellness.

A primary concern that arose early in the investigation of vaccine safety was the exposure of infants and young children to mercury, a known toxin, through mandatory childhood immunizations. This concern had been raised as a possible underlying factor in the dramatic rise in rates of late-onset or 'acquired' autism. The symptoms of autism are markedly similar to those of mercury poisoning.

Significant concern has been raised about the continued use of mercury in medical applications decades after the recognition that mercury can be harmful, especially to our most vulnerable population – our children.

This report will address one form of mercury in medical applications, ***Thimerosal,*** as a preservative in vaccines.

In July 2000, it was estimated that 8,000 children a day were being exposed to mercury in excess of Federal guidelines through their mandatory vaccines.

One leading researcher made the following statement to the Committee in July 2000:

"***There's no question that mercury does not belong in vaccines***." etc. a Report - see Vol. 3

A Future with Hope
Fort Worth, Texas
2008 General Conference
The United Methodist Church

Protecting Children from Mercury-Containing Drugs

United Methodist Church, Fort Worth. 23 April – May 2, 2008

https://calms2008.umc.org/Text.aspx@mode=Petition%26Number=409.html

https://pathwaystofamilywellness.org/wellness-lifestyle/the-united-methodist-church-resolves-to-protect-children-from-mercury-in-drugs.html

Policy Base: The United Methodist Social Principles, 162.J (Alcohol and Other Drugs), 162.T (Right to Health Care)

Theological Foundation: In Mark 10:13-16, it says, "People were bringing little children to him in order that he might touch them; and the disciples spoke sternly to them. But when Jesus saw this, he was indignant and said to them, 'Let the little children come to me; do not stop them; for it is to such as these that the Kingdom of God belongs. Truly I tell you, whoever does not receive the kingdom of God as a little child will never enter it.' And he took them up in his arms, laid his hands on them, and blessed them."

Photo by Mike DuBose

When the 2008 General Conference of The United Methodist Church, meeting in Fort Worth, Texas, approved the resolution "Protecting Children from Mercury-containing Drugs" on April 29th, it brought a new and commanding voice to the issue of mercury in medicine. Comprised of 992 international delegates, the General Conference is the top decision-making body of the United Methodist Church. In passing this resolution, the United Methodist Church affirms its commitment to safe vaccines and seeks to safeguard public confidence in vaccines and other drugs by advocating the removal of mercury from them.

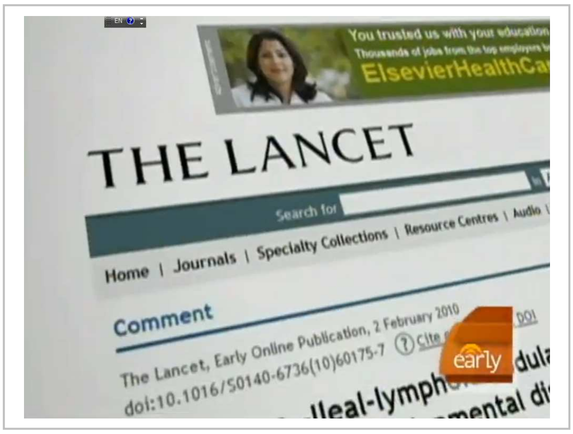
Mercury is a known poison, neurotoxin, and carcinogen. Of particular concern, thimerosal, the mercury-based 'preservative' first patented in 1928, remains commonplace in some vaccines (including flu and tetanus shots) as well as other drugs, both prescription and over-the-counter, used in the United States and abroad. With many published scientific, medical, toxicological, and epidemiological studies (some underwritten by pharmaceutical companies and government agencies) reaching opposite conclusions about the danger posed by mercury in the global drug

Delegates to the 2008 United Methodist General Conference meeting

Whereas, as demonstrated in the Social Principles, The United Methodist Church affirms:

"...wise policies relating to the availability of potentially beneficial or potentially damaging prescription and over-the-counter drugs; we urge that complete information about their use and misuse be readily available to both doctor and patient."

Whereas, Thimerosal (synonyms include: Thiomseral, Merthiolate, Thimerasol) is a severely toxic, antiquated, organic mercury compound (approximately 50% mercury by weight) that has been added to some vaccines and pharmaceutical products since the 1930s,



Whereas, numerous peer-reviewed scientific/medical studies published over many decades, at least since the 1930s, have recommended removing or restricting the use of Thimerasol in medicinal products, and have demonstrated its significant toxicity, etc. => see Vol. 3.

Vaccine Link to Autism Retracted

YouTube, 3 February 2010
https://www.youtube.com/watch?v=oBh7-qI9G08

A respected British medical journal, The Lancet, retracted a study that the childhood vaccine MMR triggers autism. Richard Roth reports on the controversy debated for more than a decade.

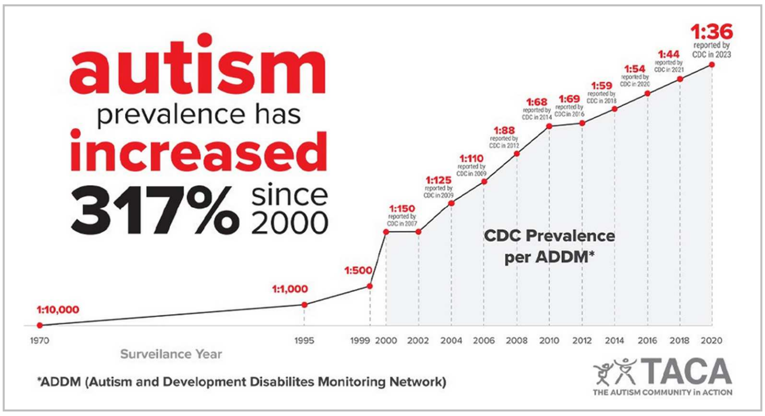
Nicolas Hulscher, MPH

How to Address the Autism Epidemic
Two Key Targets: Childhood Hyper-Vaccination and Toxic Pesticide Exposure

Focal Points, 25 February 2025
https://www.thefocalpoints.com/p/how-to-address-the-autism-epidemic?img=https%3A%2F%2Fsubstack-post-media.s3.amazonaws.com%2Fpublic%2Fimages%2Ff2850339-1bac-4006-b5b6-ccf2e6a4d759_1000x666.jpeg&open=false



A few days ago, President Trump delivered the following remarks:

You know, we have one stat that I quote, the autism stat … if you go back 15 years ago, we had like nobody. It was 1 in 20,000. Now we have 1 in 34 … So 34 or 36 kids have autism. And if you go back … 18 years, whenever that was done, it was 1 in 20,000.

So we got from 20,000 to 34-36. That's unbelievable. So there's something wrong …We've done something wrong. There's something you're going to figure it out.

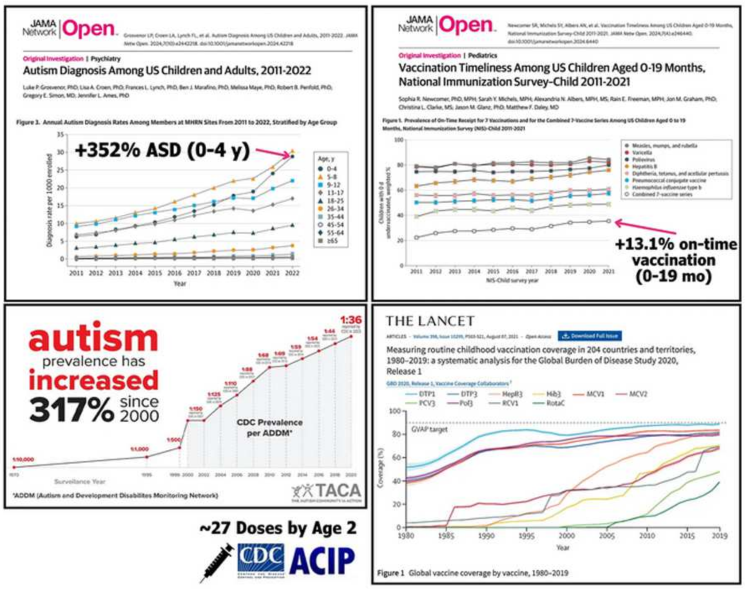
Maybe it's a spray that we spray all over the place that nobody else does – Other countries don't. The Pennsylvania Dutch [Amish], they don't do anything. And they're amazingly healthy.

President Trump is correct – the CDC estimates that 2.78% of children and 2.21% of adults have autism in America.

A 2010 study titled Prevalence Rates of Autism Spectrum Disorders Among the Old Order Amish estimated that ASD affected approximately 1 in 271 children in the Amish community. This is significantly lower than the CDC's 2010 estimate for the general U.S. population, which was 1 in 68 children. Why do Amish children fare better than others? And why is the autism rate in America continuing to skyrocket with no end in sight? We now have abundant evidence that the following factors should be key targets in addressing the autism epidemic:

TARGET #1 - Childhood Hyper-Vaccination

As of 2025, the CDC recommends that children receive up to 32 doses by age 2. This represents a massive increase in recommended vaccine doses since the inception of the 1986 National Childhood Vaccine Injury Act giving vaccine makers full liability protection:



Since they enjoy full liability protection, pharmaceutical companies currently get their injections approved with no long-term, placebo-controlled trials:

ICAN Informed Consent Action Network

None of the vaccine doses the CDC recommends for routine injection into children were licensed by the FDA based on a long-term placebo-controlled trial

Type	Doses	Age Injected	Brand	Company[1]	Control	Placebo?	Safety Review After Injection[2]	Long	Source	Note
HepB	3	Birth 1M 6M	Recombivax HB	M	None	NO	5 days	NO	Package insert at § 6.1	Note that to license a vaccine for children, the FDA relies upon the clinical trial conducted with children, not adults, because as the FDA explains, "It's important that the public recognize that, because young children are still growing and developing, it's critical that thorough and robust clinical trials of adequate size are completed to evaluate the safety and the immune response to a ... vaccine in this population. Children are not small adults[.]"
			Engerix B	G	None	NO	4 days	NO	Package insert at § 6.1	
DTaP	15	2M 4M6M 15M 4Y	Infanrix	G	DTP	NO	30 days		Package insert at § 6.1	DTP was also not licensed based on a placebo controlled trial and it increases mortality.
			Daptacel	S	DT or DTP	NO	Up to 2 months + 1 trial 6 months	NO	Package insert at § 6.1	The 6-month Daptacel trial had no control, 1,454 children and "[w]ithin 30 days following any dose of DAPTACEL, 3.9% subjects reported at least one serious adverse event."
PCV	4	2M 4M 6M 12M	Prevnar 13, PCV-13	P	Prevnar 7	NO	6 months	NO	Package insert at § 6.1	Prevnar 7 trial's control was an "[i]nvestigational meningococcal group C conjugate vaccine." In Prevnar 13 trial, "[s]erious adverse events reported following vaccination in infants and toddlers occurred in 8.2% among Prevnar 13 recipients and 7.2% among Prevnar 7 recipients." In Vaxneuvance trial, "serious adverse events...were reported by 9.6% of VAXNEUVANCE recipients and by 8.9% of Prevnar 13 recipients" but deemed "safe" because "no notable patterns or
			Vaxneuvance PCV-15	M	Prevnar 13	NO	6 months	NO	Package insert at § 6.1	

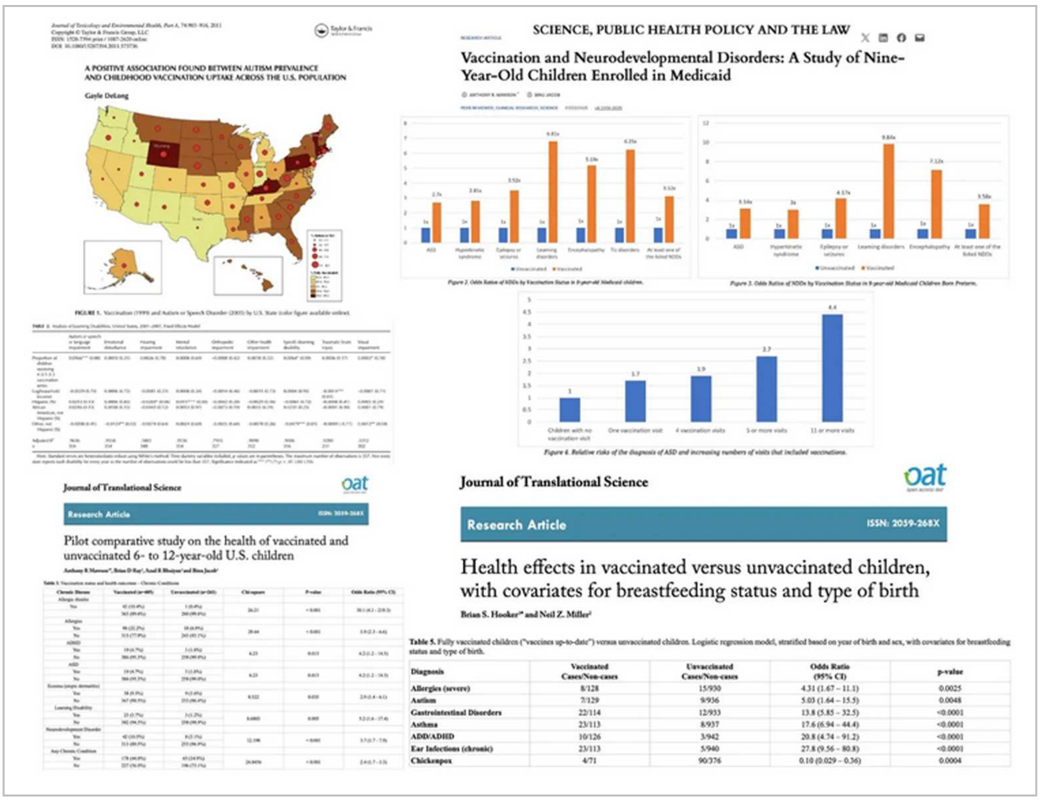
We recently observed that autism rates have skyrocketed alongside the ever-expanding inadequately tested childhood vaccination schedules:

This corroborates at least 4 peer-reviewed studies demonstrating a strong association between childhood vaccination and autism:

DeLong (2011) – State-Level Analysis

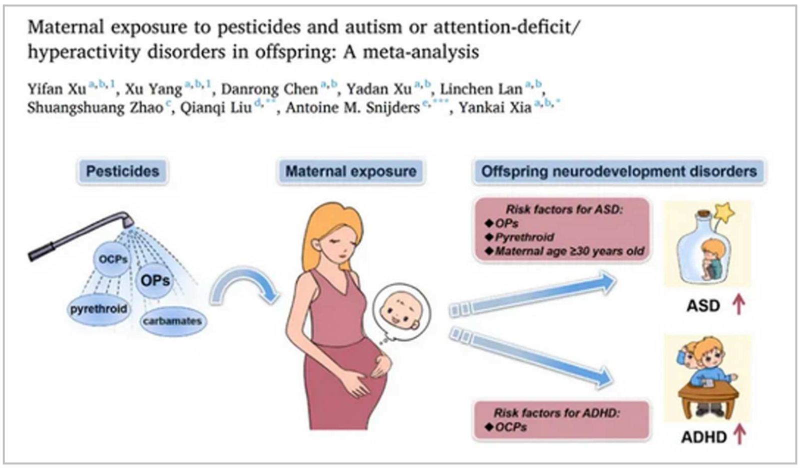
- 1%↑ vaccination → 1.7%↑ autism prevalence (680 additional cases, $p < 0.01$)

Mawson et al. (2017) – n = 666



- OR 4.2 (320%↑ autism risk, $p = 0.013$)

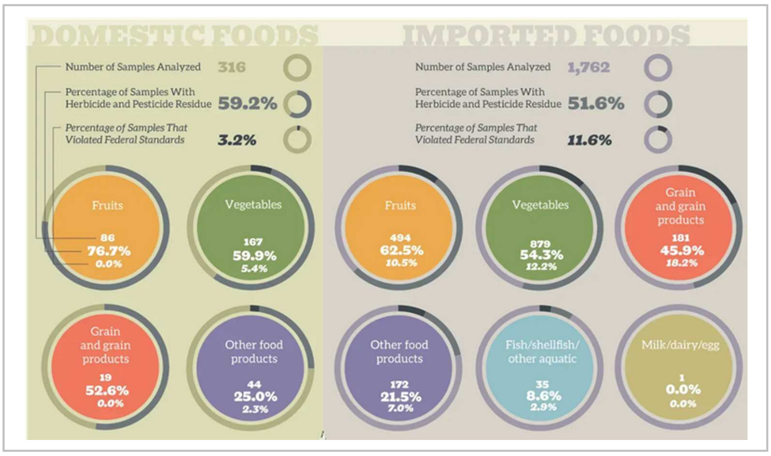
Hooker & Miller (2021) – n = 1,565



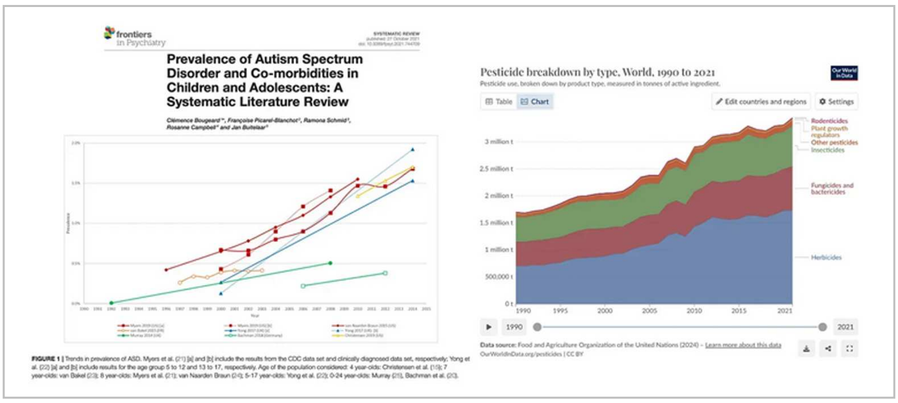
- OR 5.03 (403%↑ autism risk, $p = 0.0048$)

Mawson & Jacob (2025) – n = 47,155

- OR 2.7 (170%↑ autism risk, $p < 0.0001$), RR 4.4 (340%↑ for 11+ vaccine visits, $p < 0.0001$)

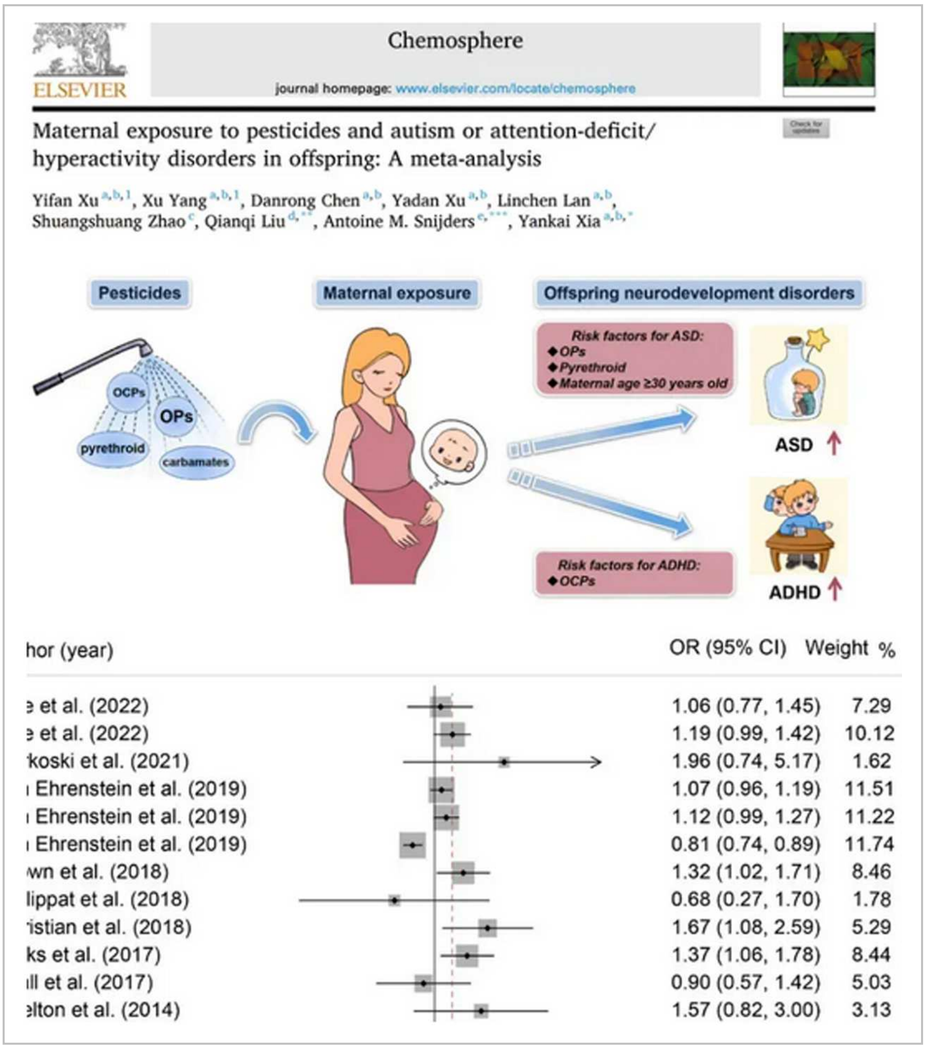


TARGET #2 - Pesticides
As President Trump stated, "Maybe it's a spray that we spray all over the place."
The Association Between Pesticides and Autism
Nicolas Hulscher, MPH
November 16, 2024



By Nicolas Hulscher, MPH
=> https://www.thefocalpoints.com/p/the-association-between-pesticides

The FDA 2020 Pesticide Residue Monitoring Report "tested for approximately 750 different pesticides and selected industrial compounds on 2,078 human food samples (316 domestic and 1,762 import samples) in its regulatory monitoring program." Nearly 60% of all domestic foods contained herbicide and pesticide residue, with 3.2% violating federal standards. 11.6% of all imported foods violated federal standards for pesticide residues:

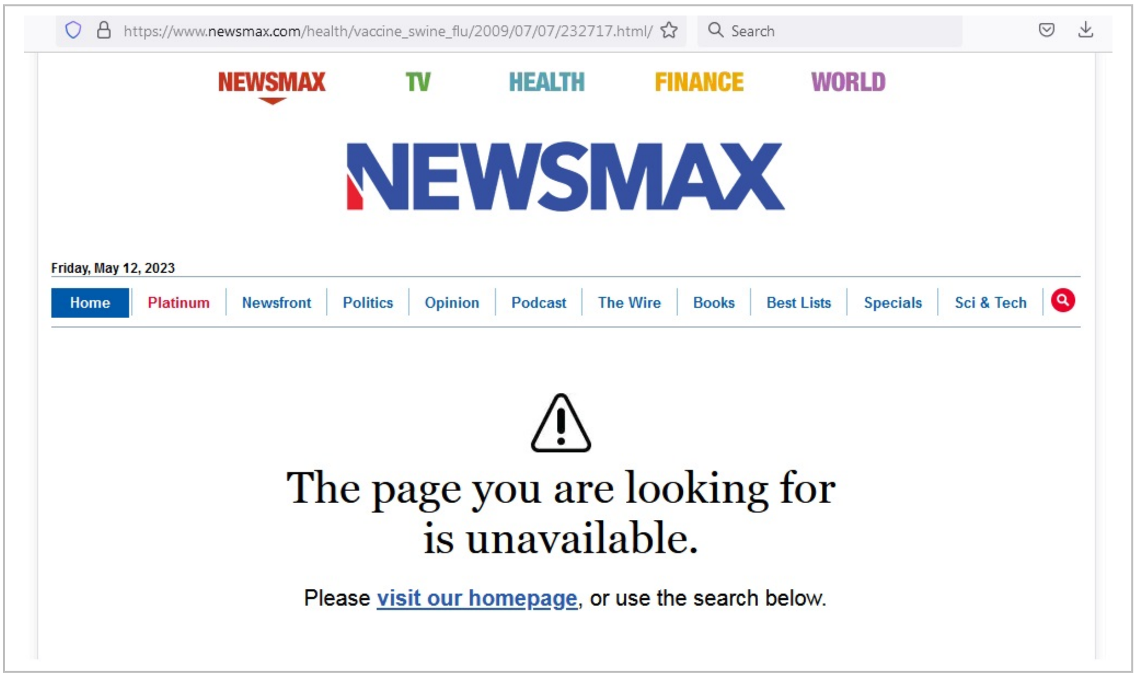


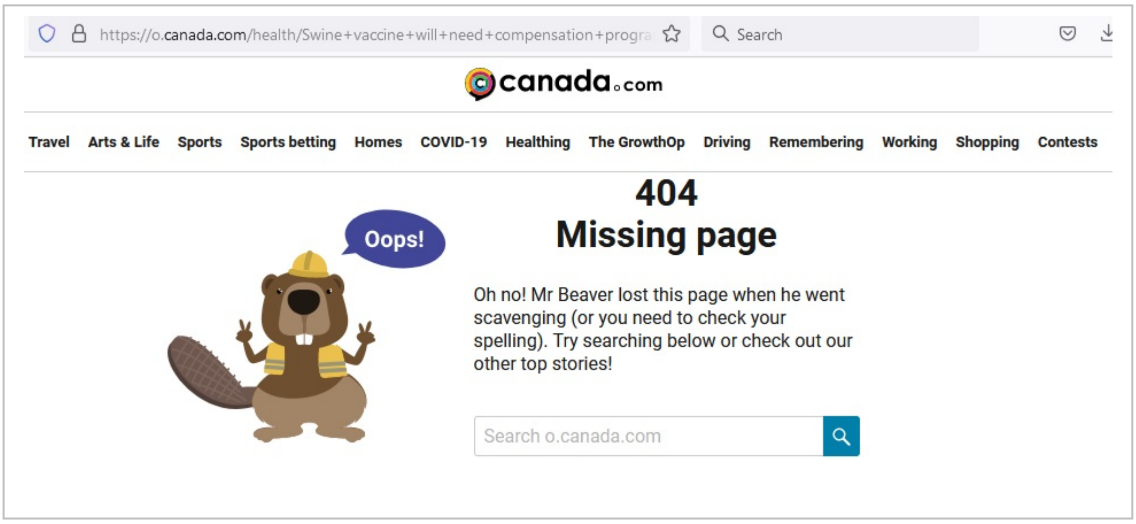
Since 1990, autism rates have skyrocketed along with pesticide use:

A 21-year case-control study by Roman et al found a 34% rise in ASD prevalence rate in regions with elevated pesticide use compared to regions with low use [OR: 1.34, 95% CI: 1.24–1.44].

Pu et al found that the exposure to high levels (0.098%) glyphosate during pregnancy and lactation caused ASD-like behaviors in male juvenile offspring (mice).

A meta-analysis by Xu et al included 19 studies and found maternal pesticide exposure was associated with a 19% increased risk of ASD in offspring [pooled OR = 1.19, 95% CI: 1.04-1.36].:





These data suggest that restructuring the CDC's childhood hyper-vaccination schedule and drastically limiting toxic pesticide use should be two priority targets in addressing the autism epidemic. A comprehensive, science-driven investigation into these factors is urgently needed to protect future generations.
